Conscription limits the age of the fighting man to thirty years, but there is no age limit for buying LIBERTY BONDS.

Loading and Shipping Clean Coal

Letter No. 1.—Reading the many interesting letters in *Coal Age* makes me wonder that any mine official can afford to be without the paper. There is one item referred to in the letter of W. R. Jones, on "The Fuel Situation," Mar. 16, p. 513, that I feel should be fully discussed, especially at the present time, when there is a strong temptation for miners to load dirty coal and for operators to ship an inferior quality of coal, believing that the great demand for fuel will excuse the practice.

Looking back a few years, I recall a time when a certain mine official gave orders to load out certain inferior qualities of bony coal that had been discarded and thrown into the gob, claiming that the company could sell the stuff for coal at that time. At some other operations in that vicinity teams were loaded at the rock dump with the same discarded bone that had been thrown out previously as unmarketable. This stuff was hauled to the railroad, loaded and shipped as coal.

It cannot be denied that a similar condition exists today, and that large quantities of unsalable stuff is being shipped to market for coal. At times the character of the material has been such that it could not be burned on the furnace grate, under forced draft, without being mixed with coal of good quality, and then only at a great loss in heat value.

Operators guilty of such a practice fail to realize that little is required to start a bad habit that it will take weeks and months to overcome. It is of the utmost importance, then, that everyone, operators and miners alike, use their best efforts to load and ship clean coal. The best quality of coal is required now more than ever, as only a good grade of fuel can give the highest efficiency when burned in ships, munitions plants and other industries working to win the war.

It is gratifying to note the patriotic action of many of the officers of the United Mine Workers' organization, who have not hesitated to address their members and urge the need of loading clean coal if they desire to assist the Government in the present war crisis. I noticed that a board member, Peter Farrar, and a district organizer, Patrick Eagen, proved their patriotism recently when addressing a local meeting of the miners, by urging with great emphasis the need of every man loading clean coal to be sent to the top for shipment.

It is to be hoped that all officers of the union and officials of mining companies everywhere will do the same and urge their men to put their shoulders to the wheel and do their part to keep the fires burning and win the war. JOHN BUGGY.

The Fuel Situation

Letter No. 3—The discussion of this question, recently started in *Coal Age*, should result in throwing much light on the actual situation regarding the coal supply of this country. Let us hope that it will receive the earnest attention of coal-mining men.

The daily press still contends that a coal shortage threatens the entire country, claiming that the production of bituminous coal fell far short of the requirements during the last two months, which is quite true, owing to the unprecedented demand for fuel to supply the bunkers of the navy and industrial power plants, whose activities have been more than doubled in attempting to furnish what the war demands.

The prediction that the output of coal in this country will be 40,000,000 tons less in the present year than in 1917 and the quoting, by uninformed reporters, of other misstatements of so-called statistics are calculated to stir public opinion and cause the lash to be used where it is least deserved. Such reports are conspicuous for their destructive rather than their constructive policy, and for their failure to fix the responsibility for the actual shortage of coal.

In contrast to this condition it is observed that the coal mines, in many parts of the country, are working little more than half the time and miners are drifting from place to place in search of regular work, telling their hard-luck stories of the scarcity of jobs. In some respects the situation is similar to that which prevails when cars are plentiful and there are no coal orders.

EFFORTS OF THE GOVERNMENT

Knowing the ability of the coal mines of the country to handle an aggregate output of 100,000,000 to 150,000,000 tons more than the present yield, the Fuel Administration has very properly been organized, as an arm of the Government, for the purpose of securing an increased production of coal. As suggested by N. H. S. in his letter, *Coal Age*, Mar. 2, p. 428, it is probable that the Administration should have adopted a more liberal and expansive policy and turned its attention earlier to the great underlying cause of the coal shortage, which has been found to be the transportation problem.

From all appearances it would seem that the railroads are striving to do their bit in the trying situation, but are practically unable to handle the coal that the mines can produce. I agree with N. H. S. when he says that "what the nation needs is constructive criticism." In general we are inclined to criticize by tearing down in

stead of lending a hand to build up and supply what is needed.

Few of the contributors to these columns, it may be assumed, have a knowledge of the first principles of transportation and would care to chance the deserved laugh by assuming to dictate a policy intended to unravel the transportation entanglement. Such an attempt would sound ridiculous to the well informed, and the guilty one would be quickly "railroaded" back to the mine where he belonged. Nevertheless even an amateur efficiency expert may suggest something that might prove of service to your Uncle Samuel in his hour of trial.

TRANSPORTATION THE REAL PROBLEM

It is evident to the onlooker that the great need of the railroads today is more cars and engines. We understand that there are thousands of railroad cars sidetracked over the country and awaiting repairs. It is natural to assume that the Administration is making every effort to have these cars repaired and again put in service, but the work progresses slowly owing in part to a lack of material and in part to a want of labor, since the work affords a lower wage than can be secured elsewhere. It is human nature for a man to prefer to work one or two days a week at $5 a day than to work six days out of the week for a less wage.

I have wondered if it would be impracticable to use some of these cars that are partially defective through the lack of one or more minor parts on short hauls and level grades where the standards of safety are not so severe, and thereby release other cars for service on the main lines.

As has been suggested at different times, use can be made of the lakes, canals and navigable rivers in many instances, which would relieve the congestion of traffic on the railroads. More barges should be built for this service. If necessary river towns like Pittsburgh might even be permitted to stock the coal, for distribution later when the congestion of traffic is not as great as at present. Barge transportation should be encouraged everywhere in order to release, as far as possible, cars for the transportation of coal to inland towns and other points not reached by water. Present indications are that the coal shortage will exist next winter if it is not felt during the coming summer. W. H. NOONE.

Examination of a Mine

Letter No. 5—As James H. Taylor has intimated in his letter, *Coal Age*, Mar. 9, p. 472, it is too often the case that the fireboss in a mine is made the "goat." My experience of 15 years in this state enables me to say that this is frequently true in Colorado. The fireboss in our mines has not the authority to act but, as has been stated by Robert A. Marshall (Feb. 2, p. 256) he must obey the orders of the mine foreman and do the work given him.

Since the introduction of electric mine lamps in coal mining the idea has become more or less prevalent that there is not the same need of taking precautions in regard to gas as when the mine was worked with open lights or safety lamps. It is commonly believed that the use of electric mine lamps makes it almost impossible for the gas to be ignited. For this reason the work of the fireboss is much underestimated and it would seem that almost anyone is thought to be capable of performing the duties of a fireboss, just so he complies with the mining law.

I fully indorse the suggestion made by Mr. Taylor that all firebosses should act as assistant mine inspectors and be appointed by the state inspector and under his jurisdiction. The fireboss would then be free to perform the duties of his office without fear or prejudice, since the mine foreman would have no authority over him.

There is, again, another consideration affecting this question, which is that the mine foreman would exert more care in the operation of a mine in his charge and give more attention to matters relating to safety if the fireboss was a state officer. The foreman would then live in daily fear of a bad report of the mine being sent to the state mine inspector.

In any event it is my conviction that the safe operation of a mine demands the constant inspection of the working places by the fireboss, who should devote all of his time to that end. The numerous other things that he is now called upon to do, such as hanging doors, building stoppings, repairing curtains, etc., should be done by someone else than the fireboss.

Under the present system, which is the custom in this state, the fireboss has little time to devote to the examination of the mine during working hours, this work being wholly confined to his first examination of the mine in the morning, before the men go to work. Allow me to say that, in my opinion, the fireboss is the most important man in a coal mine and should be so considered in the interest of safety. COLORADO MINER.

Miners and the War

Letter No. 9—Coal mining is an industry that has suffered greatly during the past year, owing chiefly to the scarcity of labor and the shortage of cars to transport the coal to the markets, but, as has been said, the Government is making every effort to counteract that difficulty by assuming control of the railroads and assisting them to handle all the coal that the mines can produce without further delay.

At the present time, it is up to the miners themselves to keep the markets supplied with coal this summer and the coming winter and avoid another great coal shortage that caused so much suffering last winter. The companies are planning for a larger output this year than ever before. And with the coöperation of the miners there is little doubt that the year 1918 will never be forgotten for record production of coal.

With an increase output of coal there will be a larger production of other materials all of which go to help win this great world war. The miner, therefore, holds

a position that places him in the forefront of the great army that is struggling for democracy. While the miner is at home, it does not follow that he is not doing his bit for his country. The President has said that if the miner and farmer fail, armies and statesmen are helpless. Now is the time then, for the miner to show the President that he is behind him in his hour of trial.

The way for us miners to do our part is to report for work on all the coming holidays and work the mines to their fullest capacity. Then, we can say that we have done our duty, but we will not be able to say that until we have taken our share of the war on our own shoulders. So lets get together, boys, and make this a banner year for the mines. Hoist old glory to the top of the pole. Wave the Stars and Stripes over Germany and free the world from Prussian militarism.

Shotfiring re Explosion

Letter No 8.—I glean from the reading of John Verner's letter, *Coal Age*, Jan. 5, p. 33, that the miners in Iowa were permitted to fire their own shots, at the end of each shift, and that ordinarily two or more shots were fired in each working place, with the result that the shots following the first, in a place, "had to be fired in the presence of a hot, dense cloud of powder smoke produced by the preceding shot or shots."

Mr. Verner states that this practice continued during a period of many years and claims that the results showed that the powder smoke had a quenching effect on the flame of a possible explosion. He argues therefrom that "a reduced circulation of air in the workings of a mine, at the time of firing, lessens the liability of an explosion taking place."

REASONS FOR NOT REDUCING CIRCULATION AT FIRING TIME

Kindly allow me to give a few reasons why I consider these conclusions are wrong:

1. Coal-mining conditions seem to require that, in the use of black powder, the exposure of new faces of coal caused by the firing of shots affords a greater emission of gas as the work proceeds and a larger production of fine coal dust, either of which, combined with the hot powder smoke produced in firing, will generate an explosive mixture that should not be allowed to accumulate in the workings.

2. When shots are fired in a reduced quantity of air in a mine, no one can tell just what is going to happen. The shots may liberate a feeder of gas in the coal or a sudden inrush of gas may result from a heavy fall of coal or roof. Few mining men will be willing to say that it is safe to experiment with a reduced circulation of air, in the face of these conditions.

3. Assuming that the mine workings are extensive and a considerable area of goaf exists, containing accumulations of blackdamp and possibly other gases, the fall of pressure caused by reducing the circulation in the mine will produce an outflow of these gases onto the main roads, which may hinder the escape of the men after firing their shots. I note that Mr. Verner frankly admits that the mixture of gases produced, in blasting in a close place, is injurious to health and may even prove dangerous to life.

4. In my judgment, the firing of two or more shots, which means as many as the miner chooses, in a working place at one time is an unsafe practice and, if allowed, would require the thorough ventilation of the place where the shots are fired.

I fully agree with R. W. Lightburn, who states, Feb. 9, p. 301, that "in order to properly and safely perform this work, it should be done in an abundance of pure, fresh air." My opinion is that the quantity of air circulating in a mine should be increased, rather than decreased, at the time of firing, in order that the gases, produced by the explosion of the powder and otherwise, would be swept out of the mine and the working faces kept clear of any explosive mixture.

In closing, let me say that an experience of 20 years in shotfiring and bossing, as mine foreman, has taught me that the first consideration in all mine work is the safety and efficiency of its performance. I consider it an unsafe practice for a man to thrust an open light into a crevice behind a shot where an explosive mixture may exist and result in disaster and loss of life. In general, I would say that any condition that involves a deficiency in the oxygen content of mine air is injurious and unsafe. J. M. RODDY.

Springfield, Ill.

Letter No. 9.—I fully agree with the conclusion of R. W. Lightburn, *Coal Age*, Feb. 9, p. 300, as to the necessity of having plenty of fresh air circulating in a mine, at the time of firing shots. This will not only allow the shotfirers to work in pure air, but the smoke and gases produced by the firing of previous shots are swept into the return airway and carried out of the mine before they can do any harm. It is assumed, of course, that the work is properly started on the end of the air and that the shots are fired in regular order, advancing against the air current.

I cannot agree with Mr. Lightburn, however, when he asks, "Is it not true that, in a limited supply of air, a larger quantity of carbon monoxide will be produced?" My opinion is that when a shot is properly tamped the mine air is completely excluded and the combustion of the carbon is supported by the oxygen contained in the powder. This being the case, the gases resulting from the combustion are independent of the oxygen of the air.

If it were true that the complete combustion of the powder depended on securing the necessary oxygen from the air, it would follow that the explosion of the powder in blasting must be completed in the air, which Mr. Lightburn will probably agree is only true of a windy or blownout shot where the force of the explosion is partly expended on the air.

In the same issue of *Coal Age*, page 301, R. J. Pickett expressed the belief that "present-day methods of mining and blasting coal are responsible for the explosions that occur so frequently in blasting." He mentions the old practice of firing shots by the use of a needle and squib. Does he mean to say that men using these former methods and knowing that their daily

wages depend on the amount of coal they can blast down and load out are safer miners than the shotfirers of today, who are specially trained for that class of work and responsible to a Mines Department for its proper performance?

What appeals to me as the chief cause for the frequent explosions resulting from shotfiring is the continued use of a long-flame explosive such as black powder. Frequent reference has been made to the danger of the use of black powder in blasting coal. In the 30 years of my experience in coal mining I have never known of an explosion being traced directly to the firing of a blast when the explosive used was one named in the permitted list of this province and required by the Mines Regulation Act.

Safety in Use of Permissible Explosives

There is always an element of danger attending shotfiring in coal mines; but the danger is reduced to a minimum by using a permissible explosive, because of the short flame and comparatively low temperature of the explosion. It has been shown that the ignition of a firedamp mixture requires a temperature of 1200 deg. F., which must be maintained a certain length of time before the gas can be ignited.

The presence of fine inflammable dust floating in the air lowers the temperature of ignition of firedamp and the mixture is inflamed more readily. On this account the use of the short-flame permissible explosives is important in a dusty mine generating gas These conditions have led manufacturers of explosives to introduce certain ingredients that will exert an extinctive effect on the gases produced in the explosion.

In my opinion the surest safeguard against explosions occurring in blasting is the employment of thoroughly trained and experienced shotfirers who will fire but one shot at a time in a single place and who are authorized to examine, charge and fire all holes that, in their judgment, are unsafe.

The use of an electric battery for firing the shots will also, I believe, reduce the number of fatal accidents due to blasting. Under these conditions it is my belief that the more fresh air in circulation at the time of firing the greater safety will be secured in the performance of the work. James Touhey.

Favoritism in Mine Management

Letter No. 4—The letters on this subject have been interesting to me, and, while I cannot agree with some things that have been said, there is much that is undoubtedly true with respect to the incoming of a new superintendent and his treatment of the old employees.

It is not always the case, however, that a new man will cost the company thousands of dollars, as one correspondent would have us believe. A new man is bound to bring with him and, in time, introduce into the mine new ideas and new methods. But, no wise and practical man will attempt radical changes in the operation of a mine immediately upon his assuming authority.

Any man of executive ability will be willing to admit that such a course as that just mentioned will almost invariably fail. A man of experience on taking a new position will recognize his responsibility and proceed with caution. He will allow things to follow along the old lines, and gradually correct minor difficulties but leave more important changes until he has become thoroughly familiar with all the conditions existing in the mine.

It is evident that a new man cannot show the best results when starting a new plan or making an important change in methods, but time will prove or disprove the wisdom of making the change. It is not to be supposed that a new plan will always work out successfully. In some instances, the attempted improvement will result in failure, although the experiment was worth the trying.

Success in Failure

Speaking of failures, give me the man who is willing to admit that he has one or more failures to his credit, rather than one who boasts of unvarying successes. It is the ability to accept a situation, admit failure, and start afresh that makes men strong. Such men are prepared against future reverses that are sure to come sooner or later.

In arguing this question, reference has been made to the fact that workers are frequently skeptical about accepting the new rules or adopting a new system introduced by a newly appointed superintendent. It is my experience, however, that where fairness has characterized the new official and still there are those who murmur and complain in regard to his management, they will generally be found to be the ones who stood in with the former boss and were his particular favorites.

Who Complain of "Favoritism"?

It is my belief that men who complain the most about favoritism being shown to others belong to one of two classes: (1) Those who were specially favored by the boss before the change was made and, as a result of the change, lose their prestige. (2) Those who, in a spirit of demanding their rights, complain that justice has not been accorded them. The latter class, generally, have no difficulty in securing a hearing with any boss who is fair, and he it is who is able to hold the respect of all his men.

There is an old saying: "Play favorites and make enemies." Fairplay is always recognized and commands the respect of every honest worker. In all positions of responsibility, a man should resolve to play fair and have no favorites. Favoritism in a boss makes few friends—I would say very few—but many enemies.

Let me suggest that, in contemplating changes, a newly appointed superintendent, if wise, will undertake the same gradually, giving time for the advantage of the change to be shown by the results, before completing his proposed plan. By this means, prejudices, which are often strong, are overcome and ill feeling avoided. The impartial boss makes for efficiency, which is the watchword in the industrial world today.

Golden, Colo. Fred L. Serviss.

INQUIRIES OF GENERAL INTEREST

Reversing a Mine Fan

I want to ask why the mine law of Illinois requires that the fan be reversed in case of an explosion occurring in the mine. I have studied over this matter considerably and fail to understand how such a requirement could be made a part of the law.

I reason as follows: Assuming that I was at work in a mine at a time when an explosion occurred at some point in the workings, suppose that, being thoroughly familiar with every portion of the workings and, understanding the direction of the ventilating currents, I undertook to lead the men out of the mine by a route that I believed would enable us to reach fresh air the quickest. Now, if the fan was to be reversed, the air current circulating in the mine would be changed, with the result that my calculations would all be wrong and we would soon find ourselves enveloped in the smoke and afterdamp of the explosion.

Or, again, assuming that two or more panels in a mine are ventilated by the same air split and that an explosion takes place in one of the panels, let me ask if it is not probable that the reversing of the fan would result in a second explosion taking place.

In my opinion, the reversing of the fan following an explosion in a mine would be a grave error and endanger the lives of any men who may have survived the explosion and who were working their way out of the mine by a chosen route that they hoped would enable them to reach fresh air without coming in contact with the afterdamp.

Harrisburg, Ill. INQUIRER.

As far as our knowledge goes, the Coal Mining Laws of Illinois, as revised and approved June 28, 1915, contain no provision authorizing or suggesting the reversal of the mine fan following an explosion in a mine. As has been suggested by this correspondent, such a proceeding would endanger the lives of any persons who may have survived the explosion. Mine workers should always be assured that, in case of trouble or disaster occurring in the workings, there would be no change made in the circulation of the air currents due to the reversing of the ventilating fan.

It is true that conditions might exist that would cause a temporary reversal of the air current in one or more sections of the mine. This, however, would be unavoidable should it occur, and its effect would generally be only temporary, as the pressure of the general circulation would tend to overcome those local conditions to which reference has been made.

A safe rule to follow, in respect to the circulation of air in a mine, is that the reversal of the fan should only be considered as a last resort in an extreme case, where the conditions following the explosion are found to be such that to maintain the old circulation would mean the destruction of the only avenues of escape for the unfortunate men entrapped in the mine.

A fire at or near the foot of a downcast shaft or slope, or on the intake airway of a drift mine, may make it wise or necessary to change the direction of the circulation by reversing the fan, unless it is possible to short-circuit the air current at a point inby of the fire and thereby prevent the smoke and gases generated by the fire from being carried into the mine. This is almost the only instance that would warrant the reversing of the ventilating fan.

Centrifugal Pumping

Kindly permit me to submit the following question regarding the operation of two centrifugal pumps. These pumps are capable of delivering 1500 gal. per min. under a head of 125 ft. when running at a speed of 1750 r.p.m. The driving unit is a 150-hp. Westinghouse motor, which is set up between the two pumps, one being on either side of the motor.

I would like to ask, what head would these pumps operate under when connected up in series; that is to say, so that one of the pumps will discharge into the other. Also, with this arangement, what should be the capacity of the two pumps and would the motor be overloaded by this arrangement? Is it necessary to lubricate graphite bearings?

Seward, Penn. CHARLES MARTIN.

A prominent manufacturer of centrifugal pumps to whom this question was submitted stated that it would be better to ask the information desired of the manufacturer of the pump, since much depends on the particular type of pump and details of construction. However, assuming that each of the pumps mentioned by this correspondent is good for a 125-ft. head ordinarily the two pumps when connected in series would be capable of handling practically the same quantity of water under double the head of a single pump.

Again, assuming that these pumps are designed for a capacity of 1500 gal. per min., under a 125-ft. head, the two pumps working in series should be able to handle about the same amount of water against a head of 250 ft.

Replying to the question of overloading the motor in this operation, it may be stated that a peculiarity of the centrifugal type of pump is that the horsepower required for its operation increases as the head decreases, in a pump designed for a given service. Also, the pump will develop its maximum efficiency at a given speed. For these reasons, when the two pumps in question are not operated under the full head for which they are designed, there would be a tendency to overload the motor.

The lubrication of the so-called graphite bearings is generally supplied through an oil reservoir connected with the bushing of the bearing. It is necessary to keep the graphite, which is contained in grooves cut in the bushing, in a moist condition.

EXAMINATION QUESTIONS

Miscellaneous Questions

(Answered by Request)

Ques.—If 40,000 cu.ft. of air is to be delivered per minute; (a) what should be the diameter of the port of entry of a fan having two ports [the fan being double intake]? (b) What should be the width of the fan blades?

Ans.—(a) For a double intake fan, circulating a quantity of air (Q), the diameter (d) of the port of entry or the intake circle is found by the formula

$$d = 0.023\sqrt{Q} = 0.023\sqrt{40{,}000} = 4.6 \text{ ft.}$$

(b) In a properly designed double-intake centrifugal fan the width of the fan blades may be taken as $\frac{5}{8}$ of the diameter of the intake orifice. Applying this rule, the width of the blades, in this case, would be $\frac{5}{8} \times 4.6 = 2.875$ feet.

The diameter of the intake circle is therefore 4 ft. $7\frac{1}{4}$ in. and the width of the fan blades is 2 ft. $10\frac{1}{2}$ inches.

Ques.—An entry in a mine is 7 x 10 ft. in section and 6720 ft. long; what is the velocity of the ventilating current passing through this entry when the water gage stands at 2 inches?

Ans.—First, find the rubbing surface and sectional area of the airway and the unit pressure corresponding to a 2-in. water gage; thus, $s = 6720 \times 2(7 + 10) = 228{,}480$ sq.ft.; $a = 7 \times 10 = 70$ sq.ft.; $p = 2 \times 5.2 = 10.4$ lb. per sq.ft. Then, substituting these values in the formula for the velocity of the air current we have

$$v = \sqrt{\frac{pa}{ks}} = \sqrt{\frac{10.4 \times 70}{0.00000002 \times 228{,}480}} = \text{say } 400 \text{ ft. per min.}$$

Ques.—A point that may be designated as *B* is 33 yd. east of another point *A;* a third point *C* is 18 yd. north of *B;* and a fourth point *D* is 24 yd. east of *C*. What is the distance from *A* to *D?*

Ans.—From the data given the point *D* is 33 + 24 = 57 yd. east and 18 yards north from *A*. Therefore, the distance from *A* to *D* is equal to the hypotenuse of a right triangle whose sides are 57 and 18 yd., respectively. The length of the hypotenuse *AD* is therefore $\sqrt{18^2 + 57^2} = 59.77$ yd.

Ques.—How many cartridges 24 in. long and $1\frac{7}{8}$ in. diameter can be made from a full keg of powder 11 in. long and 9 in. in diameter?

Ans.—The cubic contents of this keg is $11(0.7854 \times 9^2) = 699.787$ cu.in. The volume of a single cartridge is $24(0.7854 \times 1.75^2) = 57.72$ cu.in. Hence, the number of cartridges that can be filled from a single keg, in this case, is 699.787 ÷ 57.72 = 12.1, or slightly over 12 cartridges.

Ques.—Suppose that, in a fiery mine, the quantity of air in circulation is 175,000 cu.ft. per min., measured on the return, and contains 4 per cent. (or 1 in 25) of firedamp when the barometer is 30 in. (a) What quantity of firedamp is given off in the mine? (b) What is the least decrease of the quantity of air that will render the return air explosive? (c) What increase of gas will render the return air explosive?

Ans.—(a) In this case, the gas being $\frac{1}{25}$ of the volume of the return current, the quantity of gas given off in the mine is 175,000 ÷ 25 = 7000 cu.ft. per min.

(b) The lower explosive limit of pure methane and air is reached when the proportion of gas to air is 1:13; and, at this point, the firedamp mixture would be 14 times the volume of the gas, or 14 × 7000 = 98,000 cu.ft. per min. Therefore, the decrease in the quantity of air that will cause this condition is 175,000 — 98,000 = 77,000 cu.ft. per min.

(c) To produce the same condition by an increase of the quantity of gas would require 175,000 ÷ 14 = 12,500 cu.ft. of gas per minute. The required increase in the volume of gas is therefore 12,500 — 7000 = 5500 cu.ft. per minute.

Ques.—How many 3-in. pipes will be required to run off as much water as one 12-in. pipe, all the pipes being of equal length?

Ans.—For the same head, the flow of water in each pipe is proportional to the square root of the fifth power of the dameter of the pipe. Hence, the number of 3-in. pipes that will carry the same volume of water as one 12-in. pipe, under the same head, is equal to the square root of the fifth power of the ratio of the diameters. The ratio of the diameters being 12 ÷ 3 = 4, the number of 3-in. pipes required is $\sqrt{(4)^5} = 2^5 = 32$ pipes.

Ques.—The airways of a mine are one mile long and the water gage is 0.7 in. If the length of these airways is now increased four times and the velocity of the air current is also increased from 500 to 700 ft. per min., what will be the water gage reading?

Ans.—The unit pressure or the water gage due to the circulation of an air current in a mine or airway varies as the length of the airways and the square of the velocity of the current. In other words, the water-gage ratio is equal to the product of the length ratio and the square of the velocity ratio, which gives, in this case

$$\frac{w.g.}{0.7} = \frac{4}{1}\left(\frac{700}{500}\right)^2 = 4\left(\frac{7}{5}\right)^2 = 4 \times 1.4^2 = 4 \times 1.96$$
$$= 7.84, \text{ say } 8 \text{ in.}$$

Ques.—If 20,000 cu.ft. of air per minute is passing into a mine, how would this quantity divide itself between two splits of the following dimensions:

(a) 4 ft. high, 12 ft. wide and 14,000 ft. long;

(b) 6 ft. high, 8 ft. wide and 16,000 ft. long?

Ans.—The air current will divide equally between the two splits given in this question, because they have equal sectional areas and equal amounts of rubbing surface. The sectional area (*a*) and rubbing surface (*s*), in the two splits, are as follows:

Split A, $a = 4 \times 12 = 48$ sq.ft.

Split B, $a = 6 \times 8 = 48$ sq.ft.

Split A, $s = 2(4 + 12)$ 14,000 = 448,000 sq.ft.

Split B, $s = 2(6 + 8)$ 16,000 = 448,000 sq.ft.

COAL AND COKE NEWS

Harrisburg, Penn.

In a resolution adopted by 300 coal operators in the central bituminous field, meeting at Altoona at the call of J. P. Cameron, district representative of the state fuel administration, the shippers urged that if all priority orders and assigned cars were abolished production would be increased, labor unrest assuaged and discrimination ended. The present method of assigning cars for railroad fuel supply was also disapproved. A more equitable method was asked and the matter was left in the hands of a committee of fifteen with instructions that it be taken up with the Fuel Administration and the Director General of Railroads.

Stimulated by the note of impending labor trouble, if the present method of car distribution is continued, the operators pledged themselves to coöperate with the district representative so that he can distribute equitably among the shippers emergency tonnage required by the Government. He has been unable to do this because operators have neglected to give him complete reports as to the amount of coal produced.

That 1,000,000 tons of coal could be transported each year from the anthracite fields of Pennsylvania to tidewater by boat if some part of the $500,000,000 Government appropriation for shipbuilding were used to build 200 barges will be made the substance of a report to the railway administration in Washington by William H. Schoff, secretary-treasurer of the Atlantic Deeper Waterways Commission, who has completed a two days' inspection of the old Schuylkill canal from Fairmount dam to Port Clinton.

Birmingham, Ala.

Mining operations in the Birmingham district are picking up steadily, and the coal output is correspondingly on the increase. Despite the bad start in January and part of February operators assert there is no doubt but that a record production is certain for 1918. Announcement that the Tennessee Coal, Iron and Railroad Co. will open a new mine in Blue Creek will be followed shortly by other announcements of equal importance, gossip in mining circles here indicate. The Cullman Coal Co., before the year is out, will be mining coal on a large basis at Bremen, in that county, while in Walker and even in Jefferson County new developments are promised.

The coke market in the southern territory is strong. Many of the larger consumers are making inquiries here for coke and local representatives are being provided. Harold McDermott, of the New Castle Coal Co. is working on possible contracts for the Guggenheimer interests in the smelting line, but so far as can be learned there has not been a great amount of the product obtained for that concern. Government prices prevail for both coal and coke and there is contentions as to prices.

Labor in the mining sections of the state is doing better, though the men are not striving for limit production. In other words, there are many men working in the mines who will not put in a full day, nor will they work a full week. The earnings of short time apparently are sufficient to satisfy their needs as a result of the advance scale now being paid.

A final showing of coal immediately available for river transportation, character of craft now on the river and other data regarding the Warrior River development has been prepared by the Birmingham district operators and will be forwarded to Washington the latter part of this week. The data is intended for presentation to Secretary McAdoo before the consideration of the Warrior development is resumed two weeks hence. Mr. McAdoo has taken personal charge of this proposition and, as a result, river coal operators expect quick results.

As to the amount of good bunkerage coal immediately available from running mines the following data showing daily capacity is authoritative:

Sipsey mine, 1000 tons; Empire, 1000 tons; Dilworth, 250 tons; Summit, 150 tons.

Total in Black Creek seam on the Frisco, 2400 tons.

Corona, 500 tons; Coal Valley, 1500 tons.

Total in Corona seam, on the Southern, 2000 tons.

Total available by short rail hauls to the river 4400 tons.

Payne's bend, 500 tons; Maxine, 500 tons.

Total Pratt seam, 1000 tons.

Grand total of bunker coal available 5400 tons daily, or 1,620,000 tons per annum. Bunkerage needs are estimated at 1,000,000 tons per annum. The Warrior River showing more than covers the situation.

Charleston, W. Va.

The Ohio River bids fair within the next few years to become as important a channel of commerce as it was before the advent of many railroads. Numerous projects are on foot to restore the Ohio to its former commercial status. Capitalists of Pittsburgh, Wheeling and other Ohio River points are planning to organize a corporation with a capital of $500,000 to build boats which will ply between Pittsburgh and Cincinnati, and only recently a meeting was held in Huntington, W. Va., at which the initial steps were taken by officers of commercial bodies of Parkersburg, Huntington, Cincinnati and other river cities to finance a transportation company to operate a line between Parkersburg and Cincinnati.

Greater attention is to be given the mines along the Monongahela R.R. in the future than has heretofore been the case, according to a statement recently made by Floyd J. Patton, one of the district fuel administrators in West Virginia, the National Administration having urged that more attention be given to the district referred to so as to encourage mine production there. Recent reports from the mines located on the Monongahela indicate that the car supply is much improved, operators on the Scott's Run line, for instance, stating that they had received more than 60 per cent. of their quota. Even though the Monongahela R.R. has no cars of its own, coal operators are confident that if the Government is to require fuel orders to be placed at the point nearest at hand, then the Government will require the Monongahela to furnish a sufficient number of cars to meet requirements.

Some of the more pessimistically inclined coal men in the southern part of West Virginia paint a rather gloomy picture of the outlook for production in the southern part of the state during the present year, and even go so far as to predict that the coal production in the Pocahontas and Tug River bituminous fields will fall short six million tons of last year's output, predicating their forecast on the fact that for the week of Mar. 9, about 180,000 tons were "lost," as they term it, through a shortage of cars and scarcity of labor. They also contend that the decline has been steady since last July and that there is therefore little probability of any increase in tonnage. Other coal men in the same section find encouragement in the fact that twenty large locomotives are to be put into service on the Norfolk & Western, having been sent to that road from a Western road to be used in furnishing power for additional coal trains. It is also argued that under the new system of shipments there will be much improvement in transportation facilities and that unless unusual conditions arise there will be a marked improvement in the movement of coal to market.

Fairmont, W. Va.

Senator C. W. Watson, head of the Consolidation Coal Co., is believed to be a candidate for the Democratic nomination for the United States Senate. Although he has been quoted as saying that there was too much work connected with the position for a business man, he is believed to have changed his ideas and that his candidacy will be announced formally in the very near future. Senator Watson has recently applied for a commission in the Ordnance Department of the Government. Former Senator Davis Elkins, also a coal man, is a candidate for the Republican nomination for the United States Senate. He served in that position for a short time following the death of his father, being appointed by the governor.

The Consolidation Coal Co. recently completed a coal storage bin at its Owings mine, near Fairmont, which is of frame construction, placed on a concrete foundation, and has a capacity of approximately 1800 tons of run-of-mine coal. The size of the bin is 35 x 100 ft. It is constructed of longleaf yellow pine thoroughly treated with K.R. wood preservative, and extends over two railroad tracks, making it possible to load four railroad cars simultaneously. The coal is dumped over the tipple in the usual way, going from the chutes into a conveyor by which it is carried to the top of the bin and deposited where desired by gates which can be opened or closed. The machinery employed is electrically driven.

PENNSYLVANIA

Anthracite

Scranton—Former Senator E. F. Blewitt, a local mining engineer, has asked the Scranton Board of Trade to take up the matter of having 16,000 or more mine workers who were taken from the anthracite field to serve in the Italian army returned to work in this region. According to Mr. Blewitt the mines in the hard-coal field can increase production from 60,000 to 70,000 tons a day, if the former number of mine workers can be obtained.

Tower City—The Philadelphia & Reading Coal and Iron Co. has announced its intention to build at once a new town on top of Broad Mountain. Fifty houses will be erected and will be models of miners' houses in every respect, containing good water, electric light and all sanitary accessories. Vocational training for children will be provided.

Port Bowkley—No. 14 colliery of the Pennsylvania Coal Co., on Mar. 23 dumped 2335 mine cars in nine hours. The men requested Superintendent Edgar Weichel to have a big day, so that they could show their patriotism by producing extra coal. The normal run of the colliery is 1100 mine cars per day, and the increase to 2335 cars shows the feeling of the men. The result meant that 7677 tons of coal were shipped from the breaker.

Lost Creek—The State Compensation Board has ordered a rehearing in the claim of Frank Lokus against the Harleigh-Brookwood Coal Co., in which compensation was asked because the claimant and a companion were caught in a rush of coal and imprisoned for 36 hours. The board said he was undoubtedly injured to some extent, but that it is not satisfied that the medical testimony sustains the findings of the referee. The case is the first of the kind to come before the board.

Plymouth—One double and four single frame dwellings at Carver St. were materially damaged on Mar. 20 by a settling of the surface. The cave extended as far as the Delaware & Hudson Co. coal tracks, making it impossible for the company to transfer cars of coal by this route. This same section was visited by a similar cave several months ago.

Pittston Junction—As a result of the activity of the fuel administration there will be little immediate mining of coal by the White Coal Co., where operations in the Checker vein have been followed by extensive surface subsidence. For shipping unclean coal the White Company, it is stated, will be denied any more cars, according to orders issued to the Lehigh Valley Coal Co. by the district coal administrator.

Pittston—At the direction of County Fuel Administrator A. C. Campbell, the shipping of culm from two culm banks in Dupont borough and coal from a slope in Pittston township has been stopped under the regulations requiring that run-of-mine coal cannot be sold on the market.

Bituminous

Uniontown—J. H. Hillman, Jr., of Pittsburgh, has purchased the Fuller coal tract of Coal and Redstone townships for $468,000, it was learned here. The tract includes 260 acres and was purchased at a price of $18,000 an acre. It was purchased directly

from R. M. Fry and Homer Birchnal, who held options on it.

Ebensburg—Three flat cars, brought into Revloc, the new mining town two miles from here, over the Coal and Iron R.R., were loaded and shipped on Mar. 19, making the first real shipment of coal by rail to be sent out from the new mines. There are two large shafts at Revloc, which will have a capacity of about 3000 tons a day when the mines are in full working order.

ALABAMA

Cullman—The Cullman Coal Co., recently incorporated, has filed in the office of the probate judge a deed from the Parker Bank and Trust Co. as the receiver of the Cullman Coal and Coke Co., conveying the fee simple right and the mineral and surface rights to 17,000 acres of coal lands, also the right-of-way and line of railroad of the Cullman Coal and Coke Co., extending from a point of connection with the South and North Alabama Railroad Co. at Cullman, to Bremen, a distance of some 20 miles. It is understood that the intention of the Cullman Coal company is to begin at once the development of the coal fields at Bremen.

VIRGINIA

Elkhorn City—A group of Huntington business men has acquired a tract of 462 acres of Elkhorn coal land on the Russell Creek fork of the Big Sandy River near here, and arrangements are being made to develop it on an extensive scale. Operations will begin immediately and it is expected to ship coal by July 1. A capacity of 1000 tons a day is planned.

WEST VIRGINIA

Caperton—Owing to a slide at its plant which carried the sidetracks away, in addition to about 200 ft. of the incline, the Sewell Smokeless Coal Co. has had to suspend operations for several weeks.

Weston—A mining machine is being installed at the plant of the Stone Coal Co., near here.

Clarksburg—Offices have been opened here by the Madigan Coal Co., of Connellsville, Penn., which recently began stripping coal at Meadowbrook with a steam shovel.

Shelmore—The Wolf Den Coal Co. is building 300 new miners' houses.

Austed—The Mill Creek Colliery Co. has found it necessary to suspend operations from 20 to 30 days, recent floods having washed away the power house, tramway and siding at the plant.

Fairmont—Two 3½-ton trucks with steel bodies and automatic dumps have been purchased by the Sines Coal Co. in order to haul the coal from its mines at Tammond, near Grafton.

Dodson—Extensive improvements are being made by the Garrett County Coal and Mining Co. at its tipple here.

Kingwood—The Kingwood mine of the West Virginia Coal Co. has been sold to a Greensburg, Penn., syndicate. The sale includes about 250 acres of coal land and a working mine with a capacity of 300 tons daily. The mine will be operated by the Inland Fuel Co., with headquarters at Greensburg, Penn. However, 750 acres of land are retained by the West Virginia company which plans to expend about $75,000 in driving a 60-ft. shaft and in building a power plant.

Downs—The new Rachel mine at Downs, W. Va., will be electrically equipped throughout. A 700-hp. electric engine for the coal shaft and a 350-hp. electric engine for the supply shaft are on the way. Three Sullivan shortwall machines were installed last week. Six punchers will be installed this week.

KENTUCKY

Hopkinsville—The Memphis Coal and Mining Co., a subsidiary of the Memphis Gas and Electric Co., a heat, light and power company similar to the Kentucky Utilities Co., last season started purchasing coal lands near Mannington, Ky., to supply the necessary fuel for the company's operations. The company has recently purchased about 1600 acres of additional coal land at Mannington, where the company now has three mine openings and is starting a fourth. About $40,000 will be spent on a tipple, of all-steel construction, while the coal from the various openings will all come to this tipple by tramlines. It is planned to erect large storage arrangements, so that the mines may operate steadily even when transportation facilities are at a low ebb. It is planned to expend about $200,000 in all for land and improvements at this plant.

Madisonville—The Linton Colliery Coal Co. has started work on opening a new mine at Moorman, Ky., the shaft to be only 22 ft. deep. When in operation it is claimed the mine will have a daily capacity of 2500 tons. The coal mined will be shipped out over the Madisonville, Hartford & Eastern and the Owensboro & Nashville R.R., two small feeders.

Louisville—G. M. Matthews, who for the past year has been with the J. B. Allen engineering office at Hazard, Ky., has been made general manager of the Amburgy Coal Co., recently organized by Louisville capitalists, and will shortly take up his headquarters with the company's Louisville office. The new coal company has started work on developing properties on Smoot Creek, in Letcher County, where a branch of the Louisville & Nashville is being brought in. A tipple-height seam is being developed.

Hellier—It is reported that the Elkhorn Consolidated Coal and Coke Co., of Syracuse, N. Y., will expend several hundred thousand dollars in the development of a large tract of coking coal lands which this corporation has purchased in the Marrowbone Creek section, near here.

Madisonville—The Linton Colliery Coal Co. will soon begin to sink a shaft at the new mine to be opened 2½ miles from Moorman, in Muhlenberg County. When the mine is ready for operation it will have a daily capacity of 2500 tons. The shaft will be 22 ft. deep and the coal mined will be shipped over the Madisonville, Hartford & Eastern R.R. and the Owensboro & Nashville Railroad.

Greenville—The W. G. Duncan Coal Co. has broken ground for its new central power plant to be erected at Graham, Ky. Contracts have been let for the equipment, which consists of turbo-generators, boilers, stokers and auxiliaries. The building will be of steel and brick construction. Charles M. Means, of Pittsburgh, is the consulting engineer.

INDIANA

Terre Haute—A meeting of operators whose mines are served by the Chicago, Terre Haute & Southwestern R.R. was called for Mar. 26 by President Will J. Freeman of the Indiana Bituminous Coal Operators' Association. Plans were laid to send a commission to Washington to confer with Secretary McAdoo about the scarcity of cars on that road and to demand that cars be furnished. There are thirty-one mines located on that railroad, which is almost entirely a coal road, and during the last fortnight many of the mines have been idle because cars were not available.

ILLINOIS

Tamaroa—George W. Dowell has disposed of his holdings in the Paradise and Franklin County Coal Co., of which he was president, to the Northern States Coal and Mining Co., of Chicago. The mine, which is near here, is in the heart of a field that is just being developed. Dowell will devote his attention to other mining interests in southern Illinois.

Belleville—Belleville miners are making plans to erect a labor temple at an estimated cost of about $60,000. The proposition is to be acted on by the locals and then submitted by a referendum vote to the membership.

Carbondale—News has been received here of the death at Brunswick, N. J., of Mrs. J. D. Peters, who with her husband was interested in southern Illinois mining properties, in Williamson County. Peters died a few weeks ago in New York.

Kewanee—A cave-in at the mine of the Grice Coal Co. here has left the mine in such bad shape that it can hardly be reopened. It is not thought that the expense of putting it in shape would be justified, inasmuch as there is not more than another year's mining supply in the company's holdings.

A 4½ ft. seam of coal at a depth of 140 ft. was struck by the force of the Bradford Mining Co. on the farm of Andrew Tychon, 2½ miles west of the village of Bradford. A deposit of quicksand made the opening of a second shaft necessary after operations had been carried on to within a few feet of the coal deposit. Coal will be mined within the next two months.

Springfield—The charge of disloyalty against Severino Oberdan, of Nokomis, who was tarred and feathered by "loyalist" miners at Staunton, Ill., recently, has been dismissed in the Federal Court by direction of the United States Department of Justice.

Murphysboro—Twenty-five sticks of dynamite were found in an airshaft of the Shoal Creek mine, 12 miles from this city. The failure of a percussion cap to discharge prevented an explosion. It is believed that an attempt was made to blow up the mine.

Christopher—The Christopher mine was reopened Mar. 25. The mine has been closed since November, wher an explosion occurred which wrecked the mine and caused the death of a number of miners. It is one of the largest in the state and employs 700 men when running at capacity.

Carlinville—Mulville Bros., who have the contracts for putting in a line of railroad from Anderson, on the Chicago & Alton Ry., to the Standard Oil Co.'s mine site at Schoper, have a large force of men at work and have completed over 2000 feet of new road, graded with track laid. They expect to have the bridges built and all work on the line completed by July 1. The railroad will be used to convey workmen from Carlinville to the new mines when they are opened up for work.

Athens—Mine No. 2 will be reopened.

Morris—The Mitchell mine, which was closed for repairs ordered by the State Department of Mines and Minerals, has been reopened.

Edinburg—The mine here has been closed down indefinitely on account of its dangerous condition.

Mount Vernon—The Brennan drill, operating in the southern part of Jefferson County, has struck two seams of the highest class of coal. In Prairie township, section 36, a seam 6 ft. 7 in. wide has been struck. This coal is of superior quality and is free from foreign matter. Another core drawn from another hole showed even better results. The coal is located only 600 ft. below the surface.

Herrin—The Watson Coal Co. has been incorporated here by W. A. Perrin, of this place. J. E. Allen, A. G. F. A. of the Cotton Belt Ry., at St. Louis, and G. W. Allen, of St. Louis. They took over the property of the Carbon Coal Co. and contemplate sinking a new slope mine between here and Marion. They also succeed in St. Louis the Allen Coal Co., which is liquidated and retired.

OHIO

Steubenville—Work will soon be started on the erection of a new coal tipple at the Henry Walker mine in Tiltonville. The old tipple, which has been in use for the past several years, is too far worn to carry the heavy cars of coal down the incline and has become weakened by several years of steady use. The new tipple will be finished within a month.

MISSOURI

Martinsville—The first coal taken from the new mine developed by the Chamber of Commerce of this town has been brought to the surface and sold. The project, it is said, will save the average local consumer 7c. on each bushel of coal used.

NORTH DAKOTA

Dickinson—Official announcement has been made that the Federal Fuel Co. has taken over the Lehigh mines and will erect a 24-unit briqueting plant, starting with a two-unit machine and gradually adding the other units. A $2,000,000 plant is the eventual aim of the company. The capacity of the complete plant will be 864 tons every 24 hours. Among the members of the Federal Fuel Co. are Judge Frank McNulty and J. W. Martin, both of Aberdeen, and J. C. Thompson, of Fargo.

Personals

J. E. Virgin, for the past seven years general mine foreman for the E. E. White Coal Co., at Stotesbury, W. Va., has resigned his position to take charge of No. 6 mine of the Raleigh Coal and Coke Co., at Raleigh, West Virginia.

Thomas Duffy, of McAdoo, first president of the United Mine Workers of the seventh anthracite district, forsook the mines on Mar. 19 and took a job at the Jeanesville Iron Works, a local munition plant. Duffy was in office when the 1900 strike took place and was for years a confidential lieutenant of John Mitchell, head of the international union.

Obituary

D. C. Tiffany, aged 62 years, superintendent for the Lehigh & Wilkes-Barre Coal Co., in the Ashley district, died at his home in Ashley on Mar. 19, after less than 24 hours illness of pneumonia. Mr. Tiffany had been in the employ of the Lehigh company for 48 years, most of the time in an official capacity.

Foreign News

Clover Bar, Alta.—The mine of the Edmonton Collieries, Ltd., on which work was begun last summer, has made its initial shipment, one car going to Manitoba and one to Saskatchewan, and is now in a condition to supply all orders. It has an up-to-date coal-handling plant. L. C. Stevens is president and H. C. Anderson secretary-treasurer of the company.

Nanaimo, B. C.—An attempt was made on Mar. 23 to reopen the Jingle Pot mine, which was sealed up some three months ago on account of an outbreak of fire. It was found, however, on breaking through the first stoping that a large quantity of water had gathered in the stope, and further progress was barred. Pumps will be started immediately, but it is estimated that it will take three weeks to pump the water out. Apart from the water, all the other conditions are favorable, and Manager Freeman is hopeful that as soon as the water is pumped out he will be able to resume operations.

Montreal, Can.—Mark Workman, president of the Dominion Coal Co., speaking in reference to a statement by Hon. W. Armstrong, Minister of Mines for Nova Scotia, to the effect that the St. Lawrence market for coal might be permanently lost to Nova Scotia operators, said that the Dominion Coal Co. would have little difficulty in starting in where they left off in the St. Lawrence market just as soon as the required tonnage was available. He believed that the St. Lawrence trade of the Cape Breton mines would grow to greater proportions than ever after the war, as their coal was so much better than the American coal for steam purposes that manufacturers were willing to pay more for it.

Industrial News

Erie, Penn.—Harry Hamilton, said to be the first coal dealer arrested on a charge of profiteering in that commodity, was fined $500 in the United States district court of this city.

Pittsburgh, Penn.—The Duquesne Electric and Manufacturing Co., Bessemer Building, dealers in new and used electrical and power-plant equipment, announces the opening of a branch office at 230 So. LaSalle St., Chicago.

Philadelphia, Penn.—The Supreme Court on Mar. 21 dismissed appeals taken by coal companies in Lackawanna County from the action of the court there in fixing the value of coal for assessment purposes at $300 a foot-acre. The decision to dismiss was based on a per curiam made Mar. 23, 1917.

Scarbro, W. Va.—The Plum Eagle Coal Co. will mine the Eagle seam, which is a byproduct coal. An incline or rope conveyor about 600 ft. long will be built. The equipment includes twenty 1¼-ton mine cars, one 6 to 8 ton steam locomotive and six 8 to 10 ton two-way dump cars. About $30,000 will be invested in the plant. J. M. Randich is superintendent.

Maysville, Ky.—The coal docks of the Chesapeake & Ohio Railroad Co., built at this point nine years ago at a cost of $30,000, were burned along with 500 tons of coal on Mar. 18, fire having started in the boiler room in lighting a torch close to an oil tank. Practically the entire plant was consumed, the loss being estimated at $55,000.

Charleston, W. Va.—Despite unusual handicaps, the February report of coal and coke loadings on the Chesapeake & Ohio reveal a large increase over the same month of the previous year and an improvement over the first month of this year. The total loadings for February were 2,250,305 tons as against 1,921,685 tons for February, 1917. In January of the present year the tonnage loaded was 1,690,680.

Pittsburgh, Penn.—Directors of the Pittsburgh Coal Co. of Pennsylvania have declared dividends of $1.50 a share on the preferred stock and $5 a share on the common stock. The common dividend is payable in quarterly installments of $1.25 a share beginning Apr. 25, 1918. Directors of the Pittsburgh Coal Co. of New Jersey declared a dividend of $1.25 a share on the preferred stock.

Columbus, Ohio—Engineers from the Norfolk & Western R. R. have made extensive surveys over the 250-acre tract purchased southeast of Columbus several years ago, which will be improved by building a large yard for the assembling and collection of coal cargoes from West Virginia and southern Ohio. The Norfolk & Western connects at Columbus with the Hocking Valley, which carries lake shipments to Toledo.

Erie, Penn.—Action of coal operators in the western Pennsylvania district of the United States Court, demanding the return of their books and papers seized by Federal agents when the "profiteering" charges were made, will not handicap the grand jury to any great extent, Government authorities say. Officials of the seven concerns under charges have been subpoenaed and they will be compelled to submit whatever books are needed.

Cincinnati, Ohio—Plans for the convention of the Michigan-Ohio-Indiana Coal Dealers' Association, to be held here Apr. 15, include an address by J. A. D. Morrow, director in charge of coal distribution with the United States Fuel Administration. R. A. Colter, president of the Cincinnati Coal Exchange, states that full information will be given to the dealers regarding the Fuel Administration's program, and its orders will be made plain. A two-day convention will be held.

Nashville, Tenn.—The Dayton Coal, Iron & Railroad Co., of Wilmington, Del., capital $5,000,000, has filed articles in Tennessee, with plans to establish headquarters at Chattanooga, and plans to take over the equipment, etc., of the Dayton Coal and Iron Co., which was in the Chattanooga bankruptcy courts last August, the assets being purchased by H. S. Matthews, of Rome, Ga. The company has large holdings in the Dayton (Tenn.) district, and it is planned to start operations again.

Louisville, Ky.—The value of moving-picture theaters as an aid in holding miners in isolated districts is generally recognized by large coal-mining companies, many of which operate their own picture theaters, commissary stores, etc. A recent advertisement of the Climax Coal Co., of Shamrock, Ky., asking for miners to go to Edgewood, Ky., near Middlesboro, called attention to the following requisites: "An excellent camp, good schools, picture show and other amusements." Full time was also offered.

Fairmont, W. Va.—A new organization of West Virginia Coal Operators, to be known as the West Virginia Mining Association, is to be formed, and C. H. Janims, president of the Central West Virginia Coal Operators' Association, has circularized the leading operators of the state asking their coöperation in the move. It is planned to make the new state organization a branch of the American Mining Congress, 50 West Virginia operators now being members of the Congress. A meeting to organize will be held soon, probably at Washington.

Charleston, W. Va.—Two sets of appraisers have been appointed by State Tax Comissioner Walter S. Hallanan to pass on the value of approximately 5000 acres of coal land in Harrison and Raleigh Counties, belonging to the estate of the late Nathaniel Ewing, of Uniontown, Penn. The appraisements are to be made for the purpose of levying an inheritance tax. The Board of Appraisers for the Harrison County holdings consists of James N. Hess, Howard Robinson and C. J. Ryan; and for Raleigh County, J. Q. Hutchinson, C. L. Heaberlin and W. O. McGinnis.

Sullivan, Ind.—Foreclosure of a mortgage against the Consolidated Indiana Coal Co. as to its ownership and rights on 4500 acres of coal land in Sullivan County has been asked for in a suit filed in the Federal District Court at Indianapolis by the Guaranty Trust Company of New York, trustee under a mortgage securing a bond issue of $2,773,000. The coal company was placed in a receivership in the Federal Court in Illinois in 1915. Stewart K. Smith, of Chicago, was appointed receiver of the company, which owned coal property in Illinois and Iowa as well as in Indiana.

Cincinnati, Ohio—The Union Gas and Electric Co. has issued an announcement to its industrial customers that during the coming summer there will be no gas furnished manufacturing plants at the former industrial rates, all gas consumed being charged for at domestic rates. This, it is estimated, will result in consumption by industrial concerns being reduced by three-fourths, and will mean a correspondingly greater use of coal. Formerly summer rates to industrial consumers were extremely low, and made it possible for them to use gas at a considerable saving over the cost of coal.

Frankfort, Ky.—Suit has been filed by the Carterville Washed Coal Co. against the Kentucky Jewel Coal Co., before Charles N. Wiard, clerk of the United States District Court, Frankfort, similar to the R. A. Brawer suit against the Clear Creek Coal Co., which was recently before the court. The petition of the Carterville people alleges that defendant entered a contract on Apr. 25, 1916, to furnish plaintiff 500 cars of block coal and 700 cars of egg coal at prices ranging from $1.35 per ton to $1.80; that 227 cars were delivered and 373 cars were not, and asking for judgment of $23,872 with interest from April, 1917. Humphrey, Middleton & Humphrey, of Louisville, filed the suit.

Columbus, Ohio—The Ore and Coal Exchange, which takes the place of the Lake Shippers' Pool Association of last year, was organized recently at Cleveland by a meeting of coal operators, ore shippers and vessel men. The organization will be under governmental regulation and will have absolute charge of all lake shipments from the lower lake ports during the season of 1918. The association was formed by the naming of the following executive committeemen: A. A. Augustus, chairman; George E. Cameron, Edward A. Uhrig, representing upper dock interests; W. M. Collins, R. S. McVeigh, Horace Robbins, C. C. Maurer and J. P. Walsh. Mr. Walsh represents Pennsylvania and eastern Ohio interests on the committee. The executive committee will be called together soon for the selection of a director and assistants. Headquarters will be located at Cleveland.

Dallas, Tex.—At the suggestion of Wiley Blair of Dallas, Federal Fuel Administrator for Texas, the Federal Fuel Administration has authorized a graduated scale of reductions for consumers of coal in Texas who make purchases during the summer months when there is better transportation and coal can be transported to cities and towns where needed. The present price of Colorado bituminous coal at the mine on prepared sizes is $4.45 a ton, and on Oklahoma coal $5 a ton. The reductions authorized to Texas dealers are as follows: On April shipments, 75c. per ton; on May shipments, 60c. per ton; on June shipments, 45c. per ton; on July shipments, 30c. per ton; on August shipments, 15c. per ton. September shipments will be made at present prices. All reductions are effective Apr. 1 and will make the price of Colorado coal to dealers $3.70 a ton and on Oklahoma coal $4.25 a ton.

St. Louis, Mo.—The American Coke and Chemical Co., of Chicago, has purchased for its subsidiary, the St. Louis Coke and Chemical Co., a 300-acre tract just outside the city limits of Granite City, in the St. Louis industrial district. The purchase price is said to have been approximately $200,000. Operations will begin at once on the erection of a Roberts byproduct coke-oven plant and two blast furnaces, at a cost of about $5,000,000. East St. Louis sites were under consideration, but the Granite City site was found to be more desirable. The plant will be devoted exclusively to the production of high-grade metallurgical and domestic coke and byproducts from Illinois bituminous coal. It is expected that the plant, with its utilization of Illinois coal for this purpose, will have a tendency to make the Mississippi Valley the center of steel manufacture, on account of the proximity of the coal fields. The company also expects to supply coke to St. Louis consumers at a price little in excess of what bituminous coal costs.

New York, N. Y.—The financial statement for 1917 of the Elk Horn Coal Corporation gives the corporation's assets as $27,445,390, of which $20,747,334 is real estate and buildings, and $4,317,812 stocks of other companies, the balance being current assets in money, coal on hand, etc. The income account for the year follows: Earnings from all sources, $4,497,120.72; operating expenses, taxes, insurance and royalties (exclusive of income and excess profits taxes), $1,972,936.81; depreciation, $168,902.66; depletion, $109,492.37; net earnings from operations, $2,245,788.88; interest on funded debt, $414,630.98; net earnings for the year (before deducting income and excess profits taxes), $1,831,157.90; less reserve for income and excess profits taxes, $107,959.52; net surplus for the year, $1,723,198.38; less dividends declared and paid on preferred capital stock during 1917, $393,363; net surplus for the year 1917 carried to profit and loss, $1,329,835.38; profit and loss account, Dec. 31, 1916, $313,257.92; total, $1,643,093.30; less adjustment of accounts of previous years, $217,854.69; profit and loss account, Dec. 31, 1917, $1,425,238.61.

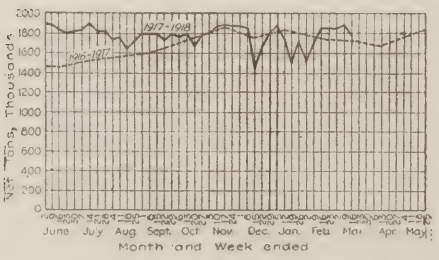
Weekly Review

Zoning Plan Announced—Car Supply Not Only Limits Production but Creates Labor Unrest—Demand for Steam Coal Unabated—Domestic Inquiry Light—Some Contracting Reported

THE long-awaited zoning plan has at last been announced by the Fuel Administration, as have also new price rulings in a few producing districts. No one can foretell with any degree of assurance just what will be the results of the new zoning policy, which goes into effect Apr. 1, as the scheme virtually amounts to a reorganization of the entire soft-coal industry. The country has been divided into a number of producing zones within which consumption will largely be confined. In this way thousands of miles of long cross-hauls will be eliminated, thus making for an increase in car utility. A reduction in anthracite shipments to the West and Northwest has also been announced by the Fuel Administration.

Transportation facilities are still bad, the sidings in and around many collieries being congested with loaded coal cars. Considering the urgent need existing for coal, the situation cannot but be viewed with alarm. Bituminous has suffered a large falling off in production, many mines being compelled to shut down because of insufficient empty cars to load. It is stated that in two West Virginia fields alone, during the 17 working days ending Feb. 25, an average of more than 10,000 men were idle every day. During March there was little improvement. If this condition is not remedied soon it will be exceedingly difficult for the operators to preserve intact their working organizations, as the mine workers, notably in the central Pennsylvania region, are dissatisfied with working only two or three days a week and threaten to leave the mines for more certain employment. The running time at the mines should be equalized, and this can only be brought about by the abolition of the pernicious "assigned car" policy of the railroads with its unequal apportionment of cars and inadequate distribution of tonnage.



The heavy requirements for steam coal preclude any let-up in the demand. Shippers have not been in position to guarantee plenty of coal, and buyers have been ready to purchase every ton available. Here and there coal is still being confiscated by the fuel authorities for the use of public utilities which do not seem able to get an adequate supply from their regular sources.

Retail dealers report many orders for next winter's requirements, and these are being accepted subject to regulations and prices at the time of delivery. Some contracting is reported for the new coal year, though uncertainty on the part of jobbers as to where their supply is to come from serves as a deterrent to the closing of contracts.

So that the consumer will not be forced to hunt for a licensed jobber through whom to obtain coal, the Fuel Administration has stated that jobbers who have made application for licenses prior to Apr. 1, but who have not received their licenses on that date, will be allowed to do business as usual.

COAL PRODUCTION

Bituminous production declined 579,000 tons during the week ended Mar. 16. The total production of soft coal (including lignite and coal made into coke) is estimated on the basis of railway shipments at 10,686,000 net tons. The rate of production per working day was 1,781,000 tons as compared with 1,878,000 tons during the preceding week. For the first time in five weeks the production per working day has fallen below 1,800,000. It is still, however, considerably in excess of 1,729,000 tons, the average during March, 1917. Pre-

liminary estimates place the week's production of beehive coke at 644,000 net tons, or 107,000 tons per working day. The production in the Connellsville and Lower Connellsville districts, as reported by the "Courier," increased from 314,409 tons during the week of Mar. 9 to 335,122 tons. Shipments of anthracite also increased slightly, from 41,807 to 42,265 cars.

For the country as a whole almost no change occurred during the week ended Mar. 9. The ratio of production to full-time capacity was 70.6 per cent., as compared with 70.7 per cent. during the preceding week. Fluctuations in output were reported in certain localities, but in general operating conditions have been singularly constant for the last two weeks.

The most favorable operating conditions are reported by the South, Southwest, Far West, and Rocky Mountain States. In the Middle West the output at present ranges from 70 to 75 per cent. of full-time capacity. It is in the great producing districts of Pennsylvania and West Virginia that car shortage continues most acute. In only three districts in those states has the output exceeded 70 per cent., of capacity during the last two weeks.

In the beehive coke industry the 65 operators reporting produced 296,030 net tons of coke during the week ended Mar. 16. The ratio of production to capacity, as reported by the railroads, increased from 60.8 per cent. during the preceding week to

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS

	Week Ended:			
	Feb. 23	Mar. 2	Mar. 9	Mar. 16
Bituminous shipments, 121 roads	189,691	197,415	200,239*	188,631†
Anthracite shipments, 9 roads	36,612	39,875	41,807*	42,265†
Beehive coke shipments, 4 roads	11,634	12,911	13,032*	13,218†

* Revised from last report. † Subject to revision.

64.1 per cent. The improvement was made possible by a better supply of cars. Losses due to shortage of coke cars fell from 27.4 to 23.8 per cent. of capacity. Losses of output attributed to shortage of labor remained constant. The same operators shipped 161,350 tons of coal, or 37.3 per cent. of their capacity as shippers of coal.

The high standard of performance reported from byproduct operators last week was equaled and even exceeded during the week ended Mar. 16. The ratio of production to maximum capacity rose from 86.4 per cent. during the preceding week to 87.7 per cent.

Out of the 12.3 per cent. of maximum capacity which the byproduct plants of the country failed to realize in actual output, 6.5 per cent. was lost through lack of coal; 0.2 per cent. because of labor trouble; 3.3 per cent. on account of repairs to plants, and 2.3 per cent. for all other causes.

Operating conditions in the several states varied but little from the performance of the week before. Kentucky was the only state to record a material decrease. The great improvement in byproduct operation during the last two weeks is evidenced by the fact that the state reporting the least favorable conditions—New Jersey—is now operating at over 75 per cent. of capacity.

BUSINESS OPINIONS

Bradstreet's—The two great salient features of the week are the large number of reports of insufficient stocks in hands of jobbers, final distributers and manufacturers and the advices that despite improvement noted at a few centers where grain movement has been and is large, the country's railroads and railroad terminals are still congested and that the opening of water routes is longed for to lift some of the burdens of superabundant traffic. That governmental buying dominates everything is hardly worth repeating.

R. G. Dun—Movements in business have continued mainly in the right direction, with steady acceleration of manufacturing and distribution and a quickening of retail demands under favoring weather conditions. The development of Spring trade, while limited by the various war restrictions and the economies of the period, is satisfactory in many instances, and financial obligations are met more promptly as shipments go forward to points of destination with less general interruption.

American Wool and Cotton Reporter—Considerable South American wool not subject to Government control has been sold during the week under review. Much more wool is now in demand for civilian purposes. Medium and fine grades of territory wools have been in large demand. The cotton situation is very mixed. Many look for higher prices. One man states that it

will reach 50c. per pound. The labor situation is a difficult one. The woolen goods market is exceedingly inactive, as the heavy weight selling season is largely over. The situation appears reasonably satisfactory to both buyers and sellers.

Dry Goods Economist—This week saw spot transactions in cotton on the New York Exchange at 34.30c. and contracts for March delivery at 33.65c., with sales for later months up to January, 1919, at various prices, the lowest being 30.44c. No such quotations have previously obtained for any substantial quantities of cotton in the history of the United States. Speed in the movement of goods from factories to stores is increasing so slowly that conditions are still far from satisfactory. In many cases goods continue to reach their destination, though far behind time. As has been the case since the first of the year, or earlier, the reliance of buyers is still on the parcel post and on the express companies.

Marshall Field & Co.—The current wholesale distribution of dry goods is greatly ahead of the corresponding period a year ago. The volume of road sales for both immediate and future deliveries shows a large gain over the same week in 1917. Customers have been into market in greater numbers. The market on domestic cotton continues strong. Collections are good.

The Iron Age—The President announced on Tuesday that the agreed prices on iron and steel products would be continued for three months beyond Mar. 31, except that basic pig iron and heavy melting steel scrap would be reduced $1 in April. This means that a maximum price of $32 at furnace for basic iron, $35.20 for bessemer iron, or a reduction of $1.10 a ton, and $29 instead of $30 for heavy melting scrap. The Government's car and locomotive orders, on which the reasons for delay have been inscrutable, are expected any day. First expectations must be revised, and if the total of car contracts distributed from time to time in the next few months proves to be but 50,000, the year's plate requirements on car and locomotives account may be 1,000,000 tons less than early estimates.

Atlantic Seaboard

BOSTON

Situation grows complicated. "Emergency" receipts light, and increased movement on contract coal not enough to give industries the reserve they want. Railroads and utilities operating on narrow margins, especially the larger ones, although New Haven Road is now in comfortable shape. J. J. Storrow's speech at Springfield makes a deep impression. Much hard work being put in for better supply of tonnage to bring New England's coal. Rail movement averages well. Still great perplexity over season after Apr. 1. Premium coal rumored. "Zoning" plan on paper throws an increase in volume toward Hampton Roads. It means a further access of regulation. Disparity in price between Pocahontas and New River. At piers a surplus of coal over bottoms. Anthracite water movement dependent upon number of tugs available. Outlook for more power is dubious.

Bituminous—A lean period was predicted for Mar. 15 and it looks as if the time had arrived. Receipts here are dependent now almost exclusively on steamers, and it happens that they are so placed at this writing that arrivals are not keeping up with coal consumption. Relatively few bottoms were at the Virginia terminals last week, and the Boston & Maine R.R., for instance, has been obliged to land heavily on what cargoes were discharging. The result is that a number of plants relying upon shipments that they were listed to receive are going to be without fuel unless some other source yields relief. Many large factories that were comfortably supplied during the season thus far are now exhausting their reserves and are finding to their surprise that prompt deliveries are not forthcoming.

The fuel administration for the present is taking less coal from the Shipping Board and other Government pools at Hampton Roads and is suggesting to the regular coal agencies that the latter furnish their own coal for such steamers as are in the service of the New England fuel administrator. Practically all the shippers have plenty of coal to their credit in the Tidewater Coal Exchange, so marked has been the shortage of bottoms, particularly among the factors who are less consistent shippers to this market but who at the same time account for a considerable tonnage.

The immediate situation falls hardest upon the largest users. The railroads and big utilities like the Boston Elevated Ry. are running on a hand-to-mouth basis and most of the large textiles are in the same position. Buyers are getting apprehensive and in the absence of any program the anxiety is fast increasing. New England has been accustomed to stocking coal, has done it as a matter of necessity, and the inability to get more than a few days' supply at a time is causing real alarm. One large consumer in easy position at this time is the New Haven R.R. A week ago this situation was so obvious that the Fuel Administration at Washington ordered coal that was standing to the credit of the New Haven in the Tidewater Coal Exchange to be turned over at the piers for emergency use. This was mainly at the New York ports, where there is now relatively much less on hand than there are boats waiting.

J. J. Storrow's speech to the New England Coal Dealers Association at Springfield on Mar. 21 focused public attention on the state of coastwise shipping. It drew forth editorial comment and answered many of the criticisms that have been heaped upon the fuel authorities for not making adequate plans to deal with the problem.

The New England fuel administrator is making every effort at Washington to get consideration in the matter of ships. The work is incessant, else no bottoms are forthcoming. Something has been said about wooden ships under one of the early programs of the Emergency Fleet Corporation, but as carriers of any tonnage worth while there seems to be some question. It is said that for oversea traffic, after allowing for ship stores, bunker coal, and other supplies, a so-called 3000-ton ship would actually take about 1000 tons of coal across the Atlantic.

Effective Mar. 23, the authorized price on coal in the Pocahontas district is $2.45 per net ton of 2000 lb. for run-of-mine. This makes a disparity of 60c. between New River and Pocahontas, two grades that have always been competitors in the same markets and until last fall were upon the same price basis. If price were any consideration this ruling would be certain to upset selling arrangements of long standing and would cause no end of confusion. As it is, buyers will gladly take either coal, provided they can get the bottoms to move it, and the mine operator in the more favored field will smilingly pocket his extra money.

A similar price adjustment has been ordered for part of the Pittsburgh field in Pennsylvania. The effect of these moves on the volume of coal produced remains to be seen. Operators will not be so likely to exert themselves getting labor, if the selling price is continued on a $2.45 basis.

Rail movement through the gateways continues favorable. On the 25th nearly 1400 cars of coal came through all the transfer points, although Harlem River and Maybrook on the New Haven are still difficult. There is a marked shortage of locomotives, although improvement in this respect is promised within a few days. The total accumulation at both points on the same day was in excess of 3000 cars, all kinds of freight.

Buyers who return from certain of the bituminous regions report an utter inability to negotiate contracts for next season. No program with regard to priorities or "assigned cars" has yet been announced, and the perplexity of New England consumers is something large. Meanwhile there are very definite rumors that liberal premiums are being exacted.

Anthracite—The great anxiety of retailers along the coast is over the prospect for tugs to move barges. Our company alone is reported to have had 24 loaded barges in the Delaware River at one time awaiting power, and only three tugs en route. The prospect for more tugs cannot be said to be hopeful.

NEW YORK

Complaints made of lack of anthracite domestic sizes. Situation serious and shipments are slow. Retail dealers receive plan of distribution. Retail prices may be reduced 35c. Bituminous miners restless. Car supply poor and production is light.

Anthracite—Everywhere one hears complaints of the lack of supplies. The demand for coal continues unabated notwithstanding the discount of 30c. per ton at the mine which Dr. Garfield has announced goes into effect on Apr. 1. The heavy production at the mines has had no apparent effect on stocks at the loading docks here. On all sides is heard the plea for more coal, but receipts do not increase. No one seems to have any surplus to sell to the spot buyer, and the retail dealers who have their usual source of supply are among those who complain. At the wholesale offices it is stated that the usual shipments are being made, but that the demand is unusually heavy for this time of the year.

The mines are working steadily and almost every conceivable kind of a car is being filled with coal, but there are days when cars are not to be had and the mines are idle.

The retail distribution plan for the year ending Mar. 31, 1919, was announced on Monday of this week by County Fuel Administrator Reeve Scaley after a conference with the retail dealers of Manhattan Borough. Dealers are to fill orders for consumers on their books during the previous year, but no order shall be filled until an order blank signed by the consumer shall be presented, the order shall then be given a serial number. The dealer may then make delivery in full when the order does not exceed six (6) tons. Should such order exceed in the aggregate six tons, no dealer shall deliver or cause to be delivered more than two-thirds of the amount of the necessary requirements for the year ending Mar. 31, 1919, until each customer who has placed an order and is willing to receive delivery has received two-thirds of his necessary requirements. Afterward the other one-third shall be delivered.

Dealers are required to file with the County Fuel Administrator a statement containing names and addresses of household consumers to whom aggregate delivery of more than 50 tons has been made, together with the amount of tonnages so delivered in the previous month, and a statement containing the names and addresses of apartment houses or consumers to whom an aggregate of more than 100 tons has been delivered for storage.

No coal shall be delivered for storage in areaways, backyards, vacant lots, etc., without the special permission of the Fuel Administrator, and no dealer shall deliver carload or bargeload lots to any domestic consumer or group of consumers without the permission of the United States Fuel Administrator. Any dealer or consumer who violates the regulations is subject to the penalties prescribed by the Lever Act, which imposes a penalty of $5000 fine or two years' imprisonment, or both.

There has been no let up in buying in anticipation of the discount announced to become effective on Monday next. Shippers have not been in a position to guarantee plenty of coal and buyers have been ready to purchase every ton available.

Retail dealers report many orders for next winter's requirements on hand, all of which have been accepted subject to regulations and prices at the time of delivery.

The anthracite steam coal situation is easier. No announcement has come from Washington as to Government prices for these coals. Buckwheat No. 1 is hard to get, but rice and barley are easier, the latter particularly so because of the scarcity of bituminous with which it is mixed in many instances.

Current quotations, per gross tons, f.o.b., Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.30	$7.05
Egg	6.20	6.95
Stove	6.45	7.20
Chestnut	6.55	7.30
Pea	5.05	5.80
Buckwheat	4.30@5.00	5.50@5.80
Rice	3.75@3.95	4.50@4.80
Barley	3.25@3.50	4.00@4.25
Boiler	3.50@3.75	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—Local conditions are anything but satisfactory. Supplies are short and there is little coal left for the spot buyer. Dealers generally are of the opinion that unless conditions change quickly the situation here will become serious. They also believe that a change for the better must come shortly or there will not be much chance of preventing a serious shortage of coal in this market next winter.

Conditions at the mines are serious. Car supply has been so bad that day after day the miners have been idle until now they are in many cases without money, some of them have been unable to earn more than enough to pay running expenses. They are now becoming discouraged and unless conditions improve quickly the operator believes many will seek other means of employment. Government reports show that for the week ended Mar. 16 bituminous production shows a decrease of 579,000 tons.

Dealers are more favorably impressed with the plan to license jobbers, and at the conclusion of the two days' sessions of the National Coal Jobbers Association held here

it was announced that the Association recognized the distinct advance which the Fuel Administration has made in deciding to license the jobbers, which plan the Association takes as evidence that the coal jobbers will be permitted to use their capital and organization to help solve the war problems.

The bunkering committee of the Wholesale Coal Trade Association of this city has issued a supplemental list of pools suitable for bunkering purposes, as follows: South Amboy, Nos. 9 and 10—Any good Greenburg coal or its equal; Port Reading, Nos. 9, 10, 22, 23, 31, 33, 34 and 36; B. R. & P., 12, 14 and 15; St. George, Nos. 22, 23, 31, 33, 34 and 36, and Port Liberty, Nos. 9, 10, 23; B. R. & P., 12, 14 and 15. The bunkering situation is steadily improving and there is very little delay now in coaling vessels.

PHILADELPHIA

Anthracite trade still extremely active. New rules for dealers. Cross margin again fixed at $2.50. Cash discount eliminated. Steam prices now controlled. Short weights to stop. Distribution plans being worked out. Bituminous zoning plan announced. Development anxiously awaited. Modifications expected. Brokers almost idle. Traffic improves slowly. Priority orders objected to.

Anthracite—The month just closing has probably been the busiest March ever experienced by the trade. Ordinarily there is considerable easing off in business in anticipation of the April reduction, but this year the retailers have been busy straight through the month. As a matter of fact the householders have never really caught up on the shortage of last winter and the business now is created by the need of sufficient fuel to tide the people over the cool days of spring, and no anxiety is shown by them in the event that they will have a ton or two over for next year purchased at high prices. The receipts from the shipping companies have been fairly large, but not nearly so heavy as most dealers, especially the larger ones, would wish. Large tonnages continue to be sent to other markets by the operators and local dealers are wondering how long this will continue, as they are particularly anxious to start actively on their storage orders.

Aside from the business of selling coal the dealers have had a busy week familiarizing themselves with the rulings of the Federal Fuel Administration by which they are to be governed during the new coal year commencing Apr. 1. In a three-page letter of instructions mailed this week to all retail men in the county every detail is covered. The outstanding feature is that the gross margin of $2.50 per ton on egg, stove, chestnut and pea, as now allowed by the authorities, is not to be disturbed.

While the dealers are not loud in their complaints, yet they feel a great injustice has been done them by the rule that forbids them to charge more than 25c. per ton for carrying coal into cellars. This is particularly unfortunate for the suburban dealers who serve few homes where coal can be unloaded directly from the street into cellars.

For the first time the gross margin of profit on anthracite steam sizes delivered by retailers to steam trade, including buckwheat and smaller sizes, and also bituminous coal, is to be regulated beginning with Apr. 1. On the former it is not to exceed $1.75 per ton for chute delivery, where the fuel is for power, commercial, hotel or apartment house purposes. On the latter where the uses and method of delivery are the same, $2 is the limit fixed as the gross profit.

This week the Federal Fuel Administrator for Pennsylvania stated he believes he has succeeded in convincing the operators they must stop mixing relatively low-priced pea coal with high-priced chestnut. This practice was one of the most difficult problems confronting his administration.

The basis of distribution for the coming coal year has now been about worked out by the operating companies. All shipments will be based on deliveries made for the period from Apr. 1, 1916, to Mar. 31, 1917. It is understood that no company will accept any business from buyers who have had no shipments during that period, except for some very good reason, such as slow pay or poor financial condition. While the plan is believed in a general way to be a fair one, there are bound to be many difficulties crop out if it is strictly adhered to.

It seems now that the question of carload deliveries to private consumers is about to be satisfactorily settled. The fuel committee has let it be known that it is not its intention to interfere with legitimate deliveries of this kind, particularly where the hauling of the coal is done by a regular retail dealer. This applies particularly to such parties who have been accustomed to buying their coal in this manner for a number of years, or at least prior to April, 1916. It will be necessary to have the approval of the local committees so that the usual check to prevent hoarding may obtain.

There has been some little lull in the very small sizes of steam coal recently. Some of the larger companies have been long on barley and have actually solicited new business. Among the individuals, who are the principal shippers of culm, it is reported that this size is also somewhat dull.

The prices per gross ton f.o.b. cars at mines for line shipment and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$5.90	$6.05	Buckwheat	$3.15	$3.75
Egg	4.80	6.00	Rice	2.65	3.65
Stove	5.05	6.35	Boiler	2.45	3.55
Nut	5.15	6.40	Barley	2.15	2.40
Pea	3.75	4.65			

Bituminous—With the announcement of the zoning system by the Government the trade anxiously awaits the working out of the plan. While some doubts have been expressed from the very beginning of the plan, it can be taken for granted that the coal men will do the utmost to give it a fair trial.

The railroad traffic conditions while very much improved over the past winter are still far from meeting the demand. It now seems to be almost entirely a problem of motive power, and it is stated that if locomotives could be kept in repair this phase of the problem would soon be eliminated. However, the railroad officials continue to assure shippers that they can note a constant change for the better and it is hoped that they will soon be able to show real results.

BALTIMORE

Easiest market for weeks despite drop in national tonnage report. Jobbing trade busy making new connections. Retailers wait for orders.

Bituminous—While official Washington reported a decidedly decreased mining tonnage for the past week, the supply situation here was the easiest for weeks past. There was no longer evidence of scramble, although the fuel administrator is still directing certain apportionments. The local relief was probably largely due to the fact that the railroads managed to clean up part of the considerable congestion of loaded cars at Brunswick and Cumberland. Because of congestion that continued on some of the northern connections, considerable coal that was billed that way was reconsigned and moved here in order to get the sidings cleaned up. The supplies both at tide and for all rail trading were therefore fairly easy. The jobbing trade is busy adjusting itself to the new conditions to exist after Apr. 1. Many large consumers have already signed up with jobbers to retain the latter as purchasing agents. The public as a whole in fact seems more concerned with establishing some stable supply connection for the coming year than with the method of exact price. There appears to be little complaint on the plan of allowing jobbers the commission for service and credit extension in many cases. The jobbers themselves, while they did not get all they asked through the modification of the original drastic order wiping out jobbing commissions, appear to be well satisfied with developments.

Anthracite—The fuel administrator here has not announced his definite plan of action for retailers after Apr. 1, or the schedule of prices. It is generally accepted that the card application system will be put in force for purchasers. A plan to supply but two-thirds of the book orders to any one consumer at the outset of the year seems a strong probability.

Lake Markets

PITTSBURGH

New zoning system studied. Arrangements for Pittsburgh and Connellsville districts quite satisfactory. Prices reaffirmed. Heavy contracting done. Some free coal offered.

Interest in the coal trade this week is centered largely upon the details of the new zoning system, which became available at the beginning of the week. Satisfaction is universally expressed that the Pittsburgh district has been given so much latitude, that indeed it is not confined to one exclusive zone at all, as is the case with the great majority of producing districts.

Such necessary movement of Pittsburgh and Connellsville coal into Ohio as would be interfered with by the zoning system will be taken care of by the special permits provided. All the normal movements of byproduct coal will be thus covered.

The reaffirmation of former prices as applied to the Pittsburgh district, as announced late last week, seems to have been fully expected by the trade. The basis price of $2 was reaffirmed and this carries with it the 45c. extra as well as the differentials for slack and screened coal. Thus the only change that will occur Apr. 1 is the slight change in the position of brokers, whereby they must be licensed and will be permitted to make a profit by buying under the set price and selling at any price up to the set price, being permitted also to make brokerage transactions as formerly, with a charge up to 15c. to the consumer. In view of the latest costs reported to Washington the price is a favorable one for the district and leaves no possible ground for complaint on the part of producers with mines that are in the least efficient.

There has been a heavy contracting movement in the past few weeks, for the twelve months beginning Apr. 1, the fact that prices were not fixed for the period not being a drawback, as buyers knew they would have to buy and sellers knew they would have to sell, and there was no fear that prices would be prohibitively high or prohibitively low. The possibility that free coal may at times sell below the set price did not discourage large consumers from making contracts, as it has been a common experience in the past for spot coal to sell below contract prices, the contracts being advantageous to buyers nevertheless on account of the steadier deliveries obtained. There is now a moderate amount of free coal offered in the market, but it is chiefly of relatively low grade. The local fuel administration is just beginning to appoint inspectors to watch coal and indicate any that must be improved or sold at a 50c. discount. The market remains quotable as follows: Slack, $2.20; mine-run, $2.45; screened, $2.70, per net ton at mine, Pittsburgh district, with permission to brokers to charge 15c. extra to buyers when regularly commissioned to make a purchase for them.

BUFFALO

Coal more plentiful. With enough cars the situation would be easy. Jobbers still wondering over their fate. Not much faith in the zoning plan.

Bituminous—The supply is not good, but it is so much better than it was that nobody is complaining now. At the same time all of the former uncertainty remains. The jobbers are making haste to get licenses and they will live up to them if they know what is required. The difficulty now is that so many new orders come out that nobody knows what to do. This has been the case for a long time.

The jobbers are gaining in confidence, though they hardly think that all of them will be needed. All effort is being made to obtain contracts with the mines and quite a good many have been made, though they are not much more than understandings between producer and distributor. Everything has to be made subject to Government regulation. Still it is the idea that a contract of any sort tends to keep the jobber and the operator closer together. It at least appears to be certain that if the operator turns his back on the jobber the consumer will take him up. The complaint is that the arrangement of prices gives all the profits to the operator.

Price quotations are about out of the question, especially since the zoning order has come out, for it is doubtful just what the special coals which may go anywhere, really are. If this section is to be confined regularly to Allegheny Valley coal, there is going to be difficulty, for it is hard to get miners to work the thin veins of that region.

Anthracite—The situation turns on the coming April prices. The supposed decline of 30c. a ton has not yet been confirmed by the companies, so the shipping agents here are not able to make any prices and some of them send the April orders back to the retailers. They do not exactly know what to do. Meanwhile the city supply is good enough to meet all emergencies and the county fuel administration is finding little to do. It is not expected that the supply will run down again this season. At the same time there is clamor for next winter's coal, but that cannot be met now. Canada is uneasy. Shippers are saying that more anthracite was shipped there last season than should have been and advise the buying of bituminous to help out.

DETROIT

Receipts of bituminous coal comfortably offset requirements. Anthracite supply is short. Retailers ask $3 margin.

Bituminous—There is quite a satisfactory movement of bituminous coal into De-

troit, the amount arriving offsetting in large degree the current requirements of steam and domestic consumers, though the quantity is not so great that any free coal is to be found on tracks. The larger proportion of the shipments are from West Virginia and Ohio mines and practically no smokeless coal is to be found.

Steam coal users are maintaining a steady demand, which has been somewhat increased in volume by the operation of several large new industrial plants employed in the manufacture of war munitions. Wholesalers and jobbers are advising customers to take advantage of present conditions, wherever possible, by creating reserves. There is reason to believe some effort is being exerted to accomplish this, though in the case of many of the industrial plants the lack of facilities for coal storage in quantities greater than would provide for a few days' needs prevents any important accumulation.

Uncertainty as to what prices will prevail later in the year is serving quite effectually as a handicap on the closing of contracts for future delivery. This is especially true in reference to retail dealers who fear that coal bought at present price might hinder distribution to customers, if competing dealers by delaying their buying should obtain coal cheaper. Meantime the period when lake navigation will reopen is rapidly approaching, and with its arrival there is great probability the shipments by rail will be largely diminished.

Anthracite—Jobbers and retailers are puzzled over the anthracite problem. Receipts are light, so small in fact that retail dealers are in many cases unable to supply customers requiring stove and egg sizes. Efforts to obtain an explanation of this condition at a season of the year when the movement of anthracite might be expected to show good volume have been unsuccessful.

Detroit retailers are protesting against the contention of W. K. Prudden, Michigan fuel administrator, that a margin of $2 a ton should be adequate on domestic business in the period after Apr. 1. The retailers insist a $3 margin is necessary to offset increased costs.

COLUMBUS

Steam demand is keeping up well, but there is a slight falling off in domestic orders. Contracting is held up awaiting the revised price list and the completion of the zone plan of distribution.

The continued warm weather has taken the edge off the domestic trade in Ohio and consequently there is a slightly softening tendency shown during the past week. The steam trade continues strong in every particular, and producers as well as distributors believe that the present status of the market is merely a breathing spell before the coming of the lake trade, which is expected to be strenuous. The tone of the market is fairly good and future prospects are considered bright.

Consumers of steam grades have been taking advantage of the slight lull to accumulate some surplus stocks and many have succeeded in laying in quite a surplus. This is especially true of the public utilities corporations, which suffered a great deal last winter. Manufacturing plants of all kinds are now being operated with a full fuel supply. Railroads are also using a large tonnage as the freight movement is as heavy as formerly. Contracting for steam tonnage is being held in abeyance until after Government prices are readjusted.

The domestic trade is rather quiet, which is something new in that branch of the business. Retailers are stocking up to a certain extent, and many householders are laying in their next winter's supply of fuel. Nevertheless there is a slight softening noticeable and this is expected to continue until after the lake season opens. Retail prices are firm at the levels which have prevailed for some time. Pocahontas is in good demand and stocks are extremely scarce. Some West Virginia splints are finding their way into the local market. Anthracite is arriving only in limited quantities.

The production in Ohio fields has been fairly good during the past week. This is especially true of the Hocking Valley and Pomeroy Bend fields. In eastern Ohio there is still a shortage of transportation and the output is restricted to about 65 per cent., a part of which is taken for railroad fuel. Other fields are producing a good tonnage.

The lake trade is expected to open earlier than formerly, judging from reports from the upper lake region. At least producers and jobbers are looking forward to an early opening and preparations have been made to rush a large tonnage to lake ports as soon as possible. Some fix the date for the opening of navigation at Apr. 15.

Prices of short tons f.o.b. mines are as follows:

	Hocking	Pomeroy	Eastern Ohio
Sized grades	$2.70	$3.05	$2.70
Mine-run	2.45	2.80	2.45
Screenings	2.20	2.45	2.20

CINCINNATI

Heavy demand from all departments of the trade, for summer delivery and for immediate use, continues. Freight congestion is hampering business, although the car supply is better.

With the complete realization which exists among coal consumers, large and small, of the necessity for getting an adequate supply of fuel in storage during the spring and summer months, the demand for coal is continuing at a figure never before known this early in the season, and bids fair to increase, rather than diminish, as the spring advances. It is also true that the current season of consumption for heating purposes is not yet over, as a period of warm weather has been succeeded in this section by colder weather, necessitating further consumption of coal by domestic consumers, which has furnished additional stimulus to the demand in the retail market. The restrictions imposed upon purchases by domestic consumers have also served as a warning that it will not be possible to obtain coal at any time and in any quantities desired; while industrial consumers, on the other hand, have fresh in mind the conditions which existed during the past winter, from which many are only now recovering. The serious congestion of freight at all terminals, including Cincinnati, and on the tracks of all of the railroads, is interfering badly with the movement of coal, and gives every indication of hampering the movement of fuel during the summer months to an extent which will prevent a normal movement. This is a factor which the trade is fully aware of, and is one which cannot, apparently, be disposed of.

LOUISVILLE

Short car supply is handicapping operations in both eastern and western Kentucky fields, increasing difficulty of operators in holding labor. Domestic and steam demand both good, with dealers anxiously awaiting summer prices.

The coal mine operators of the city and state are sitting still, and waiting with much interest such a time as the Government decides to fix summer coal prices. Many dealers believe that prices will be fixed at the mine about Apr. 1, but actions of state fuel administrators in calling on the public to lay in their coal supplies now make it appear as though there will be no price-fixing done this year. Eastern Kentucky operators feel confident that mine quotations will be readjusted and are not anxious to book much additional business until the question of prices is settled. In the eastern Kentucky field the general situation is about the same, the supply of coal cars continuing short, with labor scarce and hard to hold.

In western Kentucky the car supply has been uncertain. The Louisville & Nashville has been supplying about 40 per cent. of coal car requirements, while the Illinois Central has been in worse shape, some mines not having a car on Illinois Central sidings for four days at a time. Under such conditions it has been hard to hold labor. However, there is a good demand for western Kentucky steam coal, with manufacturers endeavoring to buy nut and screenings, and domestic demand picking up somewhat due to many consumers endeavoring to place orders early. Yard stocks are picking up somewhat, and retailers are endeavoring to lay up stocks before booking any orders that are not for immediate consumption.

BIRMINGHAM

Current consumption causes a steady movement of steam coal, but booking of business for extended deliveries of both steam and domestic grades awaits new Federal schedules and regulations. Production improves little, as miners decline to work full time.

The heavy requirements for steam coal prevents any interruption in the demand and movement of this grade, but operators and consumers are holding off from the placing of orders for any large tonnages for delivery over an extended period until Government prices and regulations are announced. Domestic inquiry is light, dealers expecting some price concessions by Apr. 1, and the demand from consumers can be met early from present stocks.

Coal brokers view the new regulations philosphically and announce that they will be strictly observed when received. The opinion is expressed that legitimate business will hardly be impaired under existing conditions in the coal industry, the broker merely having to look to the buyer for his commission instead of the operator, the compensation allowed him being the same that is now being received.

Complaint is general that coal production is being curtailed seriously by the continued indifference of the miners to observe full-time schedules. The high rate of compensation mine workers are now receiving is principally accountable for these conditions.

Coke

CONNELLSVILLE

Movement improving slowly. Trouble on the Pennsylvania main line. Occasional foundry coke offerings. Screenings from old dumps offered.

The coke movement continues to improve at times and rarely loses any of the ground gained. In the first two months of the year there was no week in which shipments amounted to as much as 300,000 tons, but each of the first two weeks in March showed about 335,000 tons, and last week's shipments are estimated at 350,000 tons or more, while this week may show a slight further increase. Car supplies on the Monongahela R.R. were 60 per cent Monday of this week and 30 per cent. Tuesday, with expectations of better supplies later. One difficulty of late has been that a number of the cars furnished have been gondolas, some capable of carrying only 20 or 25 tons of coke.

Offerings of foundry coke in the open market are somewhat less infrequent than formerly, but there is still a great shortage and buyers usually have to show necessity before they can make purchases. Sometimes this can be done between buyer and operator, but frequently the good offices of the fuel administration are invoked. There is little spot furnace coke offered. As operations are irregular an operator with a surplus usually has some that has been in the oven 72 hours, and that is classifiable as foundry coke if sold to a foundry, hence it is offered in that form.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Mar. 16 at 335,122 tons, an increase of 20,713 tons, and shipments at 334,584 tons, a decrease of 631 tons. Rail shipments, however, increased a shade, as river shipments were only 4000 tons, against 9200 tons the preceding week.

The market remains quotable at the set prices: Furnace, $6; foundry, 72-hour selected, $7; crushed, over 1 in., $7.30, per net ton at ovens. Considerable business is now being done in screenings obtained from old dumps. A favorite method is for a contractor to buy a pile outright and get what he can. Some of this, fairly clean but with occasional lumps of "ash" and raw coal, has been sold at $5.50; but the brokers handling the business expect to get better prices as consumers become familiar with the quality of this material as salamander fuel and similar functions.

Birmingham—Movement of coke out of the district to which track equipment is restricted is being much hampered by inability to secure the necessary box-car equipment, and producers are getting behind with foreign deliveries. The demand continues good, and inquiries for foundry coke come from many distant points—Saginaw, Mich., for instance. Mexican interests have been negotiating for a large tonnage, but so far have been unable to place it.

Middle Western

GENERAL REVIEW

Market extremely quiet. Few storage orders of any consequence have been placed.

Market conditions the past week have been dull. The trade has been in a stage of expectancy, awaiting the announcement of the definite program to be outlined by the Federal Fuel Administration. The matter of zoning held up the placing of orders, and also to some extent the hopes of the buyer that Illinois and Indiana coal would be reduced in price.

The announcement of both a definite zone plan and the new prices for Illinois and Indiana has had the effect of putting the producer's mind at rest as to what he will be able to get for coal, as well as to the place he may ship the coming year. The trade is therefore planning to get down to business at an early date.

One of the shocks of the week is the announcement that there will be no smokeless Eastern coal allowed to move into this section. This does not include hard coal, which will be undisturbed other than what is naturally to be expected by reason of limited car supply and embargoes. Those who have used Eastern bituminous coal in former years are rearranging their boiler walls so as to get the highest possible efficiency from Western coal.

Car supply has shown some improvement over the preceding week. Particularly is this true on the Burlington and Missouri Pacific. The Illinois Central and Chicago & Eastern Illinois lines have not made so good a showing as the two former named. As a whole Williamson, Franklin and Saline Counties have had a 75 per cent. car supply. At no time so far has there been plenty of orders to take care of all the coal produced in any of the three foregoing counties. However, reports indicate that some of the mines in the Springfield and fifth and ninth districts are having some difficulty in moving promptly their outputs.

The new prices affect but two groups in Illinois, with the exception of mine-run, which will be 5c. per ton higher beginning Mar. 23.

CHICAGO

Market quiet on domestic, but steam users are absorbing all the better grades offered.

The announcement during the week that no Eastern bituminous coal would be allowed to come west has had a marked effect on the dealers. The policy in the past was to get as much Eastern coal as possible as soon as the winter demands were out of the way. It was expected that this course would also be followed this season, but since reliance will now have to be placed solely on Illinois and Indiana coals, dealers in most instances have made no plans to obtain a supply. Now that zone and price questions are settled, dealers expect to arrange their next year's connection at once and start the filling of customers' orders as rapidly as possible.

Quotations in the Chicago market are as follows, per net ton f.o.b. cars at mines:

	Williamson and Franklin	Saline and Harrisburg	Fulton and Peoria	Springfield	Carterville	Grundy, La Salle, Bureau and Will
Steam lump	$2.65@2.80	$2.65@2.80	$3.05@3.20	$2.65@2.80	$2.65@2.80	$3.35@3.50

MILWAUKEE

Warm weather brings tranquility to the fuel market. Coal and coke easily obtainable. Shutting down of malt houses releases anthracite buckwheat stocks.

Genuine spring weather has retired the subject of coal for the time being, but consumers are ready for a drive upon the coal piles as soon as April arrives and the Federal Fuel Administrator makes public his edict as to prices and limitation of supplies.

All kinds of coal and coke, except chestnut anthracite, seem to be easily obtainable in moderate quantities. The shutting down of malt houses released considerable buckwheat anthracite which had been held in reserve for that industry.

State Fuel Administrator W. N. Fitzgerald, upon his return from Washington, whither he went to consult the Federal fuel authorities, made a statement that in his opinion the supply of hard coal for Wisconsin the coming winter would be as great as, if not greater than, that of last year. A report from the East that many western states would receive nothing but soft coal caused much uneasiness among consumers whose furnaces or heaters will not consume bituminous coal.

ST. LOUIS

Extremely quiet situation with an abundance of coal from all fields and no absorbing market. Car supply still short on some roads. Steam demand quiet. Anthracite shipments good.

The market has been an extremely quiet one with plenty of coal under demurrage at East St. Louis from all fields. There has been a holding up of business by the buyers generally, anticipating new prices.

The prices announced under date of the 23d, showing an increase of 5c. a ton at the mine for Illinois mine-run and other prices, same as heretofore, should open up an extremely good business from now on.

The arrangement whereby western Missouri is not to get any Illinois coal is going to work an extreme hardship on a certain section of the state that has to a large extent depended upon Illinois for its principal fuel. Especially is this so when it comes to storage coal for the spring and summer months, inasmuch as Missouri coal will not store at all and Kansas coal is an extremely poor stocker.

Locally, the situation is quiet. There has been no domestic business, and the steam trade has been overloaded. From the Carterville field there has been an abundance of coal. The Wabash and Chicago & Alton embargoes against Chicago still hold, and this has caused an unusual supply of coal to be thrown in here.

Working time in the Carterville field is better than it has been for some time past. The car supply on the Illinois Central and Iron Mountain, however, is not good and motive power on both these lines is extremely poor. In the Duquoin the same condition practically exists.

The Mt. Olive field seems to be working better than the others and is finding a ready market for practically all of its tonnage. The car supply here is good, and there has been an abundance of this coal for the local market, as well as outside.

In the Standard field the same complicated conditions prevail. The Missouri & Ohio and the Illinois Central have been reduced to as low as one to two days a week car supply. The Illinois Southern Ry. transfer at St. Genevieve being out of order has thrown a great deal of Missouri & Ohio coal into the St. Louis market.

Practically all the roads at East St. Louis have unbilled coal. Working conditions in the Standard field have improved considerably. There is no dissension among the workers and conditions in a general way are very satisfactory.

There has been a considerable tonnage of anthracite coming in. The past week has probably seen 1500 to 2000 tons. A few cars of West Virginia smokeless has gone through and considerable Arkansas has been booked but not moving as yet.

Coke for domestic purposes is more plentiful than at any time since last summer.

There will be no change in the retail price of coal until some time in the early part of April, and the prevailing market here is per net ton f.o.b. mine:

	Williamson and Franklin County	Mt. Olive and Staunton	Standard
6-in. lump	$2.65@2.80	$2.65@2.80	$2.65@2.80
3x6-in. egg	2.65@2.80	2.65@2.80	2.65@2.80
2x3-in. nut	2.65@2.80	2.65@2.80	2.65@2.80
No. 2 nut	2.65@2.80	.....	.....
No. 3 nut	2.65@2.80	.....	.....
No. 4 nut	2.65@2.80	.....	.....
No. 5 nut	2.15@2.30	.....	.....
2-in. scrgs	2.15@2.30	2.15@2.30	2.15@2.30
2-in. lump	.....	.....	2.65@2.80
3-in. lump	.....	2.65@2.80	.....
Steam egg	2.65@2.80	2.65@2.80	2.65@2.80
Mine-run	2.40@2.55	2.40@2.55	2.40@2.55
Washed:			
No. 1	$2.65@2.80	$2.65@2.80	.....

I. C. C. Decisions

No. 8298—P. Dougherty Co. vs. Baltimore & Ohio Railroad Co. et al. Submitted Sept. 27, 1916. Decided Feb. 6, 1917.

Charges at Baltimore, Md., for trimming bituminous coal in single-deck vessels, with hatch openings of certain sizes, not found to have been or to be unreasonable or unduly prejudicial. Complaint dismissed.

No. 9558—West Virginia Rail Co. vs. Chesapeake & Ohio Railway Co. et al. Submitted Nov. 5, 1917. Decided Feb. 9, 1918.

Rates for the interstate transportation of light section steel rails in carloads from Huntington, in the state of West Virginia, to points on the line of the Norfolk & Western Ry. in West Virginia and Virginia, certain of which were prescribed by the Commission in West Virginia Rail Co. vs. Baltimore & Ohio Railroad Co., 26 I. C. C., 622, not shown to have been or to be unreasonable, unjustly discriminatory, or unduly prejudicial Complaint dismissed.

No. 9354—Lincoln Commercial Club vs. Colorado & Southern Railway Co. et al. Submitted May 14, 1917. Decided Dec. 15, 1917.

Upon complaint that rates on bituminous coal, nut, pea and slack, in carloads, to stations on the Chicago, Burlington & Quincy R.R., in the state of Nebraska—Sweetwater to Angora, both inclusive—from mines in the State of Colorado are unreasonable; and that the failure of defendants to publish and maintain lower rates on nut, pea and slack coal to the same stations subjects complainants' members to undue and unreasonable prejudice and disadvantage and gives to other coal dealers located at other stations in the same general territory undue and unreasonable preference and advantage; Held, that the evidence shows the adjustment of rates complained of is, as regards nut coal, unduly prejudicial within the meaning of the act.

General Statistics

SOUTHWESTERN INTERSTATE COAL OPERATORS ASSOCIATION

The following table, which gives a comparative statement of tonnage for the years 1916 and 1917, covers only tonnage of Association members estimated as approximately 95 per cent. of production in Missouri, Kansas and Arkansas and 20 per cent. in Oklahoma since September, 1916.

State	1916	1917	Increase	Decrease
Missouri	3,088,734	3,627,418	538,684	.....
Kansas	6,116,351	6,511,860	395,509	.....
Arkansas	1,364,274	1,487,774	123,500	.....
Oklahoma	1,851,207	651,816	.....	1,199,391
	12,420,566	12,278,868	1,057,693	1,199,391

NORFOLK & WESTERN

Below is a statement of the coal tonnage from mines on the Norfolk & Western Ry. and from other railroads, for the month of February, 1918:

From:	Net Tons
Pocahontas field	1,309,126
Tug River field	272,704
Thacker field	234,624
Kenova field	77,658
Clinch Valley field	121,156
Other Northern and Western fields	16,532
Total Northern and Western fields	2,031,800
Williamson & Pond Creek R.R.	151,588
Tug River & Kentucky R.R.	49,623
All other railroads	71,070
Total	2,304,08.

COAL AGE

Volume 13 NEW YORK, APRIL 6, 1918 Number 14

The Loan—A Great Opportunity

THE Liberty Loan offers to the coal operator an opportunity to transform his employees from men without a definite aim into men with a well-defined purpose in life. Some men have never saved anything except what they have spent in sundry furnishings for their homes, which furnishings are already sadly mauled and disfigured by frequent shiftings from village to village.

"MA, THAT'S THE COMPANY WE'RE STOCKHOLDERS IN"

The chance is good to sell them something that will stand by them in the future, something that will make them feel that they have a recognized place in the order of things. We do not really become a part of the country till we have contributed to its support, whether as tax payers or as bond buyers, for "where our treasure is there will our heart be also."

The Liberty Loan furnishes the opportunity for starting America on a road of thrift, a chance to remodel our old shiftless habits and give us a steadiness, a determination and a purpose which too many of our workingmen have hitherto not had.

Drift will give place to thrift. It is time that some such change should take place, and the coal operator will fail to do his duty to the country and himself if he neglects to take advantage of it.

The recognition of a public duty, the exhibit of public spirit on the part of a citizen raises him out of the narrow rut of his individualism. If to spend money on a flag makes a man a better citizen, lending and spending money to defend that flag will make him a super-citizen.

There is too much disposition to say that large sales of bonds cannot be made. They can be sold if we have the necessary enthusiasm and faith and put the right energy in our canvass. Properly appealed to, there are few workingmen at mines that work with reasonable steadiness who will not buy bonds and pay for them in short order.

The need of our country appeals forcibly to every man, woman and child. Let every operator get the men together, and if he can't make a convincing speech himself, after a few words of introduction, let him call on some politician or some church orator. Let him post the timely bulletins that he will find in *Coal Age*, both in the editorial and advertising departments of the paper. Let him supplement these by the telling cartoons in the daily newspapers and such bulletins as are being distributed by the various Government departments and the National Safety Council.

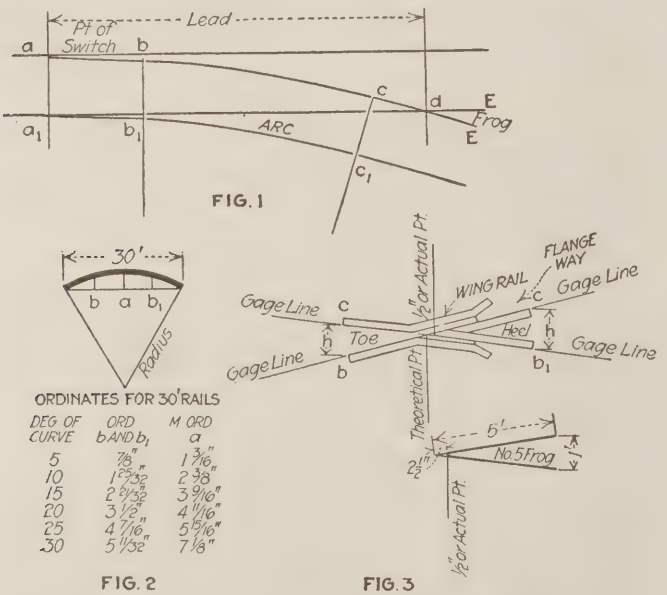
But the appeal by word of mouth is worth all the others. The coal operator should lead in this Liberty Loan movement and indeed in all good movements. He should identify himself with every good work. He should put himself always in the position of leader among his men.

Our social work is too much restricted to mere talk as to the appropriate relation of the employee to the employer, to the stupidity of class antagonism and to the value of co-operation. All such disquisitions are true but unconvincing.

What we need is a positive programme, a national purpose, an actual co-operation, an act of faith and service in which we are all equally engaged, and there will be less need then to discuss just exactly where we all stand in relation to one another.

IDEAS AND SUGGESTIONS

Frog, Switch and Track Formulas



BY O. H. HAMPSCH
Washington, D. C.

In the figures and tables below I have given several simple and fundamental principles of track laying as applied to mine work. Too often little or no care is taken in laying track in important places in mines, whereas if the foremen were familiar with a few track rules and tables more regular turnouts could be made.

A poorly laid switch or frog is a weak point in a track and the cause of many derailments and accidents. These cost time, output and money. They might be avoided if a little pains were taken in laying switches.

In most cases I have found the trouble with switches to be that the curvature and angle of frog do not correspond with each other as they should (a No. 4 frog, say, having a No. 6 lead) or that the stiffness or flatness of the curve is out of proportion to the frog angle. It must be remembered that in manufacture the switch points and frogs are made straight and not curved with the lead rail as many suppose. In Fig. 1 only the distance bc or bc_1 is curved to connect switch points and frog, the position of the frog to vary with the angle and lead.

Fig. 3 shows the terms most commonly used in handbooks and track tables. Simple rules for measuring frog members are as follows: Measure the spread h on the toe of the frog and add to it the spread h_1 on the

FIGS. 1, 2 AND 3. ILLUSTRATING SWITCH DATA

heel of the frog, taking care that the measurements are made to the running or gage line of the rail. Next measure the length of the frog bc or bc_1 of the same unit—that is, in inches or feet and decimals thereof. Divide the spread $h + h_1$ into the distance bc (or bc_1) and the number corresponding will give the number of the frog. Example: If $h = 6$ in., $h_1 = 9$ in. and $bc = 60$ in., the frog number equals $\frac{60}{6 + 9} = 4$.

Another rule for ascertaining the frog number is to find the point f on the frog where the spread equals 1 ft., and from this point measure the distance to the theoretical point or the intersection of the gage lines. This point is in front of the actual or ½-in. point, the distance being one-half of the frog number in inches—that is, a No. 6 frog distance from the actual to the theoretical point equals 3 in., a No. 5 frog 2½ in., etc.

The observance of a few of the fundamental rules regarding frog, switch and track laying, and the exercise of more care in laying tracks by trackmen will do much to diminish the many derailments and accidents caused in mine work. These have heretofore too often been disregarded.

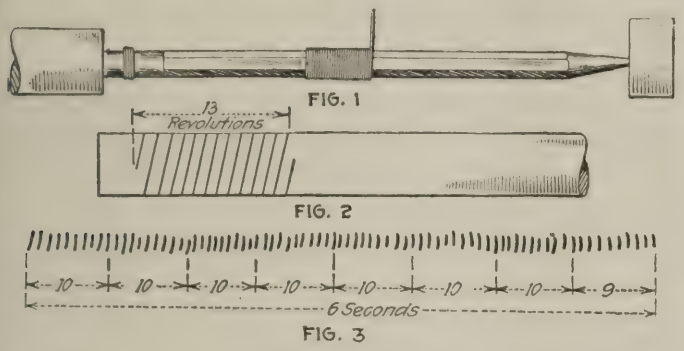
Counting Revolutions Without a Counter

BY W. F. SCHAPHORST
New York City

A speed counter is not an absolute necessity for determining the speed of a turbine, motor, spindle, shaft or other rapidly rotating machine part. Speed can be counted "by hand" to a surprisingly high limit by using the fingers in connection with the nimble mind.



For instance, you can count up to 10 very quickly—much more quickly than you can from 10 to 20. This is because it takes more time to allow the longer names to pass through your mind, such as 13, 14, 15, etc. They are all two-syllable words, whereas one, two, three, four, etc., are mainly one-syllable words. The logical way to count rapidly, therefore, is to count up to 10 over and over and keep tab on the number of times counted to 10 on your fingers. It will surprise you how easy it is to count in that way. To count 400 or 500 r.p.m. in that manner is no trick at all. If one should try counting "straight," however, he will find it too cumbersome to say "twenty-one," "thirty-seven," etc., even mentally, and the job will have to be abandoned.

I stumbled upon this method of counting mentally quite by accident one day while testing a gasoline engine. I permitted the key in the main shaft to strike my finger at every revolution and mechanically tried to count. I found that I could get up to 10 easily, but not far beyond, and as a result I thought of this repetition method of counting.

Just let some projecting piece from the shaft, pulley, or whatever it may be, strike a finger of one hand as it rotates, and with the fingers of the other hand keep tab on the number of tens. It is not necessary to count

a full minute, of course. If you count for 15 seconds, multiply the result by four and the product is the revolutions per minute. If you count for 10 seconds, multiply the result by six and the product, again, is the revolutions per minute.

Another simple way is to attach a long thread to a lead pencil (Fig. 1). The pencil should have a rubber

FIGS. 1, 2 AND 3. VARIOUS METHODS OF COUNTING REVOLUTIONS

eraser at one end. Hold the eraser end against the end of the shaft in the same way that the regular speed counter is used, pressing against the point of the pencil with a piece of hard wood or metal to provide a pivot bearing, and the thread will wind upon the pencil as it spins around.

At the end of a half minute, or five seconds, or any convenient interval, remove the pencil and count the number of turns of thread upon it. It is then a simple matter to compute the revolutions per minute. If you have had the pencil winding the thread for six seconds, multiply the number of turns by 10 and the result is the revolutions per minute.

If conditions are such that the machine or shaft can be stopped temporarily, a simple way to count the revolutions is to run a lead pencil lengthwise of the shaft for a period of five, ten, or more seconds, making a mark on the shaft during that period (Fig. 2). The mark made, of course, will take the form of a spiral, and all that is necessary is to count the number of turns made during the test period and then compute the revolutions per minute, which is done as already explained.

This method is valueless if the shaft cannot be stopped. One point worthy of remembering, however, is that the mark will remain on a shaft for some time. At the end of the day's run, therefore, it would be possible to count the revolutions per minute made during any period of the day. If the shaft is a long one it can be made to register the speed during any hour or every hour.

Another effective and simple method is to file a nick in the end of the shaft and run a piece of cardboard or paper along against the edge with the result seen in Fig. 3. A series of marks will be made on the paper as indicated in the sketch, and by timing the operation and counting the number of marks it is a simple matter again, just as above, to determine the speed of the shaft. Even if the speed is 3000 r.p.m. or more it makes no difference with this method.

For example, this record shows 79 marks made on the paper in six seconds. It will be noticed that I have divided the record into groups of 10 marks to facilitate counting and in order to guard against error. "Divide the number of seconds into 60 and multiply by the number of marks" is the rule that applies to this and cases explained in the foregoing.

$$60 \div 6 = 10$$
$$79 \times 10 = 790$$

Therefore the shaft makes 790 r.p.m.

It is now clear that a special speed counter is not an absolute necessity. There are many ways in which problems can be overcome that appear difficult at first blush. A speed counter is handy, to be sure, and one should be owned if it is necessary to determine speeds often. But for special cases any one of the above hand-made counters will do quite well indeed.

You buy LIBERTY BONDS *because the man behind the gun is doing his bit and you want to do yours. He cannot fight long without your help.*

Coal Mining in Relation to Engineering

BY L. H. FRIEND, M. E.
Denver, Colo.

Many coal mines develop, become producers and get along for some time without the assistance of an engineer other than to comply with the law which requires a map of the mine to be made every six months, showing the area of coal extracted. This is possible where an expert looked over the ground before operations were started and had an accurate survey made to show the topography of the ground at the probable site of the plant.

Anyone laying out a plant would also often advise prospecting by drill and otherwise to determine conditions under which the coal seam existed. Drill holes should give the thickness and quality of the coal, the nature of the top and bottom rock and the elevation of the seam at different points. If the drill holes have been put down systematically and in sufficient number, then the strike and dip of the coal seam can be determined.

The consulting engineer, being provided with complete information, determines the best underground development, harmonizing it and the surface improvements to secure the best results in the mining, preparation and shipment of the coal. It is important that a system of mining be planned which will give not only a satisfactory daily tonnage but also recover a large percentage of the coal—give a plant which will at the same time be a source of pride and profit to the owner.

In the operation of the mine, an engineer can to advantage set sights in rooms and entries, thereby securing uniform development and tend to prevent a squeeze and other difficulties. Levels run on haulage roads give a profile which discloses at once where hollows should be filled in and high points be cut down. A more uniform grade permits of cheaper haulage and increased tonnage.

If a mine is to show satisfactory results it should have in the management a capable man who will pay strict attention to details of operation—good ventilation and drainage, straight rooms and entries with adequate pillars, good rolling stock and sufficient power to move it, etc.—one who thoroughly understands men and machinery.

New Plant and Mines of the Coal Run Mining Company

BY DEVER C. ASHMEAD
Tarrytown, N. Y.

SYNOPSIS—*Article describes a new plant under construction and a standard system of mining to be adopted—a panel system is to be employed which is somewhat different from that ordinarily followed. Trolley and storage-battery locomotives will be installed. Tipples are standard in design.*

TWO old mines are being remodeled and four new mines opened by the Coal Run Mining Co., at Coal Run, Penn. These operations at the present time have an output of 1700 tons a day, but when the new developments are completed about 4600 tons of coal a day will be produced. The company owns approximately 4000 acres of coal land and intends to take all the coal out through the six openings mentioned above. Four of these openings are in the upper Freeport seam, the other two being in the lower Freeport. The upper Freeport seam has 4 ft. of clean coal and a slate top and fireclay bottom, while the lower Freeport has 5 ft. 2 in. of clean coal, the top and bottom being of the same nature as that in the other seam.

Although the upper seam is 72 ft. above the lower, it is possible to open all the mines at tipple height, because the axis of the Jacksonville-Saltsburg anticline passes through this property. The lower Freeport outcrops on one edge of the tract, but soon dips below the surface. Of course, the upper Freeport dips with it, bringing it in a short distance to tipple height. The general dip of the coal is 5 per cent. N 62 deg. W.

The Coal Run Mining Co. is associated with one of the large operating companies in Indiana County and has adopted the methods used by its larger brother. Everything in connection with the operation has been standardized—for instance, the drift opening, the tipple, the mine workings, the substations, the fans, the crossovers, the cars, and the houses. The system of mining has also been standardized, and is followed as closely as the underground conditions will permit.

The walls supporting the drift mouths are built of cut sandstone laid in mortar, making an attractive approach to the openings. The mine is opened on the four-story system, having a right air-course, a main

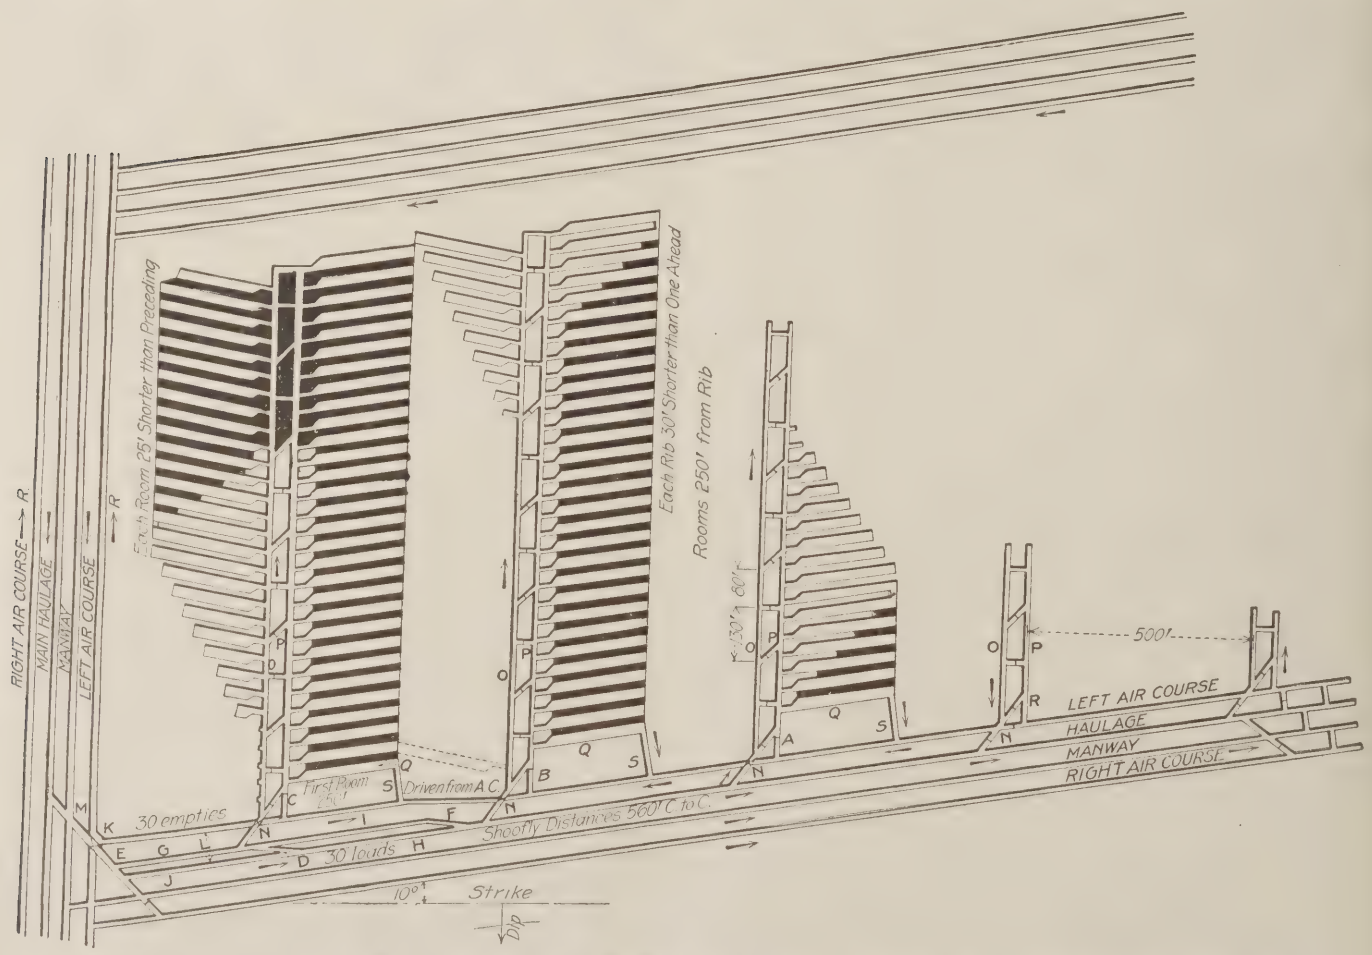


FIG. 1. DETAILS OF THE STANDARDIZED SYSTEM OF MINING OF THE COAL RUN MINING COMPANY

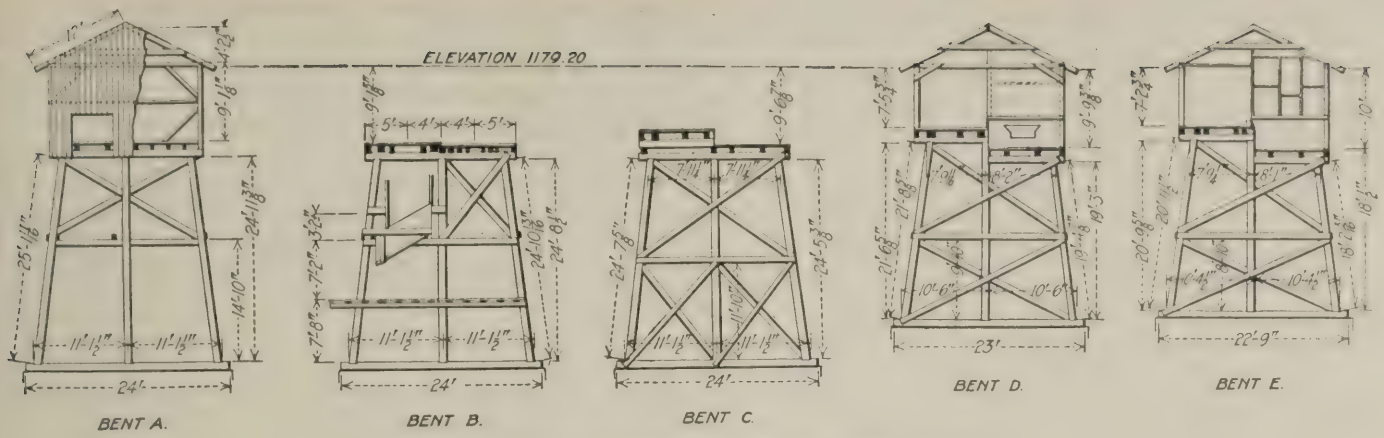

FIG. 2. CONSTRUCTION DETAILS OF THE TIPPLE

haulage road, a manway and a left air-course. The main entries are driven to the greatest dip of the coal and on 50-ft. centers. As each entry is supposed to be 10 ft. wide, a 40-ft. pillar is thus left.

Fig. 1 shows the standardized system in detail. Cross-entries with the same number of headings are driven at an angle of 80 deg. to the main headings. This allows sufficient grade to take care of the drainage. These cross-entries are driven on 1500-ft. centers. The four cross-entries with their pillars take 150 of the 1500 ft., leaving a 1350-ft. pillar to be worked. In case the cross-entries are short the manway and one air-course are omitted.

Butt entries are driven parallel to the main entry up the pitch of the coal. As the rooms are 250 ft. long, and a pillar of 100 ft. is left between the ends of the rooms and the main left air-course, the first butt entry on each cross-entry is driven, starting 350 ft. from the left air-course of the main entry. Then every 560 ft. a new butt entry is turned parallel to the first butt entry. These entries are 1250 ft. long.

As stated above, the rooms are 250 ft. long. They are driven on 40-ft. centers, the room itself being 22 ft. wide and the pillars 18 ft. The rooms are turned off both sides of the butt entries at an angle of 80 deg., giving them a pitch of about 1 per cent. and allowing them to drain.

The panel *A*, Fig. 1, shows the rooms being driven on the right side of the butt entry as it advances. The rooms are so driven that the face of one is always 25 ft. in advance of the one immediately following. As soon as the rooms reach their proper length, the robbing of the pillar commences. It is planned to pull about five of these pillars at one time, the face of each being kept 30 ft. behind the one immediately preceding. This gives the robbing face a straight line at an angle of about 45 deg. to the face of the rooms. All the pillars are taken out except 40 ft. which is left at the end of the room pillars to support the butt entries.

When the butt entry has been driven to within 100 ft. of the cross-entry above (this is left for a barrier pillar) it is stopped, and the rooms are turned on the left side of the butt entry coming back. When three or four rooms are driven up the robbing of their pillars is commenced, and the same method of keeping each rib 30 ft. shorter than the one ahead is followed. In this case, instead of leaving a heading stump to protect the haulage road this is robbed, as is also the pillar between the headings and the heading stump on the other heading (see panel *C*, Fig. 1; the shaded portions show robbing). This method brings the whole butt entry back at the same time.

Near the main entry at the beginning of each cross-entry a sidetrack is provided to handle all the coal for the cross-entry unless this entry should be over eight to ten panels, when another sidetrack would be provided further along.

The left air-course of the cross-entry is started about 30 ft. nearer the outside at *K*, Fig. 1, than it ordinarily would be if there were no sidetrack. This leaves the pillar *L*, of about 70 ft., between the airway and the haulage road. This pillar is split by the heading *GI* for a distance of about 700 ft. where this heading joins

FIG. 3. ARRANGEMENT OF TRACKS FROM NO. 5 MINE

the haulage road, and the left air-course comes back to its normal position. The short heading *GI*, at its halfway point *D*, is connected to the haulage road. Track is laid in both the haulage road and the heading *GI*, and switches are installed at *E* and *F*, a cross-over switch being located at *D*. The heading *GI* and the haulage road are connected to the main haulage road by the diagonal drift *M*.

The sidetrack is operated as follows: The main-line

motor comes from the main haulage road through *M* to the empty track *G*. Here it drops 30 empties, uncouples, runs through *D* and couples to the loads waiting at *H*. The loaded cars are taken through *J* to *M*, then to the main haulage road and outside. The first gathering motor leaves its loads on *H*, where 30 cars can be stored, then runs through *D* and back on *I*, and waits until the main-line motor brings the empties. The gathering motor then couples to the empties and runs through *I* and *F* to the haulage road. The second motor, if there are loads on *H*, makes a flying switch at *F* and then goes through the same performance as the first motor. The haulage roads and the butt entries are connected by the shooflys *N*.

The main haulage road and the manway act as the intake for the air, while the left and right air-courses serve as the return. The air for each panel passes from the haulage road *HJ* through the shoofly *N*, then through the left butt entry *O* into the rooms on that side (if any), then across to the light butt entry *P* and through the rooms (if any) to the first room on the right *Q*, or *R* if the first room has not been finished. If the room has been finished, *R* is bratticed and air passes through *Q* and *S* to the left air-course and then to the outside.

The arrangements for directing the air are such that the men at the working faces breathe pure air. None of the air that passes through old workings or over falls goes to the miners. Bricks are used for all stoppings. These are embedded in mortar for the permanent stoppings and are loose for temporary ones. The doors are only temporary and are of wood. The overcasts have brick piers and sidewalls, and the floors are made of steel rail with brick laid endways between the webs. The overcasts have a cross-section 10 x 5 ft. In Fig. 1 the stoppings are shown by double lines, doors by one line and overcasts by a cross.

The ventilation is supplied by two small Stine fans. These are 6 ft. in diameter and are driven by 10-hp., 440-volt, three-phase motors. One of the fans is at the No. 1 mine, the other being at No. 3. These fans will soon be replaced by 150,000-cu.ft. Jeffrey fans. These will be 6 ft. in diameter and driven by a 100-hp., multi-speed, 440-volt, three-phase, alternate-current motor. The small fans will be moved to the new operations and used until the development warrants their replacement by the large Jeffrey fans.

The grades in the butt entries are 5 per cent. in favor of the loads, the cross-entries ½ per cent. in favor of the loads and the main entry 5 per cent. against the loads. The rooms are driven as near level as possible, but the grade is not allowed to exceed 1 per cent.

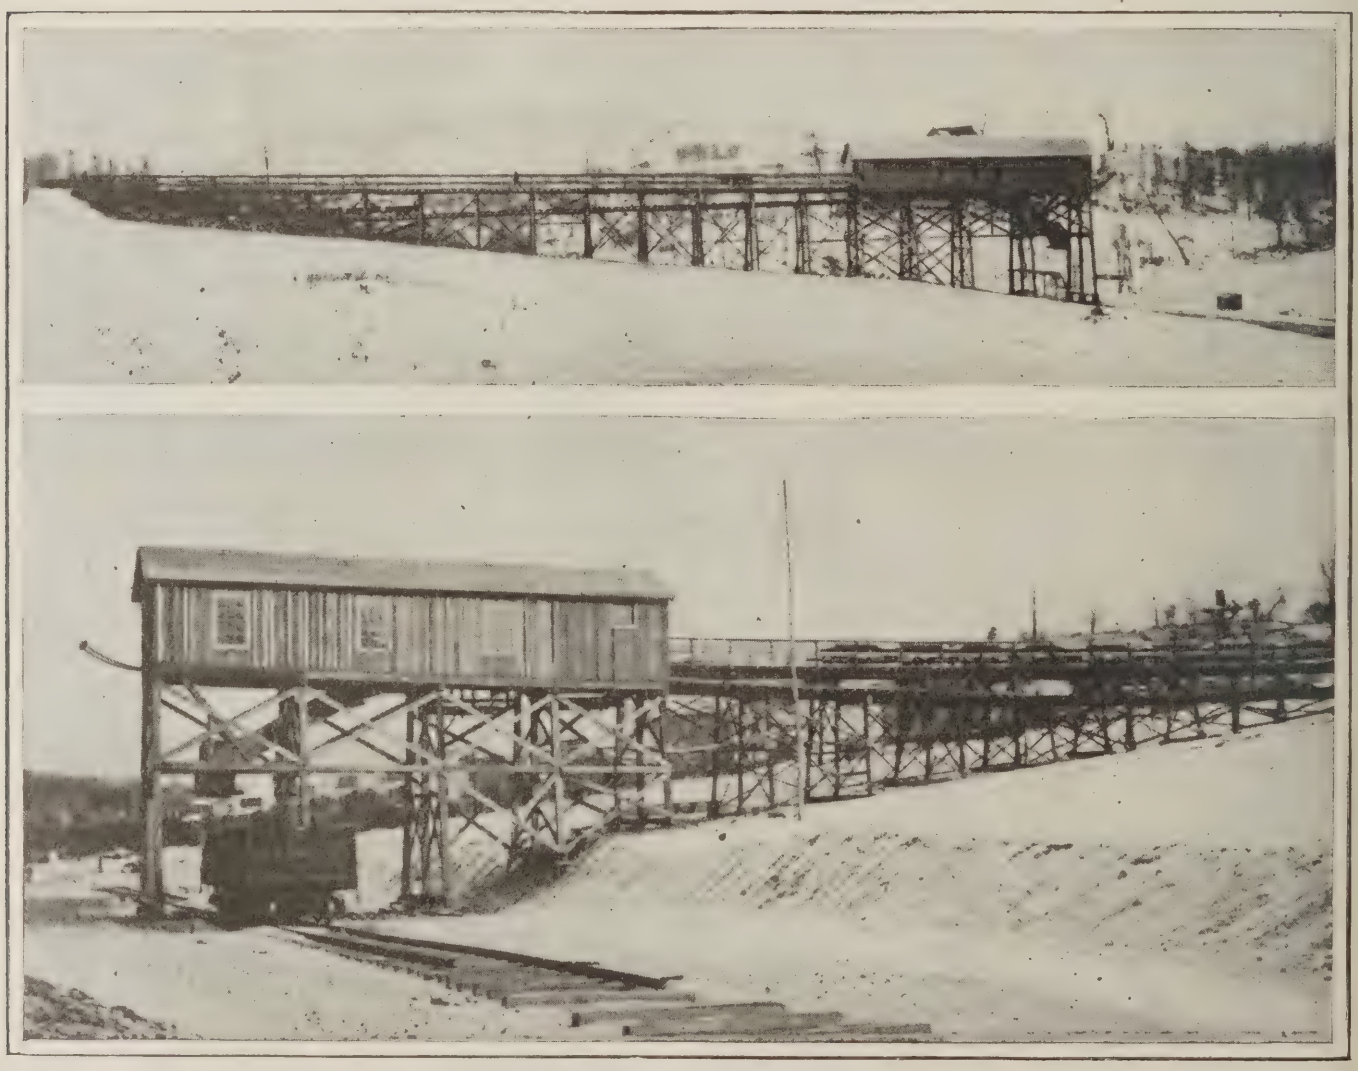

FIG. 4. VIEWS OF TWO OF THE TIPPLES BUILT BY THE COAL RUN MINING COMPANY
Above—Tipple at Nos. 4 and 5 mines. Below—Tipple at Nos. 6 and 7 mines

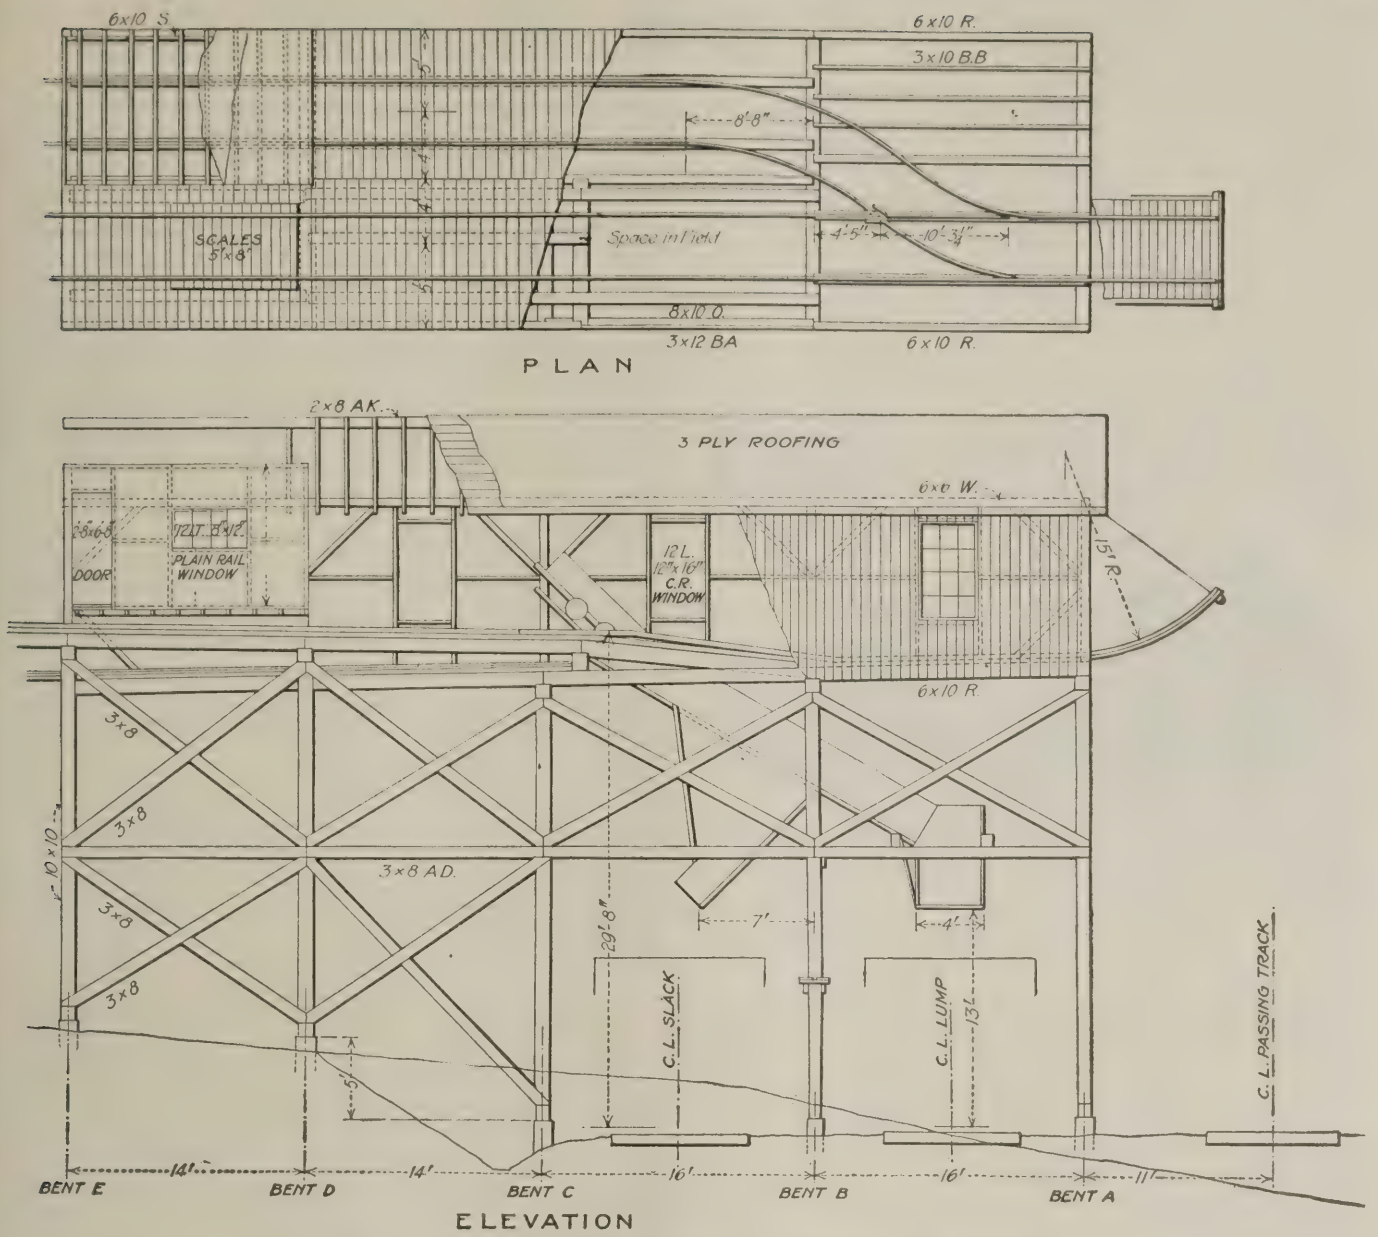

FIG. 5. PLAN AND ELEVATION OF STANDARDIZED TIPPLE

As the main headings are driven to the dip it is necessary to handle the water with pumps. At present only mines Nos. 1 and 3 have their main headings driven in any considerable distance and their territory developed. Therefore they are the only ones that have pumps. No. 1 mine has two 300-gal. triplex pumps, and mine No. 3 has one of the same kind and type. These pumps work against a head of 100 ft. and are operated by direct-current motors, the discharge pipe from which comes to the surface through a borehole.

The coal is undercut by Goodman machines of the shortwall type. The coal company now has sixteen of these machines and is adding as many more as it can get delivered. The coal is loaded into cars of 3000-lb. capacity. These cars are built of wood, are 9 ft. long, 4 ft. 4 in. wide across the top, 32 in. high, 42 in. gage and weigh 175 lb. They are equipped with hand brakes. Phillips car wheels are used. These wheels are greased once a month. The rail in the rooms is 16 lb., while that on the headings is 40 lb. Cambria steel ties are used for the room tracks and 5 x 7-in. wood ties are used on the haulage roads.

The company has three 10-ton and four 6-ton General Electric trolley locomotives. Besides these is one 6-ton Goodman cable-and-reel gathering locomotive. All tnese are at mines Nos. 1 and 3, the old operation. At mines Nos. 4 and 5 is one 5½-ton Ironton storage-battery locomotive equipped with Edison storage batteries. At mines Nos. 6 and 7 is another Ironton

TABLE I. LENGTH OF OUTSIDE HAUL AND GRADES

Mine No.	Length of Haul, Ft.	Grade
1	100	1.75 per cent. in favor of loads
3	300	1.75 per cent. in favor of loads
4	1,500	3 per cent. in favor of loads
5	1,500	Level
6	1,200	4 per cent. against loads
7	1,200	4 per cent. against loads

locomotive of the same size with the same equipment. Thus far these storage-battery locomotives have been used only for construction work, and they have given good satisfaction. It is the intention of the company to try them at gathering, and if they prove satisfactory they will be adopted for this purpose through all the mines, using the trolley locomotives only for main-line haulage.

The outside haulage problem is a simple one, as all the distances from the mine openings to the tipples are short, as shown in Table I.

Fig. 3 shows the general arrangements of the tracks from the No. 5 mine before ballasting (the track to No. 4 mine was not laid when photograph was taken). The opening to the No. 4 mine can be seen in the upper right-hand corner of the illustration. The track from this opening curves around the hill on a 2 per cent. grade and connects with the track on the curve in the foreground of the illustration.

Coal from mines Nos. 1 and 3 is dumped over a double tipple. The side nearest the No. 1 mine is an

FIG. 6. TYPE OF TWO-STORY HOUSES ERECTED AT COAL RUN

old tipple which is being remodeled. The No. 3 side is new and up to date, and is similar to the tipples at the other four mines with the exception that horned instead of crossover dumps are used. No. 1 mine has an output at present of about 600 tons and No. 3 mine of about 1100 tons a day. The production will be increased shortly to 1000 tons and 1200 tons respectively.

Coal from the Nos. 4 and 5 mines is dumped over the same tipple that serves mines Nos. 6 and 7. These tipples, standardized in design and exceedingly simple in construction, are of a type that has been adopted for use by this company and its associated companies throughout central Pennsylvania. The tipples at the Coal Run mines are designed for a capacity of 1200 tons a day and for the preparation of two kinds of coal, either straight run-of-mine or run-of-mine with the slack removed. The main timbers in the bents are 10 x 10 in. and the cross and longitudinal bracing is 3 x 8 in. The stringers for the loaded tracks are 6 x 10 in. The tipple proper consists of five bents, and as many more bents as are necessary are used to connect the tipple with the track grade. See Figs. 2 and 5 for construction details of the tipple.

The loaded cars are dropped by gravity on a 1¾ per cent. grade to the scales on the tipple, where they are weighed. Thence they run by gravity to a crossover dump of the Phillips type, on which they are dumped. The car is then kicked off by the next loaded car and runs about 20 ft. to a kickback, which is suspended over the end of the tipple by iron rods, as is shown in Fig. 2. From this kickback the cars run on a 1½ per cent. grade to the empty track. Two tipples are illustrated in Fig. 4. The upper view is of the tipple at the Nos. 4 and 5 mines while the lower is of the one at the Nos. 6 and 7 mines.

At the tipple are three railroad tracks, one a passing track, one a run-of-mine loading track and the other a slack-loading track. The loading chute is so arranged (see Fig. 3) that one plate on bottom can be removed and screen bars put in its place.

One substation supplies power to all six mines. This substation is contained in one-half of a red brick building, the other half of which houses the machine shop. At present the substation equipment consists of one 25-cycle, 575-volt, 522-amp., three-phase, 6600-volt, alternate-current synchronous converter built by the General Electric Co. The alternate current will be changed later to 22,000 volts. The machinery for doubling the capacity of the substation has already been purchased.

The current is carried by a high-tension transmission line from a central station at Luzerne, 11 miles away. All the oil switches and transformers are in the substation. The feeders for mines Nos. 1 and 3 pass through boreholes to the mine workings.

Of the 85 houses now on the property 74 are four-room double frame houses two stories high. These houses are shown in Fig. 6.

Ask yourself what would be the financial attitude of Washington and Lincoln toward this war were they alive today. Do you think they would refuse to buy LIBERTY BONDS?

Bulgaria Has Only One Railroad Mine

The first coal mine in Bulgaria was opened by the government in 1879. Apparently it was soon worked out. The authorities then opened a mine at Pernik, about 15 miles from Sophia, on a branch railroad to the main line running from Sophia, southwesterly to Kustendil. It is a mine of some pretensions, producing, in 1916, 610,000 tons and employing one quarter of all the miners in the country. The coal is bituminous and runs in seams 6 to 10 ft. thick with light cover.

But though this is, or was, Nov. 10 of last year, according to the United States Consular report, the only railroad mine there are plenty of coal showings and many mines from the east to the west end of Bulgaria. Thus there is the government mine at Bobovdol in the southwestern part of Bulgaria and the Prince Boris mine, perched in the Balkan Mountains, operated on a government lease. The Boteff mine is near-by, and a German company also has several mines, first operated in 1912. The coal is 3 to 23 ft. thick but crushed as fine as sand and needing briqueting before marketing.

Further east are lots of coal areas between Gabrovo and Sliven, but the coal is only 2 ft. thick and pulverized. A coal mine, without any of the necessary facilities, is producing about 30 tons per day. Still further east are many other mines. Brown coal is found only 15 miles from the important Black Sea port of Bourgas. More northerly is an 8½-ft. bed of anthracite. Bulgaria is a land of possibilities if it only had railroads, capital and progressiveness.

Working Thin Beds by Longwall

BY ROWLAND GASCOYNE
Johannesburg, Transvaal, South Africa

SYNOPSIS—*Both mining engineers and miners are as a rule strongly prejudiced in favor of the method of working to which they are accustomed. Unless market conditions are abnormal it requires considerable courage to attempt the operation of a thin coal bed on the longwall system, when the only labor available has been accustomed to some other method. Generally speaking, however, longwall is the more economical system to follow in beds less than about 2 ft. 6 in. in thickness.*

JUDGING from the questions frequently asked in *Coal Age* regarding the best way of working thin beds of coal, and the fact that longwall seems to be frequently recommended where conditions seem suitable, it would appear that in the States and Canada some attempts are being made to work abnormally thin beds of coal.

As a rule mining engineers brought up to longwall methods are as prejudiced against the adoption of other systems as those brought up to room-and-entry are to the adoption of longwall. The same prejudice prevails with the workmen, and nothing militates against the change from one system to another, even if conditions underground call for such a change so much as this prejudice.

A Puzzle in Mining Costs

Take for instance the experience related by J. F. K. Brown in an article entitled "A Puzzle in Mining Costs" (*Coal Age*, Vol. 9, No. 6) wherein it soon becomes evident that the prejudice of the men against the adoption of longwall was as fatal to its success as the abnormal thinness of the measure—namely, 16 inches.

One would think that to attempt to work successfully under normal market conditions such a thin bed as 16 in. requires some courage, without being hampered by prejudice on the part of the workmen. To try a new method of working under such underground conditions, and in face of this prejudice, requires even more courage and tact; and it is no wonder that it was regarded as somewhat of a puzzle.

With a bed as thin as 16 in. under 30 ft. of shale, which again is overlaid by 30 ft. of sandstone, the conditions for longwall working ought to be more favorable than working by room-and-entry. An engineer accustomed to longwall would probably always adopt that method with such a thickness of shale for a roof, but in the successful working of longwall the floor has also to be taken into consideration as well as a host of other conditions.

It would perhaps be an advantage and more easily understood if we attempt to follow and deal with the difficulties as they arose in Mr. Brown's experiments. In the first place to make a longwall face parallel to the "cleats" cannot always be recommended. In a bed of fragile coal the proportion of small coal made by working parallel to the cleats might make all the difference between working at a loss and a profit, and with a shale roof the cleats might act as lines of weakness and thus add to the timbering difficulties. With a hard coal and sandstone roof, working parallel to the cleats might prove an advantage. All such small details must be taken into consideration.

With regard to timbering it was stated that the men had never previously worked in longwall workings, and were prejudiced against the system. Under these circumstances it is impossible for the longwall method to have had a fair trial, unless there was some one practically acquainted with all the troubles of this system to act as instructor and take a leading part. It is no wonder that the roof was kept in what Mr. Brown describes as a state of "animated suspension." Had he continued to work under these conditions until the "top weight movement" came on there would probably have been much more animation observable, and less suspension.

With a roof like the one described and the working face running parallel to the cleats the area of roof exposed must be kept down to a minimum and as little of it permitted to rest on timber as will allow of the conveyance of coal along the face. This is shown by the fact that the timber along the face had to be frequently changed, a practice always to be avoided if possible, as in itself it may be regarded as proof that the face is not being advanced at a sufficient rate. The acceleration of the speed of the face would also, as suggested, reduce the difficulty experienced in transporting the coal.

Should Have Adhered to Longwall

It is evident that Mr. Brown's failure in the first section of longwall opened was due to the causes stated, and it is perhaps fortunate that work was suspended before the top weight came on, otherwise the whole of the workings might have collapsed.

Mr. Brown did not state whether the waste was closely packed. Presumably it was, but it may be pointed out that with such a roof, until the floor and roof have come together, and the gateway is constructed in solid ground, there would be little hope of settled conditions prevailing. It may be true that work was stopped just when earth movements were commencing to show themselves, but had the longwall method of working been persevered with until the conditions mentioned above had prevailed, there would perhaps be quite a different tale to tell about the adaptation of the longwall method of working to this thin bed of coal.

When we come to consider the No. 2 section of longwall in the experiment mentioned by Mr. Brown, we find that several of the suggestions mentioned above with regard to the No. 1 section were adopted with advantage, and it would almost appear that had operations been continued some degree of success would probably have been obtained.

Working at right angles to the cleat and reducing the exposed roof to a minimum seems to have proved bene-

ficial, while the timbering seems to have been better arranged. It is to be noticed, also, that to facilitate the loading of the mine cars a cut was made in the floor of the gateway and small cars used along the face. No information is given as to the method adopted in stowing up the wastes so as to steady the roof. It is presumed that every care was taken to stow the waste as solidly as possible, but whether packs of either stone or timber were used nothing definite is stated.

An intermediate pack of waste often saves considerable timber and should be used wherever practicable, and props regarded only as instruments of safety to prevent falls in the working place and not to resist subsidence, which in any form of longwall working is impossible to attain. It is impossible to say whether in the course of time it would be possible to use less timber in the shape of packs in the gateway, and thus reduce the cost of timber. At all events, in the starting off of a longwall face to stint the packs of timber would be doubtful economy. It is pointed out, however, that although the No. 2 longwall experiment was more successful than the No. 1 experiment, the results were not yet entirely satisfactory, the troublesome part being the removal of the coal and rock from the face to the mine mouth.

In one place Mr. Brown states that no attempt was made to build up the cavity formed by taking out the coal, as no stone fit for the purpose was obtained from the roof. I hope this does not mean that the waste rock made at the face was taken out of the mine while empty spaces were left in the goaf in which it was possible to stow this waste rock. If this waste rock was not deemed good enough to build packs with, there can be no excuse for leaving empty spaces in the waste and sending rock out of the mine, which, however unsuited for packs, was valuable for stowing material.

Removal of Waste Material Expensive

Any system of working which involves the removal of a larger quantity of waste material than coal must necessarily be expensive, and the question arises could not this handling of waste material be reduced? The extraction of only a thickness of 15 in. of coal does not leave much room for the stowage of waste rock, and if to work 15 in. of coal it is absolutely necessary to take down 18 in. of roof, there seems little hope of avoiding the transport of waste rock out of the mine. Many collieries are working beds of coal 2 ft. and 2 ft. 6 in. thick successfully by longwall, without taking down the roof in the working places, and if only Mr. Brown can reduce this taking down of the roof in the working places, say to the extent of one-third, the benefit ought to be considerable.

With such a thin bed as 16 in. Mr. Brown gives interesting figures as to the comparative costs between longwall and pillar-and-room working. The outstanding features of these are the higher costs of timbering and tramming in the longwall system as compared with the pillar-and-room working. It is easy to understand perhaps why timber should cost more in longwall than in pillar-and-room, but one would expect that this extra cost would be more than counterbalanced by cheaper mining and stonework. These Mr. Brown estimates the same in both systems. Tramming costs in longwall ought not to be more than in pillar-and-room under the same conditions underground. But it seems reasonable to lay the blame on the amount of waste rock handled, which brings us back to the thinness of the bed worked. Mr. Brown suggests that the adoption of mechanical haulage would prove a solution to all these troubles. This, of course, will depend upon the distance the coal has to be moved, but it ought not to have any bearing on the mining merits of the two systems of working discussed, as practically the same amount of transportation will have to be done in both cases.

The problem here to be solved is how to obtain an output of 50 tons per day from a bed of coal 15 in. thick. There is no spare power available, so that coal cutters are out of the question. If the longwall system was adopted and the necessary power available, five coal cutters and the use of coal conveyors at the face would solve the whole question, but we are asked here to obtain an output of 50 tons of coal per day with no mechanical facilities worth mentioning.

Have Gateways as Far Apart as Possible

We will assume that the longwall method of working is decided upon, and in such a thin coal bed it will be advisable to have the gateways as far apart as possible. I would fix them 100 yd. apart so as to save the cost of stonework and its handling as much as possible. Each gateway would therefore serve 50 yd. on either side. I would use small cars to convey the coal along the faces to the gateways. The floor in the gateway would have to be taken up to make the requisite height, say 6 ft.

To obtain the required amount of coal five stalls would be necessary, each 100 yd. long, and the face would advance about 4 ft. per week. Every effort must be made to keep the waste down so that it can be all stowed in the goaves, and if possible none sent out of the mine. The packs along the gateway sides should be built 12 ft. wide and strengthened with old timber chocks, and if intervening packs between the gateways can be built to steady the roof, so much the better. The solid stowing of the goaf must be kept as close to the working face as possible, so as to reduce the weight on the timbers.

If these instructions are followed five or six working places 300 ft. in length ought to produce 50 tons per day. To increase the output additional working places would of course be required. Gateways 100 yd. apart may seem abnormal, but to work a 15 in. bed of coal successfully such a distance between the gateways seems necessary in order to reduce to a minimum the unprofitable handling of stone.

In the same issue of *Coal Age*, under the heading of "Inquiries of General Interest," a novel proposition is made to run an endless rope along a longwall working face, in order to reduce the number of roads and their maintenance.

The thickness of the bed in this instance is said to vary from 20 to 27 in., while the depth is given as 110 ft. The coal measured is overlaid by 2 ft. of soft, sandy shale, followed by 2 ft. of impure, compact, hard coal. Then follows 6 ft. of block slate overlaid by sandstone. The roadways are driven 30 ft. apart. The inclination of the bed is not stated, but as it is proposed to use an endless rope along the face, it may be presumed that the inclination is small. As the coal is said to be hard,

probably the cutting is done in the 2 ft. of soft, sandy shale, so that the height along the working faces will probably be about 4 ft. The impure coal is taken down in the roadways, making them 6 ft. high in the first construction.

The object sought here by the inquirer is to reduce the number of roadways to a minimum, as also their cost of maintenance. At the outset it may be stated that the number and cost of the road can not be materially reduced without complicating matters along the working face by installing an endless rope, even if it was practicable to do so. The roof must be good to allow such a suggestion to be seriously made, since clearly any fall of roof along the face would incur serious stoppages.

The question one is inclined to ask is why are the gate roads, in face of their cost, constructed only 30 ft. apart, which for a bed of coal averaging only 2 ft. thick seems quite unnecessary? Why not have the roadways farther apart by abandoning three out of every four of the present roadways? If the roadways are constructed so close together with the object of supporting the roof by the packs, why not build packs in the goaf without going to the expense of constructing roadways? If, as supposed, the 2 ft. of soft sandy shale is taken down at the face, it ought to go far toward filling the goaf in a solid manner and thus reduce the number of waste packs required.

Why Not One Good Main Gateway?

It would be interesting to know at what distance from the face the roadways when brushed up to the block slate become too low to use without re-brushing. If all the gateways need this re-brushing, would it not be more profitable to make one good main gateway, say every 250 yd., even if it involved the brushing of the block slate, and so cut off three gateways on either side by new slant roadways when the old roads got too low for use without re-brushing?

It is, of course, difficult to make suggestions when all the facts and conditions are not known, but providing the conditions are as surmised, the making of a roadway over 30 ft. in the exploitation of a coal bed averaging only 2 ft. in thickness seems quite unnecessary. The primary use of roadways is of course to facilitate the removal of the coal from the working face, and it ought to be manifest that fewer roadways are required for this purpose in a 2-ft. bed, say, than where the seam worked is 6 ft. thick or over. To make roadways only 30 ft. apart in a 2-ft. seam, appears therefore to be incurring unnecessary expense, unless some satisfactory explanation can be given for such an unusual practice.

In a case like this the minimum distance between the gateways ought to be, say 120 ft., and even this may prove too small if the roof is good, or where it is possible to use mechanical coal conveyors along the face. The objection may be urged that if the number of gateways be reduced, the working face will not advance as rapidly, and the roof will rest longer on the timbers. A little reflection, however, will show that in a thin coal it is not the number of gate roads that causes the face to advance, but the number of machines or men put to work at the face.

To increase the number of gate roads by placing them only 30 ft. apart would rather deter than advance the face, owing to the additional labor required in connection with the construction and brushing of these passages, especially if that labor could be utilized along the face. There may be of course some prejudice among the men against working in longer places than 30 ft., but a little reflection will show that in a thin coal bed this extra construction of gateways must add materially to the working costs.

In the two instances already dealt with the thinness of the beds, say from 16 in. to 24 in., makes the propositions anything but attractive and demands an abnormal selling price to enable the collieries to be worked at a reasonable profit. Coal-cutting machines and coal conveyors along the face are to be recommended, but it frequently happens that these appliances are not available.

There can be little doubt that where the underground conditions are favorable the longwall method of working ought to be more suited to the extraction of thin beds than the pillar-and-stall system. In a bed of coal, say 2 ft. 6 in. thick, possessing a good roof, where mechanical coal cutters and conveyors can be installed along the face, no great or noticeable difficulty ought to be experienced; but where the thickness is less than 2 ft. 6 in., many difficulties are encountered, the most formidable of course being the large amount of stone handled in these ultra-thin beds.

Prejudice on the part of the workmen against the longwall method of working is a serious obstacle and one exceedingly difficult to overcome. It may be found expedient to counteract this prejudice by introducing a compromise between pillar-and-room and longwall working, so that by a process of evolution as it were the longwall method is gradually introduced. In instances like this it may even be necessary to adopt retreating longwall where underground conditions will admit of this method being practiced. Generally speaking, however, where the coal bed is under 3 ft thick and conditions are suitable, the longwall method of working ought to be adopted.

Cost of Producing Anthracite

The cost of producing anthracite coal ready for market, according to data compiled by the general committee of anthracite operators of Philadelphia, Penn., divides roughly into 60 per cent. for mining, 30 per cent. for preparation and 10 per cent. for taxes, insurance, workman's compensation, royalties and fixed charges. Of the total cost of production about 70 per cent., sometimes above 75 per cent., is labor cost. The average production of anthracite per mine worker per working day for ten days prior to the war was 1.96 tons. For the decade to 1916 the breakers ran an average of only 221 days a year. The largest number of mine workers in the anthracite regions was 180,000 in 1914. It averaged 175,000 to 177,000 prior to the war, but is now 153,000.

As the mining industry has been more and more scientifically conducted, the waste of anthracite—that left in the ground and that discarded on the dumps—has been greatly reduced. In 1887 steam sizes made only 6.9 per cent. of the total anthracite sent to market. For 1917 30.7 per cent. of all was of the small steam sizes—coal which 25 years before would have been thrown away as useless.

The Byproduct Coke Oven, Its Coke and Its Byproducts—I*

By WILLIAM HUTTON BLAUVELT
Consulting Engineer, Syracuse, N. Y.†

SYNOPSIS—*The United States may lag behind Europe in the percentage of coke produced by the byproduct process but not in the efficient operation of such byproduct ovens as are in operation. Advantages in the use of silica brick and the gain derivable from great intensity of operation.*

THE technical and engineering problems in the manufacture of coke are today the problems of the byproduct oven. Except in a few special localities, practically no beehive ovens have been built in the United States for the last 5 or 6 years except as renewals of old plants, and during these years the total number of beehive ovens in existence has been steadily falling. On the other hand, the number of byproduct ovens has increased from 4624 in 1911 to a total of about 7660 in operation at the end of 1917; with 2800 building this makes a total of about 10,460 which will be in operation in 1918, or shortly thereafter.

Preliminary Government estimates place the total production of coke for 1917 at 56,600,000 tons, the largest tonnage in the history of the industry. Of this 34,000,000 tons or 60 per cent. was beehive, and 22,600,000 tons, or 40 per cent. was byproduct coke. Some time in 1918 the production of byproduct coke should pass the beehive output, and when the byproduct ovens now building are completed the total byproduct capacity will be about 40,000,000 tons of coke per annum, which is over 70 per cent. of the record-breaking total coke production of 1918. The reasons for these changes in the coking industry are familiar to all of us, and need not be discussed here.

Improvement in Oven Design

Since the byproduct oven was brought to this country from Europe, in 1892, it has been radically improved, and from the point of view of American metallurgical practice it is safe to say that the American ovens are superior to those of Europe. The points of superiority are mainly those of larger units and larger output per unit, and the greater extent to which labor-saving machinery has been introduced. The increased output is largely due to the use of silica refractory material, which permits higher heats and shorter coking time than are employed in Europe. The modern American oven will carbonize commercially more than 20 tons of coal per day, and contrary to the European idea that slower operation is necessary to conserve the plant, this rate of operation with only current repairs, can be maintained for an indefinite time. The byproduct oven is not old enough in the United States to make it possible to state from experience how long an oven can be operated at maximum efficiency. There are a number of plants in different parts of the country which were built 16 or 18 years ago, which are more efficient today than in the first year of operation, and which show costs of operation which compete well with those of the most modern plants.

The accompanying illustrations, Figs. 1 and 2, show the earliest and the latest development of one of the prominent types of ovens in use in this country. It is not the purpose of this paper to discuss mechanical details of oven development, and the illustrations show sufficiently well the principal changes in the design. The first ovens had a capacity for carbonizing 4.4 tons of coal per day, as compared with the present capacity of over 20 tons mentioned above.

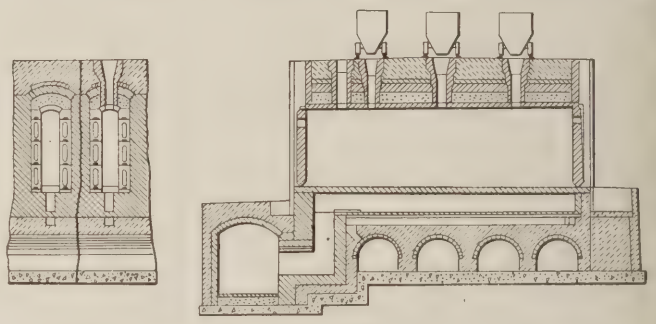

FIG. 1. EARLY DESIGN OF BYPRODUCT OVEN

The early ovens were economical in heat consumption because the heat in the waste gases was utilized efficiently in raising steam for the operation of the plant. On account of the growing demand for oven gas for metallurgical and other uses, the change to the regenerative type of oven has been general. While this type of oven is not so economical of the total heat produced by the combustion of the gas as is the combined oven and boiler plant, it makes available for use half again as much of the surplus gas as did the older type of oven. Modern ovens require for carbonization of the coal less than 40 per cent. of the total heat in the gas produced.

Description of Oven

Fig. 2 illustrates one of the principal types of the modern oven, and a few words of description may be appropriate here. The byproduct oven is essentially a closed chamber, heated from the outside, and in the coking process the volatile matter of the coal is distilled off with careful exclusion of air. This point distinguishes it in principle from a beehive oven, where the heat is generated by combustion within the oven itself, with the resulting destruction of everything except the coke. The oven shown consists of a chamber about 36 ft. long, 12 ft. high, and of a width depending upon the coal that is to be carbonized. In American practice the

*Paper presented at the New York meeting of the American Institute of Mining Engineers, February, 1918, entitled "The Byproduct Coke Oven and Its Products."

†Coke expert, Fuel Administration.

average width varies from 16.5 to 21 in. Modern ovens usually have about 2 in. of taper toward the discharge end to facilitate the pushing of the coke.

The ovens are usually heated by a portion of the gas recovered from the distillation of the coal, although sometimes producer gas is substituted. In all the successful ovens this gas is burned in a series of flues which control the travel of the burning gases and distribute the heat over the entire side of the oven. The success of any oven design depends very largely upon its ability to distribute the heat evenly over the entire surface which forms the wall of the oven, and it is by no means an easy problem to control this distribution accurately over an area of 432 sq.ft. In some ovens the flues composing the heating system are vertical and in others horizontal. The oven shown is the chief exponent of the latter arrangement.

Horizontal vs. Vertical Oven Flues

Both systems have their advocates, and the details of both have been worked out so that they can be relied upon to give the uniformity of heating necessary for satisfactory operation. Naturally the representatives of each system prefer their own type. The advocates of the horizontal flues find them more accessible for supervision, easier to control, and easier to maintain. The somewhat lower temperature that can be maintained in the upper flues under all conditions of operation is a desirable feature for the best results. One feature of the oven shown is the strong middle wall between the ovens extending from the foundation to the top, which gives the structure great stability and permanence and acts as a heat reservoir to help maintain uniform temperatures, which is important, because when a new charge of cold wet coal is dropped in the oven there is a great demand for heat to start the coking process quickly. These middle walls also permit any oven to be repaired or entirely relined with a minimum interference with adjacent ovens.

Fig. 3 shows the flow of the air and gases through the system. From this illustration it will be noted that one pair of dampers near the stack does all the reversing of the air and gas. The cold air enters the system from a fan located at a point near these dampers, flows through one of the two main flues, and is distributed to the regenerators by a system of firebrick slides. The air is heated in the regenerators to about 1000 to 1100 deg. C. before entering the flue system of the oven and meeting the gas to be consumed.

It will be noted that this gas is supplied at several points in the flue system, and that it flows steadily through the supply pipes, its direction in the oven being reversed by the reversal of the current of air, so that no attention need be given to this point by the operator. That is, when the currents are flowing upward through the flue system each gas stream is bent upward and burns in the flue above the gas pipe, which is opposite the partition wall. When the flow is downward, the gas streams are bent downward. By means of these several supplies of gas the heat is supplemented as needed and all the air supplied is consumed by the last admission of gas. The products of combustion pass out to the other regenerator and thence to the reversing dampers and chimney in the same manner as in an openhearth furnace.

In the earlier types of ovens, when luminous gas was used, much of the heating was done by radiation, but in modern practice, where the benzol is removed from the gas, the combustion is not luminous and the heating is done mainly by conduction. To this end, in the system described it has been found quite advantageous to maintain a reasonably high velocity of the hot gases in the flues, making use of the principle which has been developed in some types of hot-blast furnace stoves and other furnaces, where a high velocity of the hot gases has been shown to be most effective in the transfer of heat to the adjacent surfaces because it sweeps away the sluggish layers of gas lying against the surfaces, which, if not removed, would form efficient nonconductors of the heat which we desire to transmit to the coal charges in the oven.

Operation of Byproduct Oven

The total amount of heat delivered to the combustion flues is usually regulated by the pressure on the supply of air and gas; and the distribution of the heat among the various flues is controlled by a simple regulation of the relative amount of gas to each flue. Each flue may be conveniently inspected through a peephole accessible from the working platform outside; and it is found that the convenience of this inspection and control is an important factor in obtaining the best heating conditions.

The coal is charged into the oven from a hoppered larry car running on the top of the oven structure, the fuel usually being delivered through four charging-holes. The fifth hole, shown in the illustration, serves to carry off the volatile products of the distillation. The

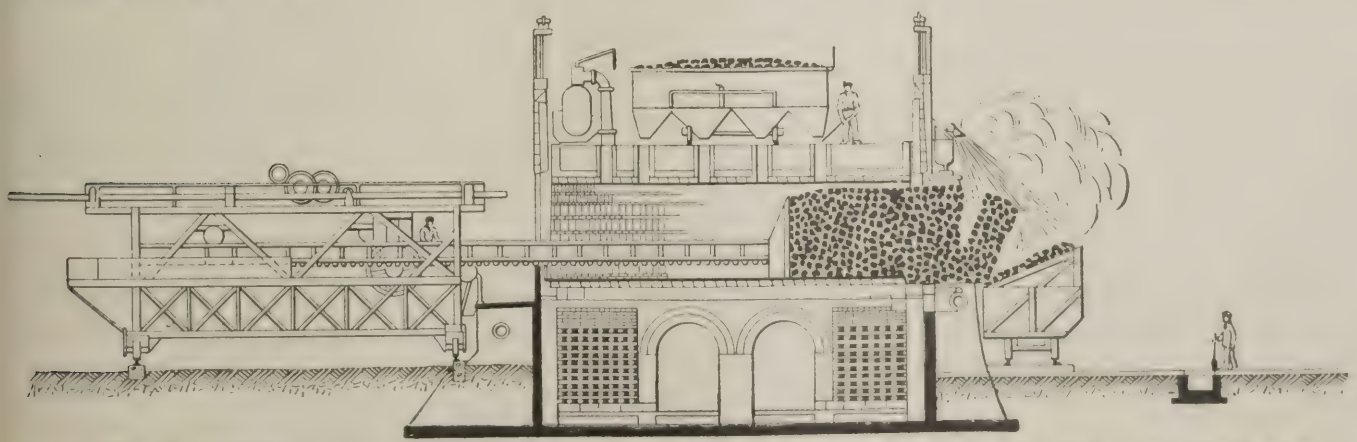

FIG. 2 MODERN BYPRODUCT OVEN WITH CHARGING LARRY, DISCHARGING RAM AND COKE CAR

coal is leveled, after charging, by an auxiliary ram on the coke pusher, the space being left between the top of the coal and the top of the oven for the outgoing gases to reach the point of discharge.

Upon completion of the coking process the doors are raised, and the coke is pushed out by an electrically operated ram. The doors are then lowered and sealed and the oven is ready for another charge. Many attempts have been made to develop a mechanically sealed

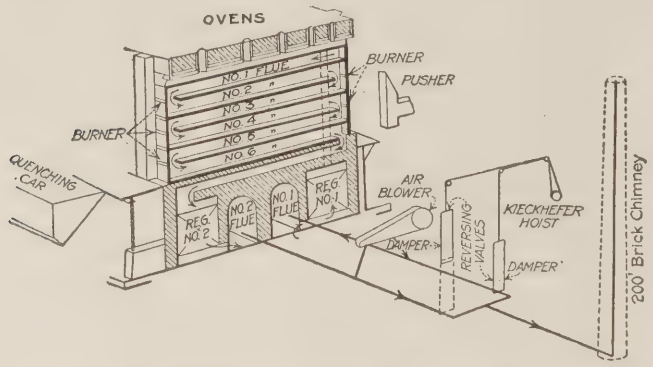

FIG. 3. DIAGRAM OF OVEN VENTILATING SYSTEM

door, but the conditions of operation make this mechanical sealing a difficult problem, and nearly all plants still use the mud joint. Careful designing of the door and its seat make this mudding a much less serious matter than might be supposed.

Use of Silica Brick

As stated above, silica brick is largely used in modern byproduct oven construction. There seemed at first many obstacles to its successful use for such construction, the principal objections being the large amount of expansion of the brick when heated and the tendency to spall, due to sudden changes in temperature. When silica brick was first used in the crowns of beehive ovens it was thought that it would be an absolute failure, but it was unexpectedly successful. It was first employed in byproduct ovens at the plant of the Cambria Steel Co. and was soon after generally adopted.

It has been found that, since most of the expansion takes place below a red heat, the variations in temperature during operation do not give any trouble, and the superior resistance of silica brick to high temperatures and its satisfactory conductivity under operating heats make it a superior material. Notwithstanding its success in American practice, I understand it has not been employed to any extent in Europe, and only a few years ago some prominent English brick makers stated that they did not believe it could be employed, notwithstanding statements that came from America.

Size and Width of Ovens

The cubic capacity of a byproduct oven has increased nearly four-fold since its first introduction into this country. The larger capacity has the advantage of reducing the cost of operation per unit of product, and the smaller number of units also reduces cost of construction and repairs. Increases in length and height of the oven chamber have no effect on the product and are limited only by structural and heating conditions. The width of the oven, however, is a more important factor in the coking process.

In the early days of the byproduct oven in Europe it was thought that the lean coals of Belgium, running as low as 15 per cent. volatile, required a very narrow oven, perhaps not over 14 in. wide, while for high-volatile coals a width of 20 in. was not infrequent. American practice has not demonstrated any such simple rule as this, and perhaps the reason may be found partly in the fact that oven plants are generally located at the point of consumption of the coke. Hence mixtures of coals can be more easily obtained, and for this reason most plants operate on about the same average percentage of volatile matter. It has not been definitely shown in American practice that a particular width of oven is best suited to coal of a certain composition. Narrower ovens have certain advantages.

First, a faster coking time per inch of width with a given flue temperature.

Second, a somewhat higher yield of byproducts.

Third, a somewhat more uniform cell structure as between the portion of the coke nearest the wall and that nearest the center of the oven.

On the other hand, the larger number of operations of the oven crew when handling the narrower ovens increase the labor cost and the repairs. It has yet to be developed what is the best oven width to average these conditions. The widest ovens operating in this country have an average width of 21 in. and the narrowest 15 inches.

It will probably take much further investigation to determine where between these limits can be obtained the best equalizing of conditions, and whether the mixture of coals naturally available for a given plant will be a factor in determining the best average width. Some coals require higher temperatures than others to produce the best coke, but it is not clear that this fact will lead to the selection of wider ovens for such coals. It is not clear that we can say today that any width is definitely the best for a given set of conditions, but much study is being given to this subject, and we may before long have some better data.

Quality of Coke

In the discussion of this subject I shall not go into the chemical composition of coke, since the permissible amount of any impurity for a given use is well understood, and the different elements are easily determinable. The physical structure of the coke is quite as important as its chemical composition. It is the physical structure which gives coke its advantage for metallurgical work over other forms of solid fuel, and it is important that the structure should be adapted to the conditions under which the coke is to be used.

The blast furnace is the great coke consumer. In the days of the beehive oven one kind of coal gave a coke with a certain physical structure, and another coal gave another structure. Furnaces either adapted their practice to the coke, or changed their coke supply. Coke was recognized as hard or soft, porous or dense, and that was about all we knew regarding physical structure.

Mr. Brassert says in his paper on "Modern American Blast Furnace Practice," read in 1914, that "the early coke produced in our byproduct ovens, even from the same coals as were successful in the beehive oven, burned too slowly and made our furnace operations exceedingly difficult, by preventing rapid and continuous movement

of the stock. The lack of knowledge and experience along these lines was responsible for the slow progress attending the introduction of byproduct ovens in this country." The economy of the byproduct oven practically forced its adoption by the furnace operators, and for several years, as Mr. Brassert states, "at a number of American plants byproduct coke has been made which rivals in quality our best beehive product."

The byproduct oven, with its variable mixtures of coals, variable heats, coking time, width of oven, fineness of coal charged, and other controlling factors, permits a control of coke structure formerly impossible. The problem is to determine first, what is the structure best adapted to standard furnace practice, while recognizing that special practice requires modifications of structure; second, what conditions are necessary to produce that structure.

Notwithstanding the general acceptance of Gruner's theory of ideal combustion in the furnace, the production of a high thermal heat at the tuyeres is of the first importance, and the best coke is that which reaches the tuyeres in proper condition to produce the highest temperatures in the tuyere area, and in just sufficient quantity to do the amount of work required there under the conditions produced at this maximum temperature.

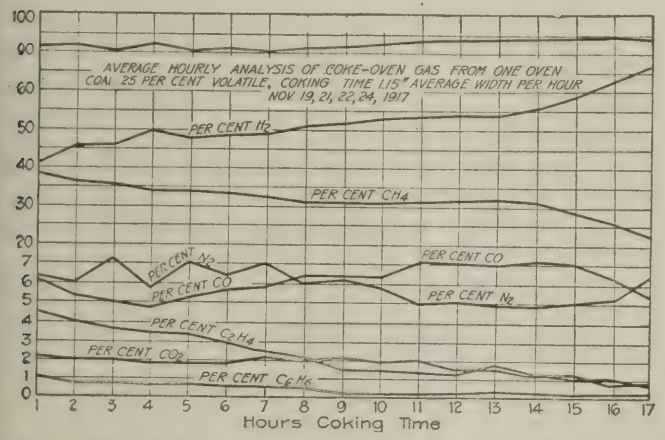

FIG. 4 SHOWS WHAT GASES ARE MADE EVERY HOUR OF THE COOKING PROCESS.
Upper line shows percentage of combustible gas in oven

The ideal coke is one which will descend through a furnace shaft to the combustion zone in front of the tuyeres with the least loss from attrition and oxidation, and when it arrives there will burn at the highest possible rate. Of course, there are paradoxical qualities. However, Mr. Walther Mathesius points out in his interesting paper on "Chemical Reactions of Iron Smelting" that "modern American coke-oven practice has made enormous strides toward approaching this apparently paradoxical ideal." He stated that this is accomplished by producing coke with an open-cell structure, in which the cell walls themselves are amply strong and well protected by a graphitic coating.

The time of contact of the blast with the coke in the tuyere area can be only a few seconds and the speed of any chemical reaction decreases as the relative quantities of reacting and resulting substances approach equilibrium. Therefore, the farther these relative quantities remain from the status of equilibrium, the higher the rate of resultant combustion. With the facts now before us I am disposed to believe that we should, in seeking to produce the best blast-furnace coke, aim to produce an open-cell structure, with cell walls strong and hard. Later experience may, however, show that there are other requirements that are not now known to us. It is not necessarily true that the open-cell structure is the same thing as a high percentage of cell space. The advantage of an open-cell structure is that it gives the oxygen of the air easy access to the carbon. It is

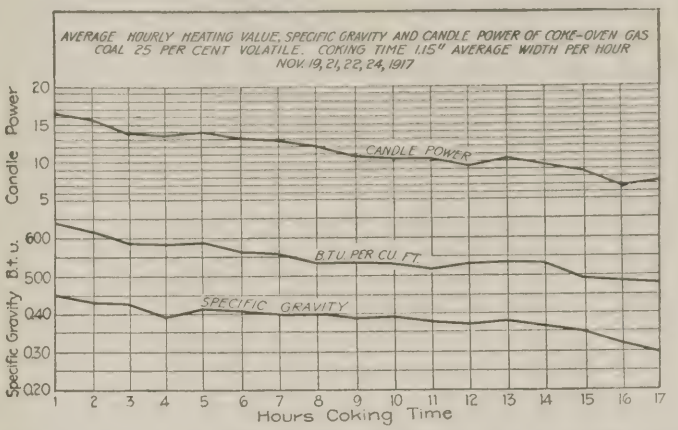

FIG. 5 GRAPH SHOWING LIGHT, HEAT AND WEIGHT OF COKE-OVEN GAS HOUR BY HOUR

entirely possible that a coke of very fine cell structure, having say 50 per cent. of cell space, might offer less surface for prompt combustion under practical conditions than another coke containing larger cells but having the same percentage of total cell space.

The composition of the cell wall, which it is agreed should be hard, thin and strong, and, according to Mr. Mathesius, covered with a graphitic coating that is smooth and bright, is a much more complicated matter. What are the conditions of coal mixture and coking which produce this kind of wall? I think we have not yet found the answer to this question, although we know some of the conditions that are favorable to this result. The coal mixture, the degree of fineness of grinding, the coking time, and the heats are probably all factors.

Our search for the best coke structure to meet a given set of furnace conditions is not an easy one, but we know better which path to start on than we did even a few years ago. Are we not agreed on the following points at least?

1. The coke must be hard.
2. It must have an open structure; that is, cells of good size, filling about 50 per cent. of the coke volume.
3. It must have a high rate of combustibility.

Can we add anything more to this list? Some investigators have concentrated their comparisons on the rate of combustibility, but I cannot believe that this test alone is sufficient to determine the best coke structure, because it ignores one of the sides of the paradox. While the best coke must burn rapidly at the tuyeres, it must also resist attrition and oxidation during its descent in the furnace. Good-sized cells and a good percentage of cell space, coupled with a hard structure, would seem to give a coke corresponding to Mr. Mathesius' definition. Testing the rate of combustion has been a help to us, and I hope we will find a test for hardness of structure better than the crushing of the 14-in. cube specimens, over which so much time used to be spent in the days when John Fulton wrote his book on "Coke."

(To be continued)

Two Readers Condemn the "Resistless Stopping"

This from John Verner of Chariton, Iowa. He believes that an open cross cut betters the air supply and so helps to feed the explosion. A weak stopping may therefore aid in extending the explosion and a strong stopping may help to confine it to a small area.

I HAVE read the report of the proceedings at the Coal Mining Institute of America, as published in *Coal Age* of Dec. 15, 22 and 29, 1917, and I was especially interested in the discussion of the question: "What are the prime requisites of a satisfactory permanent stopping?" The discussion of the question apparently was wholly confined to the consideration of the probable effects of strong or weak stoppings on the propagation of mine explosions.

Mr. Affelder, who propounded the question, stated that in a certain mine the stoppings were so constructed that they would break down in the presence of a comparatively low pressure. An explosion occurred in that mine and soon came to an end, the stoppings in its path being destroyed. In view of this Mr. Affelder expressed the opinion that the early subsidence of the explosion appeared to be due to the collapse of the stoppings affording release of pressure and to the opportunity given in consequence for the expansion and dissipation of the heated gases. For this reason Mr. Affelder believed that the presence of weak stoppings was of value in checking an explosion.

End of Drift Hard Place to Start Explosion

According to the report in *Coal Age*, "the institute did not take very kindly to W. L. Affelder's resistless stoppings as a means of limiting explosions in coal mines," and the view was expressed "it is questionable whether the release of pressure has much effect except at the point of origin."

It has been found that by using the same means of ignition it is much easier to start a dust explosion in a small than in a large area and that reproduction of explosive combustion in unusually high and wide places has sometimes failed to occur. These well-known facts probably gave rise to the theory that release of pressure or opportunity for the comparatively easy projection of the heated gases tends to prevent or obstruct the start and propagation of a dust explosion. The theory, however, is not in harmony with the facts.

The experimental gallery at Eskmeals is about 800 ft. in length and 7 ft. 6 in. in diameter. On page 496, Vol. 6 of *Coal Age*, this statement appears: "It has been found extremely difficult if not impossible to start a dust explosion from a shot fired from the face or closed end of the gallery and to assure success the shots are fired 50 ft. from the closed end." In the absence of the opportunity for the expansion of the heated gases in opposite directions it was extremely difficult if not impossible to start a dust explosion, whereas with the opportunity provided, the start of the explosion was assured.

On page 39, Bulletin 56, of the Bureau of Mines, is found a description of tests made at the Bruceton mine, showing practically the same results as at Eskmeals. Tests were first made in the Bruceton exterior gallery, consisting of a steel tube about 100 ft. in length, 6 ft. 4 in. in diameter, closed at one end by a plank stopping and open at the other. The cannon was placed against the plank stopping of the closed end and a hole was cut through the stopping opposite the bore of the cannon. Shots fired from the cannon into the gallery produced explosions without fail.

Suggest That Mr. Affelder Explain This

This exterior gallery is so arranged that it can readily be connected with the mine itself. When the gallery was so connected and in consequence the distance from the cannon to the opening was increased from 100 ft. to approximately 1200 ft. with two right-angled turns greatly increasing the resistance to the rapid projection of the heated gases from the shot at the closed end, the effect, as the report states, was striking. When the shot was fired in the steel gallery with its open end affording an easy release of pressure, the flame not only traversed the full length of the gallery but extended into the air for many feet, but, under otherwise the same conditions, when the gallery was connected with the mine, the dust was inflamed only in the first half of the gallery and the mine itself was not affected at all.

Here is another significant fact. It has been found that old mines, where the mine resistance is great, are practically immune from dust explosions and that they occur frequently in new mines where the mine resistance is comparatively small.

It is well known that the easy removal of insufficient tamping increases the danger from a blown-out shot and that an increase in the depth of the hole and a corresponding increase in the length of the tamping, the amount of the explosive used remaining the same, lessens the danger. The application of this lesson should help in measuring the probable influence of the easy collapse of weak stoppings in checking a mine explosion.

Strongly Built Stoppings Throttle Explosions

In view of the above it can be said that the presence of strongly built stoppings, capable of resisting the pressure of the initial blast, tends to help in throttling the explosion at its point of origin, and that the release of pressure by the destruction of weak stoppings by the force of an incipient explosion and the consequent easier projection of the heated gases, may be of material assistance in spreading the explosion throughout the mine.

I think it can be safely stated that the subsidence of the explosion in Mr. Affelder's mine was not due to the collapse of the stoppings, but was brought about by other causes not observed by him.

This from W. H. Noone, P. O. Box 5, Thomas, W. Va. He contends that all stoppings should be strongly built of mine refuse faced with concrete.

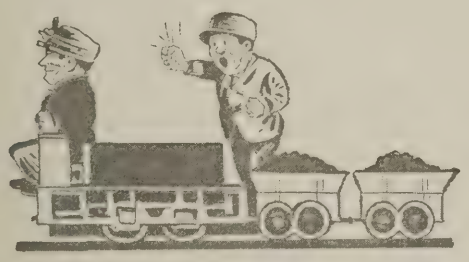
THE Coal Mining Institute of America, held recently in Pittsburgh, discussed the resistless stopping in reference to limiting the force and area of an explosion. It appears that the history of mine explosions attests that there have been no absolutely indestructible stoppings built, and that neither a wood nor other resistless stopping has the capacity of confining an explosion to the area of its origin. Personally, I believe in good stoppings—as nearly indestructible as possible.

I would not like to assume that we are faced by the alternative of either having men asphyxiated by reason of a number of stoppings being blown down or having them killed outright because the stoppings were too strong to afford the explosion an opportunity to lose force by expansion. The answer of the Mining Institute of America was both "yes" and "no," which is no answer.

F. W. Cunningham's plan to have a strong center wall with rock piled to the roof on either side appears to be a good one and such a stopping should be capable of withstanding the force of an explosion.

Wood stoppings are not to be recommended in a mine where the coal is gaseous or highly inflammable. Neither are wood stoppings any longer economical on account of the high cost of lumber. The most practical and economical stoppings are built with the rock and refuse of your mine, assuming that it makes plenty of this material. Start your wall four, five or six feet thick at the pavement, according to the amount of rock and dirt available, and gradually incline the wall on both sides toward the top.

The outsides of the wall being evenly and substantially built, the inside should be filled with the finer dirt and refuse. The wall should then be given a good coat of concrete to make it practically fireproof and airtight. If you have any dirt left you can pile it clear up to the roof on either side in the manner indicated by Mr. Cunningham. The impurities of the coal, the slate, roof rock and coal from the falls, and the refuse that accumulates on the haulages will furnish enough material for stoppings in almost any mine. It is cheaper to keep haulages clean by filling up the crosscuts than to build stoppings of brick, lumber or other material.



If it is possible to reckon with the phenomena of mine explosions in building our stoppings, we should try and do so; and perhaps many of our readers can give valuable advice on the subject, the result of their experience. In some instances it seems that an explosion will blow down a stopping or two and expend itself in a small area adjacent to the point of origin and thus do but little damage. Another will have force enough to be felt throughout the mine.

Emphasis, of course, must be laid on other conditions that either favor explosions, or develop the mine's security against them. It must be remembered also that stoppings are fundamentally a part of the ventilating system, and they should be made sufficiently permanent and tight to assure satisfactory ventilation.

The Patrioteer

Written expressly for Coal Age

By Rufus T. Strohm

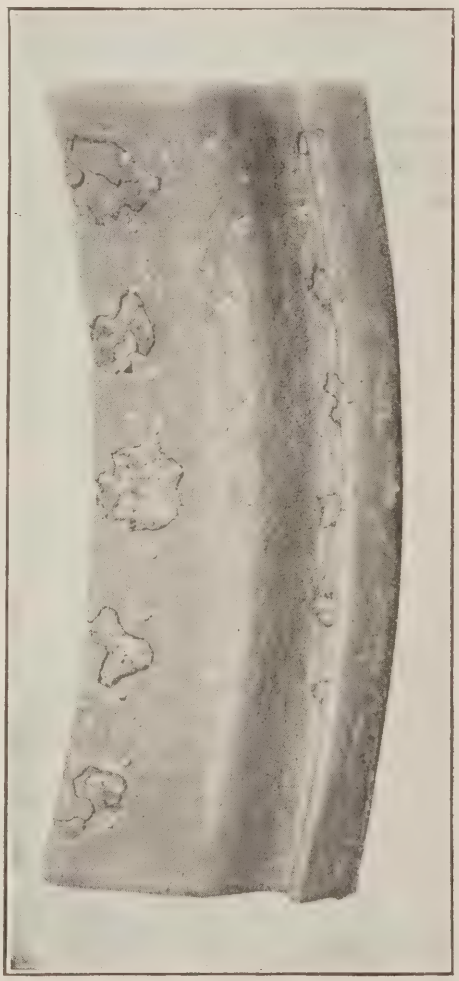
I bellered an' I swore

Why they don't pin one on me

I've bin readin' in the papers how the boys that's over there
Hev bin fightin' like the devil on the land an' in the air;
Every day some airplane feller does a little flyin' roun'
An' to keep himself in practice brings a dozen Taubes down;
Er some Sammy single-handed raids a piece of German trench
An' they both git hero's medals from the pleased, admirin' French.
They deserve the praise they're gittin', but it seems to me, by gum,
That the world is quite fergittin' all us heroes here to hum.

Turn your eyes on me, fer instance, cast yer optics on my chest,
An' you won't find any medals dingle-danglin' on my breast;
Yet in bein' patriotic an' in service that I've done
I don't reckon that there's any that can beat me, barrin' none.
For when winter took the country in his big an' frosty hand,
An' a mighty yell fer fuel echoed up an' down the land,
Then I turned my whole attention to the workin' of a mine
That had not been doin' nothin' since the days of 'ninety-nine.

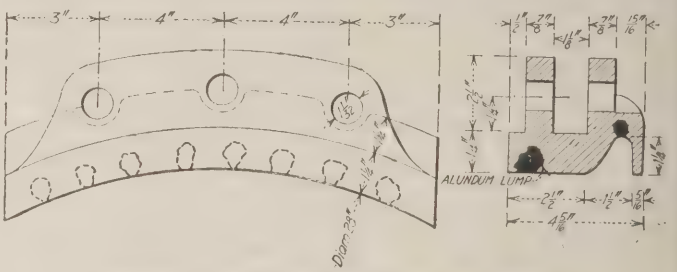
Now, the stuff was full of sulphur, there was lumps of slate and bone,
There was rock an' dirt in pieces, there was chunks of gob an' stone;
But a bit of it was shiny, an' the most of it was black,
So I sold it free an' gladly, never holdin' nothin' back;
Fer the cries of freezin' millions sorter tetched my tender soul,
An' I did my best to warm 'em with my cars an' cars of coal;
So I driv an' urged the miners, an' I bellered an' I swore,
An' I bullied 'em an' bribed 'em so they'd dig a little more.



Nights I hardly tetched a pillow, days I scarcely stopped to eat,
All fer fear the shiv'rin' people wouldn't git sufficient heat;
But when springtime come cavortin' puttin' winter on the trot,
Did they shower me with praises an' with blessings? They did NOT!
'Stid of that, they damned me plenty, up the hill an' down the dale,
An' they said I was a traitor an' I'd ought to be in jail—
Me, that slaved to give 'em fuel! So, I say, it's hard to see,
When they're handin' out their medals, why they don't pin one on me.

NEW APPARATUS AND EQUIPMENT

The Feralun Brake Shoe



A source of great inconvenience and expense in coal mines is the "double flanging" of locomotive drivers. This process is particularly rapid on electric locomotives where much sand is employed as the sand not only grinds away the metal of the tire, but the electric sparking between wheel and rail has an important effect. The rail thus cuts into the locomotive tire rapidly, with the result that a second, or false, flange appears on the outer edge of the tire while the true flange becomes higher than it should be. Either or both of these circumstances may cause trouble at frogs and switches.

The truing of such treads is not an easy job. After running a few weeks or months the tires become extremely hard at and near the surface. Turning tools, be they of ever so good quality and carefully tempered, are soon dulled or broken in removing this extremely hard skin. Of course, alloyed and high-speed steels are, in such work as this, vastly superior to the older carbon steels; but even tools forged from the former material often have their edges or points damaged or are broken in two in truing tires in the lathe. To obviate the difficulty and inconvenience arising from double, or false, flanging the American Abrasive Metals Co. some years ago developed what it calls the "feralun" brake shoes. These brake shoes are shown in the accompanying illustrations. The feralun brake shoe does not differ materially in form or shape from the ordinary cast-iron shoe. It is distinctive, however, in that along the outer edge and over the flange pieces of alundum are embedded in the metal. These alundum fragments are placed within the mold before pouring and are held in their proper position by nails or other means while the molten iron is run around them. As the iron solidifies and contracts these lumps of abrasive material are gripped and held in place with great firmness and rigidity.

PHOTOGRAPH OF SHOE SHOWING ALUNDUM CAST IN PLACE

When such a brake shoe is applied to a locomotive, the alundum cuts away the false flange along the outer edge of the wheel tread as rapidly as it is formed.

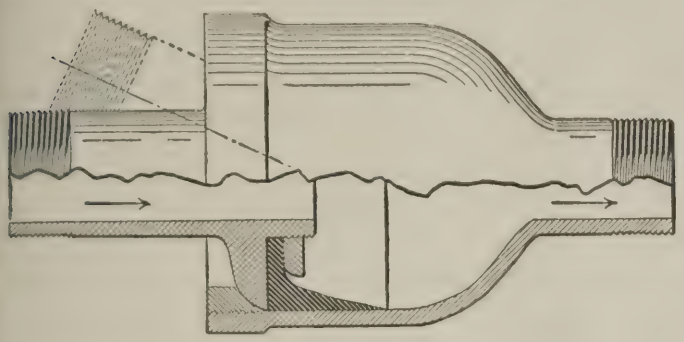
SIDE VIEW AND SECTION OF SHOE

In similar manner the true flange is ground down and kept at approximately its proper height.

Of course, the rapidity with which the wheel tread wears down depends largely on how profusely the motorman uses sand. In some instances where little sand is used it has been found profitable to alternate the use of the feralun shoe with that of the ordinary cast-iron shoe. In most cases, however, this procedure is unnecessary.

The feralun brake shoe is made in all standard sizes and shapes. Because of the construction of the shoe it sometimes has been found advantageous to make it of a slightly different shape than the one regularly supplied on the locomotive, also somewhat heavier. In some instances the shoe and holder are cast in one piece, as is shown in Fig. 2, thus insuring strength and long wear.

This type of shoe has been tried so long and so often that it is by no means an experiment. The first cost of the shoe is naturally higher than that of a plain cast-iron piece of the same dimensions, but its wearing qualities more than compensate for this difference. In addition, wheels fitted with these shoes are effectively prevented from grooving or double flanging.



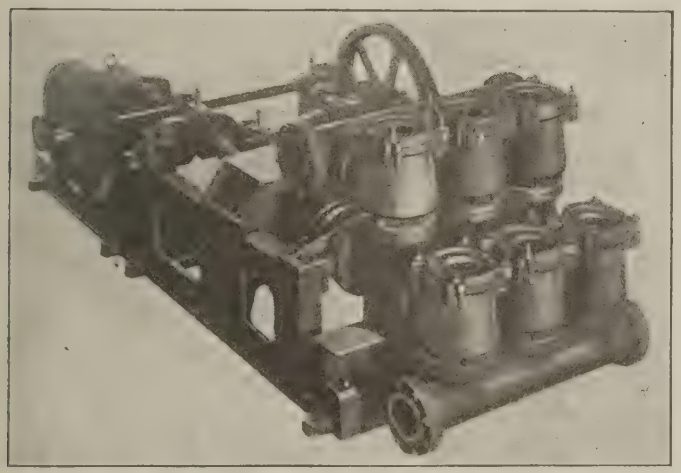
Germany has announced her eighth tyranny loan. We are about to offer our THIRD LIBERTY LOAN. *Can we allow ourselves to be outdone by Germany?*

Flexible Pipe Joint

A useful fitting for pipe lines has recently been devised, and is being offered for use on steam, air, water and other pipe lines. It consists primarily of a cup-shaped end screwed inflexibly to a joint in the line. Into this fits a movable, curved socket which screws to the

end of another joint in the line, as shown in the illustration.

This ball-joint fitting is known as the Berry flexible joint, and where it is inserted an angle may readily be formed in the line. It will act also as an expansion joint, since the ball fits into the cup in such a way that it is free to move backward and forward, thus taking up the variations in the length of the pipe due to



HALF SECTION OF JOINT

temperature. The flexibility of the joint allows it to absorb vibrations satisfactorily and thus saves the line from damage from this source. The device is manufactured by the Iron Clad Joint Co., of New Orleans, Louisiana.

Germans believe the citizen exists for the state, while Americans insist that the state lives for the citizen. Buy a LIBERTY BOND *and preserve the American view.*

A New Mine Pump

The accompanying photograph shows a new pump which the Harris Pump and Supply Co., of Pittsburgh, Penn., has recently completed and placed on the market. It is a horizontal wood-lined station pump, ranging in size from 300 to 500 g.p.m. The pump is heavily built for severe mine pumping conditions. The pump is of the pot-valve type, with the water end made up of 12

separate pieces, all parts coming in contact with the water being protected by wood lining, except the valve pot covers, which are coated on the inside with lead, and the plungers, which are made to suit local conditions.

A new patented valve of the hidden reinforced type is being used. This, by its construction, affords the max imum free area through the seat for a given port area, with a consequent lower water velocity through the valves. This greatly lengthens the life of the seats and valves and gives much less trouble from clogging by dirt.

All parts of this pump are interchangeable. Pumps of this design are now running and giving excellent service.

Unless we lend the Government voluntarily by investing in LIBERTY BONDS, *the Government will be forced to conscript our wealth.*

Inclosed Float Switch for Automatic Control of Pumps

Some of the first float switches were doubtless used in connection with sump pumps in basements of buildings. Present-day uses of these switches, however, cover a wide field of manufacturing and industrial applications.

As an improvement on the open type of float switch, the Cutler-Hammer Co., of Milwaukee, Wis., is now manufacturing a new inclosed switch which is built to stand hard usage and has a switching mechanism that is positive in its operation. The opening and closing of the switch blades is accomplished by the rise and fall of a heavy copper float, which by means of a rod and lever drives a roller, against the action of a spring, over the point of a cam. This opens and closes the switch with a quick action.

THE FLOAT AND SWITCH

This switch will not get out of step, which is the chief objection to some devices of this kind. The upper part of the switch carries all the operating mechanism and is also provided with mounting lugs. They are made for several different methods of mounting. The inclosing tank can be removed easily for inspection or making connections. The upper casting is provided with an opening and bushing for the entrance of conduit.

These switches are made with one, two, three and four poles. The single-pole switches are intended for use with self-starters for automatically controlling direct- or alternating-current motors. The two-, three- and four-pole switches are intended for use with single and polyphase motors which may be thrown directly on the line when starting.

India Has Some Deep Shafts

According to G. George, who delivered a paper before the Mining and Geological Institute of India, there are three collieries in India with shafts 1000 ft. deep. At one colliery shafts 1200 ft. deep are being sunk and at another the shafts will be 1500 ft. deep. A colliery is planned with shafts as deep as 1800 feet.

More New Prices

New coal prices, effective Mar. 29, were announced by the Fuel Administration last week as follows:

State or Field	Run-of-Mine	Prepared Sizes	Slack or Screenings
Arkansas—(see Note 1):			
Johnson, Franklin and Sebastian, except the Excelsior district	$3.70	$4.60	$2.40
Logan and Scott Counties and the Excelsior district of Sebastian County	4.35	5.15	2.60
Oklahoma—(see Note 1):			
Leflore, Haskell, Okmulgee, Tulsa, Rogers and Coal Counties and the Hartshorn-Wilburton vein in Pittsburg and Latimer Counties	3.70	4.60	2.40
McAlister vein in Pittsburg and Latimer Counties	4.25	5.10	3.00
Washington:			
Screened Coal (sub-bituminous):			
Kittitas County	3.55	3.95 (See Note 2)	2.50
Screened Coal (bituminous):			
Lewis and Thurston Counties	2.75	3.95 (See Note 3)	1.25
Washed Coal (bituminous):			
Kittitas County	.....	4.00	....
Pierce, King, Lewis and Skagit Counties	.....	6.00 (See Note 4)	2.50
Washed Coal (sub-bituminous):			
King County	.....	5.00 (See Note 5)	1.50
Lewis County	.....	3.95 (See Note 6)	1.25

Note 1.—Summer reductions must be made in prices on all grades, except slack as follows: March, 75c.; April, 60c.; May, 45c.; June, 30c.; July, 15c.
Note 2.—Special steam and gas, $3.25.
Note 3.—Lump nut, $3.25; nut, $3.
Note 4.—Mixed steam, $5.25; straight steam and gas, $4.80.
Note 5.—Pea, $3.50; buckwheat, $3.25.
Note 6.—Nut, $3.75; pea, $3; buckwheat, $1.50.

The following prices are effective as of Apr. 1:

State and Field	Run-of-Mine	Prepared Sizes	Slack or Screenings
New Mexico (See Note):			
Raton District	$2.35	$3.25	$1.65
Gallup	3.05	4.05	2.00
Carthage	4.25	5.05	3.55
Cerillos	4.05	4.55	3.55
Sugarite and Monero	3.00	4.00	2.00

Note—Summer reductions: April, 50c.; May, 40c.; June, 30c.; July, 20c.; Aug., 10c.

All operators who have complied with the Washington wage agreement are authorized to add 45c. per ton to the foregoing prices.

Coke Prices Fixed to July 1

Coke prices fixed by the War Industries Board will continue in effect until July 1. All matters of price now are being handled by the new Price Fixing Committee of the War Industries Board. The announcement as to coke prices was made in connection with that relating to the Price Fixing Committee of the War Industries Board ment reads as follows:

"The President has approved the recommendation of the Price Fixing Committee of the War Industries Board that the maximum prices heretofore fixed by the President upon the recommendation of the Board, upon ore, coke, steel and steel products, subject to revision on Apr. 1, 1918, be continued in effect until July 1, 1918; from Apr. 1 to July 1; however, the maximum price of basic pig iron be reduced from $33 to $32 per gross ton, and that the maximum price of scrap steel be reduced from $30 to $29 per gross ton. No new contracts calling for delivery of any of said commodities or articles on or after July 1, 1918, are to specify a price unless coupled with a clause making the price subject to revision by any authorized United States Government agency, so that all deliveries after that date shall not exceed the maximum price then in force, although ordered or contracted for in the meantime. It is expected that all manufacturers and producers will observe the maximum prices now fixed."

Buy a LIBERTY BOND. *Everybody is doing it.*

Warns Public To Buy Early

No chance exists for a misunderstanding of the attitude of the Fuel Administration this year in the matter of early purchase and storage of coal by domestic consumers. In a formal statement given out Monday by Dr. Harry A. Garfield, the Fuel Administrator, he said: "The great storage capacity of the country lies in the bins of the individual consumer and there the country's coal reserve must be built up during the spring and summer when coal production is unhindered and the transportation facilities of the country operating at their highest efficiency."

He sounds a warning, however, against overstocking: "Every ton of coal that is hoarded against future needs and is not used during the winter is actual waste. The labor and transportation used to bring the coal to the consumer and the actual energy of the coal itself are withheld from doing their part toward speedy victory. Consumers should secure just a little less coal than they believe they need and should make every shovelful give its full value in heat and power. Every shovelful saved means help for the industries in turning out supplies for our troops abroad, help for the ships that must bridge the 3000-mile gap between our shores and the battle-front, and help toward ultimate victory."

The Fuel Administration is even going so far in the matter of securing early buying as to make this offer: "The Fuel Administration will coöperate with all communities in an effort to provide storage for emergency stocks of coal to be set aside during the spring and summer to meet emergencies of weather and transportation which may arise next winter."

Increased Freight Rates on Anthracite

The order providing for an increase of 15c. per ton in the railroad rates on anthracite coal in official classification territory, with the limitations provided, reads as follows:

It is ordered that the order of Mar. 12, 1918, entered in this proceeding authorizing certain increases in rates on anthracite coal between points in official classification territory named in the suspended schedules, be, and it is hereby, modified in the fifth paragraph thereof to read as follows:

It is further ordered that the commodity rates on anthracite coal, contained in the schedules under suspension in this proceeding, in so far as increased by 15c. per long ton, or less, as stated in said schedules, be, and they are hereby, approved; provided that such rates between points in official classification territory shall not be increased by more than 15c. per long ton. Provided further, that where a through rate between two such points in the United States is made by combination, appropriate provision is made in the schedules that the aggregate increase of the factors applicable in such combination shall not exceed 15c. per long ton; provided further, that where through rates from points in official classification territory in the United States to Canadian destinations are made by combination the factors applicable to the Canadian frontier used in such combinations may be increased by not more than 15c. per long ton, which increase shall accrue to carriers within the United States.

Higher Price for Clean Coal

Twenty cents a ton may be added to the Government coal price by operators who use special means for eliminating impurities. A permit, however, must be obtained from the legal department of the Fuel Administration before the addition may be made. Coal which has been specially cleaned will be designated by cards buried in the coal at the time of loading and by notations on the invoice. The initial permits are to expire July 31, but in cases where operators have complied carefully with the regulations they will be extended.

Interstate Commerce Commission Retracts Statement Made on Previous Opinion

The Interstate Commerce Commission took unusual action last week when it withdrew certain statements reflecting on the Delaware, Lackawanna & Western Coal Co. and the Delaware, Lackawanna & Western Railroad Co. The statement made in the previous opinion is as follows:

"The record shows that when the shipments in question moved the complainant was, and that it still is, a subsidiary of the defendant, and that the defendant has endeavored in various ways, both lawful and unlawful, to give preference and advantages to the complainant. The payment of freight charges by the complainant to the defendant seems to have been largely the transfer of money from one pocket to another. The fact, however, does not simplify or aid the complainant's demand for an order of reparation. Moreover, an award of damages in the present proceeding, from some points of view, would simply be an extension, under our authority and with our approval, of the practices condemned in the Anthracite Case."

In retracting the foregoing statement, the Commission now says:

"That language was based largely on the facts before us in the Anthracite Case, 35 I. C. C., 702, the record in which was referred to and made a part of the record in this proceeding. The history both of the past and present relationship between the coal company and the railroad company was fully developed on the rehearing, and it was made clear that the language in question, in so far as it concerns this relationship, must be withdrawn as not being justified by the conditions existing at the time the report was written."

Weekly Production Statistics

Bituminous coal production for the week ended Mar. 23 was 10,972,000 tons, or a little gain over the week preceding, when there was a decided falling off. Anthracite shipments showed a gain of over 200 carloads, or 42,487 cars for the week. Beehive coke production continues to make a good showing, the week's figures having been 635,000 tons. Byproduct-coke ovens are working at 88 per cent. of full-time capacity and produced during the week under review 464,264 tons.

Brief Washington Notes

J. A. Galligan, of Chicago, and James A. Ballard, of Detroit, have been named district coke representatives of the Fuel Administration in the territory contingent to their respective cities.

Pending the preparation of forms for permits and applications, retailers may add to their selling price allowances made to operators for special preparation of coal. In granting this permission, however, the Fuel Administration orders all retailers to keep an accurate record covering all purchases and sales of specially prepared coal as reports on these purchases will be required later.

Coming Meetings

AMERICAN ASSOCIATION OF ENGINEERS will hold its fourth annual convention May 14 in Chicago, Ill. Secretary, A. H. Krom, 29 South La Salle St., Chicago, Ill.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS' annual convention June 26-28 at Atlantic City, N. J. Secretary, F. L. Hutchinson, 29 W. 39th St., New York City.

AMERICAN INSTITUTE OF MECHANICAL ENGINEERS will hold its spring meeting June 4-7, at Worcester, Mass. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

MICHIGAN-OHIO-INDIANA COAL ASSOCIATION will hold its annual convention Apr. 10 and 11, at Cincinnati, Ohio, with headquarters at the Hotel Sinton. Secretary, B. F. Nigh, Brunson Building, Columbus, Ohio.

INDIANA RETAIL COAL MERCHANTS ASSOCIATION will hold its spring meeting Apr. 10 and 11, at the Hotel Severin, Indianapolis, Ind. The meeting will be a strictly business affair, most of the time being given to discussion of retailers' problems. Secretary, R. R. Yeagley, 703 Fidelity Trust Building, Indianapolis, Ind.

THE LABOR SITUATION

EDITED BY R. DAWSON HALL

General Labor Review

The decision of the National Board of Labor as to the principles and policies which will govern its action in dealing with employers and employees for the duration of the war was announced on Mar. 29. It has an important bearing on the decision in cases like that of the Hitchman Coal and Coke Co. Under the head of right to organize, the declaration of principles says:

"1. The right of workers to organize in trade unions and to bargain collectively, through chosen representatives, is recognized and affirmed. This right shall not be denied, abridged or interfered with by the employers in any manner whatsoever. 2. The right of employers to organize in associations of groups and to bargain collectively, through chosen representatives, is recognized and affirmed. This right shall not be denied, abridged or interfered with by the workers in any manner whatsoever. 3. Employers should not discharge workers for membership in trade unions, nor for legitimate trade-union activities. 4. The workers, in the exercise of their right to organize, shall not use coercive measures of any kind to induce persons to join their organizations, nor to induce employers to bargain or deal therewith."

Open Shop Not to Be Deemed a Grievance

In reference to the present state of unionism its principles are thus defined:

"1. In establishments where the union shop exists the same shall continue and the union standards as to wages, hours of labor and other conditions of employment shall be maintained. 2. In establishments where union and non-union men and women now work together, and the employer meets only with employees or representatives engaged in said establishments, the continuance of such condition shall not be deemed a grievance. This declaration, however, is not intended in any manner to deny the right, or discourage the practice of the formation of labor unions, or the joining of the same by the workers in said establishments, as guaranteed in the last paragraph, nor to prevent the War Labor Board from urging, or any umpire from granting, under the machinery herein provided, improvement of their situation in the matter of wages, hours of labor, or other conditions, as shall be found desirable from time to time. 3. Established safe-guards and regulations for the protection of the health and safety of workers shall not be relaxed."

Women at Man's Work to Get as Much as Men

Other rulings are as follows:

"If it shall become necessary to employ women on work ordinarily performed by men, they must be allowed equal pay for equal work and must not be allotted tasks disproportionate to their strength.

"The basic eight-hour day is recognized as applying in all cases in which existing law requires it. In all other cases the question of hours of labor shall be settled with due regard to governmental necessities and the welfare, health and proper comfort of the workers.

"The maximum production of all war industries should be maintained and methods of work and operation on the part of employers or workers which operate to delay or limit production, or which have a tendency to artifically increase the cost thereof, should be discouraged.

"For the purpose of mobilizing the labor supply with a view to its rapid and effective distribution, a permanent list of the number of skilled and other workers available in different parts of the nation shall be kept on file by the Department of Labor, the information to be constantly furnished: 1. By the trade unions; 2. By state employment bureaus and federal agencies of like character; 3. By the managers and operators of industrial establishments throughout the country. These agencies should be given opportunity to aid in the distribution of labor, as necessity demands.

"In fixing wages, hours and conditions of labor regard should always be had to the labor standards, wage scales and other conditions, prevailing in the localities affected.

"1. The right of all workers, including common laborers, to a living wage is hereby declared. 2. In fixing wages, minimum rates of pay shall be established which will insure the subsistence of the worker and his family in health and reasonable comfort."

Anthracite Mine Workers Are Industrious

In the anthracite region, no developments have taken place regarding the threatened secession. The union is a badly threatened organization, but it contrives, with all its buffetings, to be reasonably seaworthy and to find place for new deckloads of passengers at nearly every port of call.

The operators and fuel administrators in the anthracite region have been desirous of keeping the mines steadily at work during the Holy Week and Easter season. The leaders of the mine workers agreed that Maundy Thursday, Good Friday and Holy Saturday should not be kept as holidays. They appear to have been entirely successful in enabling the mines to run, though some of the mines were somewhat short-handed. Good Friday has been a holiday for years hitherto, the men preferring not to work on that day.

But Easter Monday was also Apr. 1, the day set apart by the union for celebrating the inauguration of the 8-hour day in the bituminous region. Its religious and secular importance and the need the union had to present its case in favor of the increased dues made the union leaders persistent in advocating its observance. The mine workers too were somewhat tired and stale with their long grind.

The difficulty about the men imported by the Lehigh Coal and Navigation Co. into the Panther Creek district has been settled. These men were said to be evading military service and were charged with spreading pro-German sentiment. Some of them were said to be Austrians. A general tie-up of the mines of the Navigation Company was threatened, but President Kennedy, of the Seventh union district, tried hard to straighten matters out. John J. Casey, of Wilkes-Barre, a representative of the United States Department of Labor, investigated the matter and reported in favor of the employment of the men. The Navigation Company is importing men in large numbers for work at its mines.

Citizenship Is an Honor to Be Sought

The mine workers in Columbiana County, in the northeastern edge of the coal fields of Ohio, are compelling the foreign miners to become naturalized or forfeit membership in the union. One wonders what good are citizens who enter their citizenship by compulsion and not by preference. Citizenship is an honor to be sought, not a punishment to be inflicted. The Ohio mine workers in their state convention in Columbus adopted a resolution to compel all alien miners to become United States citizens just as soon as they have been here the required length of time. Those who failed compliance with this rule were to be expelled from the union.

The laws of the United States are framed on the idea that naturalization should be a free act of the individual after he has learned to desire such naturalization. The

country does not seek to put itself under obligation to defend and care for persons who are not American at heart. We have already too many citizens with varying degrees of hyphenation for us to wish to add in any way to their number. The better plan would be for the union to prohibit such men from voting at union meetings until they have taken those steps which will render them capable of voting on national affairs. In the last week of March no less than a dozen Austrian mine workers declared their intention of becoming citizens, the union at West Point having chosen May 1 as the limiting date for those seeking citizenship. Expulsion is threatened for all those who neglected to perform this duty before that date.

Subdistrict No. 5, which is the Eastern Ohio region, has a large service flag 36 ft. long and 12 ft. wide. It bears 1000 stars, the union having that number of men in the service.

The Virginias, Hitherto Quiet, Have Troubles

In some of the counties of West Virginia adjoining Kanawha County foreign propagandists have been particularly bold and active within the last few weeks. Most of the agitators are believed to be members of the Industrial Workers of the World. One of the propagandists is a Greek who has been attempting to foment trouble among Greek miners. Governor Cornwell has been investigating the activities of these trouble-makers and has made it plain that any man trying to cause industrial disturbance will be severely dealt with.

In Horse Creek, Boone County, West Virginia, a strike at the coal mines has been in progress for two weeks. It is the outgrowth of an attempt to organize the mine workers. As far as can be learned some of the men do not wish to join the union, but those that do belong are believers in "benevolent assimulation" and desire to compel them to come in.

Just over the West Virginia line in the Clinch Valley the United Mine Workers have men at work in Big Creek and Coal Creek organizing the men at the mines of the smaller corporations. In Big Creek they have been successful but in Coal Creek no organization has as yet been started.

Some Persons Truly Bode No Good to Anyone

No new developments have taken place in the Colorado split. The Seattle Union Record well compares John R. Lawson's career with that of William D. Haywood. Both were charged with murder, Haywood being alleged to have killed the former governor of Idaho. Labor spent large sums of money to free them both, the Haywood defense being paid for by the American Federation of Labor. Both men were freed and both when freed threw in their fortunes with hostile organizations. The moral is quite plain though the Union Record does not appear to draw it. The union must be careful to give its allegiance and support to men of safe and sane principles of action, men who can be depended on to be fair in their judgments in regard to all men. Often the union is not conservative enough in its choice of men and the trouble they cause to capital is but a foretaste of the trouble they will later cause to the labor organization to which they temporarily belong.

There is an agitation at Alberta, Canada, against alien enemies, just as there is in the United States. The miners feel that citizens should be granted consideration first. On Mar. 27 Premier Stewart practically assured a deputation from the United Mine Workers at Edmonton that the provincial government would take a census of the mine workers so as to determine how many of them were alien enemies.

About 60 per cent. of the mine workers are said to be of foreign birth, mostly Italians, Austrians and Russians. Not more than half of these men are of alien enemy nationality and nearly all of them are naturalized citizens. But the naturalization does not confer any miraculous regeneration of heart and will. Canada, like the United States, has too many half-baked citizens and perhaps would be less badly hampered if they could be classified unqualifiedly as alien enemies. Had naturalization been attained at greater trouble and been urged less insistently the possession of citizenship would have been a surer guarantee of that change of viewpoint which the acquisition of naturalization papers is supposed to evidence. As with the penitents at the mourner's bench, the work of regeneration is so incomplete that after a few weeks it needs to be done all over again.

In the Glace Bay district of Nova Scotia the difficulty is about the threatened introduction of Chinamen. Robert Baxter, vice president of the Amalgamated Mine Workers, and James B. McLachlan, the secretary of the same organization, held a meeting of the mine workers employed by the Dominion Coal Co. on Mar. 24, and both spoke against the immigration of coolies. Meantime, Silby Barrett, president of their organization, and George Varbin, of the Phalen local, are in Newfoundland. They expect to stay a month and to recruit 1000 men to work in the Glace Bay mines. The work is being undertaken for the government through orders issued by Fuel Controller Magrath who followed a suggestion made by the executive board of the Amalgamated Mine Workers.

Nova Scotia Steel Co. May Have Big Strike

The mine and steel workers of the Nova Scotia Steel and Coal Co. have been talking strike. They want an extra dollar per day so that their wage will be equal to that paid to the employees of the Dominion Coal Co. There are about 3000 men involved. By law they are allowed one day of idleness to consider whether they will call a strike. If they decide in favor of it they have to work 30 days before they can start their strike. Meanwhile an attempt will be made to settle the dispute by negotiation.

A meeting is to be held April 3 and then the question will be voted on by all the men. The boys in the Amalgamated Mine Workers of Nova Scotia are not allowed a vote.

The papers in Nova Scotia, as elsewhere, have been full of the repulse of the British and French armies in France. Many of the mine workers of the Nova Scotia Steel and Coal Co. believe that there has been no truth in the story. They think that the repulse has been faked by the corporation, and the story thus evolved has been spread on the pages of the local papers at the expense of the Nova Scotia Steel in order to convince the men that the cause of the Allies is desperate and strikes cannot be permitted.

Which is the greater pain—to part with a few dollars for a LIBERTY BOND, *or suffer the wounds of battle? The boys at the front are doing their share. Are you?*

Patriotism in Illinois Mines

Illinois mine workers do nothing by halves. Their loyalty seemed at a low ebb when the war started. Now it is at such a high tide that it sets the nation wondering. The other day 110 mine workers employed by the Royal Mining Co., at Belleville, St. Clair County, held an impromptu meeting at the head of the shaft and adopted a resolution that every man subscribe for at least one Liberty Bond of the third issue before going to work. The mine workers' union at Panama, Montgomery County, has voted to donate one per cent. of the wages of its members to war funds for two months. The gift will aggregate between $1400 and $1500.

But some of the patriotism is perhaps ill-advised. At the Peoria biennial convention the mine workers adopted a resolution that they would not work in any mine if the Stars and Stripes did not wave over it. Of course, the operators did not show any disinclination to unfurl the flag, even though they probably prefer not to have compliance forced on them. If an operator can be compelled by his mine workers to erect a flag under penalty of a strike, why should not a mine worker be compelled by the operator for whom he works to pin a flag on his working jacket under penalty of discharge?

It is said that this resolution of the mine workers was not so generally circulated that the operators all became cognizant of it. As a result, at several mines when the men came to work there was no flag flying. Thus it was that during the past week there were flag strikes at the Muren mine of the Southern Coal, Coke and Mining Co. and the Eldnar Mine of the Eldnar Coal Co., near Belleville. The mine workers of the Muren mine declare that they repeatedly requested the Southern Coal, Coke and Mining Co. to comply with the resolution. That corporation had made arrangements for the erection of a flag pole, but there was unavoidable delay. After a 40 ft. pole had been erected and a 4 x 6-ft. flag unfurled the men returned to work. They are subject to fines under the automatic penalty clause. The flag is also flying at the Eldnar mine and the men are back to work.

I'm buying LIBERTY BONDS *because if I did not buy them and other Americans followed suit, this country would deserve to get everything the Kaiser chose to hand it.*

Engineers Discuss Labor Problem—I

The New York section of the American Institute of Mining Engineers held a notable meeting Mar. 26 in the Engineers' Club for the discussion of labor and employment problems.

Sidney J. Jennings, vice president of the United States Smelting, Refining and Mining Co. and president of the Institute, traced the origin of his company from its inception to the present time. He said that its fundamental idea from the time when the shares were issued was one of coöperation and then analyzing the present relation of the company to industry added that if the company were not fulfilling its proper function it might have to be abolished. He found three dangers besetting the proper operation of the modern company. First, the capitalist may become divorced from a sense of personal responsibility in the operation of the business. Second, the actual manager or management may have considerable power without having any capital interest in the concern, and third, the laborer or worker may feel that he is only a cog in the big wheel.

Partnership, Profit Sharing, Intermediation

Mr. Jennings suggested the following methods for overcoming this feeling of the laborer that he is only a cog in the machine. He cited the fact that the United States Steel Corporation offers actual partnership through the purchase of shares in the corporation. Second, he thought that profit sharing above a fair return was one of the best means of making the company a truly coöperative agent. Third, he felt that the employment of a central employment manager was almost essential to the maintenance of harmonious relations between the company and the workers. He felt that a good employment manager could be responsible for either the good-will or the ill-will of employees which in turn would mean success or failure of the institution.

Walter Douglas, of the Phelps Dodge Corporation, operating copper mines in Arizona, said that it was becoming increasingly difficult to get the viewpoint of the wage earners due to the increasing numbers of men employed by individual companies. He contrasted former conditions when the employer or the manager or the shift boss had so few working under him that he knew them all personally and could get their viewpoints very readily, with present conditions where concerns have thousands and tens of thousands of men in their employ without the possibility of knowing them all personally or getting their point of view.

He thought that some substitute must be found to bring about the close personal touch which formerly existed in the small companies. He spoke of the necessity of getting specialists to analyze the labor problems for companies and thought that engineers should be the first to seek the aid of such specialists because the engineers were accustomed to employing special men for special problems. He thought that the manager of a concern is not suited to this particular kind of work and yet he is the one who most frequently tries to solve the problem.

Mr. Douglas believed that the solution will be found in some intermediary between the employer and the employee, and stated that the union has not as yet filled this function satisfactorily. He was quite certain that the big problem in the labor situation is not one of wages or hospital dues, but rather of the thousands of little things that the company knows nothing about until a crisis comes. It would be the duty of an intermediary to know what these things are and to correct evils before they develop into crises.

For Intermediation Choose Labor Leaders

The type of man best able to deal with labor would be one who has been a leader of labor himself and he cited Secretary Wilson and John Mitchell as types who would be good intermediaries for large concerns. Speaking for the Phelps Dodge Corporation, he said that they had an employment agent at the Copper Queen whose duty it was to employ, transfer and dismiss all workers. The foreman of any department could not dismiss a man but was obliged to inform the employment manager that the man was not suitable for that particular work, whereupon the employment manager would transfer him to some more suitable place.

The company has a pension system for those who have worked for the company for 15 years. The pension is 2 per cent. of the salary for each year worked, the maximum granted being $1000 per annum. The company also operates a benefit association to which 80 per cent. of the employees belong, to the funds of which the company contributes about an equal amount with the employees.

This past year an experiment was made in offering a flat service bonus of $100 to every man who had worked for the company one year. This was offered without regard to his position or salary and was a straight premium for sticking to the job.

(To be continued)

KULTUR

BY buying Liberty Bonds in large quantities, the mine workers are showing their patriotism and demonstrating that till the war is over those at home live only to support their sons and brothers in the blood-stained trenches and battlefields of France.

Why Not "Refine" Coal?

MANY materials that are used or may be used in a raw state are much more valuable and efficient if "refined" or otherwise "treated" before being finally consumed. Raw wheat, in the form of grain, is edible and life-sustaining, but it is certainly much more palatable and more efficient as a food for man if made into bread. And yet we know not for how many centuries wheat and other grains were eaten raw or at best only parched or boiled before man learned the art of making even the crudest of bread.

It took man a long time to learn how to "refine" from the crude brown, black or amber-colored earth-oil, the colorless gasoline that now drives his automobiles. From the financial standpoint crude petroleum is worth only a few cents per gallon; industrially it is worth its equivalent heat content in wood, coal or any other raw fuel, due allowance being made for ease of firing and the absence or practical absence of ash. In the refined state petroleum is worth several cents per gallon; while from the utilitarian standpoint it is worth vastly more than its equivalent heat in coal or wood. When refined, petroleum may be put to uses for which solid fuels can not be employed at all. In other words, the economic utility of petroleum has been expanded many times by the refining of the raw material, by splitting it up into many products highly useful in ministering to the convenience and the necessity of man.

The Bureau of Mines has recently published Bulletin 135, entitled "Combustion of Coal and Design of Furnaces," by Henry Kreisinger, C. E. Augustine and F. K. Ovitz. After describing what was perhaps the most thorough and elaborate series of tests on the burning of coal ever undertaken, the authors draw among others the following conclusions:

> The volatile matter of bituminous coal would have greater economic value if converted into gas or liquid fuel than if burned under steam boilers. Under present market conditions heat in the form of coal gas brings 8 to 16 times the price of an equivalent amount of heat in the form of coal. Gas is an extremely convenient fuel and can be used to advantage for many purposes such as cooking, lighting and heating buildings, municipal lighting, and in some industrial plants for obtaining a uniformly high temperature and clean products of combustion. The residue from the coking coals should find a ready market for house-heating and steaming purposes. As both the gas and coke burn without smoke, their separate use would tend to make cities cleaner. The manufacture of gas from coal has been a commercial undertaking for many years and is still rapidly developing, the liberal margin between the price of heat in the form of gas and the price of heat in the form of soft coal making the conversion profitable.
>
> The conversion of the volatile matter of bituminous coal into liquid fuel seems to be even more promising than its conversion into gas. By the application of proper processes it seems possible to reduce a large part of the volatile matter to liquid, of which an appreciable percentage can be obtained in the form of light oils suitable for motor fuel. Benzol has been obtained at byproduct plants for many years without any special effort to produce it. There is no doubt that with well-developed methods the yield of benzol and similar oils could be greatly increased.

Why is not bituminous coal capable of as thorough a refining as is petroleum? The products of coal distillation are many, embracing solids, liquids and gases. Of these the chief solid is of course coke. This can be easily, efficiently and smokelessly burned. The other chief product of coking is gas. This forms almost an ideal fuel for domestic and house-heating purposes. Between these two extremes lie a myriad of useful substances merging from explosives to fertilizers and gasoline or its equivalent.

Heretofore the great problem of byproduct coking has been the commercial utilization of the gas. So great is the volume of gas evolved in the coking process and so large a portion of the heat contained in the original coal does it carry that its utilization has so far been confined almost exclusively to large industrial plants such as the steel mills or to a few centers of dense population such as the larger cities.

The domestic uses of coal are now confined almost exclusively to cooking and house heating. For both of these coal is dirty, inconvenient, inefficient and wasteful. The quantity of heat utilized in actual cooking as compared to the heat generated by the fuel in the ordinary range is admittedly small. Furthermore, in most cases an appreciable amount of coal is lost through the grates Even if ash sifting is resorted to, a considerable amount of combustible matter finds its way into the ash can and eventually to the ash disposal dump. The heat thus lost is lost forever.

While it is quite possible to burn coal (and by this is meant bituminous coal, since it forms by far the greater portion of the domestic fuel of the land) smokelessly in the ordinary kitchen range, such smokeless consumption requires no small degree of skill and is consequently not ordinarily accomplished. There is accordingly a considerable loss in the form of unburned or only partially burned gases passing up the chimney.

Practically all that has been said regarding the kitchen range is equally true of the house-heating furnace. In such furnaces also there are incurred what are known in power plants as "standby losses"; that is, a certain amount of fuel is consumed in merely holding fire over more or less extended periods of time. Thus fires are frequently "banked" at night, or during certain hours of the day and sometimes over week ends or other holidays. Such banking avoids the inconvenience of building a new fire when normal heat is again needed.

Any comparison between the convenience and utility of gas and coal as a domestic or house-heating fuel cannot fail to reveal the advantage of the former. Delivered by pipe to the exact point of application it is merely necessary to open a cock or valve and apply a match to secure full heat. This heat, furthermore, is always under easy and perfect control. The fuel burns readily, smokelessly and may be applied comparatively

efficiently. With gas the dirt and inconvenience of coal are obviated and there is no carting of either fuel or ashes; there is neither loss of combustible through the grates nor standby losses.

It would thus appear that if heat in the form of gas could be furnished domestic consumers at a price even somewhat higher than heat in the form of coal, it would still be economical to use. The many advantages to both individual consumer and the community at large arising from a substitution of gas fuel for coal would render its use economically advantageous even though the price per unit of heat were higher. Under present methods of gas manufacture and the prices at which gas and coal are now sold there can be no such economic substitution, however convenient such a change might be.

It would almost seem that the time is at hand, if it has not indeed arrived, when the byproduct oven can solve the problem of cheap gas for the householder. Surely the coke and other byproducts besides the gas should almost if not quite pay for the original coal and the process of coking. It would be logical to believe also that heat could be delivered through gas mains quite as cheaply as by wagons and trucks over city streets choked with traffic, snow and ice or possibly all three. To burn coal raw is admittedly wasteful: to burn it in the form of gas and coke permits of high economy, the saving of many valuable substances, the enjoyment of great convenience, and might quite possibly go far toward rendering such "coal famines" as the country suffered last winter impossible.

I'm buying LIBERTY BONDS *because no decent, honorable man can afford not to buy them.*

Names of Coal Beds Are of Little Value

IN THE eastern coal fields of the United States, unless, in the description, the name of the coal bed is coupled with the name of the coal district in which it is found, the value and the character of the coal cannot be determined even approximately.

Undoubtedly there is a lower Kittanning bed somewhere in the anthracite region, but it is doubtless quite like the Freeport bed in the same region, if that could be identified. But both are quite different from the same beds in the bituminous regions, no matter where found. Location has had such an effect on all the beds in the anthracite region that even if we could give the different beds their names according to bituminous nomenclature every one would know at once without being told that the beds differ widely in the anthracite region from what they are in the bituminous region.

But this is true also in large degree in the bituminous region where the continuity of the beds is not a matter of debate, but has been traced without possibility of a peradventure. Here the characters of the beds change materially from place to place, and people having experience in only one section get into the habit of believing that the character of the seam is unchanged all over the bituminous region. As a matter of fact the seams vary so much that they also change their names from place to place.

Thus the lower Kittanning coal where the fuel is found to be of low-volatile character is known as the Miller *seam*—perhaps we should do better to term it the Miller *coal*. Where it has a large percentage of volatile material it loses that distinctive term. The term "Miller" defines an area as much as a bed. It is a regional name first and a seam name second.

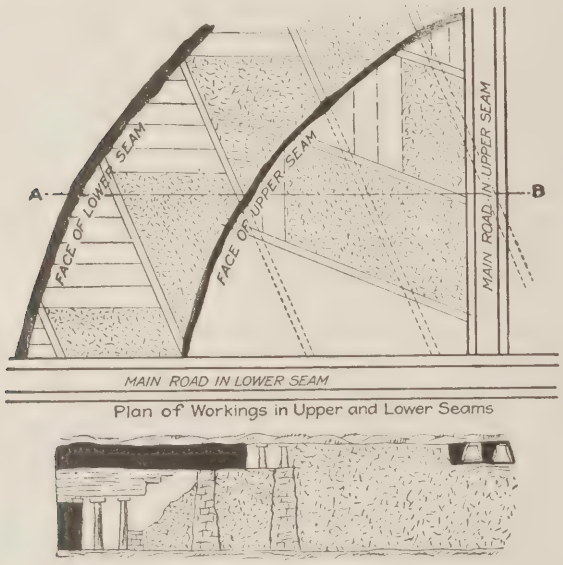
For if you would match coals with the Miller, you would find that other coals from the same district, but from another bed, more closely resembled the Miller coal than coals from the same bed in another district. That is why the name does not spread. To use the name "Miller" as a general synonym for lower Kittanning would create such a misapprehension that it would be almost dishonest to attempt to give it such currency. To use it as the name of another bed in the same district would not be so injurious to the public. In some cases the purchaser of the spurious Miller—that is coal not from the lower Kittanning bed—would have a coal of equal or higher thermal value and of greater purity in the matter of ash or sulphur.

The same is true of the Moshannon coal. It is perfectly true that the Moshannon was once regarded as a lower Freeport coal found along the Moshannon creek in the first bituminous coal basin of Pennsylvania. Today it is found possible to sell as Moshannon not only the lower Freeport coal, but all the coal from all the many beds found near Osceola and Houtzdale, whereas the lower Freeport coal at Du Bois could not be regarded for one moment as Moshannon. For "Moshannon" is a local name to express a local character. The lower Kittanning along the Moshannon creek is more "Moshannony"—if the term be permitted—than the best of lower Freeport would be, say, at Reynoldsville or Punxsutawney where the coal is wonderfully clean, but has so much volatile material that it is regarded primarily as a coking coal.

The Big Seam in the Georges Creek region produces a wonderful smithing coal, not because it is the Pittsburgh seam so much as because it is located close to the great uplift and is therefore liberally mineralized. The coal of the Sewickley seam in Georges Creek—Marylanders term it the Tyson—is much more like the Pittsburgh coal in Georges Creek than it is like the Sewickley coal in Pittsburgh.

These remarks have reference mainly to the percentage of volatile matter, but they are true also as regards purity. The lower Kittanning coal in some few places has an immense amount of sulphur and many partings. In one limited section it seems fitter for a source of sulphur than a source of fuel. In some places it is mined with facility, in others a differential must be paid, for the pick seems to stick in its tenacious surface. The lower Kittanning in the section, where it is called the Miller seam, does not have any of the unfavorable characteristics mentioned.

There is perhaps in the Appalachians one name which specifies the coal fully—Pocahontas. But if the Pocahontas coal were spread over large areas, the same statement could not be made. It may sometime be correlated to some minor bed in the extreme western and northwestern Pennsylvania field, but if so the coal would be entirely different in its fuel ratio even though perhaps just as pure as far in its ash and sulphur content.



We cannot do as one authority, who should have known better, once did. He made a cross-section of the Pennsylvania coal fields and gave a common analysis for each seam as if such a generalization had any value.

DISCUSSION BY READERS

Working the "Rooster Coal"

Letter No. 4—Kindly permit me to submit my plan for working the No. 8 Pittsburgh seam, together with the overlying "rooster coal." In my experience the best method of working these two seams is to apply the longwall method of mining, carrying the working face in the lower seam about 100 yd. in advance of that in the upper seam.

In the accompanying figure I have attempted to show the general plan, including the main roads, crossroads and gateroads in the two seams. As there indicated, the diagonal or crossroads in the upper seam are driven

PROPOSED PLAN OF WORKING THE "ROOSTER COAL"

at an angle of about 45 deg. with those in the lower seam. The main roads, in the two seams, are driven in a direction practically at right angles to each other, and the gateroads are driven parallel to them, in each case.

In the lower portion of the figure is shown a cross-section on the line *AB*. This cross-section is drawn to an exaggerated vertical scale. It shows the working faces in the two seams, that in the lower seam being about 100 yd. in advance of the face in the upper seam.

Work is commenced in the lower seam by driving the main roads through the shaft pillar, at the boundary of which a longwall face is opened out. Crossroads are driven off the main road at an angle of about 70 deg. and at distances of, say 80 to 100 yd. part. The gateroads are driven parallel to the main roads at distances of about 15 yd. apart, center to center.

As shown in the sketch, the coal in the lower seam is taken out beneath the drawslate. A short distance back from the face, however, the drawslate and the mixed slate-and-coal parting separating the two seams are allowed to fall. The refuse is built up in substantial walls to support the coal in the upper seam. This refuse forms the floor on which the miners stand when working the rooster coal.

When the work in the lower seam has advanced a sufficient distance, the work of taking out the rooster coal is started by ripping the roof on the main roads in the lower seam, at a convenient point for driving an incline to the floor of the upper seam. When this is reached, the main roads are driven in the upper seam and crossroads turned at an angle of about 70 deg. off the main roads.

The work in the upper seam is identical with that just described in the lower seam. As the crossroads in the upper seam all cross those in the lower seam at an angle of about 45 deg., there is less difficulty experienced in maintaining good working conditions while taking out the rooster coal.

In this method of working, great care must be taken to build substantial packwalls and fill up between them with the slate that formed the parting of the two seams. By this means it is possible to make a good floor for working the upper coal. When proper care is taken in performing the work, I believe it is possible to take out 100 per cent. of the coal in each seam. This is the method employed for working the "Red Coal," and the "Ras Las" coal in the Rhymney Valley, South Wales.

Oak Hill, W. Va. WM. DICKINSON.

American citizens should buy LIBERTY BONDS, *because they are the means by which the United States is keeping its faith with the Allies in the war.*

Danger and Discipline

Letter No. 2—Much has been said and written about the increasing number of fatal accidents in the mines of this country. It has even been stated that the fatality rate in coal mining has exceeded the tonnage rate.

While numerous inquiries have been started to ascertain the causes of these accidents, the fact still remains that they continue to increase in frequency. John Rose, in his letter, *Coal Age*, Mar. 2, p. 431, has attributed the increase in mine accidents chiefly to the relaxation of mine discipline. He describes in an interesting manner the reasons why operators and miners alike show a less regard for safety rules than ever before.

LARGE INCREASE OF MINE FATALITIES

The report of the Bureau of Mines shows a larger number of fatalities have occurred in the mines, during the past year, than is recorded for any one of the seven previous years. A brief glance at the records of Illinois shows that we have, in this state, contributed our share toward this unnecessary slaughter.

However, while this great loss of life is naturally deplored, it is some consolation to feel that the lives thus sacrificed have blazed a way that may and I hope will lead to a more effectual means of securing greater safety in mining operations.

The high death rate shown in coal-mining reports has impressed on everyone the need of a more strict enforcement of mining laws and a higher regard for human life. In our own state, we have two shining examples of executives who have awakened to a realization of the need of a more active campaign in the interests of mine safety. I am proud to say that these are Governor Frank O. Lowden and Evan D. John, Director of the Department of Mines and Minerals.

Within the past two months these two officials have decreed that the number of fatal accidents in mines, in this state, must be diminished. As a first step, they have issued orders to the mine inspectors of the state, demanding a strict enforcement of the mining laws, in their respective districts, and the arrest and punishment of any and all parties guilty of violations of the law, in accordance with its provisions.

As an excuse for laxity in the enforcement of the mining laws during the last few years, it is said that many operators could not keep their mines in the required condition, because of the weak state of the market for coal. Some companies were even forced into bankruptcy, owing to this cause and the need of maintaining safe conditions in the mine. The coal industry is now reaping a harvest of death from the seed that was sown during this laxity of discipline.

Arrest and Prosecution for Violations of Law Has a Good Effect

A shining example of the new policy inaugurated by Governor Lowden and Director John appears in the arrest and prosecution of the superintendent, mine manager, two shotfirers and the two men who drilled the "dead holes" that were the direct cause of the explosion that occurred at the Citizens mine, in Springfield, Feb. 23, 1918, in which four men lost their lives.

At the instance of Director John, an examination was made by James Taylor, who has charge of mining investigations for Illinois, and two state mine inspectors. They reported the results of their investigation to the department, with the result that the arrest and prosecution of the guilty parties was authorized at once.

A second example of the strict manner in which violations of the mining law are to be handled is shown in the arrest and prosecution of the superintendent, mine manager, and night boss of the Virden mine, of the Royal Colliery Co. This action was authorized by Director John as the result of an investigation into an accident that occurred in this mine Feb. 22, 1918, when four men were killed by the explosion of 26 kegs of powder on the shaft bottom.

It is gratifying to know that a new era has now dawned, in Illinois, and is fraught with possibilities regarding the future safe operation of mines. This will prove a great relief to every mine worker who has, heretofore, had no assurance when he left his home in the morning for work, that he would return in safety at night.

The safety-first campaign to which I have referred will certainly save many lives and win for its projectors a place in the hearts of the 86,000 miners engaged in coal mining in the state. It is to be hoped that they will receive the hearty coöperation of every coal-mining man and operator in Illinois. With the remembrance of the 2695 men who were killed in the mines of this country in 1917, in his mind, everyone's interests in mine safety should be greatly increased.

———, Ill. State Mine Inspector.

American citizens should buy Liberty Bonds, *because the men we have sent into the perils of the trenches have a right to our support.*

First Aid to the Uninjured

Letter No. 3—When this subject was first set for discussion in *Coal Age*, Jan. 19, p. 156, I was inclined to think that there was a catch in the idea that there could be such a thing as giving first aid to the uninjured. However, a little reflection impressed me with the serious conviction that there is truly more need of giving first aid to workers who, through a lack of foresight or by the exercise of insufficient care and caution, expose themselves to danger.

The first aid necessary to be given the uninjured is of a wholly different nature from that which we have been accustomed to practice as "first aid to the injured." The old saying teaches that it is far better to "lock the stable door before the horse is stolen," and the same principle is involved in the idea of giving "first aid to the uninjured."

We cannot urge too strongly the necessity of foresight and keeping in mind the ever-present possibility of accident to the unwary mine worker. For example, the fireboss reports the mine to be safe for work when he has completed his morning examination; and, as the men follow each other into the mine, the foreman gives them the usual instructions to exercise care, telling a miner, "watch that roof in your place," and cautioning a driver to "go slow until we can get a chance to fix that track."

Disregard of Cautionary Aid by Uninjured

The answer comes naturally, "I will," but how soon is the promise forgotten, and the aid given the *uninjured* proves fruitless and must be followed by *first aid to the injured*, made necessary by an avoidable accident. The foreman's caution and instructions to his men are first aid to the uninjured. His foresight anticipates the possible accident; but, while the aid extended will prove effective in some cases, it will fail in others.

On the one hand, a naturally reckless, though experienced miner, will remember the caution given him when entering the mine in the morning and his careful inspection of the roof before proceeding to work, followed by the setting of a post under a loose piece of top, saves him from a fatal accident. On the other hand, the forgetful worker goes unmindful of the caution given him and becomes the victim of his own neglect. The reply of both of these men was the same, but the one was faithful to his promise, while the other gave it no heed.

Allow me to say, in closing, that the phases to which this injunction of "first aid to the uninjured" can be

applied are many. In the sinking of a shaft, it calls for the careful consideration of the equipment, the headgear, hoisting engine, ropes, shaft timbers, and other details respecting the safety of the work in hand. Not to consider these matters is evidence of lack of foresight.

Again, a certain place in the mine is found to be unsafe and so reported; work is stopped in the place but resumed later before the necessary timber has been set to make it safe. This likewise is an evident lack of foresight on the part of the man in charge. To my mind, the basis of the whole question is self-preservation.

Reinforced Concrete Mine Timber

Letter No. 1—Reading the article entitled "Supporting the Roof in Coal Mines," by R. D. Brown, *Coal Age*, Mar. 9, p. 454, leads me to submit for discussion by readers a reinforced concrete timber frame that I devised some two years ago. Five of these frames were made and put in place in an air-course, at that time, and they have stood the test satisfactorily up to the present.

As shown in the accompanying figure, the reinforced concrete collar is supported on two reinforced concrete

REINFORCED CONCRETE-TIMBER FRAME

legs, which are inclined toward the center of the entry in the usual manner. The collar is reinforced with two iron rails arranged with their bases in contact, while the tread of the rail is exposed on the upper and lower surfaces of the collar, as shown in the detailed cross-section on the right of the figure. Each leg is reinforced with a single rail, the base of the rail being exposed on the inner surface of the leg.

The construction of these reinforced concrete timbers is simple and so well understood that a further description is unnecessary. Old discarded rails cut to the desired lengths are used. The ultimate cost of constructing the timbers is trifling, as compared with the price of steel and wood today. Similar timbers can be made to meet all conditions in mines.

The plan has the advantage that all old rails and pipe can be utilized in this way instead of sending them to the scrap heap. If desired, in order to secure greater strength, four rails can be used in the reinforcement of a collar and two rails in each leg. I gladly recommend the use of such reinforced concrete timbers in mines not subject to heavy squeeze, which might render their use doubtful.

Shotfiring re Explosion

Letter No. 10—Prof. C. M. Young in his letter *Coal Age*, Mar. 2, p. 430, says that he made a number of laboratory tests to establish the inflammability of powder smoke. While admitting that the results obtained were not conclusive in this respect, Mr. Young claims, that there is a possibility of combustible gases being produced when coal is blasted in a close place or heading.

Personally, I have no doubt whatever regarding the production of such gases under the conditions named, and I agree that they are inflammable under favorable conditions. However, I fail to discover any proof that the presence of what he terms "powder fumes" contributed, in his experiments, to the inflammability of the gases.

THE PRACTICAL TEST AND ITS RESULTS

In the practice of coal mining, I have made several thousand tests in blasting coal from the solid in "close places or headings." On going back to the face to fire a second or third shot, I found the place filled with hot powder smoke. The presence of a considerable amount of carbon dioxide (CO_2) was plainly indicated by the pronounced shrinking away of the flame from the wick of my lamp and by the appearance of the flame itself.

Along the floor of these places there was but little smoke and the air was fairly good. There was a perceptible movement of air along the floor toward the face, caused by the sudden rise of temperature in the place. Under such conditions, I have repeatedly lighted the gaseous mixture in the crack of a standing shot, in the presence of a thick and hot cloud of powder smoke that extended from the roof of the heading almost to the floor; but, in no instance, were the "powder fumes" inflamed by these miniature explosions.

Frequently, I have seen the gases extracted from the shattered coal ignite and burn quietly at the face, for a few seconds after the firing of a shot; but in none of the cases observed was there any indication of a continuation or extension of flame by the "powder fumes" present. On the contrary, it appeared that the presence of these fumes had a quenching effect on the flame at the face, and the evidence I saw in this respect, in my investigations of explosions, confirms this view.

Evidently, to my mind, the inflammation at the face was due to the addition of needed air to the hot gases

issuing from the interstices of the coal and extracted from the latter. This air reached the face in the manner just mentioned, which made ignition possible and overcame the quenching effect of the smoke at that point.

On the same page to which I have referred, W. H. Noone alludes to a suggestion someone has made that the circulation of air be temporarily increased in sections of the mine where shots are to be fired. It is fortunate indeed that suggestions of this kind have had but little support. They should be summarily rejected, because the act of increasing the draft in a mine, at firing time, is almost like pouring coal oil on a smoldering fire.

Although I cannot agree with the conclusions of John Moffatt, Mar. 9, p. 470, I appreciate the value of his facts. The phenomena he observed are of much assistance toward reaching a correct understanding of the process by which dust explosions are started and propagated. My views regarding this matter have been stated in *Coal Age* on several occasions, and many of its readers are probably familiar with them. I may say that these views were fully sustained by the results of the tests made at the Eskmeals Experimental Station and described by the late Samuel Dean, in *Coal Age*, Vol. 6, p. 294.

Eskmeals Tests Supported by Practice

It has been intimated that the Eskmeals tests did not warrant definite conclusions regarding the process of propagation, because they were made under artificial conditions not existing in the practical working of a mine. But the letter of Mr. Moffatt, just mentioned, proves by several tests, made under actual and generally prevailing mining conditions, that the results he obtained fully warranted the conclusions based upon the results shown in the Eskmeals tests.

Mr. Moffatt states that the mine he worked in was new and only down a short distance as mines go to day, that the ventilation was good and no gas present. The phenomena he observed occurred in a close place, that is, there were no crosscuts connecting it with the adjoining places. The coal was undercut and he observed when he fired the two rib shots together, that there were heard after reports or secondary explosions, which apparently grew louder as the place advanced, and, on the last occasion, when he fired the two shots together the sound and force of the after report was heard far out on the lower levels. When the shots were fired separately the last shot, if fired before the fumes were allowed to cool down, gave a low after report.

Mr. Moffatt expresses the opinion that these after reports or secondary explosions were caused by the absence of proper ventilation and the presence of powder fumes. But it will be readily seen that the ventilation of this place or the amount of fresh air entering it and moving rapidly along the floor toward the face was far greater immediately after the shot or shots were fired than at any other time. It is quite obvious that this air movement toward the face was stronger and faster when induced by the combined heat of the two shots fired together than when only one shot was fired and a less amount of heat produced.

The air flowing into the place may have carried with it a small amount of coal dust; but, in any event, it supplied sufficient oxygen to be mixed with the hot gases extracted from the shattered coal at the face to cause their ignition with nearly explosive effects. The noticeable interval between the firing of the shots and the after report is an important feature and the factors developed during that interim and their possible influence in determining subsequent results should have careful consideration.

Examination of a Mine

Letter No. 6—My previous letter, relating to the examination of a mine by a fireboss in Colorado, seems to have given the impression to a number of readers that the custom in Colorado, as described, tended to lower the efficiency of a fireboss and the standard of examinations. This is all a mistake.

It is true, as I stated, that the examination of the mine by the fireboss ends when he has returned to the shaft or slope bottom, entered his report and turned the mine over to the foreman who then takes charge and directs whatever work must be done.

The Colorado Coal Mining Laws discriminate between a mine that is generating gas and one that is free from gas. In the former case, the law requires the fireboss to enter the mine, for the purpose of making the early examination, not more than three hours before the time for the men to commence work. In the latter case, this time is extended to five hours.

After the fireboss has made his examination and reported he is allowed one hour to go home and get his breakfast and, on his return to the mine, he reports to the foreman, who naturally sends him to remove any dangers that may have been reported. It should be stated that the fireboss is ordered to do other work only when there are no dangers to be removed.

Fireboss' Work in Colorado

Always, in a gaseous mine, there is the understanding between the mine foreman and the fireboss that, on his return from breakfast, he is to devote himself wholly to the extending of brattices and other work pertaining to the ventilation of the mine and the removal of dangers discovered in the working places. Two men are generally employed on the work of building stoppings, doors, etc.

Let me say that the examination of a mine during working hours is the duty of the mine foreman, assistant foreman and safety mine inspector, alike, in all gaseous mines. In my opinion, if this system had been employed generally in coal mines, hundreds of lives would have been saved that have now been sacrificed owing to inefficient or insufficient inspection of the working places.

It is my belief that, in most instances, this great sacrifice of life can be attributed to firebosses being given too much liberty and permitted to work as they choose. Where such a custom prevails in mines, the

firebosses roam about the mine according to their own choice, and the foreman, who is responsible for the safe operation of the mine, seldom knows where the fireboss can be found.

It was this condition that caused the miners of Colorado to urge the enactment of a new law that would give the mine foreman full charge of a mine during working hours and make him responsible for the safety of life and property. We consider this law the best in the world. ROBERT A. MARSHALL.

Farr, Colo.

That man in khaki, to whom you wished "best luck," wants you to buy LIBERTY BONDS *and show that you meant what you said.*

Favoritism in Mine Management

Letter No. 5—Speaking of favoritism in bossing, I do not think that any sane manager would place a man in a responsible position because he was a favorite in some respects, or a popular fellow in the community, a "ward healer" or other influential politician, without regard to his ability to produce results in the mine.

Like Mr. Rose, whose letter appeared in *Coal Age*, Jan. 26, p. 213, I believe that men who have been employed a long time in the same position in a mine invariably fall into ruts and wasteful methods. This is strongly characteristic of men of advanced age. A younger person, no matter how much he may know in regard to mining cannot assume to tell the older man that his method is wasteful or unscientific. The result would be that the proffered advice would be ignored entirely or the man told to mind his own business.

It cannot be denied that, under such conditions, a change is desirable and will generally prove the advantage, if not the necessity, of keeping abreast of the times and using the most up-to-date methods and appliances. It goes without saying that a new superintendent will do his best to improve the operations in his charge and make a stronger showing, if possible, than the man who has preceded him and he will generally succeed for a time.

PRACTICE IN MINES IN ENGLAND

In his letter, Mar. 9, p. 471, Thomas Hogarth mentioned instances of men holding positions 20 or 30 years, in the mines of England. He does not say, however, what I believe is true, that the firebosses and other assistants have very little to say about running affairs. As a fact, the Miners' Union control everything pertaining to wages, safety of men, mine laws, etc.; and I would say the mines are far from up to date.

Why it is that there are always some of the men who do not like the coming of a new boss is because they find that he will not turn things loose and let them do as they please, or as they have been accustomed to doing under the old boss. The new boss' first efforts are, naturally, to eliminate waste and secure greater efficiency in every branch of the work.

Mr. Hogarth says that "a new man coming to take charge of a mine should study well the conditions before attempting to introduce new ideas and methods." That is all right; but, let me say, he should not study too long before he tells the men what he is there for.

Speaking from my own experience, a new foreman will not be long in his position before some fireboss or assistant foreman will tell him that his section is in bad shape explaining that the old boss would not let him do what he wanted to make it right. It will then be up to the new man to decide quickly the course he is to pursue. It may prove that what the assistant wants to do is an unnecessary expense, which the new boss must decide.

Where there are no changes made in the working force of a mine, it appears to me more like a lot of men running a race but having no definite goal, which makes the race an endless one. In that case, who cares whether he is on the head end or tagging on the tail, as in England. There, if a man starts in as fireboss, he is apt to continue in the same position. My motto is, "keep things moving and up to date."

Men in Blind Alleys

Letter No. 2—The argument advanced in the letter of Timothy Goldon, *Coal Age*, Dec. 22, p. 1069, is, to my mind, but another reason why young men should study to gain a knowledge of the theory and principles relating to their work. Without such a knowledge of theory, a worker is very apt to find himself, sooner or later, in one of Mr. Goldon's "blind alleys."

A young man is seldom willing to listen to the advice of an honest well wisher who has travelled the road before him and whose words should be an inspiration to him to throw off the shackles that bind him and prove that he is worth while.

The "humble pie" that our friend, Mr. Goldon, describes as the diet of the man in a blind alley is, to my mind, nothing more nor less than a potion that could properly bear the label of the skull and crossbones. The man who is satisfied to continue to eat "humble pie" when he has the ability to do otherwise has had his mind poisoned; he is morbid and of little use to himself or to anyone else.

That "blind alley" is a stumbling block to honest endeavor. It leads nowhere and the employer who is responsible for having such blind alleys in his business or organization is a traitor to the best interests of his men. While he himself resides on an avenue or street that leads somewhere, he has made it practically impossible for his employees to gain the needed exercise that is essential to successful work and service.

Where blind alleys exist in an organization one may properly look for other defects, such as side-stepping capability and the showing of favoritism, through friendship, to the incompetent. I heartily concur with Mr. Goldon's concluding remark, "never permit friendship to override justice, but give the job to the man who can get results." Results speak for themselves.

INQUIRIES OF GENERAL INTEREST

What Caused the Explosion?

Kindly permit me to submit a question that has caused me to lie awake nights in a vain effort to solve the mystery. It concerns an explosion that occurred in a mine that was supposed to be free from gas. The explosion took place at a time when no one was in the mine and started, as was ascertained later, in the old workings that were wet.

The mine was ventilated wholly by natural means, there being no fan or furnace. It was a drift opening, and an air shaft 32 ft. deep was located a short distance back on the hillside. Previous to the time when the explosion occurred, the mine had been idle for two months. The question I desire to ask is: Under these conditions, what is it possible to assume was the immediate cause of this explosion, and was it a gas or a dust explosion? FIREBOSS.

Harrisburg, Ill.

There are instances of mysterious explosions taking place in mines under conditions that make it difficult to offer a reasonable explanation. In the present case, it is stated that the mine was "supposed to be free from gas." This statement, however, may be taken as only meaning that the mine did not generate sufficient gas to be detected by the ordinary means when the mine was in operation.

A period of two months' idleness, it may be said, would give an opportunity for gas to accumulate in the old workings, and a possible fall of roof may have ignited the gas and dust raised by the fall. This would seem to be the most reasonable explanation to offer, but we would be glad to hear from others who may be able to suggest other possible causes.

Money is as necessary for the success of this war as is the circulation of the blood to life. Buy a bond and help the cause.

Preparation of Coal

A short time ago I read with interest an article that appeared in *Coal Age* [Feb. 9, p. 276], treating on the preparation of coal for market.

In the course of his article, the writer described a specially arranged picking-table or screen known as the "Marcus patent picking-table screen." It was stated that the arrangement was such that the coal passed successively over circular perforations 1⅛ in., 2 in. and 4 in. in diameter, these being separated by blank picking spaces that gave ample opportunity for the thorough cleaning of the coal by picking out all foreign matter.

It has occurred to me that such a screen would be well suited to the preparation of the coal in this district, although I know of none being used here at the present time. The coal we are working is a sub-bituminous coal which makes a splendid domestic fuel when properly handled so as to prevent undue breakage of the lumps. Owing to the keen competition, in this market, it is necessary for operators here to give particular attention to the cleaning of the coal.

The seam worked, here, contains a little bone which must be picked out in preparing the coal for market. Our practice, thus far, has been to first pass the coal, as it comes from the mine, over a ¾-in. screen 9 ft. long, which delivers it directly into the weigh basket. After weighing, the lump is screened out over a 1½-in. screen, the egg over a ¾-in. screen, while the nut coal is separated by a ¾-in. screen, the remnant passing through this screen being slack. Owing to the soft nature of the coal, it is necessary that it be handled with care to prevent breakage as far as possible. The several sizes are loaded into box cars for shipment.

At the present time, I am anticipating the erection of a tipple to handle 500 tons of coal in 8 hours, and shall be thankful for any suggestions that may come from the readers of *Coal Age*. Our proposition is young, and the available means being limited, matters of economy in equipment and operation are of much importance. I shall be glad to consider an estimate of the approximate cost of erection of a tipple such as will be adapted to our conditions.

C. S. DONALDSON,
Lethbridge, Alta., Canada. Supt. Federal Coals, Ltd.

We quite agree with this correspondent in his conclusion that the Marcus patent picking-table is well adapted to the preparation of a coal such as he has described. This screen is manufactured by the Roberts & Schaefer Co., McCormick Building, Chicago, Ill., who no doubt will be glad to estimate on the cost of construction of a suitable tipple and equipment designed to handle this coal at the least expense and loss by breakage. We are confident, also, that many operators and superintendents who read this will be glad to offer practical suggestions regarding the economy of operation, through the columns of *Coal Age*.

Buy a LIBERTY BOND. *Everyone is doing it.*

Barometric Pressure re Air Column

Kindly show the method of finding the equivalent, in feet of air column, per inch of mercury or barometric reading, assuming a temperature of 60 degrees.

Springfield, Ill. STUDENT.

Since the weight of 1 cu.in. of mercury is 0.491 lb., each inch of mercury column indicates a pressure of 0.491 lb. per sq.in. or $0.491 \times 144 = 70.7$ lb. per sq.ft. But air at 60 deg. is estimated at 13 cu.ft. per lb. and an air column corresponding to a pressure of 70.7 lb. per sq.ft. is therefore $13 \times 70.7 =$ say 920 ft. in height.

EXAMINATION QUESTIONS

Illinois Mine Managers' Examination November, 1917

(Selected Questions)

Ques.—What horsepower will be required to ventilate a mine employing 410 men and 26 mules, when the water gage reads 1.6 in., assuming the efficiency of the fan engine to be 60 per cent.?

Ans.—The Coal Mining Laws of Illinois require a circulation of 100 cu.ft. of air, per man, and 500 cu.ft. per animal per minute, in a mine not generating gas. If the mine is generating gas, the law requires a circulation of 150 cu.ft. of air per minute for each man employed underground, in addition to the amount required for each animal.

Assuming, in this case, that the mine is not generating gas, the volume of air required by law will be $410 \times 100 + 26 \times 500 = 54{,}000$ cu.ft. per minute. Then, taking the efficiency of the fan and engine as 60 per cent., the horsepower required to produce a circulation of 54,000 cu.ft. under a water gage of 1.6 in. will be

$$H = \frac{54{,}000 \times 1.6 \times 5.2}{0.60 \times 33{,}000} = 22.69\ hp.$$

Ques.—If 27 hp. is producing a circulation of 70,000 cu.ft. of air per minute in a mine, what quantity of air will be produced in the same mine when the horsepower is increased to 64?

Ans.—Assuming the conditions in the mine remain constant, and ignoring the slight change in the efficiency of the ventilating fan, the quantity of air in circulation will vary as the cube root of the horsepower producing the same. In other words, for the same conditions in the mine and a constant efficiency of the fan, the quantity ratio is equal to the cube root of the power ratio, which gives, for the required quantity (x) in this case.

$$\frac{x}{70{,}000} = \sqrt[3]{\frac{64}{27}} = \frac{4}{3}$$

$$x = \frac{4}{3}(70{,}000) = 93{,}333\ cu.ft.\ per\ min.$$

Ques.—A barometer registers 30 in., at the surface, what will it register at a point 1890 ft. below the surface?

Ans.—It is customary to allow approximately 900 ft. of depth for each inch of increase in barometric reading, which gives, in this case, $1890 \div 900 = 2.1$ in. increase. The reading of the barometer will therefore be 32.1 in.

Ques.—To what use is electricity applied in the operation of a coal mine? Name the four electrical units in common use.

Ans.—Electricity is used in coal mining for the purposes of power, lighting and signalling. It is particularly useful in the transmission of power into a mine, for the operation of coal-cutting machines, drills, electric-haulage locomotives and electric fans and pumps. Many mines are now lighted throughout by electricity, incandescent lamps being used on the haulage roads and travelingways, and electric mine lamps in the working places. Most mines are equipped with some system of electric signalling, using a telephone system or signal gongs. Electric batteries are very largely employed in the blasting of coal, because of the increased safety afforded in performing the work.

The four electrical units in common use are: The ampere, volt, ohm and watt. These indicate, respectively, the strength of the current or quantity of flow; the pressure, or difference in potential between the input and the output of the electric current; the resistance of the current depending on the length, diameter and kind of material forming the conductor; the power of the current, which is expressed by the product of the amperage and voltage.

Ques.—Find the length, in feet, of an arc of 30 deg., the radius being 14 ft.

Ans.—Since there are 360 deg. in a full circle, the length of an arc of 30 deg., for a radius of 14 ft., is $30/360(2 \times 3.1416 \times 14) = 7.32$ ft.

Ques.—What precautions should be taken, in blasting, to safeguard mines that are dry and dusty and generate explosive gas.

Ans.—Under these conditions, the safest method to adopt is to employ competent and experienced shotfirers, whose duty shall be to examine, charge and fire all holes drilled by the miners, and refuse to fire any holes that, in their judgment, are unsafe. The entire mine should be divided into districts and a sufficient number of shotfirers should be employed that ample time can be given for the air current to sweep away the gases generated by the firing of the shots.

Each fireboss should examine each working place before firing a shot therein, to ascertain that it is free from gas and accumulations of fine coal and dust. As a further safeguard in blasting in a dry and dusty mine, a thorough sprinkling system should be installed that will enable the face of each room and entry where shots are to be fired to be sprinkled before firing.

Ques.—In what seasons of the year, and why, are dangers from coal dust to be expected, and to what extent would you allow coal dust to accumulate or to be deposited, before considering it dangerous?

Ans.—The cold winter months present and increased danger from coal dust in mining, because of the comparatively dry condition of the air current circulating in the mine and the larger production of coal in that season than is true in the summer season. In the winter the cold intake current, by reason of the rise in temperature, in passing through the mine, exerts a much greater drying effect on the dust. No dust accumulations should be permitted in any portion of the workings, as the danger is greatly increased thereby.

COAL AND COKE NEWS

Harrisburg, Penn.

Running all anthracite coal mines by electricity may be the Federal Government's next step. The 25 mine inspectors in the hard-coal field held a conference on Mar. 28, to consider electrification on a large scale to aid in the winning of the war. The Federal Department of Mines submitted 10 questions on which it asks information, most of them relating to electrification and to the economies now effected in mines already thus equipped. Engineers of some of the large coal companies say that it will take several months to answer the questions intelligently. Seward E. Button, the new chief of the State Department of Mines, presided.

The age question also was taken up, but no decision as to the adjustment of a conflict in laws of the Federal Government and Pennsylvania laws was reached. The 1917 Federal law prohibits the employment of boys under 16, but the older state law, while barring boys under 16 from working inside the mines, permits those between 14 and 16 to be used above ground.

Car shortage has caused a loss of 211,029 tons of coal in the central Pennsylvania bituminous fields during the week ending Mar. 23, according to a report of J. P. Cameron, district representative of the National Fuel Administration. Mines on the Pennsylvania R. R. divisions in western Pennsylvania produced but 314,613 tons during that period whereas the capacity of the mines is 525,660 tons of coal.

Mines are being operated only a little more than half their capacity, and there is no prospect of improvement under the present system of car distribution the report states. Labor shortage caused a loss of 9437 tons. The mines delivered 1097 cars to the railroads for fuel during the week and sent but 760 cars to tidewater. The blockade on the Pennsylvania R. R. is almost as serious now as it was during the severe weather of January, Mr. Cameron declares.

The H. C. Frick Coke Co., Pittsburgh, has asked the State Department of Mines whether girls can be employed at lamphouses where the mine lamps are cleaned and filled. The chief of the department—Seward E. Button—referred the matter to the attorney general, who rendered an opinion to the effect that while women may not be employed in or about the mines females over the age of 16 may be employed in lamphouses if they are some distance away from the entrance of the mines.

In another opinion to Button, C. B. Ross, Latrobe, inspector of the second bituminous district, is informed that he has the power to approve the tapping of an abandoned mine that is filling with water and endangering the workings in an adjoining mine.

The Schuylkill Navigation Co., operating the old canal from Port Clinton to Philadelphia, has given orders to its employees to get the yards and the boats in shape for early service. The company has dredges at work, and various levels have been drawn off to permit mud and culm to be removed from the channel. South of Reading the dams, channels and locks are in good shape, but the winter floods carried a great deal of mine culm to the dams. All have been drawn off and it will take many weeks to clear the channels for the boats. A dredging machine to work pneumatically is expected to go into operation on the canal in a short time. The present dredges are steam machines, not modern in size or pattern. Work on repairing the ice-broken dam at Norristown, in the Schuylkill River, is reported to be making progress. It is necessary to the operation of the canal.

The Anthracite Consumers' League issued a statement on Mar. 29, rejecting a proposed compromise with the coal companies of the Schuylkill region whereby the taxes on the coal lands in Schuylkill County were to be increased from 60 to 100 per cent. The league asserts that in order that the coal land taxes in this county shall equal those in other counties an increase of 1000 per cent. should be made in the coal assessment. The league says, "We are witnessing now the spectacle of mendacious corporations, fairly rolling in wealth, holding up the education of little children because the trust has the political power to cheat the public treasury." In order to sidetrack the raising of taxes the league says the coal companies will try to raise the rates on individuals.

One of the most serious problems confronting the anthracite operators at the present time is the difficulty in securing sufficient timber to properly insure the safety of the miners. This is especially true of the heavier timber needed for gangway purposes and at the present time operations have been temporarily halted on account of the inability of timber contractors to meet the ever-increasing demands upon them.

Birmingham, Ala.

Steel plants, foundries, railroads, machine shops and other coal and coke-using industries in the Birmingham district are operating at capacity limit, and as a result business in coal circles during the week reflected marked activity. All coal consuming industries report a congested condition as far as orders in hand are concerned and prospects are for further accumulation.

Coal mining is active and production at the mines continues to improve. There is no easing up in the supply by any means. Many persons are seeking an opportunity to begin stocking up on coal for next winter's needs, in accordance with the ideas of the Fuel Administrator, but so far there has been no coal offered on the market. Coal companies are maintaining that all attention must be given to production and delivery.

There is practically no labor dissension of any magnitude in the district. One of the larger mines of the Woodward Company lost a day's output during the week owing to a local lay-off, but the differences were quickly settled and practically every mine is working its full force.

Chairman Frank B. Fowlkes, of the Jefferson County Fuel Board, and Secretary J. H. Duncan, after an exceedingly busy week reported on Mar. 30 that practically every retail dealer in this district had been supplied with the new customers' cards. These cards are issued under the direction of the Federal Fuel Administrator, and the new regulation which became effective Monday requires that each customer fill in the card stating his needs and other information, before a delivery is made. The order applies to householders, public utilities and all industrial users of coal alike. The county board on Monday inaugurated a campaign to educate consumers up to the need of putting in their supplies as early as possible, and a house-to-house, industry-to-industry campaign is planned.

The final figures on coal production in Alabama, as well as the coke output for the past year, are now being tabulated, and there is an increase shown in the comparison with the figures of the previous year. The coal production in 1917 went to about 20,500,000 tons against 18,086,197 tons in 1916 and 14,927,937 tons in 1915. The coal production during the first three months has been sufficient to bring out an estimate that Alabama will produce this year not less than 22,500,000 tons of coal.

The coal production for the past year will be between 5,000,000 and 6,000,000 tons, while in 1918 the production should be at least 6,500,000 tons. There is a demand for every ton of coal and coke, and the labor question is the controlling issue in regulating the production.

There is need for men at many collieries in this state. The coke ovens are not here to increase the coke production very much, but all the ovens here will be kept in steady operation so that every demand may be met and the production for the year maintained.

The coke production, however, even under the most favorable conditions, could be only a trifle greater than it is now. Prices are fixed by Governmental regulation, but the margin is sufficient to allow a satisfactory profit for the producer, ample to stimulate capacity production.

Charleston, W. Va.

That car shortage is one of the biggest factors in limiting the production of coal in West Virginia is illustrated by production figures for the Pocahontas and Tug River districts for the week ending Mar. 23, the total output for that week in the districts mentioned being over 426,000. The total tons lost was 98,909, and of that tonnage 73,426 tons were lost because of car shortage and 20,760 tons were lost because of labor shortage, the ratio being 2 to 7. However, the tonnage produced and shipped from the Tug River and Pocahontas fields has exceeded the prediction made a week or so ago by the pessimistically inclined that the tonnage for the districts referred to would show a material decrease.

In the northern part of the state the car situation is so bad that there is almost open warfare between the lines in the Fairmont field and the operators there. It is claimed that the regional car supply there is almost 6000 cars short. The claim is made by the operators that the Baltimore & Ohio is discriminating against the Monongah Division which taps the Fairmont field in favor of the Pittsburgh division, where the competition is keener and where the operators charge the Baltimore & Ohio is afraid to fall behind with its car supply lest competing lines secure the business. The operators even claim that the Pittsburgh division is ahead of its quota.

Coal operators believe that the only remedy for the inability of the railroads to furnish cars is to build more cars and that the building of such cars is almost as important as building more ships, because each is dependent on the other as a means of transportation.

Governor Cornwell has signified his willingness to call a conference of representatives of the various coal associations in West Virginia to discuss plans for extending and enlarging the export coal trade with the South American countries after the war, in accordance with a suggestion made by the "West Virginia Mining News," if the various associations approve the suggestion for such a conference. The governor on Apr. 2 addressed a letter to the president and secretary of each of the coal associations, in which he expressed himself as being in hearty sympathy with the movement to enlarge the market for West Virginia coal at the end of the war.

Louisville, Ky.

The Interstate Commerce Commission at a hearing in Louisville last week took under advisement complaints of the Ohio Valley Coal Operators' Association relative to freight rates on western Kentucky coal being unfair to the operator, and asking that rates from western Kentucky to Louisville be made on a basis of $1.05, the present rate as from eastern Kentucky, instead of $1.45. In addition through rates are asked for shipments from western Kentucky mines to points in Indiana, Ohio and Michigan. The railroads directly affected are the Big Four, Illinois Central, Louisville & Nashville, Chesapeake & Ohio, and Pennsylvania principally.

The plaintiffs, represented by J. V. Norman, of Louisville, asked for rates which would enable them to go into the Covington, Ky., and Cincinnati district, and into sections north of the Ohio. It was shown that no progress has been made in western Kentucky for several years due to an unfair freight rate, which has favored shipments from eastern Kentucky, and made it impossible to compete against mines in Indiana and states north of the river.

Indiana operators were represented by attorneys who endeavored to show that reduction of rates would result in greater

competition as for the Indiana mines, and they made a strong protest against any reduction in the rate.

The hearing principally developed that present rates are unfair to western Kentucky operators, and that Indiana operators would be more than willing to see the western Kentucky mines operated at a loss rather than take a chance on the Kentucky product being given a square deal, and allowed to enter into competition.

PENNSYLVANIA

Anthracite

Locustdale—Bancroft mountain is to be stripped of its surface for a distance of two miles and the great coal veins will be exposed to the open air. It will thus be possible to undertake daylight mining on a greater scale than ever before attempted in this region. The Philadelphia & Reading Coal and Iron Co. is undertaking the work, having acquired the tract from the Bancrofts, who were a firm of independent operators who developed tracts of coal extensively near here a half century ago.

Hazleton—Coal companies of the Lehigh field are turning down new business every day. This was announced on Mar. 28, in connection with rejection of an order from a Canadian firm which wanted a half million tons of anthracite delivered before fall and offered to pay in advance. Most of the efforts to get fuel are made by the Canadian factories which are not permitted by the Government to stock up this summer and those owners are desperate in their anxiety to secure supplies. The operators here cannot take any new business, as their output is already engaged.

Glenlyon—Two miners were entombed in the mines of the Alden Coal Co. on Mar. 27, when a fall of rock occurred in one of the gangways, shutting off communication. One of the men was rescued about 20 hours later by a number of fellow workmen, who had worked all night clearing away the rock. The other man, Adam Krenzneskie, was found dead on Mar. 29 when the party of rescuers broke through the fall.

Pottsville—Announcement has been made by the Philadelphia & Reading Coal and Iron Co. that extensive tracts of land owned by the company will be placed at the disposal of its employees for "war gardening" purposes. The lands, which are fertile, are located throughout Schuylkill and Northumberland Counties, and the work will be directed by a scientific agriculturist. W. J. Richards is president.

Tower City—The United Mine Workers of America, Local No. 1261, have made announcement that $4000 will be subscribed to the Third Liberty Loan, and $1000 for War Saving Stamps.

Bituminous

Osceola Mills—The Liberty Coal Mining Co. is installing new equipment at its shaft mine near here. When the improvements are completed the mine will operate on central station power and the capacity of the mine will be materially increased. Charles M. Means, of Pittsburgh, is consulting engineer.

Pittsburgh—A new corporation organized in Pennsylvania, the Orenda Smokeless Coal Co., on Apr. 1 purchased from the Merchants Coal Corporation, of Pittsburgh, Penn., its Orenda mine, together with about 1700 acres of unmined coal, at Boswell, Somerset County, Pennsylvania, on the Baltimore & Ohio R. R. The mine has a capacity of 2000 tons per day and is operating in the C seam of coal, by means of a slope from the outcrop. The property includes several farms and a considerable acreage of the E seam of coal, together with a slope, known as Orenda No. 3, driven down about 1000 ft. several years ago but not equipped or provided with railroad facilities. The sale includes the stock of the Boswell Land and Improvement Co., the Boswell Electric Co and the Jenner Water Co., the two latter furnishing light and water to the incorporated village of Boswell. A. W. Calloway, of Baltimore, Md., president of the Davis Coal and Coke Co., is president of the new company.

Corning—A vein of soft coal 5 ft. thick has been discovered on the Davenport farm, about 35 miles north of the coal fields of Tioga County.

Washington—Fourteen hundred acres of coal land in East Finley township have been optioned by J. S. McGill, representing Pittsburgh coal operators, at a price of $182,000.

WEST VIRGINIA

Mercer—The Louisville Coal and Coke Co. and other coal companies have been sued by R. C. Reed and Dora A. Lilly, in the circuit court in Mercer County, for $10,000 damages. It is alleged that property of the plaintiffs was injured by the coal operations dumping cinders into the Bluestone River, these cinders being washed upon their land.

Wheeling—The Echo Coal Co. is opening a new mine at Edgwood, near here. The concern has taken over the Dailer tract, as well as 81 acres of the Pittsburgh seam, which was purchased from J. A. Chambers. Contracts have already been let for the concrete opening to the mine, as well as for a large concrete air shaft. It is expected that the operation will be producing 200 tons a day by June 1. E. K. Delaney, president of the Burlington Coal Co., of Martins Ferry, Ohio, is head of the Echo company.

Kingwood—The new Florence mine of the Deaker Hill Coal Co., on the West Virginia Northern R. R., was opened on Mar. 27. The tipple has been completed, and it is believed that the mine will be a big producer.

Bluefield—The Borderland Coal Co., at Borderland, Mingo County, has awarded a contract to W. B. Elswick, of Williamson, to erect 40 one-story brick cottages. The houses will have asphalt shingle roofs, hardwood floors and electric lights.

Fairmont—At an emergency meeting of the Central West Virginia Coal Operators' Association held here last week, F. J. Patton was elected secretary of the association. Mr. Patton has been acting secretary for the last month or so. The executive board pledged itself to support the Government in every way and also the railroad and fuel administrations, though lamenting the fact that under railroad administration orders fuel must be shipped west instead of east, in the markets of which most of the companies have their contracts.

Philippi—Its members handicapped by their inability to secure an adequate car supply, a special meeting of the Tygarts Valley Coal Association was held at this place last Tuesday. The wagon mines have felt the pinch particularly, according to statements made by members.

Hinton—A new tipple, with shaker screens, loading booms, etc., is being built by the Turkey Coal and Coke Co., which operates in this field.

INDIANA

Terre Haute—A series of meetings of coal miners is now being held over the state, the speakers to be sent to the state by the National Fuel Administration. The meetings are being held at Clinton, Linton, Bicknell, Terre Haute, Twelve Points, Dugger, Winslow and Boonville. The meetings were arranged by request of the Indiana Fuel Administration and are designed to bring the miners of the state into closer contact with National fuel problems.

ILLINOIS

Hillsboro—Six Italians have been arrested here on suspicion of having been implicated in an apparent attempt to blow up the Panama Coal mine. In a sack at the bottom of the shaft 25 sticks of dynamite were found, communicating with which was a fuse with a detonating cap. The fuse had been lighted but had gone out after burning several feet. Shortly before the discovery was made three men were seen running away from the air shaft. A room occupied by some of the Italians was searched and I. W. W. literature and letters were found.

O'Fallon—Two kegs of powder were exploded Saturday, Mar. 23, in the Prairie mine. The explosion occurred at a point about half a mile from the shaft and the same distance from the air shaft, in a room approached by an untracked entry. The explosion occurred just after the miners had passed on their way to work. A fuse about 20 ft. in length was found in the entry. A stone weighing about 200 lb. had been placed on the two kegs. State mining officials and the Government secret service are investigating.

Duquoin—The Harris-Dillovou-Dimond Coal Co. has been formed by the consolidation of the Crown Coal Mining Co., the West Franklin Coal Co. and the Modern Coal Co. The new company will develop Williamson County coal land and will have a capacity of 5000 tons a day. The object of the consolidation is to work out economies and to increase production. The officers are John M. Dillavou, president; Chester A. Harris, vice president; Eugene Stevens, secretary, and Jesse Dimond, treasurer.

Virden—The North Mine, which has been closed down has been reopened. A new fan has been installed which is modern in every way and exceeds the minimum requirement set by the state for mines the size of the Virden shaft.

Springfield—Damages for $12,500 have been awarded Charles J. Lemasters in a suit filed by the Springfield-Chicago Mining Co. A piece of defective track threw a car he was driving off the track, which caused it to collide with a mine support. A piece of slate was loosened in the roof which fell and struck Lemasters in the back of the neck, breaking one of the vertebrae.

Belleville—Every miner in the Belleville territory has pledged himself to buy a Liberty Bond of the third issue, the purchases being made on the installment plan. It is estimated that there will be 400 bonds purchased by miners in this territory.

OHIO

Crooksville—The New York Coal Co. has started work on its new mine opening on the Woods farm near here.

KENTUCKY

Harlan—The short supply of cars which has been received in this district for several months past is resulting in many miners deserting mines on the Louisville & Nashville and going over to the mines located on the Norfolk & Western, where a much better supply of cars is resulting in the operators being enabled to guarantee steadier work. Many miners stuck through the shortage during the winter under the impression that steady work would be afforded in the spring and summer. Without this work materializing they are being forced to make changes.

Harlan—The United States Steel Co. has been bringing men into the district in coach loads for hastening development of the new plant on the Poor Fork Branch. This plant will be completed probably within five months and will have a considerable production, which will be shipped to company steel plants.

Louisville—Apr. 15 has been set for Louisville interests to start reorganization of the old Continental Coal Co., which will become the Federal Coal Co. The old Continental Coal Co. entered bankruptcy during May, 1916, as a result of Chattanooga interests refusing to abide by a settlement agreement. The reorganization is a result of action taken by the United States Circuit Court of Appeals, Sixth District, affirming the opinion of Judge Cochran, of the United States District Court, Eastern District of Kentucky, in the case of S. Thurston Ballard against the Federal Coal Co. of Delaware and persons interested. The suit was on behalf of about 100 persons holding about $1,000,000 of stock in the old Continental company. The new company will take over 16,000 acres of coal land and operations at Pineville.

Whitesburg—The Kenmont Coal Co., at Hamden, Ky., has made several improvements in its plant and equipment, enabling the company to increase its daily output to 12 to 15 cars.

Whitesburg—The Marion Coal Co. is making an important development on Rockhouse Creek, where the new mining town of Coalvein is being established about a mile from Blakey. A number of new mines have sprung up along a new Louisville & Nashville branch being constructed into the district.

Stanford—The Boering Land and Mining Co., which has large coal and timber interests in Harland and adjoining counties, recently declared a dividend which takes $18,000 from the surplus fund. At this meeting John W. Fox, the noted Kentucky novelist, was elected a director of the company, succeeding his late brother, James W. Fox, who died last winter. Mr. Fox for many years has been close to big developments in the fields, having lived near Cumberland Gap the greater part of his life, and having based several big selling novels on Kentucky developments.

NEW MEXICO

Gallup—The old Thatcher mine east of town, which has been idle for several years, is to be worked again and will be producing coal soon. S. E. Wood and J. Stewart are to operate the mine.

Foreign News

Amsterdam, Holland—The newspaper "Handelsblad" learns from a German source that after Mar. 31, when the economic arrangements between Holland and Germany expire, the export of coal to the former will cease.

Sydney, Australia—Australia miners unions have decided to go into business as mine-owners. The Newcastle Colliery Employees' Federation will be the first in the field, having voted this week to acquire control of a large mining property.

Personals

Charles A. Braun has been appointed assistant sales manager of the Stonega Coke and Coal Co., with offices at 1727 Land Title Building, Philadelphia, Penn.

L. R. Taylor, who recently resigned as superintendent of the Virginian Ry., at Princeton, has formed a connection with the J. C. Sullivan mines in Raleigh and Wyoming Counties.

D. G. Thomas, mine superintendent of the Union Pacific Coal Co., at Rock Springs, Wyo., has resigned to accept a similar position with the Megeath Coal Co. at Winton, Sweetwater County, Wyoming.

Stanley Gleason, of Pittsburgh, Penn., has been promoted, effective Apr. 1, from the position of transitman to the division engineer of the Pittsburgh division of the United Coal Corporation to succeed W. H. Hogue, resigned.

W. E. Davis, of Hazard, Ky., has sold a controlling interest in the First Creek Coal Co. to E. L. Douglas, Jesse Morgan and some Detroit interests, and personally will give his attention to developing the property of the Midland Coal Company.

T. V. Smith has been promoted with the Solvay Collieries Co. from the position of assistant to the chief engineer with headquarters at Huntington, W. Va., to the position as assistant superintendent of the company's Coaldale colliery at Hellier, Ky.

Capt. G. W. Shaw, for five years district manager at Louisville for the Pittsburgh Coal Co., has been transferred to the Pittsburgh division. Captain Shaw, during his stay at Louisville, has looked after the river traffic work, which has lightened in this district to such an extent that he has been placed in charge of the work on the Monongahela River. E. T. Quinby, the company's local secretary, will look after the river end.

Trade Catalogs

Hughes Mechanical Gas Producer. Wellman-Seaver-Morgan Co., Cleveland, Ohio. Bulletin. Pp. 8; 8½ x 11 in.; illustrated. Describes the features that have made this gas-making machine popular with a large number of users.

The Tuerk and Hunter Electric Fans. Frank H. Seely Jr. Co., 421 Widener Building, Philadelphia, Penn. Folder. Pp. 8; 3½ x 6¼ in.; illustrated. Contains specifications and prices of oscillating, non-oscillating and ceiling types of electric fans.

Link-Belt Roller Chains. Link-Belt Co., Chicago, Ill. Booklet No. 358. Pp. 16; 6 x 9 in.; illustrated. Was issued to give preliminary information on recent roller chain developments, pending the revision of the company's No. 257 Roller Chain Data Book.

Automatic Reclosing Circuit Breakers and Relays. The Automatic Reclosing Circuit Breaker Co., Columbus, Ohio. Bulletin No. 30. Pp. 20; 8½ x 11 in.; illustrated. Gives a general description and the theory and application of this concern's automatic reclosing circuit breakers and relays for the protection of direct-current circuits.

The Pump That "Manistee" Builds. Manistee Iron Works Co., Manistee, Mich. Booklet. Pp. 20; 9 x 6 in.; illustrated. A rather unique publication descriptive of the RoTURBo pump built by the Manistee Company. On first opening the book the complete assemblage of a multi-stage pump is shown. As each page is turned the view discloses the pump with a part removed.

Industrial Storage Battery Locomotives. Jeffrey Manufacturing Co., Columbus, Ohio. Catalog No. 231. Pp. 24; 6 x 9 in.; illustrated. Contains interesting illustrations and description of various installations, information regarding details, as well as useful data for users of storage-battery locomotives, with particular emphasis on the employment of this well-known locomotive by industrial plants, lumber yards and contractors.

How to Save Coal. Bailey Meter Co., 141 Milk St., Boston, Mass. Bulletin No. 41. Pp. 20; 8 x 10½ in.; illustrated. Just at the present time, when the need for economy in the use of coal is so urgent, this bulletin, with its valuable suggestions on steam generation, should be on every power plant official's desk. The Bailey meter accurately records the steam flow on a uniformly graduated 12-in. circular chart, reading directly in per cent. boiler rating; or if desired in thousand pounds per hour or boiler horsepower.

Community Homes Built With Steel Forms. The Hydraulic Pressed Steel Co., Cleveland, Ohio. Booklet. Pp. 31; 8¾ x 11¾ in.; illustrated. The title page of this booklet, which is an excellent example of the printer's art, states that it was issued for the purpose of assisting those who are giving consideration to the much discussed question of industrial homes. Under different chapter heads is described fireproof, sanitary, industrial houses, together with first cost, permanency and low maintenance. The booklet is excellently illustrated by two-color halftones and line drawings, and reflects the experiences of the Hydraulic Pressed Steel Co. and its effort to combine profit-producing with the welfare of every employee.

Industrial News

St. Louis, Mo.—Effective April 1, the Old Ben Mining Corporation, the largest Franklin County coal operator, closed its St. Louis office. The headquarters are in Chicago.

Philadelphia, Penn.—The Pennsylvania Supply and Equipment Co., of 421 Widener Building, has been succeeded by the Frank H. Seely, Jr., Co. The change affects the firm name only and was effective as of Apr. 1.

Cleveland Ohio—The Lakewood Engineering Co. announces the opening of a district office at 448 Broadway, Milwaukee, Wis., with Frederick T. Kern and J. N. Young, both formerly of Kern, Hunter, Inc., as its representatives.

Columbus, Ohio—The combined offices of the Gem Coal Co., the Doanville Coal Co., and the Cleveland & Philadelphia Coal Co., the latter a selling agent for the other two, which produce coal, have been moved from the Huntington Bank Building to the Capitol Trust Building.

New York, N. Y.—The annual report of the Central Coal and Coke Co. for the year ended Dec. 31, 1917, shows net profits of $819,583, as compared with $334,224 for 1916. Gross profits amounted to $1 258,989, against $673,269 the year before Combined net profits of Central Coal and Coke Co. and Delta Land and Timber Co. totaled $1,302,496.

Columbus, Ohio—The new rulings of the Federal Railroad Commission regarding the use of open coal cars by small "wagon mines" will permit several hundred such mines in central Ohio to open for operations during the spring and summer months. These mines were forced to close during the winter on account of the refusal of the authorities to permit cars to be placed for them.

New York, N. Y.—Dodd-Dubosque Company, Inc., announces that it has succeeded to the investigation, sales plans and advertising business formerly conducted by the J. D. Barnhill, Inc., at 110 West 34th St New York City, with offices at the same address. The officers of the new company are as follows: Philip S. Dodd, president; Clayton Dubosque, vice president and treasurer; William T. Andrews, secretary.

New York, N. Y.—MacGovern & Co., of 114 Liberty St., well-known dealers in second-hand equipment, announce the opening of branch offices at Pittsburgh, Penn., and St. Louis, Mo. The office in Pittsburgh is located at 498 Union Arcade, and is under the direction of L. H. Tippins and W. L. Sprengle. The St. Louis office is at 315 North 12th St., and is under the direction of R. S. Fisher, district manager.

Houghton, Mich.—Calumet & Hecla subsidiaries are suffering considerable loss through continuance of the stubborn fire that for two weeks has been burning steadily in the soft coal pile at Dollar Bay. Fighting this fire has been a costly task and it is not yet under control, notwithstanding two steam shovels and a crew of 60 men have been removing the coal steadily. Gas from the burning pile reaches Houghton, Hancock and Dollar Bay communities. Over 100,000 tons were stored.

Cincinnati, Ohio—Suit has been filed in the Common Pleas Court by the Andrews Steel Co. and the Newport Rolling Mills Co., both of Newport, Ky., against Jewett, Bigelow & Brooks, alleging failure on the part of the coal concern to furnish coal to the steel companies as provided by contracts said to have been entered into, and total damages of $117,000 are asked in consequence by the plaintiffs. The contracts upon which the suits are based are alleged to have provided for the delivery of 75,000 tons of coal.

St. Louis, Mo.—Coal wagon drivers have made a demand upon the Coal Haulers' Service Exchange for an increase in wages of $3.50 a week. Officials of the service exchange say that the demands will be granted. An appeal will be made to the St. Louis fuel committee for permission to advance the price of coal sufficiently to cover the increased wages. The bureau is composed of wagon-lot dealers who do not have switches. A. W. Powers is president and William Kay secretary.

Louisville, Ky.—Inability to obtain rails, machinery and equipment of various kinds is resulting in several planned developments being held up. One eastern Kentucky mine has been ready for some time to start shipping five cars a day, but has been waiting for five months for delivery of aero baskets and ropes, the other work having been recently completed. At the present time terminal congestion at Louisville, Cincinnati and other points is resulting in equipment being held up indefinitely that should make fast time.

Columbus, Ohio—Notices have been sent out through the Ohio branch of the National Council of Defense and the Ohio Fire Marshal's office that all handlers and users of explosives will have to take out a license. Alien enemies and all persons who are subjects of nations at war with the United States will be refused licenses. Violation of the act and failure to secure a license will lay the person liable to a fine of $5000. Licensing agents are located in every county. All coal operators who use explosives will be required to secure the license.

Louisville, Ky.—H. B. Hanger, of Richmond, Ky., and H. P. Mason, of Frankfort, Ky., of the Mason & Hanger Co., contractor who built Camp Taylor, at Louisville, and who are installing switches and connections at the new Federal powder plant at Nashville, besides handling many large Government contracts, are incorporators of the new house of Mason, Hanger & Coleman Co., of Charleston, W. Va., which is incorporated with a capital of $100 000 for the purpose of constructing railroads, waterworks, locks, dams, sewers and public work generally; to acquire, manage and operate coal, iron, oil and timber properties. The other incorporators are also Kentuckians, including Frank Chinn, of Frankfort: L. B. Weisenburger, Jr., and W. O. Furr, of Frankfort.

Pittsburgh, Penn.—Effective as of Apr. 1, 1918, Colonel Henry P. Bope has resigned his position as vice president and general manager of sales with the Carnegie Steel Co. to devote his time to private interests. Colonel Bope became connected with Carnegie Brothers & Co. in November, 1879, and has remained continuously in the sales work of that company and its successors up to the present time. He has been succeeded in office with the Carnegie Steel Co. by William G. Clyde, who was assistant general manager of sales at Pittsburgh in charge of the Bureau of Bars and Hoops. Mr. Clyde by the promotion has also become a member of the board of directors of the company. Charles L. Wood long assistant to Mr. Clyde, has been promoted to be asistant general manager of sales in charge of the Bureau of Bars and Hoops.

New York, N. Y.—During 1917 the Pennsylvania Railroad Co. carried over its various lines 10,721,121 tons of anthracite, 50,205,005 tons of bituminous and 14,482,474 tons of coke, a decrease of 1,166,315 tons of anthracite, an increase of 2,551,704 tons of bituminous and a decrease of 1,877,819 tons of coke as compared with the tonnages transported in the previous year. The coal consumed by locomotives during the year amounted to 17,557,309 tons, an increase of 1,360,800 tons over the previous year. The company has on its rolls 3804 pensioners, an increase of 184 over 1916, and the pensions paid during the year amounted to $1,473,605.06, an increase of $290,905.34 over 1916. The oldest employee receiving a pension during the year attained the age of 96 years; while the average age of all pensioners, as of Dec. 31, 1917, was 72 years, 10 months.

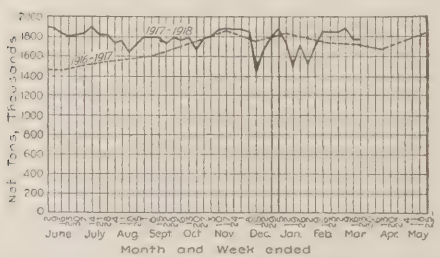
MARKET DEPARTMENT

Weekly Review

Uncertainties Being Cleared Away—Anthracite Demand Strong with Little Likelihood That Enough Will Be Mined To Meet Requirements—Bituminous Production Still Far Below What It Should Be Due to Poor Car Supply—Active Market—Some Talk of Cancelling Contracts

THE National Fuel Administration is making rapid strides in the work of clearing away the uncertainties besetting the coal industry. A zoning policy has been announced; new price regulations have gone into effect; jobbers are practically unhampered in their methods of doing business; local fuel administrations in the different states have been organized to take charge of distribution — in short, the path is being smoothed for a quick movement of coal from the mine to the consumer's bin.

Now the cry is for production—for more and yet more coal. The demand for anthracite is insistent. Stocks are down to rock bottom, notwithstanding the fact that record tonnages are being produced at some mines. With the added demand that will surely come from household consumers during the next few months there arises the question, "Will the output equal the requirements?" It is hard to see how this can be answered in the affirmative, though it is a bit too soon to be pessimistic. Just at present, however, the number of cars handled at the loading piers shows an improvement that under ordinary conditions would be sufficient to create a surplus, but which now indicate that the demand is more than keeping pace with the supply. Dealers are accepting orders subject to Fuel Administration regulations, though no contracting is reported for the smaller coals.



No improvement in conditions is reported from the bituminous mines. In the large district about Altoona, Penn., the car supply has been far below normal, and the motive power available is insufficient to clear the yards promptly enough to insure regular movement of cars to and from a large number of operations. Hundreds of mines in the bituminous district of Pennsylvania have been idle for days, one particular mine in this district not having received a car in over three weeks. From West Virginia, Kentucky, Illinois and Indiana come like reports. The results are a material reduction in output at a season when every condition should be favorable and an increasing disinclination on the part of operators to make commitments for months ahead. Until there is some policy with regard to assigned cars that shows some evidences of being consistently carried out, it will be impossible for many mines to work more than half time. Not much improvement can be expected under the present system of car distribution.

The market showed signs of activity during the past week, though the trade is still a little uncertain due to the fact that the making of contracts is confounded by Government commandeering and preferential shipment orders. The zone system is also adding complexities. There is some talk of the Government cancelling all contracts for coal which did not expire on April 1, the idea being that such a step would eliminate all high-price contract coal and place the entire production of the country under control of the Fuel Administration.

COAL PRODUCTION

Production of bituminous coal increased slightly during the week ended Mar. 23. The total production (including lignite and coal made into coke) is estimated at 10,972,000 net tons. The average production per working day is estimated at 1,828,000 net tons as compared with 1,729,000 net tons during March, 1917.

The total production of beehive coke is estimated at 635,000 net tons, or 106,000

tons per working day; a decline in average daily production of 1000 tons compared with week of Mar. 16. The production in the Connellsville and Lower Connellsville districts, as reported by the "Courier," increased from 335,122 tons during the week Mar. 16 to 339,580 tons.

Anthracite shipments increased from 12,265 to 42,487 cars.

The ratio of production to present capacity declined from 70.6 per cent. in the week ended Mar. 9 to 66.3 per cent. for the week of Mar. 16, due in part to transportation difficulties in the east and in part to absence of orders for coal in the far west. The lack of demand for coal in the Southwest, Rocky Mountain and Pacific Coast States was even more noticeable than during the previous week. Mines in these states reported a loss of 275,296 tons due to "no market," compared with 201,006 for week ended Mar. 9.

The reports of conditions in the Connellsville and adjacent coke regions for the week ended Mar. 23 show continued improvement. Fifty-seven of the principal operators in the Connellsville, Greenburg and Latrobe districts reported a production of 273,420 net tons or 65.6 per cent. of their full time capacity as compared with 64.1 per cent. during the preceding week. Losses due to shortage of cars and labor slightly declined. The same operators produced 152,400 net tons of coal.

The ratio of production to capacity of byproduct coke plants during the week ended Mar. 23 (87.8 per cent.) was the same as in the previous week. The losses on account of lack of coal represented 6.4 per cent. of capacity, the same as the previous week. Kentucky, Maryland, Tennessee and Washington increased their production to maximum capacity. The lowest ratio reported—in New Jersey—was 79.6 per cent., an improvement over 76.5 per cent. in the previous week. Indiana was the only state reporting decrease in production during the week ended Mar. 23 due to lack of coal.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS

BUSINESS OPINIONS

Marshall Field & Co.—Current wholesale distribution of dry goods is well in advance of the corresponding period of a year ago. Road sales for both immediate and future deliveries show good increase over the same period in 1917. Merchants have been into market in slightly smaller numbers. The market on domestic cotton goods continues strong. Collections are good.

Bradstreet's—Trade expands as the season advances, and optimism grows, though many chafe under price regulations imposed by the Government. Lack of labor, dearth of materials and paucity of cars prevent even heavier movements. An early Easter, accompanied by favorable weather, has brought retail trade to the forefront, buying from wholesale dealers for fall shipment is active, industry is brisk, collections are more favorable than otherwise, crop news, except for absence of rain in the southwest, is excellent, and widespread preparations are being made for increased planting this spring.

Dry Goods Economist—Due partly to the financial outlook and partly to shortage of labor and of raw materials, there is nothing surprising in the predictions heard on all sides that still higher prices for textiles will prevail. There has been no recession in the prices of raw cotton, silk or wool. Instead, the markets are firm and some advances have been noted. Raw cotton, for example, reached 34.40c. this week, the advance being based on reports of continued drought in the Southwest.

American Wool and Cotton Reporter—The wool supply is becoming scarcer and the market becoming stronger. One feature of the week under review has been the cleaning up of practically all the 4s and 5s B. A. wool in the market. The woolen goods market remains steady—with produc-

tion up to the highest possible point under existing conditions. Manufacturers expect that there will be sufficient shortage of goods to make possible at least reasonable profit margins.

Iron Age—A remarkable recovery in pig-iron production is shown by the statistics for March gathered by wire from 344 blast furnaces. The total was 3,213,091 tons, or 103,648 tons a day, as against 2,319,399 tons in the 28 days of February, or 82,835 tons a day. As coke supply has increased, more furnaces have wheeled into line, the net gain in the month being 24. The 344 coke iron furnaces in blast Apr. 1 were producing at the rate of about 106,500 tons a day, as compared with an actual average production of coke iron in the year 1917 of 105,000 tons a day.

Atlantic Seaboard

BOSTON

Jobbers file application for licenses. No clear program, and apparently no action on assigned cars. Buyers in quandary. No improvement in Tidewater receipts. Rail shipments fair. Bottoms extremely hard to get. Hampton Roads dispatch good. Distribution the coming year a serious problem. On present consumption industry will keep running, but where will be the reserves? Pennsylvania operators largely unresponsive. Selling connections of many years standing given up, apparently for good. Anthracite program now quite definite. Retail regulations issued. Wide opening for much confusion. Plans not flexible enough to meet situations that will arise.

Bituminous—New England factors have applied for licenses and have been assured that unless they hear otherwise from Washington they may continue in business as if licenses had already been issued. Representative houses are besieged by manufacturers and other buyers wishing to contract, but they are powerless to act. Firms that have certain contracts for a score of years have been obliged to notify customers that the latter must look elsewhere. In many cases a Philadelphia house or one nearer the mines has a sales contract for the output of a mine for a number of years, and where in other seasons the selling compensation has been shared with New England agencies the prospect is such that each concern in position to do so wants to collect the whole 15c. The New England connection is therefore left in the cold. While the "jobber" has been allowed to stay in business his livelihood, so far as bituminous is concerned all-rail, seems likely to be taken from him. Even the distributor of Pocahontas and New River finds himself in a dilemma with regard to selling commission. And this is only one of the anomalies created by present regulations.

Bituminous all-rail is coming through in fairly good volume, as compared with two months ago. Barely enough is received to keep plants running even on a hand-to-mouth basis. There are considerable areas in New England heretofore relying exclusively upon all-rail shipments where only the emergency supply drawn from tidewater allows the industries to run. The price on water shipments via Hampton Roads is now about $9.50 per gross ton f.o.b. Boston or Providence. In some cases rehandlers are asking as high as $11.20, but this latter is the exception. When this basis is compared with $3.05½ per net ton f.o.b. mines for all-rail shipment plus $3 or so freight, the inequality is striking. Neighboring factories may face that inequality, but apparently there is no remedy. One month a consumer may get his coal all-rail, the next from tidewater. And there is no way of being sure of either!

The shortage of high volatile grades, particularly for illuminating and for by-product use, is causing real alarm. Blast furnaces are using an enormously increased tonnage and attention is being called to quantities of low sulphur coal used for fast train service. One New England railroad alone uses 150,000 tons and at a time when gas utilities are not able to get more than a percentage from their usual sources. The fact that anthracite also is going to be hard to get has a bearing on the probable scarcity of gas coal. Lime burners are also in straits for these grades, and unless long flame coal is forthcoming it will go hard with a lot of industries that are dependent upon them. It will be increasingly difficult this year to distinguish between "essential" industries.

Boats are still extremely scarce and are likely to continue so. The allotment of ships to the various interests will have to be most carefully administered, and at best there will be much dissatisfaction. It is beginning to be realized that the same authority that has the distribution of coal should also have the disposition of steamers and barges. The Shipping Board authorized rate to Boston is still $3.25 from Hampton Roads, the demurrage rate varying according to tonnage. Dispatch at the Virginia terminals has been good through March and the flow of coal certainly has been sufficient for the boats arriving. There is talk of equipping one of the old Norfolk piers for bunkering purposes exclusively. That should help, together with the thawing facilities that are being installed against next winter.

Anthracite—At this writing "spring prices" have not yet been given out, although there is little interest here in a possible reduction. Freight increases will absorb some, both rail and water, and the great anxiety of buyers will continue to be "to get coal." Receipts increase not at all, arrivals being contingent so largely on the tugs available. One day last week there were 20 barges loaded and loading in the Delaware, and only two tugs due. Unless some power is furnished New England is sure to be bitterly disappointed in any distribution that is now aimed on the 1916 basis.

NEW YORK

Demand for anthracite domestic sizes continues to be heavy, and dealers accept orders subject to new prices. The smaller coals easier, with prices slightly reduced. Production is heavy but insufficient to create a surplus. Bituminous conditions not satisfactory. Railroads favor certain mines, while others have to get along with curtailed car requirements.

Anthracite—The demand continues unprecedented for this time of the year. Stocks are down to rock bottom notwithstanding the efforts of the producers to create a surplus and even with the heavy production reported from the mining fields retail dealers have comparatively little coal in their yards.

Production is steadily improving and now that the Federal authorities and labor representatives have come to an agreement regarding strikes during the continuation of the war it is not expected there will be many interruptions of work in the mining fields. Records are being reported at some of the mines, while reports show that shipments are steadily increasing. Not many complaints are being received regarding unclean coal.

The number of cars handled daily at the loading piers shows a big improvement, which under ordinary conditions would be sufficient to create a surplus, but which now indicate that the demand is more than keeping pace with the supply.

There is an active demand for buckwheat, with a good supply of rice, barley and screenings on hand. Offers of part cargoes of the domestic coals with an equal amount of the smaller sizes are said to have been refused by some dealers who said they had not place to store the steam coals. Some dealers are willing to take anything in order to obtain domestic coals. No contracts are being made for the smaller coals for next winter.

Although no further official notice had been received from Washington regarding the discount of 30c. per ton in the mine prices for the domestic sizes of anthracite coal, Reeve Schley, New York County fuel administrator, announced on Tuesday a 35c. reduction in the retail prices. This includes the 30c. reduction from the mine prices and a 25c. cut from $2.50 to $2.25 per ton in the gross margin of profit allowed the retail dealer. This total reduction of 55c. is cut to 35c. because of the increase in freight rates of 15c. per ton and 5c. for handling expenses due to the recent strike among bargemen. On the small anthracite sizes the gross margin has been reduced from $1.90 to $1.75 per ton, but for pea coal and bituminous the gross margin fixed several months ago of $2.10 per ton has been allowed to remain. These discounts are to remain in effect until Sept. 1 when the full winter price becomes effective again. It is understood that most of the companies are taking orders for coal with the understanding that the reduced prices will prevail.

Current quotations, per gross tons, f.o.b., Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6 15	$6 90
Egg	6 05	6 80
Stove	6 30	7 05
Chestnut	6 40	7 15
Pea	4 90	5 65
Buckwheat	4 45@5 15	5 10@5 85
Rice	3 90@4 10	4 10@4 85
Barley	3 40@3 65	3 10@4 10
Boiler	3 65@3 90	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Note—Foregoing prices are based on summer discount of 30c. per ton for the domestic sizes and the increase in freight rates of 15c. per ton on all anthracite coal.

Bituminous—Conditions are anything but satisfactory to most operators. There is a feeling among many of them that they are being discriminated against by the railroads, in that while their coals are not being taken for railroad consumption other operators are enabled to work their mines with a 100 per cent. car service. When coal was short last winter these same railroads were only too glad to get part of their supply from these same mines which are now idle a great part of the time because of the lack of cars.

In some instances offers by certain operators to continue furnishing coal to the railroads under the same arrangements as had existed have been turned down.

The order granting operators 20c. in addition to the Government prices for clean coal was welcome news to some local operators.

The license system is looked upon more favorably than it was at first. All jobbers have filed their applications at Washington for licenses to continue business and pending their issuance are being permitted to sell coal.

No improvement in conditions is reported from the mines. Production figures indicate a slight betterment but is due to heavier output at some mines, while other openings of a smaller nature have been unable to work more than half time. Car supply along the Pennsylvania continues bad, but along the New York Central is much better. Not much improvement is looked for under the present system of distribution.

Bituminous is in good demand for mixing with the small anthracite coals, and its scarcity accounts for the easier conditions for these sizes.

BITUMINOUS PRICES

	F.o.b. New York Gross	Mine Price Net	Gross
Central Pennsylvania	$5.06	$3.05	$3.41
Maryland:			
Mine-run	4 84	2 85	3 19
Prepared	5.06	3.05	3.41
Screenings	4.50	2.55	2.85

An advance of $1.35 per net ton over operators' prices is authorized on coal for export and on bunker coal supplied to steamers engaged in foreign trade.

PHILADELPHIA

New distribution plan will soon be effective. Zoning also likely. Retailers busy filing storing orders. Jobbers temporarily licensed. Large companies now selling culm. Bituminous contracts create interest. Many expired agreements not renewed. Zoning plan also affects contracts. Coal continues short, car supply being the principal factor. Premium on clean coal.

Anthracite—The distribution plan on the basis of the coal year Apr. 1, 1916, to Mar. 31, 1917, has been about worked out, and many shippers have notified their customers that they intend to ship on this basis from now on. This has caused many strange alliances. For instance, it is known that since Mar. 31, 1917, the individual shippers have deserted much of their small trade, those dealers to whom they shipped just a car or two, and in their place have been nursing some of the larger trade in the hope of serving them permanently when normal conditions once more prevailed. Under the present plan the independents must now go back to their old customers.

Another complication caused by the absence of the new Government prices is that due to the expiration of practically all steam-coal contracts these consumers are now without protection. For the past several weeks the buyers of steam coals have been on the anxious seat and have kept the shippers constantly stirred up to find out just where they stand. It is known that almost all the producing companies are willing to renew contracts on practically the same basis as last year, and with this idea in view they made up all contracts a month ago and sent them to Washington for approval. Now it is learned that the Fuel Administration has rejected these agreements on account of wage clauses and other restrictions which it has always been the custom to place in them.

The business with the retailers for filling-in orders after Apr. 1 has been quite heavy. However there are some dealers, in fact the majority, who are not making any particular effort to load themselves up with orders of this kind until they have some as-

surance of receiving the needed coal. Other dealers are taking the stand that they will go after all the business possible and then if they do not have the coal will present their orders to the fuel authorities with the hope that they will see that they are provided with the fuel to cover the orders in hand. The dealers are rigidly enforcing the filling out of the coal cards as required. In doing this there is an immense amount of work involved, but the dealers are complying, with little complaint. Receipts locally are comparatively light, as many of the larger shippers continue to ship heavily into other markets. Nevertheless a change in this respect is expected as soon as the companies begin working on the new distribution schedule.

A matter that has lately caused a good deal of comment among shippers, not to mention annoyance to them, is the new rule of the railroads not to make transfers of shipments either en route or after the cars reach destination. This action falls with particularly severe effect on the concerns who are shipping culm, as often concerns who have ordered a trial car of this material reject it after it arrives at destination, as much of it falls far below the purchaser's ideas of what it should be. In order to protect themselves it is likely the shippers will require from purchasers a signed order before shipment is made, which makes the transaction a contract and binding upon the purchaser to receive it.

The Washington authorities state that the mass of work incident to issuing the licenses to jobbers has been so heavy that it will be impossible to act on the applications for several weeks. In the meantime jobbers who have made application will be allowed to continue business as usual. There seems to be no doubt that practically all jobbers will be permitted to continue and that the issuing of the license will be merely a formality.

An interesting development of the week has been the entrance of the larger companies into the field created by the demand for culm. Heretofore the independent shippers had this trade practically to themselves, the larger operators taking the stand that it did not pay to take the cars from other sizes. The price usually asked by the companies for culm is $1, while the individuals get from $1.25 to $2 for theirs.

The prices per gross ton f.o.b. cars at mines for line shipment and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$5.90	$6.05	Buckwheat	$3.15	$3.75
Egg	4.80	6.00	Rice	2.65	3.65
Stove	5.05	6.35	Boiler	2.45	3.55
Nut	5.15	6.40	Barley	2.15	2.40
Pea	3.75	4.65			

Bituminous—The contract situation is much to the fore at this time. With the first of the month there was a heavy expiration of agreements of this kind, and while the consumers have been anxious to renew them there seems to be much hesitancy on the part of the fuel authorities to allow renewals. Of course, with a fixed price in effect there is nothing to be gained in this way, except that the consumer on his part feels that he has a certain protection as to being supplied.

Supplies continue to be short in this territory, and the lack of improvement in the car supply is a cause of great disappointment. As has been the case for some weeks now, the greatest difficulty is on Pennsylvania shipments west of Altoona, as the movement eastward of that point is reported quite good. With the limited number of cars at their disposal the miners are making the greatest use of them by loading to the fullest possible capacity, and the cars are reaching here "topped" two feet or more.

The operators were informed this week that the Federal Fuel Administration had made a ruling that where coal was prepared by the use of special mechanical appliances they would be allowed to add 20c. to the fixed Government price.

This week State Administrator Potter suggested to the national authorities the minimizing of priority orders, if not their entire elimination; the creation of a pool from which to draw coal for emergency use, and the organization of a Federal inspection system in the bituminous region.

BALTIMORE

Everybody busy signing up new contract relations and at the same time wondering how they are to be filled. Bituminous supply easier. New schedule for anthracite out.

Bituminous—The industrial world has descended on the coal men here in an effort to create new relationships under Government regulations and at the same time assure themselves of coal supply over the coming year. Many changes of form are taking place and the trade is still a little uncertain where it stands. A number of mines are probably hooking up direct with some larger consumers, but the uncertainties existing under Government commandeering and preferential shipment orders is such that much of the business is still at sea.

Jobbers too are uneasy. Many find numerous contracts with business concerns as purchasing agents easy to get, but are wondering how they are to assure themselves of the coal to supply the firms in question. Few of the mines are willing to promise the jobbers a sure supply. Even some jobbers selected to act as purchasing agents for public utilities are in the same boat. It may be that the state fuel administrator will be forced to secure the coal for a large part of the supply through jobbers, should many mines continue in their present frame of mind of refusing to make contractural relations. The immediate supply of soft coal here is a little easier, following clearing of much railroad congestion.

Anthracite—The new spring price list was announced here this week, after conferences between the city coal committee of the Maryland fuel administrator's office and a committee representing the retail coal association. The prices are 35c. off the winter schedule here, and are as follows:

Broken white ash	$10.10
Egg	10.00
Stove	10.25
Nut	10.35
Pea	8.95
Egg, Sunbury	10.25
Stove	10.50
Egg, Lykens Valley	10.70
Stove	11.10

The prices are for chute delivery, extra to be added for cost of bagging, carrying, etc. Twenty-five cents is allowed off the above schedule for cash. Under the plan consumers must fill out application cards and will be allowed two-thirds of their estimated requirements up to Mar. 31, 1919.

Lake Markets

PITTSBURGH

Coal output no better than stationary. Greater use of rivers contemplated. Premiums and penalties as to preparation of coal.

Coal output has not improved appreciably in the past week, if indeed it has not decreased slightly, as car supplies have been anything but satisfactory, eight weeks after winter weather practically disappeared. The transportation situation is not to be dismissed lightly in expectation that normal weather is to restore full movement. The situation is to be met by energetic action on the part of those in western Pennsylvania who can use the rivers. Several tipples are being built in the 14th and 15th pools of the Monongahela, which have hitherto shipped little river coal to Pittsburgh, the 15th pool being 130 miles above Pittsburgh, and there will be large shipments to Pittsburgh at least if not to Cincinnati. As is well known, the mines in the lower pools that used to furnish such a large Monongahela River coal traffic are largely worked out. Something is being done also in the direction of increased use of the Allegheny River.

There is still considerable contracting for coal being done for the twelvemonth beginning Apr. 1, but the major part of the business, or at least a very large part, had been done before the recent reaffirmation of prices, subject to Government price ruling at time of delivery. The Fuel Administration is urging that all essential wants be fully covered by contract, and that shipments be taken as fast as possible, even to the extent of buyers borrowing money to carry the coal.

There is a moderate amount of free coal in the market, but not equal to the demand in all cases. Demand from large consumers is relatively light, shipments as a rule being equal to requirements. All the intricacies of the zoning system have not been ironed out yet, as applied to Pittsburgh coal, which is under less restriction than the coal in most zones. The market remains quotable at $2.20 for slack, $2.45 for mine-run and $2.70 for screened, per net ton, f.o.b. mine, Pittsburgh district. Jobbers can charge customers a brokerage in addition, up to 15c., when regularly authorized. There is a new regulation permitting operators when licensed to do so to charge 20c. extra for coal especially prepared to eliminate foreign matter, but the regulations and standards are altogether in doubt. Considerable confusion is expected to result, at least for a time, from this new proviso, when already there is a penalty of 50c. on coal that does not pass the inspectors.

D. W. Kuhn, local fuel administrator, has fixed $5.50 per net ton for domestic coal, delivered within a reasonable distance from yards on a level haul, price at yard being $4.50. Later prices will be fixed for the hilly districts. All prices are to run to Sept. 1, when there will be an advance of 25c.

TORONTO

Coal supply still inadequate for heavy demand. Local deliveries much delayed. Consumption restricted by government order. Wood will be largely used for fuel.

Coal is being received in considerable quantities, but the supply is still insufficient to enable dealers to fill orders in arrear and meet current demands, which continue heavy. There is consequently much delay in local deliveries. A government order in council restricts consumers to 70 per cent of their normal requirements, except in cases where these do not exceed six tons per year. Dealers consider that it will be a matter of some difficulty to enforce this order. The civic authorities are considering an increase of the police force to keep up with the inspection work involved by the fuel regulations. The demand for fuel will largely be met by an increased consumption of wood, as many municipalities are preparing to take advantage of the offer of the Provincial Government to allow the cutting of cordwood in Algonquin Park.

Quotations for best grades per short ton are as follows: Retail anthracite, egg, stove, nut and grate $10; pea, $9; bituminous steam, $9; slack, $8 to $8.50; domestic lump, $10; cannel, $11; wholesale f.o.b. cars at destination, three-quarter lump, $7 to $7.50, slack $6.50 to $7.

BUFFALO

Jobbers still wondering how they are coming out. Coal is freer, except that anthracite is not sized well. No lake coal. Car shortage the chief difficulty.

Bituminous—If the car supply was what it ought to be the difficulties in the coal trade would mostly disappear. A few days ago the cars became somewhat more plentiful, and at once coal began to accumulate, with reports that certain mines which were not favorably situated were shutting down. Then there would come counter reports, of mines in certain districts that could get scarcely any cars and were losing their miners to go into other business or other mines that did get cars.

Anthracite—The situation turns on sizes and the April market. As is the case at this time of the year there is an excess of chestnut, for the big stockers of coal are asking for larger sizes, as they cannot use chestnut in their furnaces. The city distributors are taking the reports of consumers, who are to be given a percentage of what they used last year. Much difficulty is experienced by those who are expecting to move or make other changes in their needs of coal.

The city shipping agents have a sort of semi-official price to work from, though it did not come in till April and seems to be subject to unexpected changes, as is the case with bituminous. The consumer will get coal at only 15c. reduction, as the decline of 30c. is halved by a 15c advance in freight. After the price seemed to be a certainty an order arrived that all coal mined in March must be sold at March prices.

The prospect of shipments by lake are not good and they will not be till there is a surplus of coal. Shippers do not seem to be making any preparation for loading vessels, though in former seasons they sometimes had hundreds of thousands of tons loaded before the lakes opened. Buffalo harbor has long been open this season and there is scarcely any ice in the lake at this point, though it will probably be some weeks before the upper lakes are open.

DETROIT

Bituminous coal is coming to the local market in fair volume. Anthracite is scarce. Lake shippers prepare for start.

Bituminous—Shipments of bituminous coal are being maintained in sufficient quantity to offset in fair degree the current requirements of consumers. The supply arriving is not so great, however, that

any accumulation occurs on tracks, and not much progress appears to have been made by many of the steam coal users in obtaining a reserve for future needs. Demand from steam plants is maintained in substantial volume, while there is a moderate amount of buying also by household consumers, who find it necessary to continue operation of heating plants and are unable to obtain hard coal or coke.

Comment is made by some of the jobbers that slack is less plentiful than would be desirable to meet needs of their customers. Incoming shipments also include little of the prepared sizes such as ¾ lump, 4-in. lump and egg, this being due, the jobbers say, to a disposition on the part of the operators to do away with what is regarded as unnecessary work in the preparation of stock. The opinion is expressed by some of the jobbers that the reduction in number of sizes is a movement in the right direction. In the retail trade interest is at present centered on the attitude of the Michigan fuel administrator in insisting that a margin of not to exceed $2.25 a ton is adequate for dealers handling domestic stock, after Apr. 1. Among some of the retailers there is an inclination to fall back on the earlier ruling by the Federal Administration permitting a margin of not to exceed 30 per cent. over the average of the gross margin in 1915. This, it has been calculated, would permit the retailers a margin of $3.21 this year.

Anthracite—With only a small amount of anthracite coming into Detroit, the retailers are in most instances unable to fill orders for stove or egg sizes. Household consumers who desire to put in stocks for next winter's needs are unable to do so. Uncertainty as to whether Detroit is to receive anthracite in anything like normal quantity this season is a feature of the situation, disturbing both consumers and dealers. Attempts to get definite information have elicited only more or less conflicting reports.

Lake Trade—Preparations for reopening the movement of coal up the lakes are well under way. Some railroads are already offering to move coal to loading docks. The movement is expected to start in large volume.

COLUMBUS

A slight weakness in both domestic and steam grades has developed in Ohio during the past week This is the usual lull before the lake season opens and is expected to pass away as soon as lake tonnage is required.

The usual between seasons lull has taken possession of the coal trade in Ohio territory. Both domestic and steam grades are showing slight softness, but not sufficient to cause any uneasiness in any quarter. The market is taking about all the tonnage now produced and storage is the order of the day. With the opening of the lake season in several weeks this condition is expected to pass away rapidly.

Steam business is now the best feature of the trade, according to both producers and distributors. Many steam plants are stocking up a large tonnage in order to be on the safe side in case of emergency. This is especially true of public service and large steam plants. General manufacturing concerns are also stocking up to a certain extent. Many steam users ordered coal from various sources during the time of stress and in larger quantities than was then needed. This coal is now coming in and only a few cancellations have been reported. Railroads are still taking a large tonnage for the movement of freight. Some contracting for steam tonnage is reported, but many sellers as well as buyers are waiting until the expected price readjustment is finished.

The domestic trade is also rather active, although some lull is reported in certain quarters. Dealers are stocking up to a certain extent, but there is a disposition on the part of some retailers to wait and see if it is possible to get Pocahontas and West Virginia splints. As a result stocking is not as active as might be expected under different circumstances. Hocking and Pomeroy lump is now the principal coals in the local market. The zoning plan is not expected to affect the local situation to any extent.

Prices of short tons f.o.b. mines are as follows:

	Hocking	Pomeroy	Eastern Ohio
Sized grades	$2.70	$3.05	$2.70
Mine-run	2.45	2.80	2.45
Screenings	2.20	2.45	2.20

CINCINNATI

Both contract and spot demand heavy. Operators chiefly concerned with maintaining production. Traffic congestion furnishes the principal difficulty.

The beginning of the contracting season finds operators and their agents with the situation entirely in their hands, as it requires no effort this year to induce large consumers to make contracts for their fuel requirements. The difficulty is going to be in keeping up with contracts, as it was last fall and winter, as it seems certain that the transportation situation is going to continue to be the chief problem of coal operators as well as of manufacturers and other business men. Reports indicate some improvement in the matter of car supply, but the movement of freight is extremely slow and unsatisfactory, on account of the great and constantly increasing volume of traffic which has to be cared for. There are plenty of indications that large coal consumers, here and elsewhere, taking the lesson of last winter to heart, are going to do everything possible to provide storage facilities at their plants and put in some coal during the spring and summer as this seems to be the only expedient which will go far toward preventing another winter shortage. Domestic consumers are being urged to secure their next winter's fuel early, and dealers report that orders are being placed in unprecedented volume accordingly. Prices are on the Government scale, including those of dealers, which are based on a two-dollar margin.

LOUISVILLE

Good demand for steam and domestic coal, with supplies light and little stocking underway at present due to inability to obtain cars at mines. Production at present time light in all Kentucky mining districts.

Kentucky mine operators are rather discouraged with present conditions and the outlook. The trade had been given to understand and had fully expected a good supply of cars at this season, but the car supply is about as bad as if not worse than at any previous time in months. In the eastern Kentucky districts supplied by the Louisville & Nashville R. R., only about a 48 per cent. supply is being furnished. The situation is probably still worse in the western Kentucky district, where the Illinois Central has been furnishing practically no cars, some mines having gone six and seven days without a car; while on the western Kentucky Louisville & Nashville lines only about a 40 per cent. supply is being furnished.

There is an active demand for both steam and domestic coal, with domestic consumers anxious to place orders for season needs, most orders being for 15- to 25-ton lots. At the present time there appears to be no certainty that summer prices will be made effective, as the Kentucky board is going ahead on the supposition that present prices will stand. Any change will probably come direct from Washington. The domestic demand has been so good, with supplies so light, that no large stocks are accumulating, and local yards have a barren appearance, such as is shown in December.

BIRMINGHAM

Steam market active and spot demand good. No contracting being reported. Domestic inquiry improves as April is ushered in. Surplus coal hard to find. Production on about same basis as last period.

As yet no changes either in prices or classification affecting the coal industry in Alabama have been announced by the fuel administration, and it is hardly probable that there will be any revision of the mine schedules at this time except such as is necessitated by altered classifications, which are undertood to have been agreed upon.

In the meantime there is an active demand for every ton of steam coal that can be produced in the district and any surplus product is hard to locate—in fact anticipated production over contract bookings at the mines is sold in advance, as has been the case for many months.

Domestic inquiry has stiffened some during the past week and a strong buying movement is expected to develop during the first part of April, as soon as it is definitely known whether or not there will be any price revisions.

The zone restrictions for this producing district contain practically the identical territory supplied normally, some little domestic coal having been shipped into the Carolinas in past years when dull trade conditions demanded expansion of territory, but this situation does not prevail at this time and domestic mines will have to maintain steady and heavy production to supply the officially allotted territory.

Brokers and other coal men affected by the new regulations are preparing to adjust themselves promptly to the new rulings effective Apr. 1, and under the present economic conditions in the coal industry the broker will merely become a purchasing agent for the consumer, which, in fact, has been his position for quite a while, instead of a selling agent of the mines.

Coke

CONNELLSVILLE

Car supplies poorer again, especially Pennsylvania cars. Market offerings light and confined chiefly to foundry.

Conditions as to car supply, after having been relatively good for three weeks, have grown particularly bad again. Last week's car supplies averaged only between 35 and 40 per cent and supplies this week have been relatively poor thus far. It is estimated roughly that last week's coke shipments were not over approximately 250,000 tons, against about 334,000 tons shipped in each of the three preceding weeks. The main difficulty is as usual with the Pennsylvania system, whose car supplies have been especially light, and on some days its contribution to the Monongahela R.R. have been almost negligible, the Pittsburgh & Lake Erie furnishing nearly all the cars that road secured. The Pennsylvania is now restricting certain types of cars from going off its tracks, especially affecting consumers reached by the Philadelphia & Reading.

Furnace coke is only occasionally offered in the open market. Operations have been so irregular that operators if they have any coke to offer can usually offer it as 72-hour, and therefore at the $7 price, so that the limited tonnages available in the market are almost altogether classed as foundry, and this coke must be sold to foundries, which as a rule is not difficult. Even with the "restricted" Pittsburgh & Lake Erie cars a buyer can usually be found. The market remains quotable at $6 for furnace, $7 for foundry and $7.30 for crushed, over 1-in. Sellers of coke screenings, obtained from old dumps, have raised their price from $5.50 to $6, having found a good sale for this new-found material.

The "Courier" reports production in the week ended Mar. 23 at 339,580 tons, an increase of 4458 tons, and shipments at 333,537 tons, a decrease of 416 tons.

Buffalo—The situation does not change materially. A moderate and constant supply comes in and the furnaces are able to get along with it. The ore supply at the furnaces is large, so that only a few small ore charters have been made, all at $1.50 per ton from Lake Superior. Furnaces have been handicapped somewhat by shortage of men and cars, but have as a rule done well. A charter meeting is to be held this week, when rates will no doubt be fixed. A good lake season in ore is looked for.

Birmingham—Coke producers report strong inquiry for this product in the local market, but there has been no improvement in the supply of either furnace or foundry coke, and only a limited tonnage is available to the spot trade. There has been some betterment in the car supply recently and producers have been able to make some progress in catching up on delayed deliveries. The Sheffield Iron Corporation will, in the course of a week or so, have 300 beehive ovens near Jasper in shape for operation. These ovens have been idle for many years and the output from them will be used in the furnaces of this corporation at Sheffield, which will be started up in the near future.

Middle Western

GENERAL REVIEW

The desire to clean up out-of-zone orders prior to Apr. 1 made the market active during the past week.

Producers with their own sales organizations and jobbers alike have had an unusual active week, confining their main efforts to clearing their books of orders that were outside the zone limit, which became effective Apr. 1.

When the zone plan was announced by the Fuel Administration almost every sales company had at least a few orders for domestic coal booked for movement to distant points, and beyond the zoning line. This was true on the higher grade and better prepared coals of southern Illinois and Indiana. Dealers in Lincoln and Omaha, Neb., and Council Bluffs, Iowa, who have for years handled southern Illinois coal, have taken advantage of the situation and urged the filling of orders

They also placed additional orders where they thought it possible to get them filled, the result being the neglect of tonnage movement for several days to within new zone districts to the advantage of out-zoning points.

This movement no doubt would have been far greater had there been a better supply of equipment. This movement has also reflected its benefits on the producers of inferior grades of coal, because of needs close to Illinois, Indiana and Missouri points.

The question of equipment has been quite a factor in helping to steady the market. Indiana has had only a 50 per cent car supply for the past week, Illinois about 65 per cent and in a number of instances embargoes have so reflected on the shippers that it had the effect of causing operators to find a new market for their coal. The taking away from Illinois and Indiana operators of markets that had been established for years, because of rail connections, has caused considerable confusion, which will take some time to overcome. This applied in particular to the Danville field, which depends to a great extent on the Wabash and Big Four railroads for its car supply. Danville is near the state line and had for years shipped a considerable tonnage into Indiana, east of the east zone for Illinois coal. Some of the operators from this field have asked Dr. Garfield to allow them to continue temporarily their movement into Indiana until they might establish connections elsewhere in the zone in which their coal is permitted to move.

CHICAGO

Market firm on better grades, buying heavy.

The Chicago market continues to be firm on high grades of Illinois and Indiana coal, and the trade is quickly taking up all free offerings. Williamson, Franklin and Saline County operators are not finding it difficult to get all the orders they need. During the week past several important factors entered the game, including some of the large railroad companies in the North and Northwest. Every possible pressure is being brought to bear on the consumer to show him that it is necessary to buy coal now if a coal famine is to be avoided next winter.

Quite a few contracts were closed during the past week, all at the Government price and subject to the approval of the Federal Fuel Administrator. The form of contract generally used was the one adopted by the National Coal Association and approved by Dr. Garfield.

Quotations in the Chicago market are as follows, per net ton f.o.b. car at mines:

	Williamson and Franklin	Saline and Harrisburg	Fulton and Peoria	Springfield	Carterville	Grundy, La Salle, Bureau and Will
Steam lump	$2.65@2.80	$2.65@2.80	$3.05@3.20	$2.65@2.80	$2.65@2.80	$3.35@3.50

MILWAUKEE

Coal men scraping the bins and yards in order to make the fuel supply last until first lake cargoes arrive. Fine weather helps the situation.

A survey of the coal district in Milwaukee harbor reveals the fact that the big coal handlers are "scraping the dish," so to speak and that Milwaukee's fuel supply is almost exhausted. Fortunately the weather continues so warm that the consumption for heating purposes has been reduced to a minimum, while rail supplies keep the busy industries moving. Prices are the same as they were in February and will no doubt be held steady until the Federal Fuel Administrator orders a change.

It is believed that after the houseowners in the cities have been supplied with their quotas of fuel it will not be a difficult matter to estimate the needs of the floating population in small flats and rented dwellings. In the rural districts the task of estimating transient needs will be an easier problem. It is becoming more apparent every day that there will be a great hegira to the wood piles the coming winter and that coal will be abandoned in the average country home from now on and until the coal situation betters.

The fuel administrator will review the mass of applications carefully, and in case it is thought more coal is asked for than is really needed an explanation will be requested.

ST. LOUIS

An unusually quiet market, with plenty of coal. Car shortage acute on Mobile & Ohio. Prevailing also on other lines. Steam demand easy, with no domestic business. A good tonnage of anthracite moving in and some Arkansas.

The local condition is extremely easy. There is practically no steam call at all, and all steam sizes are heavy. This does not apply on the coal from any one particular field, but is prevalent on all steam sizes from all fields. Coals that were difficult to get and have been in demand for many months, such as Nos. 1, 2, 3, 4 and 5, are a drug on the market. This is caused largely on account of the embargoes against Chicago on shipments via the Chicago & Alton and Wabash.

The domestic demand is light, both in the city and country, caused by an expectation on the part of the public that prices would go down on Apr. 1. Shortly after the first of April new prices are to be set in St. Louis for the domestic trade, and this will stimulate business. Everything looks extremely good for an unusual domestic tonnage.

The past week in the Carterville field has been unusually quiet. There has been a shortage of cars and in some places a shortage of water for washers and boilers. At a few mines there has been a little unbilled coal caused by being loaded in foreign equipment.

The Mt. Olive field has been a trifle heavy the past week in some sections. A few mines have had coal left over, but this was practically nothing in comparison with the tonnage produced. In a general way this tonnage has moved north and west up to the first of April in extremely heavy volume on account of the zone restrictions which went into effect on Apr. 1, which prevented Illinois coal from going out on the Omaha, St. Joseph or Kansas City market. This coal was largely domestic sizes, and at no period in the history of this field has such a tonnage moved in such a short space of time to the western markets.

The same conditions prevailed largely throughout the Standard field up to the first of the month. Nearly all the available well prepared lump and nut coal moved to the western market.

The car shortage is severe on the Mobile & Ohio and also on the Illinois Central and Iron Mountain lines. This has kept the tonnage down somewhat, but there has been no shortage of coal. As a matter of fact if car supply improves there is apt to be an over-production in the Standard field on account of the restricted areas into which the coal can now move.

During the past week a heavy volume of anthracite has been coming in and a few cars of West Virginia smokeless. There has been a fairly good tonnage of semi-anthracite and smokeless from Arkansas.

New prices for this territory are practically the same as they were previous to the first of April, with the exception that mine-run is 5c. higher.

The prevailing prices are, per net ton f.o.b. mine:

	Williamson and Franklin County	Mt. Olive and Staunton	Standard
6-in. lump	$2.65@2.80	$2.65@2.80	$2.65@2.80
3x6-in. egg	2.65@2.80	2.65@2.80	2.65@2.80
2x3-in. nut	2.65@2.80	2.65@2.80	2.65@2.80
No. 2 nut	2.65@2.80	.....	.....
No. 3 nut	2.65@2.80	.....	.....

No. 3	2.65@2.80	2.65@2.80	.....
No. 4	2.65@2.80	2.65@2.80	.....
No. 5	2.15@2.30	2.15@2.30	.....

Williamson & Franklin Co. rate is 87½c. Other fields 72½c.

SEATTLE

Outlook poor for West this winter.

The asumption made by the F deral Fuel Administrator that the coal-producing fields of Washington, Montana, Wyoming, Utah, Colorado and New Mexico can supply the bituminous coal needs not only of these six states but also of California, Oregon, Idaho, Nevada and Arizona, and must do so after Apr. 1 when shipments into these states from other fields must stop, is not founded on fact. It means that the coal fields of Wyoming, Utah, Colorado and New Mexico will have to supply not only their needs but practically the entire needs of California, Idaho, Oregon, Nevada and Arizona, as well as over 1,000,000 tons to Montana and over 250,000 tons to Washington, for these two latter states are not now nor did they last year produce anywhere near what they consumed.

Washington last year produced 4,002,749 tons of coal while Montana produced 4,406,155 tons, a total of 8,408,903 tons. Washington consumed 4,161,400 tons while Montana consumed 5,370,202 tons, a total for the two states of 9,531,602 tons, a difference of 1,122,699 tons consumption over production. Montana last year imported 1,158,612 tons of coal and exported 186,565 tons. Washington imported 539,263 tons and exported 380,610 tons. Under the new arrangements it would not be expected that Montana would export any coal, which would still leave her an excess consumption of 972,047 tons over production. Of Washington's imports 50 000 tons were from Montana and 12,000 tons from eastern states, which she could not expect this year. About 356,000 tons were imported from British Columbia and 121,897 from Utah and Wyoming.

If Washington did not export any coal this year she would have to import 150,000 tons of coal from Utah and Wyoming which, combined with her production, would just equal her consumption; and her 380,000 tons of exports to California, Oregon, Idaho and Montana would have to be borne by Utah and Wyoming. It is not expected that British Columbia will be able to export to either Washington or Montana the amount of coal it did last year, which will also increase the amount of coal Utah and Wyoming mines will be expected to furnish these two states. For this reason it is safe to say that Utah and Wyoming will have to supply a deficiency of more than 1,250,000 tons of coal to Washington and Montana this year, for whatever increased production may be made in the latter two states this year will be absorbed by increased consumption.

The figures upon which the report is based are from the offices of W. J. Swindlehurst, of Montana, and David Whitcomb, of Washington.

Semifinished nuts sell at the following discounts from list price:

	Apr. 1, 1918	One Year Ago
New York	40%	50— 6%
Cleveland	60%	50—10%
Chicago	50%	50—10%
St. Louis	50—10%	.....

MACHINE BOLTS—Warehouse discounts in the following cities:

	New York	Cleveland	Chicago	St. Louis
⅝ by 4 in. and smaller	30%	45%	40—2½	40%
larger and longer up to 1 in. by 30 in.	15%	33⅓ %	30—5%	35—5%

WASHERS—From warehouses at the places named the following amount is deducted from list price:

For wrought-iron washers:

New York..$1.00 Cleveland..$2.00 Chicago..$3.00 St. Louis..$3.00

For cast-iron washers the base price per 100 lb. is as follows:

New York..$5.00 Cleveland..$4.50 Chicago..$3.50 St. Louis..$2.75

RIVETS—The following quotations are allowed for fair-sized orders from warehouse:

	New York	Cleveland	Chicago
Steel ⅞ and smaller.....	30%	35%	40%*
Tinned	30%	35%	40%*

*For less than keg lots the discount is 35%.

Button heads, ¾, ⅞, 1 in. diameter by 2 in. to 5 in., sell as follows per 100 lb.:

New York ..... $7.00 Cleveland ..... $5.85 Chicago $5.50

Coneheads, same sizes:

New York ..... $7.10 Cleveland ..... $4.50 Chicago $5.60

MISCELLANEOUS

GREASES—Prices are as follows in the following cities in cents per pound for barrel lots:

	Cincinnati	Chicago	St. Louis	Birmingham	Denver	Pittsburgh
Cup	7	5¼	6.1	7½	10	7½
Fiber or sponge..	8	6	6.4	7½	15	7½

Commercial ..	50.00	35.00	22.00	17.75	30.00	28.00

HOSE—Following are prices of various classes of hose:

	Fire
	50-Ft. Lengths
Underwriters' 2½-in.	75c. per ft.
Common, 2½-in.	40%

	Air		
	First Grade	Second Grade	Third Grade
¾-in. per ft.	$0.55	$0.30	$0.25

Steam—Discounts from list

First grade... 30% Second grade... 30-5% Third grade... 40-10%

LEATHER BELTING—Present discounts from list in cities named:

	Medium Grade	Heavy Grade
St. Louis	40+5%	35%
Denver	35%	30%
Birmingham	35%	40%
Chicago	30—10%	40—5%
Cincinnati	40—10%	40%

RAWHIDE LACING—40% off list.

PACKING—Prices per pound:

Rubber and duck for low-pressure steam	$0.90
Asbestos for high-pressure steam	1.65
Duck and rubber for piston packing	1.00
Flax, regular	.90
Flax, waterproofed	1.10
Compressed asbestos sheet	1.00
Wire insertion asbestos sheet	1.20
Rubber sheet	.60
Rubber sheet, wire insertion	.90
Rubber sheet, duck insertion	.50
Rubber sheet, cloth insertion	.25
Asbestos packing, twisted or braided, and graphited, for valve stems and stuffing boxes	1.10
Asbestos wick, ½- and 1-lb. balls	.65 to .70

WIRE ROPE—Discounts from list price on regular grades of bright and galvanized are as follows:

	New York and St. Louis
Galvanized iron rigging	+ 20%
Galvanized cast steel rigging	List
Bright plain rigging	30%
Bright cast steel	17½%
Bright iron and iron tiller	5%

MANILA ROPE—For rope smaller than ⅝-in. the price is ½ to 2c extra; while for quantities amounting to less than 600 ft. there is an extra charge of 1c. The number of feet per pound for the various sizes is as follows: ⅝-in., 8 ft.; ¾-in., 6; ⅞-in., 4½; 1 in., 3½; 1⅛-in., 2 ft. 10 in.; 1¼-in., 2 ft. 4 in. Following is price per pound for ⅝-in. and larger, in 1200-ft. coils:

Boston	$0.34½	Atlanta	$0.33¾
New York	.33¼	Denver	.30½
Cincinnati	.33⅓	Kansas City	.33½
Chicago	.32½	New Orleans	.33
St. Paul	.34	Seattle	.33½
San Francisco	.31	St. Louis	.33
Pittsburgh	.36	Los Angeles	.32

PIPE AND BOILER COVERING—Below are discounts and part of standard lists:

FREIGHT RATES—On finished steel products in the Pittsburgh district, including plates, structural shapes, merchant steel, bars, pipe fittings, plain and galvanized wire nails, rivets, spikes, bolts, flat sheets (except planished), chains, etc., the following freight rates are effective in cents per 100 lb.:

Boston	21.5	Minneapolis	35.5
Buffalo	11.6	New Orleans	30.7
Chicago	21.5	New York	19.5
Cincinnati	18.5	Philadelphia	18.5
Cleveland	13.5	St. Louis	27.0
Denver	79.0	St. Paul	35.5
Kansas City	47.0	Pacific Coast (all rail)	90.0

COAL AGE

Volume 13 NEW YORK, APRIL 13, 1918 Number 15

The Organization of Time

By Floyd W. Parsons

OF ALL things leading to individual success none is so important as the systematic and effective use of all the hours in each day. The only kind of man who can step out from the crowd and become a leader is the fellow who has so organized his time that no minutes are squandered.

Time never works, but it does eat, rust and destroy. It gives us, however, the opportunity for accomplishment. We may regain wealth by economy, knowledge by study, and health by temperance, but lost time is gone forever.

The man who is choice of his time is always choice of his company and his actions. Often it is only for a moment that the favorable instant is presented. Miss it, and months and years are lost. A stray five minutes may easily contain the event of a life. Successful men have ever been misers of moments.

All systematizing of human effort, of course, shall be based on Nature's laws. There must be hours for rest and play, so as to invigorate brain and body and give them a renewed appetite for labor. People who work best should play best—leisure is just as needful as is activity. However,

THE MAN WHO LACKS CONTROL OF HIS TIME WILL NEVER CLIMB HIGH

A PROPER MARSHALING OF THE HOURS REMOVES ALL OBSTACLES ON THE ROAD TO SUCCESS

recreation must be rational; it must have its limits and its place on each man's self-arranged daily schedule.

Success does not depend on the amount of work done, or on the number of things accomplished, but on the importance of what we do. Many men who fail do enough, but they labor at haphazard. A few jobs finished is far better than many jobs not completed. We must select the right things to do and do them when the results count for most.

Discipline in the administration of time is vital. Precepts are but theory. It is discipline that cultivates self-respect and obedience, and the best discipline is always combined with freedom, mildness and sympathy. The man who lacks self-discipline certainly cannot command others.

To get the most out of each hour requires concentration. The man who defers concentration, waiting for something important to turn up, will be unable to master the situation when the big moment arrives. Only by practice can one prepare. Not until we can shut out from our minds all ideas irrelevant to the problem immediately before us are we prepared to play a major role in life. Divided attention means broken force. No man can organize his time before he is able to focus all his energies on one point.

IDEAS AND SUGGESTIONS

Check on Explosives for Miners' Use

By R. W. Mayer
Connellsville, Penn.

The distributing powder houses are situated near the mine entrance at the mines of the United States Coal Co., of Gary, West Virginia.

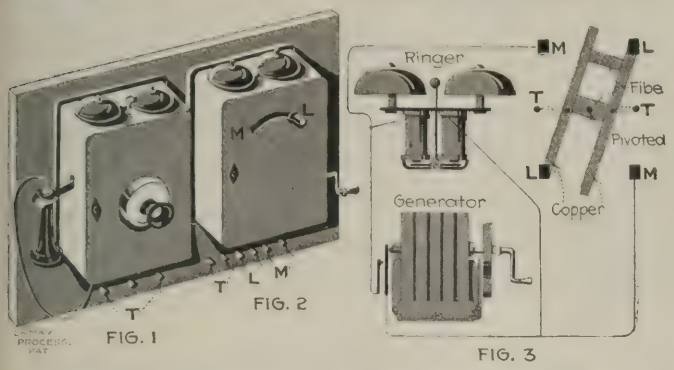
The miners pass these houses on their way to work, before entering the mine. Each mine has a distributing house, which is in charge of a man licensed to handle explosives, and also a clerk. The licensed man issues the explosives and detonators to the miners in the quantity called for, and the clerk takes the miner's name and payroll number, together with the number of detonators and sticks of explosives issued to him. The miner buys stamped brass checks at the store, or commissary, which he gives in exchange for the explosives issued to him. Each check calls for a certain number of detonators or sticks of explosive.

Each mine is divided into from six to ten districts, according to the size of the mine. An assistant mine foreman has charge of each of these districts or sections. He is in his section before any miner is allowed to enter it. He meets the men at the entrance to his section of the mine, and enters on a report sheet the amount of explosives each miner carries into the mine for that day. The distributing powder house is closed before the starting time of the mine.

The time of closing varies with the extent of the workings of the different mines. It is regulated so that a miner, after receiving his explosives, will have time enough to get to his working place before starting time, so that the amount of his powder may be checked up by the assistant foreman. The assistant foreman fires all the shots. The miner drills the holes, prepares the clay tamping and charges of powder, but does not load the holes. He also stretches out the shooting cable. Each miner has his own shooting cable. He has everything in readiness for loading the holes and firing the shots. The shots are all fired by detonators and batteries. The tamping material is a dry clay. This clay is poured into paper cylinders, tubes or cartridges which are a little smaller in diameter than the drill hole. These paper cylinders are made by rolling a piece of newspaper around a cylinder-shaped stick of the proper diameter, one end of the stick being slightly smaller than the other end so the paper cylinder will slide off the stick easily. About 2 in. of the paper is allowed to extend beyond the small end of the stick. This extending end of paper is folded against the end of the stick, when the paper for the cartridge is rolled on the stick, closing one end of the cartridge. The larger end of the cartridge stick should extend beyond the paper to furnish a hand-hold for slipping the paper cartridge off the stick. The coal is undercut by electric chain cutters during the night. The miner, while waiting for the assistant foreman to come and fire his shots, cleans the "bug dust" out of his cut and loads it into cars, sets timber close up to the coal face and lays track up against the face of coal. When the assistant foreman shoots each miner's shots he enters on his report sheet the number of detonators and sticks of explosives used by the miner, and the amount of each he has remaining on hand. Sections are of such a size that he makes his round through the section a number of times and shoots the miners' shots on any of his visits during the day. The ventilation is such that the smoke from the shots doesn't annoy the miners. When the assistant foreman makes his last visit for the day and examines the miner's working place, he questions the miner as to how much explosives he'll require for the next day. If the estimate is reasonable, he enters it on his report sheet without correction. Otherwise he corrects the miner's estimate, although this rarely happens.

This estimate is turned over to the clerk at the powder distributing house, to guide him in issuing explosives to the miners the next morning. No miner is allowed to have issued to him more explosives or detonators than called for by the assistant foreman's estimate. This supervision of the amount of explosives issued, and when and where used, apparently works a hardship on no one, unless it would possibly be the one miner out of a hundred who would use the explosive for an illegal purpose.

GETTING AHEAD



By WILLIAM GRIFFITH
SCRANTON, PENN.

THERE'S an ancient adage, time-worn and riven,
"Unto him who hath it shall be given";
But in modern days we say instead
"It's the man with a pull who gets ahead."
Now, if this is so, it is true, perforce,
That the needful thing is the pull, of course.
But when to secure it in vain you try
You'll find that the adage is all awry;
It must be reversed, like an "Irish Bull"—
It's the man with a *head* who gets the pull.

Combination Telephone System

By Frank Huskinson
Lafayette, Colo.

A telephone was needed in the superintendent's house that would communicate with various parts of the works. This residence already was provided with a local long-distance telephone, but no connection had been made with the mines and shops. The interior of the dwelling was finished and furnished in an artistic man-

FIGS. 1 TO 3. DETAILS OF TELEPHONE SYSTEM

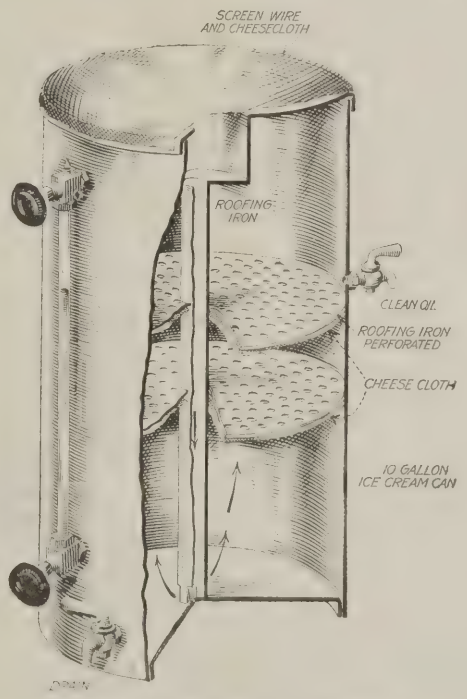
mer, and not wishing to install another telephone I made up the combination telephone system here described and illustrated.

In the accompanying diagrams, Fig. 1 shows the local long-distance telephone already installed, also the lines *LL*. I made up the neat box shown in Fig. 2 to match the one in Fig. 1, and had this just large enough to hold a magneto-generator and ringer coils, of the same capacity as those in use on the mine telephone system. I also made up and arranged a special switch and connections, see Fig. 3. This switch was mounted on the inside of the door of the box in Fig. 2. The details of this switch are as follows: *MM* are two switch contacts to which the mine telephone lines are connected; *LL* are two switch contacts to which the local telephone lines are connected; *TT* are the two terminals connected to the terminals *TT* in Fig. 1. These two lines are connected by a flexible connection to the two copper switch blades, which are held in position by the two fiber pieces. On one of these fiber pieces the switch blades are pivoted. On the other piece is the handle for changing the position of the switch from *L* to *M*, or from the local system to the mine system.

In Fig. 2 the switch handle is on the front of the box and the handle for the operation of the magneto-generator on the side. The telephone in Fig. 1 has no generator for signaling, as this type of telephone signals central when the receiver is removed from the switch hook.

In the working of this combination system the switch is always left in the position *L*, see Figs. 2 and 3. This leaves the telephone connected to the local long-distance lines *LL* and is always ready for use on this line. The ringer and the generator shown in Fig. 3 are connected to the mine telephone lines *MM*. This allows the signals from the mine telephone system to come in on the ringer (see Figs. 2 and 3); also, the mine telephone system can receive signals from the generator, Figs. 2 and 3. Any time that the signal is for the superintendent's residence, an answering ring is given, and the switch lever is moved from the *L* position to the *M* position, thereby disconnecting the telephone from the local lines *LL* and connecting it to the mine lines *MM*. As soon as the conversation is finished the switch is moved back to the *L* position, thereby disconnecting the mine lines and connecting the local lines.

The telephone, Fig. 1, and the combination box, Fig. 2, are mounted close together. This is a type of installation that can be used to advantage in many places. It is considerably cheaper than two separate telephones, takes up little room, is not conspicuous, and is just as reliable and satisfactory as two instruments would be.



Homemade Oil Filter

By Jack L. Ball
Amsterdam, Ohio

Feeling the need of an oil filter for a fan engine which is situated quite a distance from the main engine room, but the prevailing high prices preventing the purchase of a new one, I made a filter myself. This was constructed as follows:

The materials used were an old 10-gal. ice cream can, scrap roofing iron, screen door wire and cheese cloth; the gage glass connections were fittings from an old lubricator; the only new parts purchased were two cocks, one gage glass and two yards of cheese cloth.

The filter, which is illustrated herewith, was made during spare time while on shift and the cost for ma-

EASILY MADE OIL FILTER

terials was about $1. All joints were soldered, and the filter cloths and the like arranged so that when it is necessary to clean the filter all that one has to do is simply lift out the parts shown and clean them with steam. This device saves carrying considerable oil. Furthermore it cleans the used oil nicely. During cold weather it is placed on top of the steam chest, which assures warm oil.

Excuses are a sort of mental roller skate that hurries a man backward in his business career.

Successful Steel Breakers of the Lehigh Valley Coal Company

BY GEORGE W. HARRIS
Editorial Staff of "Coal Age"

SIGNAL success in industrial lines is often decided by the substitution of modern for antiquated ideas. To the anthracite operator a breaker is a mill in which four to five million dollars worth of coal may be prepared annually for a period of 25 years or so. Why should it be built of wood anymore than mills of similar importance in other industries? The progressives among the anthracite men are building steel breakers and washeries. The Lehigh Valley Coal Co. has been a pioneer in the present movement, and its practice and that of the leading designer, fabricator and builder of such structures is given in the accompanying discussion. Conditions warranting the use of steel are noted—it is decided on a cost-per-ton basis—a matter of capitalization. Various considerations affecting the design of steel breakers are mentioned—shapes successfully used are noted. Preliminaries settled, the course pursued in the design of a breaker is given. The matter is viewed broadly. The occurrence of the coal in the mine is graphically shown by the sections of basins—supplementary notes cover details. All this information is important in the successful preparation of anthracite. Lehigh Valley practice at its various steel plants is given—in detail at the Franklin Colliery. Structural steel is an ideal material for the framework of a building. The number of successful steel breakers and washeries in existence and building indicate the way the wind is blowing in the anthracite coal region.

WHILE coming over the summit of the mountains above Wilkes-Barre, Penn., winding in and out among the ravines and low hills forming the topography of the top of the ridge, an unusual opportunity to view the country spread out before him is given to the traveler on the Lehigh Valley R.R. Should it happens to be one of those rare calm mornings of that peculiar state of the atmosphere when exhaust steam rises in a perpendicular column to a considerable height —what a sight is presented over the length and breadth of the Wyoming Valley.

To the mining man, these steam columns are most interesting. They mark the location of hoisting, breaker and fan engines, so necessary to the mining and preparation of the anthracite coal of the region of which Wilkes-Barre is the principal city. The coal operator realizes better than the layman the full significance of this expenditure of power. During a recent year the Wilkes-Barre district produced 5,533,967 tons of coal, of which 563,902 tons were used for steam and heat. This means that for every 100 tons of anthracite sent out from the breakers 12 tons are charged up to running expenses. No mean item of operation at the ruling price of coal. Each year anthracite requires more careful mining and preparation, the two going hand in hand when best results are attained. With the depletion of the better seams and the thicker ones, the thin beds and those containing a larger percentage of bony and slate partings are mined. This means an overhauling of out-of-date breakers, discarding of antiquated machinery, the installing of modern types and frequently the rebuilding of the whole plant. Breaker practice has undergone many changes to suit the requirements of mine and market. Possibly as striking a change as any is the substitution of more permanent building materials for the wood almost universally used in breaker construction not many years ago.

It was in the '90s that Coxe Bros. & Co. built its iron breakers at Drifton and Oneida collieries. This company was the pioneer in this respect, and the breakers attracted much attention. Built to minimize fire risk and cost of insurance, it was not long before the Oneida breaker was destroyed by fire. At that time the difference in the cost of iron and wood was a serious item and the new method of breaker construction received a decided setback.

To-day conditions are much changed, both as to the

relative cost of steel and wood and the sentiment about steel as a building material. At present there are 18 steel breakers or washeries in the Pennsylvania anthracite field, either constructed, building or being designed, distributed as follows: The Lehigh Valley Coal Co. leads with 5; the Delaware, Lackawanna & Western has 4; the Lehigh Coal & Navigation Co. has 2; the Pennsylvania Coal Co. has 2; the Lehigh & Wilkes-Barre has 1. The independent companies have 4, of which the G. B. Markle Co. has 2. Of these 18 structures 12 were either built or the material of which they were constructed was fabricated by the Guerber Engineering Co., of Bethlehem, Pennsylvania.

FIG. 1. FRANKLIN COLLIERY—CAPACITY 1500 TO 1800 TONS

It was not a complicated line of reasoning which influenced the coal operators —both bituminous and anthracite—to adopt steel as a material with which to construct their plants for the preparation of coal. It was the natural outcome of such conditions as the increasing scarcity and cost of timber, the decreasing cost of steel, its comparative permanency, inflammability and general adaptability for structural purposes. Structural steel lends itself particularly to conditions imposed on breakers and tipples. Such buildings are subjected to severe stresses which are satisfactorily met by steel structures; on the other hand rigid construction might be seriously weakened under similar conditions of service. Steel tends to spring back after a stress—unless the safe limit has been exceeded. If wooden structures are not made rigid, the joints rapidly deteriorate under racking stresses. If water works into the joints of timber framing, decay may proceed so rapidly as to necessitate replacement in a comparatively short time. This is true of many of the sticks in a breaker. The designing of steel breakers is a new field—there is little precedent to go by. A well designed wooden breaker might serve as a guide in proportioning various members of a steel structure. But new wooden breakers often have large excess of strength in some pieces of framing—especially in the case of sticks which it would be difficult to replace. In many cases a much larger piece of timber is used than necessary to carry any possible load to which they are subjected, largely to allow for probable decay in a few years. In this weakened condition the piece of timber is still supposed to have sufficient strength.

The Guerber Engineering Co. designs a breaker so that not more than 16,000 lb. fiber stress shall develop in any member. This gives a factor of safety of 4. In connection with factors of safety, a story is told about Prof. Mansfield Merriman, the well known authority on roofs, bridges and structural work in general. He was presiding over a meeting where a certain bridge was under discussion. Being asked what the factor of safety of the structure was, he replied "the grace of God." It so happened it was a notably weak bridge.

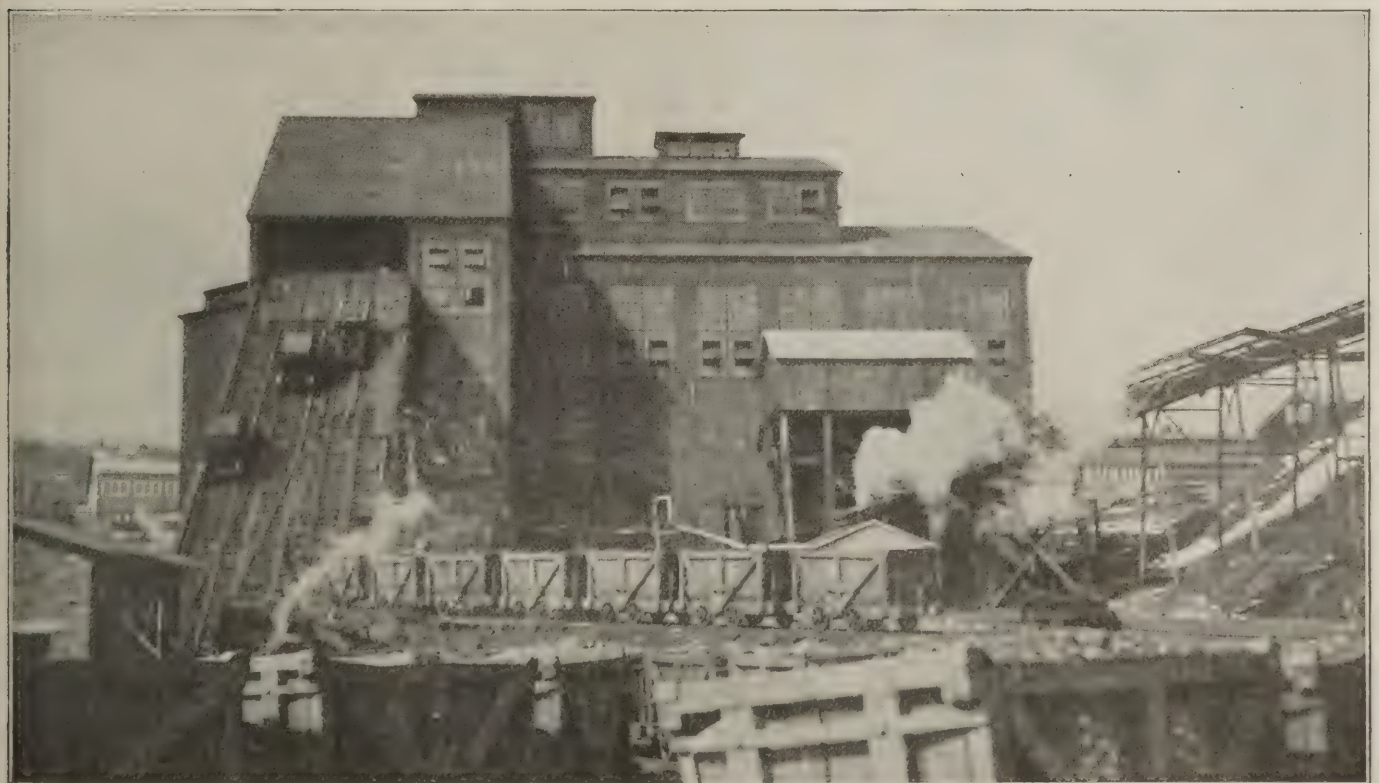


FIG. 2. DRIFTON BREAKER—ORIGINAL IRON BREAKER IS LEFT PORTION OF STRUCTURE

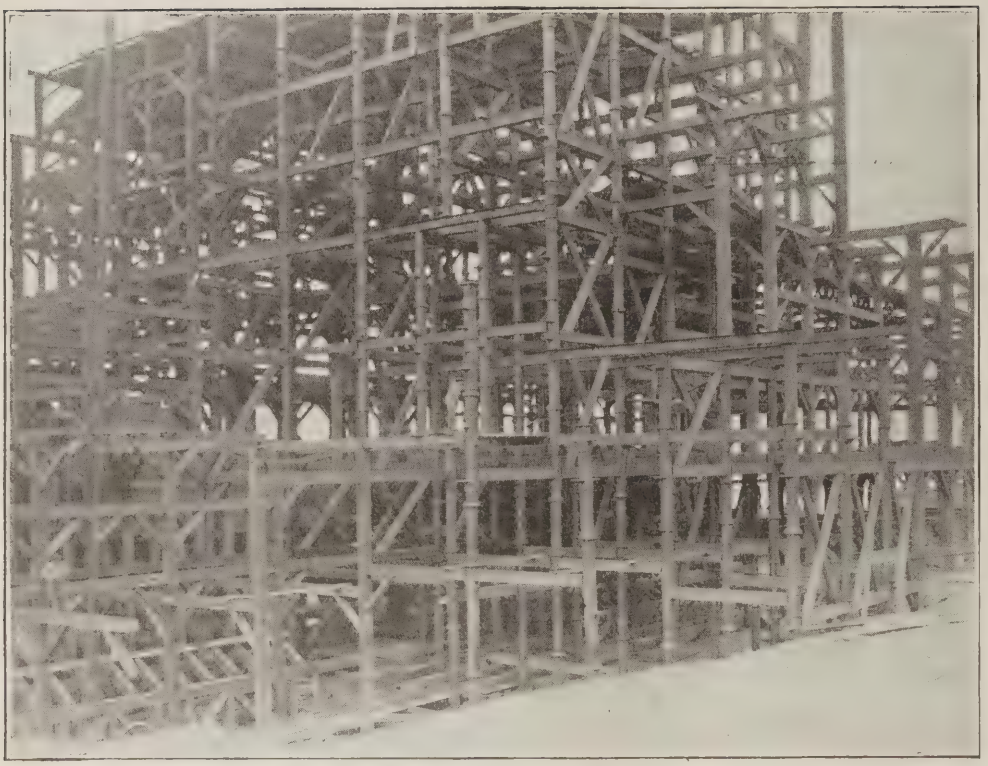

FIG. 3. FRAMEWORK DETAILS OF A WOODEN BREAKER

Figuring the loads in breaker design is a complicated problem. There are vibratory loads to consider, also variable ones. A floor may be calculated for specific load and later it will develop that the space may be used for machinery, bins of coal, etc. Machinery greatly complicates the load problem.

There should always be an economical flow of material through the breaker, yet keeping it confined to as small space as possible.

In ordinary steel buildings the floors are settled first and are continuous through one level. Not so in a breaker. Here the machinery is located and then the floors are placed to suit its requirements, being careful to have steel members not foul belts and shafts. The continuity of floors is much broken up and numerous platforms are required around machinery, etc., for the use of workmen. There is little opportunity for repeated work. The floors are at many and varied levels with no regularity.

It is customary to design a breaker from the roof down, the posts at the bottom being the last consideration. Also it is good practice to avoid complicated built-up work as offering possible crevices and cracks where moisture may sometimes enter and cause rust. Riveted work furthermore brings in the human element and an additional possibility of trouble from rust. The H column is the salvation of the breaker business. Other good sections used are beams where possible. In other words use a wide flange girder rather than a built-up section.

Breaker bracing is important and it may consist of either angles or rods. The latter type offers the advantage of adjustment at any time and rods do not take up as much room as angles. Bracing complicates connections, necessitating special design—standard connections cannot be used. Also machinery weighs and connections must be heavier than usual. This is important.

As in the case of any steel structure, breaker frames can be protected to advantage by some good paint. One or two good coats of a suitable protective paint will last for a long time. A good tar paint may be as desirable as anything—especially where wet conditions may exist. There are comparatively few breakers nowadays where coal is prepared dry. At the pockets steel should be well protected. The coal entering them is usually wet. Also it tends to wear off ordinary protection to columns and other steel members. The bottoms and sides of pockets are generally combinations of steel, cement and boards. The posts passing through pockets are often protected by cement with boards which were used as forms outside.

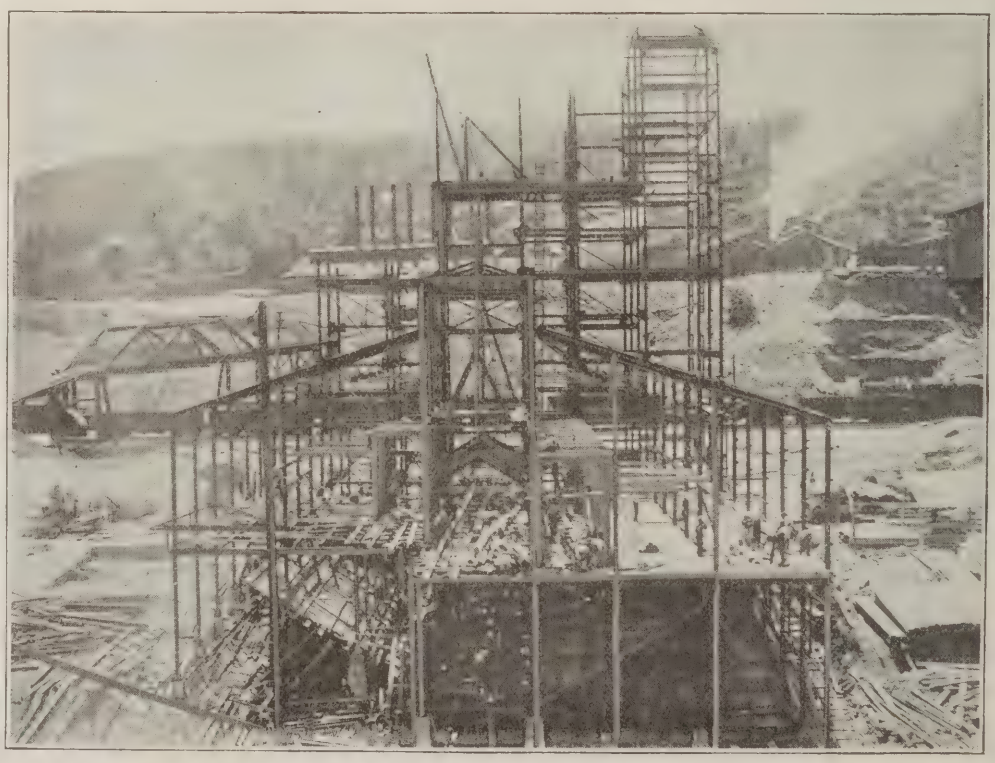

FIG. 4. PACKER NO. 5 STEEL BREAKER DURING CONSTRUCTION

FIG. 5. VIEW OF PACKER NO. 5 PLANT—2500-TON BREAKER IN CENTER

As to the actual process of erection of steel breakers conditions are generally none of the best. In many instances it is a case of building a new breaker on or near an old site. Space for storing material is usually limited, as are also accommodations for labor. Some fine records have been made in steel breaker construction from design to erection.

At the best, the life of a wooden breaker is placed at 20 years—in many cases less. The annual depreciation in certain parts is extremely heavy—in the pockets and some heavy timbers it will amount to 25 per cent. And it is very difficult to replace some of these timbers. At present the tendency is to concentrate tonnage from various mine openings for preparation in a large breaker. In most cases this arrangement fixes the life of a plant at more than 20 years. There are some instances where limited, isolated workings have been cleaned up by a small plant. In this case a wooden breaker might fill the bill.

As to whether a breaker should be built of steel or wood is tersely expressed by the Lehigh Valley Coal Co. as a case of capitalization. Thus there is a certain acreage to be developed. The coal tonnage in the ground is estimated and the annual production at the proposed plant decided upon. Then the cost for both a wood and steel breaker is computed on a cost-per-ton basis. Add annual interest charges, sinking fund and maintenance cost. The cheaper is the one to build.

Repairs and replacements in wooden breakers can be very heavy. For example, a replacement of 60,000 ft. B.M. in one breaker was at the rate of $80 per M. In another case a 26,000 ft. B.M. replacement was at the rate of $117 per M. One breaker was remodeled at a cost of $119 per M for 331,000 ft. B.M. In another case $107 per M was paid for 447,000 ft. B.M. In still another breaker $178 was paid per M for 144,000 ft. B.M. In this last case there was considerable machinery to reset, but there was still a charge of $139 per M on woodwork alone. In all of the foregoing cases of remodeling there was included taking out old work, replacement with new and resetting machinery.

The Lehigh Valley breaker foundations are designed for one ton per square foot bearing on soil. The columns are spaced so that each will not exert more than 30 tons pressure on the foundations. The breakers of this company are generally riveted structures, but some of their washeries may have bolted connections on occasion. This latter matter introduces some nice questions of judgment into the discussion. Small structures when bolted can readily be taken down and moved from place to place—profitably in the case of washeries on a 10-mile limit. It is said to cost in the neighborhood of $30,000 to move an average washery, and that amount of cash will move a lot of coal.

Should a steel breaker be decided upon several methods are followed as to designing the structure. Sometimes the coal company furnishes a structural steel concern with plans giving location of machinery, chutes, pockets and other main features of the breaker or washery. In that case the steel company may design the structural

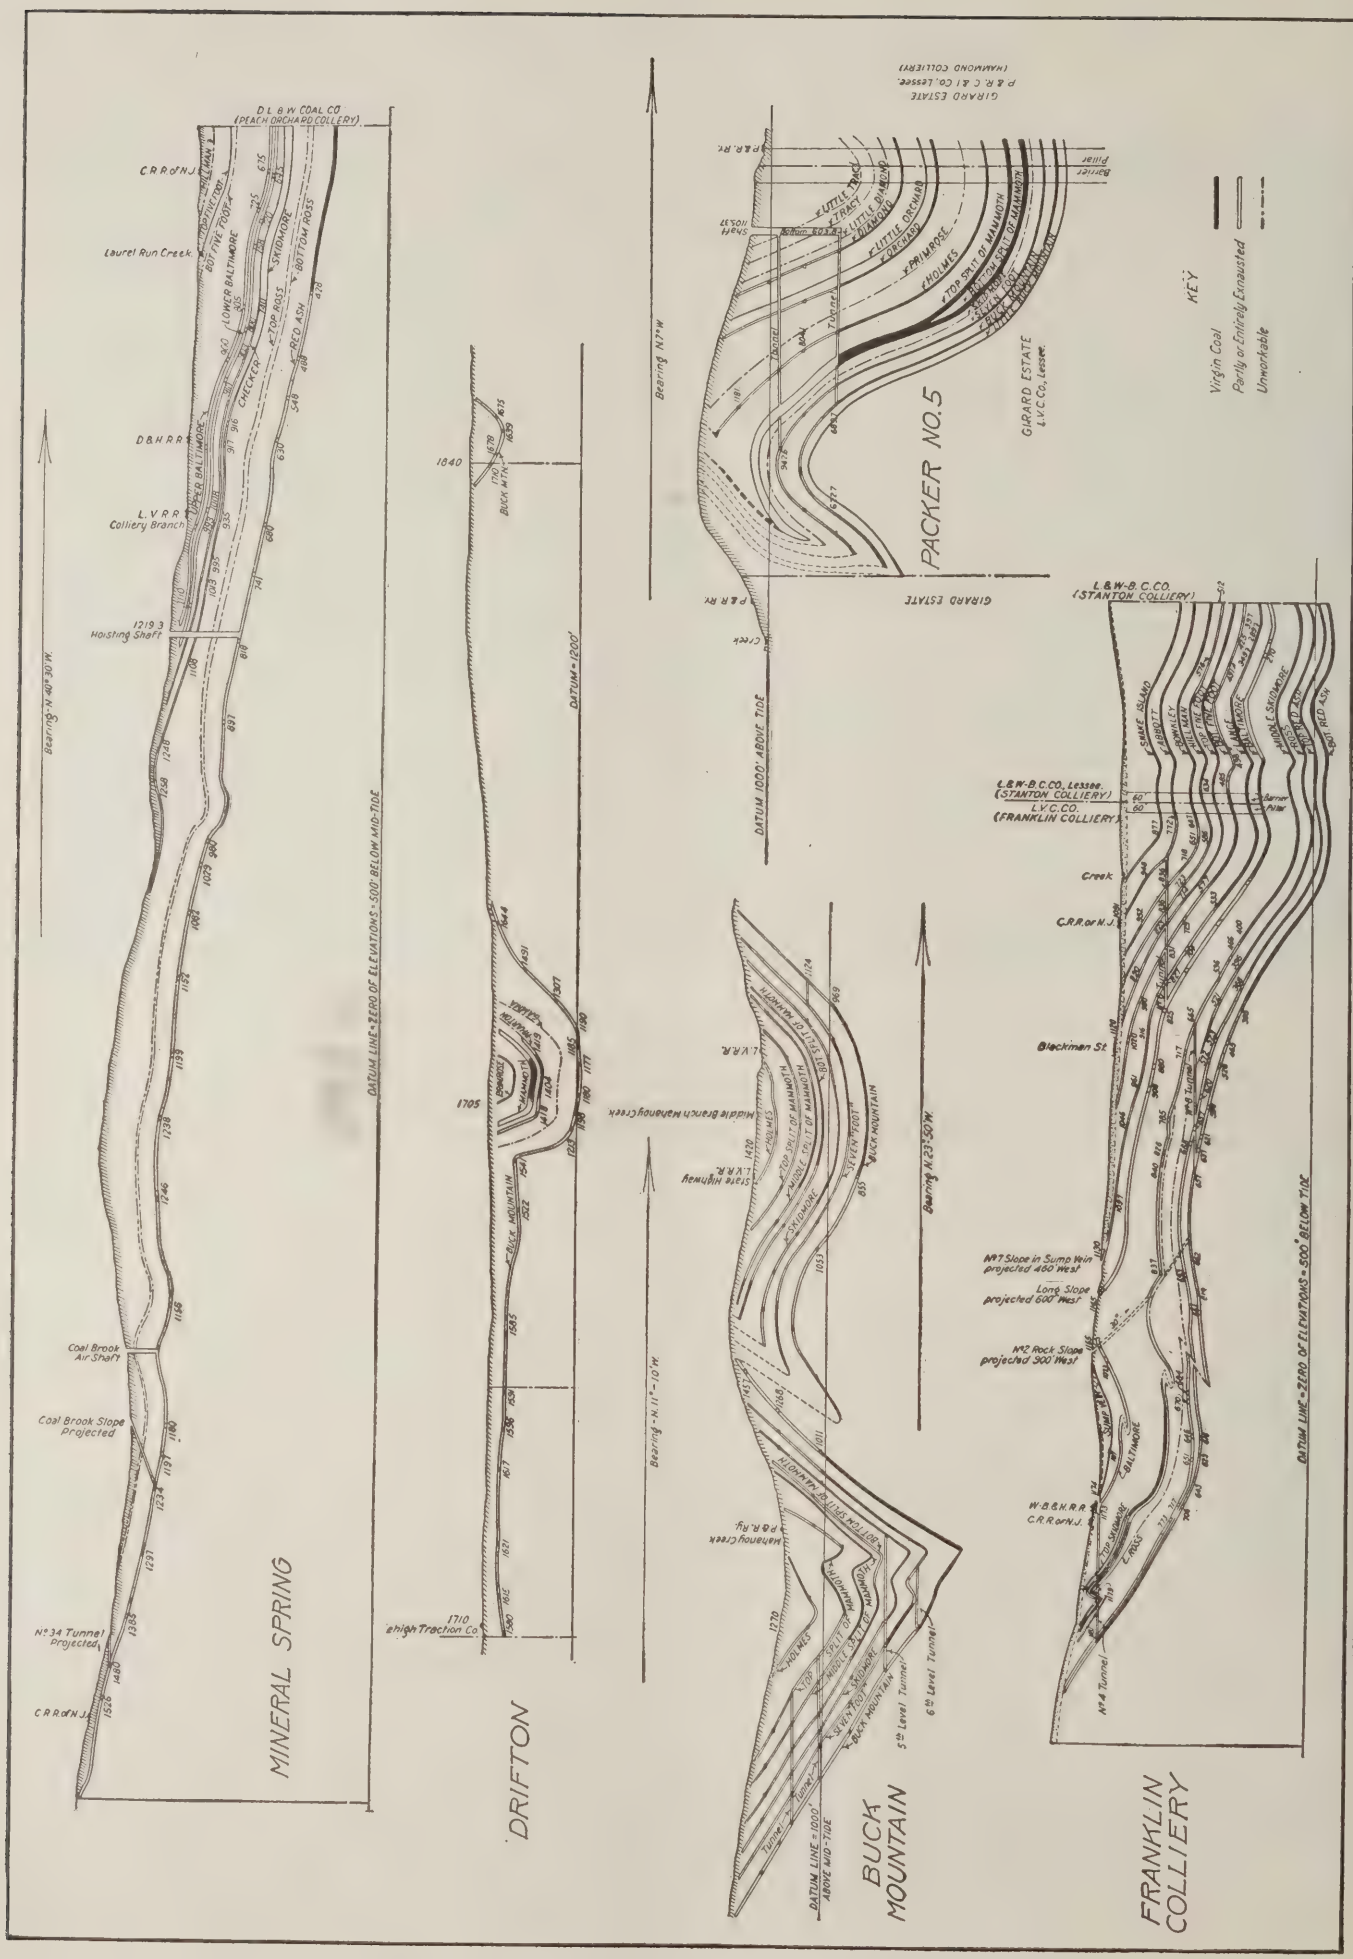

FIG. 6. CROSS-SECTIONS OF COAL BASINS AT THE FIVE STEEL BREAKERS OF THE LEHIGH VALLEY COAL COMPANY

frame, calculating stresses and working out details. From these plans the material can be fabricated. At other times, especially when the mechanical engineering department of the coal company is not swamped with other work, then they may prefer to work up complete plans themselves. A saving is effected by this method on the cost of structural material to the operator, but not necessarily on the total cost of the breaker. If the same concern designs, fabricates and erects the building, certain advantages attend. Coöperation benefits

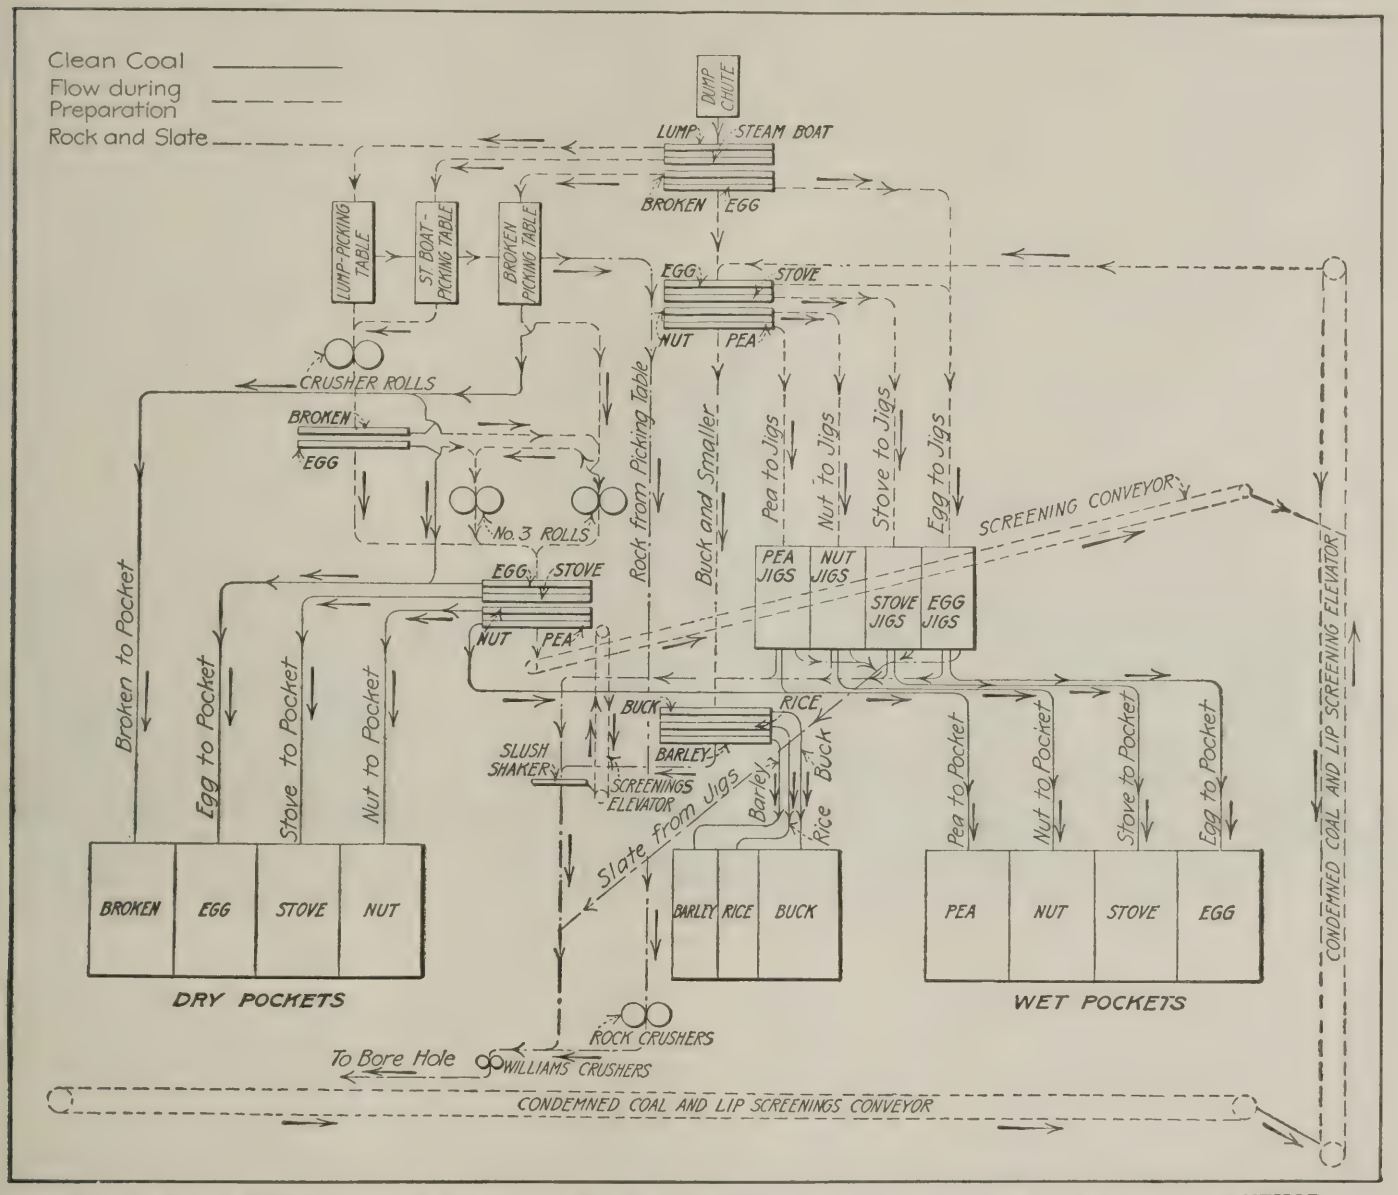

FIG. 7. FLOW SHEET OF THE FRANKLIN STEEL BREAKER, SHOWING TYPICAL WET AND DRY METHOD

may accrue in the design of practical shapes which are most economically fabricated in the shop and quickly erected in the field.

To a man who becomes completely absorbed in working out the many problems connected with the preparation of anthracite coal, the design of a breaker may be as interesting as reading a novel. As a preliminary in such an undertaking, Paul Sterling, mechanical engineer of the Lehigh Valley Coal Co., states that having a certain tract of coal on which to locate a plant, estimate the total tonnage which will likely be prepared over the proposed breaker; judge as to the probable character of the run-of-mine; sketch out the probable flow sheet and settle on the daily output. The cost of the breaker should be reduced to a cost-per-ton basis, which is obtained by dividing the cost of the structure by the total estimated tonnage in the property.

Next the probable make-up of the shipments should be determined. Also the probable per cent. of each size. Suppose the following eight sizes are to be made: Broken, egg, stove, nut, pea, buckwheat, rice and barley. Should it be decided not to make broken coal, then add a percentage of each size to the next lower. Likewise in the event that no broken or egg are to be made. When the sizes of coal to be made have been determined and the percentages fixed, then the machinery for preparation can be designed. Breaker capacity for a maximum of each size should be secured. Determine the area or size of shakers; number and size of rolls; number of jigs or mechanical cleaners and sizes of all elevators and conveyors. With this information, the horsepower required to run the breaker can be determined.

Finally a plan is necessary to show the arrangement and location of the various parts of the outside plant, including the breaker, shafts or other near-by mine openings. Also empty and loaded railroad tracks with

their "light" and "loaded" scales and any other accessory plant such as boiler houses, shops, etc. The method of putting the run-of-mine coal into the breaker will depend on a number of local circumstances. A tower-hoist, barney plane or conveyor line may be used, keeping in mind that every time coal is dumped, breakage of coal occurs. If the plant is steam operated, boiler fuel must be arranged for. An adequate and suitable water supply for boilers and for coal preparation is also an important consideration.

The disposition of refuse, whether it is to be pulverized and silted into underground workings or stocked on the surface, is an important matter. Large rock and slate banks nearly always are an accompaniment of anthracite mining and preparation. They frequently occcupy valuable surface and may contribute considerable additional weight to that bearing on mine pillars. In the past, slate, rock and culm have often been placed over coal which was near enough the surface to strip.

tions. They also emphasize the necessity of putting in bracing where it belongs. Where a steel beam connects to a column—that is, a riveted field connection—then a chair or support for the beam should be built up in the shop on the post. Rolled steel shapes are used rather than built-up sections in wet breakers. The following table shows the distribution of steel in two breakers among the various members according to the position in the building:

Breaker A:	Tons
Posts or columns	125
Beams	186
Bracing	39
Roof	22
Girts	41
Stringers—Pocket	36
Rivets—Field, and rods	9
Total	458

The volume of the breaker is 640,000 cu.ft.

Breaker B	Tons
Columns	115
Beams, including pockets	183
Stairs	10
Bracing	55
Roof	28
Girts	25
Rivets and rods	11
Cast-iron chairs	3
Total	430

The volume of the breaker is 860,000 cu.ft.

Conditions under which a bed of coal exists affect mining and preparation to a large extent. If the pitch

FIG. 8. BUCK MOUNTAIN BREAKER, THE FIRST STEEL PLANT OF THE LEHIGH VALLEY COAL COMPANY

The removal of refuse as a preliminary to stripping is now generally avoided. Each one of the many points thus briefly noted is worthy of a separate paper, but space limits their discussion here to little more than topical mention.

In connection with a more detailed discussion of the five steel breakers of the Lehigh Valley Coal Co., it might be interesting to note their location in the anthracite region and refer to the section of the basin at each plant. (See Fig. 6.) Of the five plants in question, Buck Mountain and Packer No. 5 are in the western middle field; Mineral Spring and Franklin are in the northern field and Drifton is in the eastern middle field of the anthracite region. In these breakers the preparation is wet in all except the Franklin, where both the wet and dry methods are used.

The Lehigh Valley people find many commendable features in steel breakers. Everything is open, there is good light and air and nothing hidden away in dark corners. The basis of the design of their first steel breaker was to secure steel posts which should be equivalent to a 12 x 12-in. wood post under similar condi-

is light so that the miners can take mine cars to the face and load them, then slate and rock can largely be gobbed in the chamber and comparatively clean coal be sent to the breaker. Even if there are partings in the bed and bad top overhead, quite a bit of coal can be cleaned inside. Contrast the foregoing conditions with mining on the heavy pitches, where practically everything is loaded out—partings, falls of roof and coal all go to the chute and into the mine car. In extreme cases a mine car may contain 40 and even 50 per cent. of refuse.

Coal is often dirty. It is frequently wet, in addition, on account of water finding free entry to the workings through crop falls and cracks in the strata. Such adverse conditions greatly handicap both mining and preparation—especially the latter. Fig. 6 shows at a glance what the various collieries in question likely have to contend with. The breaker proposition may vary greatly with differences in pitch, purity of the seam and condition of top.

Before referring to the individual steel plants, it should be stated that all the breakers contain more or

less wood in their construction. Chutes, some machinery foundations and pocket linings (bottoms and sides) are of wood. In the case of pockets, the stringers are I-beams; lengthwise on these beams are 3 x 8-in. sticks; across these are other 3 x 8-in. timbers on 14-in. centers; and on top of all are 2-in. plank running with the pitch. On top of the plank is two-ply roofing paper, then ⅞-in. T. & G. boards, and finally 1-in. hardwood boards.

The Buck Mountain breaker, Fig. 8, was described fully in articles appearing in the May 18 and 25, 1912, issues of *Coal Age*. It has a daily capacity of 1800 tons. The breaker contains 477 tons of steel and 386,000 ft. B.M. of timber. Below the jig floor concrete was used in its construction. By reference to the section of the basin at this colliery, Fig. 6, it is seen that the pitches of the seams are heavy, notably so on the south dips. The seven seams mined are in good condition and the top is generally good.

Packer No. 5 breaker is shown under construction in Fig. 4 and completed in Fig. 5. It is the largest steel breaker of the Lehigh Valley Coal Co., having a capacity of 2500 tons. In addition to the steel, there is 690,000 ft. B. M. of timber in the building. In Fig. 3 is illustrated the framework of a wooden breaker. Note the mass of timbers extending in almost every direction and then contrast this construction with the apparently slender structural steel frame of Packer No. 5, shown in Fig. 4. Some of the many advantages of steel over wood for breaker building have been brought out previously. In the wooden frame, Fig. 3, it is interesting to note early tendencies to substitute metal for timber. Here some of the columns are of cast iron and there are a few iron or steel beams in the breaker.

Returning to Packer No. 5, the following seven seams are mined: The Diamond, Little Orchard, Orchard, Holmes, Mammoth, Seven Foot and Buck Mountain. The first three beds have bony and slate partings and a soft slate top. The remaining four seams generally occur in good condition, which is a fortunate circumstance for the pitches are very heavy. The seams at Packer No. 5 are thicker than those at Buck Mountain colliery.

Site of Pioneer Iron Breaker

The Drifton colliery of the Lehigh Valley has always been a most interesting plant. From the earliest years in its history until the death of Eckley B. Coxe, it was his special pride and many of his experiments in mining and preparation of coal were carried out here. The extensive shops of Coxe Bros. & Co. were at this place. Here Mr. Coxe built the pioneer iron breaker which the Lehigh Valley Co. added to recently. It was described by E. P. Humphrey in a paper read before the American Institute of Mining Engineers. This paper was published in the Mar. 30, 1918, issue of *Coal Age*. The original iron breaker is shown in Fig. 2 as the narrow portion and three track plane at the left of the structure. The addition is at the right, and it occupies the site of the old lump coal chute, discarded at the time the breaker was remodeled.

The seams mined at Drifton are the Mammoth, Wharton, Buck Mountain and to a limited extent the Gamma. There have been extensive strippings at this plant on the Mammoth seam. The gunboats which are to be seen on the breaker plane indicate steep pitches in the mines, and the Drifton section bears out this idea. It is expected that this breaker will develop a capacity of 2500 tons daily.

The Mineral Spring breaker is shown in the headpiece. This plant was described in an article published in the Mar. 16, 1918, issue of *Coal Age*. Some of its special features relating to safety precautions were described in an article in the Dec. 8, 1917, issue of *Coal Age*. The capacity of this breaker is about 1600 tons daily. In constructing the breaker 553 tons of steel were used and 302,000 ft. B.M. of timber. The principal seam mined here is the Red Ash, which is thick and comparatively hard, but it carries bony coal, is dirty, and there is generally a heavy clod over the bed. In general the seams at this plant are thin and dirty.

Typical Wet and Dry Plant

The Franklin colliery of the Lehigh Valley company, Fig. 1, is a particularly interesting plant. The breaker is one of the newest of the steel type of this company and has a capacity of 1500 to 1800 tons. It is the only plant of the five in question which prepares coal by both the wet and the dry methods—it is typical of this process. There is a tendency to do away with the dry way as the wet is cheaper. Twelve different seams are mined at the Franklin plant. The best seam, the Baltimore, is practically exhausted. Among the others, the Hillman and the Red Ash occur in good condition. At times many of the seams are dirty and carry slate and bone partings, also poor roof. The section of the basin at the Franklin, shown in Fig. 6, gives a good idea of the general mining conditions as affected by pitch of seam, etc.

The early history of this plant is an interesting one. In 1868 a wooden breaker was built which replaced previous ones. At that time the company operating expected to have coal only for about 20 years. In '89 the Lehigh Valley replaced that breaker by a modern one with the expectation of its life being limited again by only 20 years available coal. In 1913 a steel breaker was built with the prospect of coal for the next 30 years. This illustrates the changes which have been brought about in anthracite mining as this coal becomes scarcer and thinner and poorer seams are considered profitable for mining.

The Franklin steel breaker was necessary to handle and prepare the coal now being mined—it is different from that previously worked. Also an up-to-date breaker was necessary on account of the development of beds which could not be prepared satisfactorily in the old structure. It would have been too expensive to rebuild the old breaker, and then the annual maintenance cost on the wooden structure would have been so heavy that steel was waranted. The new breaker has a ground area of 88½ x 96 ft. and a total height of 125 ft. The total weight of steel in the structure is 488 tons. The volume of the building is 640,000 cu.ft.; it is covered with galvanized, corrugated steel and has steel sash containing 8000 panes of 12 x 18-in. glass.

This breaker was built over old workings a portion of which it was necessary to silt to avoid settlement in the mines which would damage the breaker. The first car of steel arrived on the ground on Apr. 3, 1913, and the first car of coal was dumped on Oct. 3, 1913. Coal is

supplied from three openings and concentrated at the foot of a tower hoist. Coal is hoisted to the top of the breaker in self-dumping cages to a height of 115 ft. at the rate of 150 cars per hour. Broken, egg, stove and nut are prepared dry, and egg, stove, nut, pea and smaller sizes are prepared wet at the Franklin. The flow sheet (see Fig. 7) gives the details of how coal is handled in this breaker.

The system of loading coal here, by belt converyor, was introduced in the region by the Lehigh Valley. The coal pockets are at right angles to the loading track. A 36-in. belt is used which is run at a speed of from 300 to 500 ft. per minute, the rate of speed being in inverse ratio to the size of the coal. Belt loading uses less men than by the old method, cutting the labor item in half. Loading by belt costs 1c. per ton, while chute loading costs 1.6c. per ton. The cost of the belt itself amounts to 2 mills per ton on a tonnage of 350,000 loaded. A belt has loaded 5000 tons of coal in 10 hours. The loading is managed by one man, who operates levers controlling gates at the pockets. Another man places cars for loading. Where large tonnage is handled more men are needed to see that car movement—empty and loaded—is expedited.

Considerable thought was given the subject of breakage of coal in the design of the Franklin breaker. Small lowering conveyors are used for moving lump coal from shakers to lump coal picking tables. At the discharge end of each picking table is a shifting apron which prevents excessive breakage at that point. This latter device, as well as numerous other ingenious contrivances about this plant for saving labor and doing work better and safer, is the invention of James Piatt, the outside foreman at the Franklin colliery. All chutes have rounded corners and the movement of coal is largely regulated by automatic controls, developed at the Maltby colliery by the outside foreman, Nelson White.

All breaker refuse at this plant, after being collected, passes through a No. 6 Gates gyratory crusher which reduces it to about stove coal size. This product is then passed to a pulverizer which grinds it to ¼- to ½-in. size, when it is silted into the mines. The breaker is driven by a pair of 18 x 30-in. Corliss engines belt-connected to a main line shaft. The breaker is divided into two units—pure and impure sides—independently driven, a considerable advantage when handling condemned coal. The Franklin was designed for 1800 tons, but the best dump for 9 hours has been 674 mine cars. However, the best hour hoist has been about 120 cars, which indicates that over 2000 tons might be prepared over this breaker. The best record for coal yield is 2.2 tons of prepared coal per mine car.

A paper on the preparation of anthracite coal by Paul Sterling was published in Vol. 42 of the *Proceedings* of the American Institute of Mining Engineers. This paper gives anthracite practice of 1912 with special reference to the Mineral Spring plant—all wet breakers are a modification of the methods treated in this article. Much of further interest was noted in connection with Lehigh Valley practice both in the mining and preparation of coal, but space forbids more than general comment. It is quite noteworthy that as preparation requirements become more and more exacting and as poorer and dirtier seams are mined, that less labor is employed in and about breakers. Mechanical devices are supplanting the human element. However, it cannot yet be said of coal preparation as in the manufacture of food—"it is not touched by the hand of man."

For much of the information in this article and for many of the illustrations accompanying it, *Coal Age* is greatly indebted to the various departments of the Lehigh Valley Coal Co., at Wilkes-Barre, Penn. The unfailing courtesy of busy officials should receive grateful acknowledgment. In this same connection, the Guerber Engineering Co., of Bethlehem, Penn., should have special mention.

If a man spends his time in pleasure or in just getting by, he mustn't expect more than he purchases. If he uses the same time to make himself more efficient and to win friends and gain knowledge, he again will get what he pays for. Remember, however, that time can only be spent once. You pay your time and you take your choice.

An Expeditious Car Unloader

A continuously operating car-unloading apparatus, for handling sized coal, sand, crushed rock, etc., has been invented by James B. Seaverns, a Chicago engineer. An endless belt carrying scoops is mounted on a vertical frame the lower end of which rests in the material in the car. By this means the material is scooped up and elevated to a hopper well above the car, whence it is delivered to a horizontal conveyor belt. The latter

THE UNLOADER IS READY FOR OPERATION

dumps the material into a wagon or truck, for delivery. The endless bucket elevator, provided with a concrete weight at its lower end, is supported in a traveling bridge, or crane. The elevator may thus be traversed from side to side of the car, allowing the buckets to pick up practically all the material.

A mechanical feed device advances the machine against the material in the car as fast as it is scooped up by the elevating apparatus. The machine may be provided with a two-way spout and valve in the delivery hopper, to allow the material to be spouted either to trucks on one side of the track or to a storage pile on the opposite side. The machine materially reduces the present loading time and thus tends to relieve the difficulty the railroads are experiencing in getting cars unloaded promptly so that they may be put back in service again. The machine can be operated by either electric motor or gasoline engine.

From Telegrapher to Large Mine Owner

Biographical Sketch of P. A. Coen, President of the Buckeye Coal and Railway Company

HARD WORK, coupled with the desire to succeed and make a mark for himself in the world, have been the two cardinal principles underlying the success of P. A. Coen. He is president of the Buckeye Coal and Railway Co., which controls a large area of coal in the Hocking Valley district of Ohio. Mr. Coen also conducts an important jobbing business. He is a man who has made a wonderful success in all branches of the coal business by perseverance and the capacity to master all details. Mr. Coen is now 40 years of age and has been more or less intimately connected with the coal business for approximately 17 years.

P. A. COEN
Hard work, coupled with a desire to succeed, helped him to get on top

Mr. Coen is a product of the farm, having first seen the light of day on a farm near Cambridge, Ohio. Part of his early schooling was obtained at the local railroad station, where the young boys of the neighborhood congregated, many of them learning telegraphy at their leisure moments. In fact it is said that a number of men, now prominent in the coal industry, started their business life by learning to telegraph at the little railroad office.

After mastering telegraphy Mr. Coen was offered the position of station agent, which included the duties of telegraph operator, freight and express agent, at a station on the Wheeling & Lake Erie R.R. at Beach City, Ohio. This is the junction point of the Baltimore & Ohio and the Wheeling & Lake Erie. When Mr. Coen took this position it was found that the competing railroad had all the best of the grain and live stock shipments out of that section. When the general superintendent assigned him to the position, he said, "I want you to get all of that freight business back."

Investigation showed that the reason for the success of the competing road was the better service given, especially to live stock shippers. Mr. Coen sent word to the shippers that the pens and yards would be improved and that water would be brought to the pens in order to give the animals drinking water and to cool them off in hot days. As a result business came back rapidly.

His work at Beach City attracted the attention of railroad officials and his next step was to go to a railroad and coal property in Pennsylvania, where he worked hard to master the details of the business. In 1904 he was in charge of a coal exhibit at the St. Louis Exposition. While there he familiarized himself with all phases of the coal business, but more especially the gas coal industry, by arising at 5 a. m. and spending his time going through the other coal exhibits and the testing plant operated at that point.

After the exposition he drifted back into the coal business as a salesman. He took several positions and finally landed in Oklahoma as the general manager of an operating company. When he took charge of the property, at the age of 30 years, he found that recent discoveries of oil in that territory caused practically all railroads and many manufacturing plants to use fuel oil as a substitute for coal. The market was a decreasing quantity and he undertook to see what could be done to revive it. In that work he traveled through northern Mexico and all of the southwestern states as far as the Rocky Mountains.

He studied freight rates and mastered all of the details of the business in an astonishingly short time. A law had been enacted recently making five traffic zones. The mines over which he was general manager were thus handicapped by a freight differential of 40c. He secured an attorney to appear before the Oklahoma railroad commission to have the law changed or the rulings suspended. The day of the hearing arrived and the attorney failed to appear because he missed his connections. Since Mr. Coen had spent a month in going over the case with the attorney he was familiar with all of the details and he submitted the case himself, and won his contentions as well as the admiration of the railroad commission and other operators in the state.

Mr. Coen held that position for a year and then came East to sell coal for various concerns. He finally made a connection with the Rail and River Coal Co. and had his headquarters in Toledo. In that capacity he did considerable jobbing of coal and attracted the attention of J. S. Jones, of the Jones & Adams Coal Co., of Chicago. To learn jobbing he took a former jobber into his office, learning that branch of the business through him. How well he succeeded is shown by the results obtained, as the Toledo office of the Rail and River Coal Co. is known throughout the middle west.

Mr. Coen always kept in close touch with market conditions and when there was an advance coming on through a cold spell or railroad congestion he bought heavily of coal, making a good profit. When J. S. Jones purchased the control of the old Sunday Creek Coal Co.—which was shortly after the Grand Trunk R.R. took over the mines of the Rail and River Coal Co.—Mr. Coen came to Columbus as general sales manager of the Sunday Creek. Litigation ensued and the Buckeye Coal and Railway Co. was revived. Mr. Coen was given the presidency. In that capacity he not only mastered the selling but also the operating end of the business.

Successful Shoveling Machine

SYNOPSIS — *Machinery is constantly supplanting hand labor in all phases of coal mining. Shoveling has been one of the latest operations to be successfully performed by machine. Coal mines have been somewhat slow in taking up this method of car loading, but are now adopting it more rapidly than in the past.*

MODERN mines are making increasing use of mechanical devices to secure the output demanded and to maintain reasonable cost of production in the face of constantly advancing expense for labor and material. All departments of coal mining now generally employ machinery. The electric or gasoline locomotive has supplanted the "hay burner." The undercutting machine now does the most arduous work of the miner. Boring machines are now being used to supplement the cutting machines.

Practically the only field of mining which is not well supplied with mechanical means to supplement manpower is the actual loading of the coal into the mine cars. The thinking men of the industry have long recognized the need for machinery to do this shoveling, and the principal reason why this machinery is not as prevalent as, say, the cutting machine, lies in the lack, at least until recently, of such a machine.

For over ten years designers, engineers and inventors have been paying considerable attention to this problem, and at the present time the only excuse that up-to-date mines have for not employing loading machinery is the fact that they may not be able to secure as prompt delivery of such appliances as they might desire.

The machine built by the Myers-Whaley Co. was first developed some ten years ago, and has long since passed the experimental stages through which all new machinery must go. For some years past machines of this manufacture have been in constant successful use under the most severe physical conditions. The first machines were built for loading coal, and the first one, which is shown in Fig. 1, loaded several thousand tons of coal in several experimental trials.

Some Improvement Was Needed

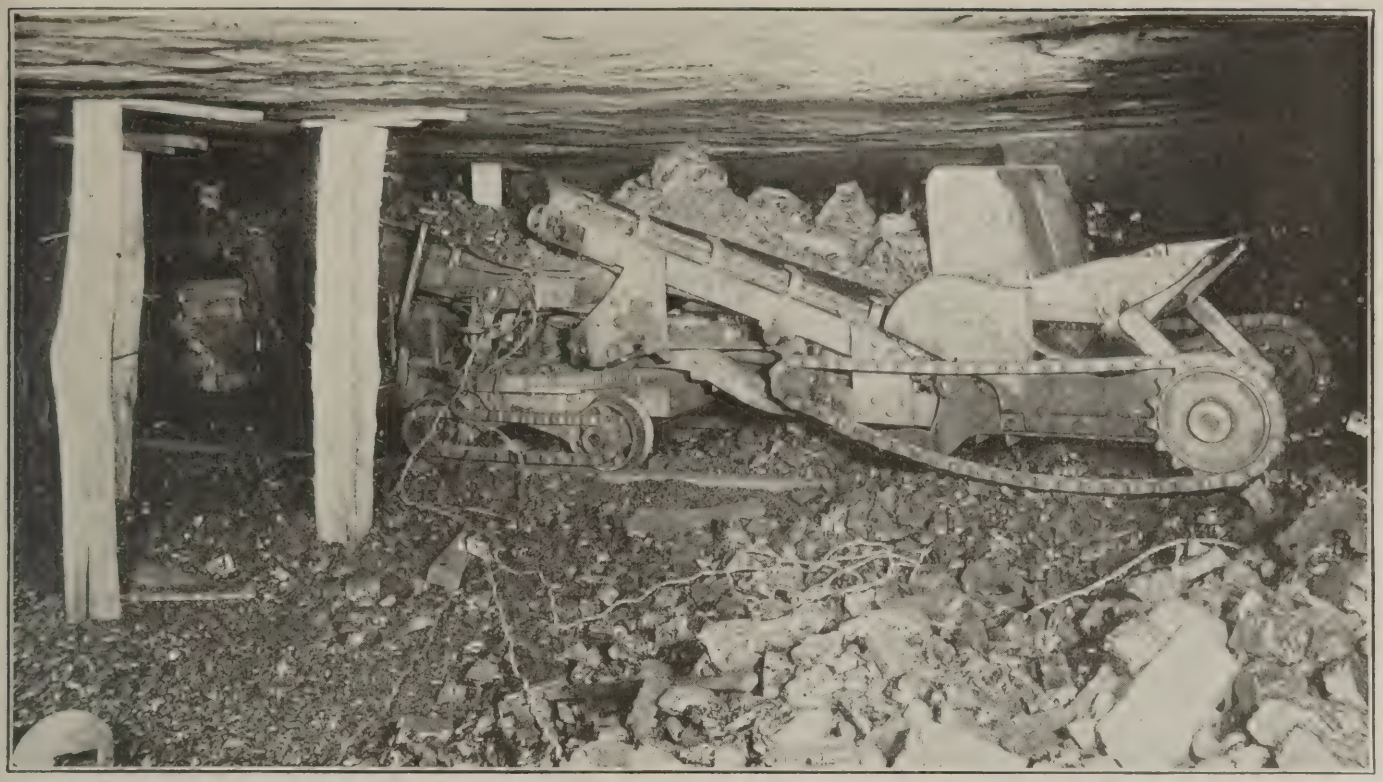
This machine was the basis upon which the later ones were designed. Being a radically new invention, it is natural that it should have incorporated in its make-up some features which would need improvement. As a whole, however, the original machine was highly successful and clearly pointed the way along which improvement should proceed.

Later on it was found that the rock and ore mining people had an even more pressing need for this machine than the coal mines, and were in a more receptive mood, willing to pay for machines and eager to obtain them. Following the line of least resistance activities were soon exclusively occupied in developing and furnishing machines for loading rock and ore, and have been so occupied for approximately the past five years.

As an illustration of how well the builders have succeeded in this particular field, one of the machines which was built six years ago and which was used for a number of years for loading rock is now in use by the Darby Coal Mining Co., at St. Charles, Va., in driving entries, and is giving successful and satisfactory service. In this work at St. Charles the entries are driven about 6 ft. high, and as the bed of coal is only 36 in. thick, it is necessary to lift a considerable amount of bottom. It was found difficult to keep men steadily at work taking up this bottom and the manager of the mine, C. H. Thompson, decided to use the shoveling machine for this purpose. He states that it has solved his problem and that he drives all entry work required with this one shoveling machine.

Another one of the older machines has been in continuous service for the past five years, loading rock salt, underground. The company has since ordered six additional machines, which indicates with what success this machine has done its work. The average loading under these conditions is from 200 to 250 tons per 9-hour shift.

Many Installations Have Been Made



A number of other interesting installations might be mentioned, but it is feared that this would take up more space than is available. It might be stated, however, that coal mines are now recognizing the usefulness of this device and that machines are now being supplied for loading coal. Such machines have recently been furnished to two of the largest concerns in Utah.

By the use of shoveling machines a considerable reduction in cost of loading is possible, even with the general advance in other costs. In addition to this the machine does the work of 15 or 20 men, and at operations not having plenty of help the men thus displaced can be put on other work. If men are not available the output can be secured without putting them on the payroll.

To those not familiar with this machine, a brief description of its operation may be of interest. Referring to the photograph, it will be seen that the machine consists of an automatic shovel mounted upon the forward end of a jib upon which jib is carried a reinforced belt conveyor which receives the coal from the shovel and transfers it to a second conveyor mounted upon a supplemental rear frame which is pivoted at the center of the machine and extends over the mine car.

The main frame which carries both the jib and the rear conveyor also supports the motor and propelling mechanism. The jib can be swung by power 45 deg. to either side, so that the shovel can reach a distance of 10 ft. to each side or clean up a space 20 ft. wide from one track. The rear conveyor can also be swung laterally so as to load either upon the machine track or upon one paralleling it.

The entire machine is moved forward and backward under the control of its operator, who is stationed upon a platform on the jib frame. From here he can clearly see the shovel and direct it. The controller for starting and stopping the motor is also mounted upon this platform directly in front of the operator. He can

THE ORIGINAL SHOVELING MACHINE AT WORK IN A COAL MINE

therefore start and stop his machine, swing the shovel laterally, and move the machine forward and backward without leaving his seat.

The shovel is entirely automatic in its action and is a unique piece of mechanism consisting of a shovel member, 34 in. wide, having an auxiliary or rear section fitted into it. The shovel is actuated and supported by a crank which rotates continuously, and which is driven by heavy roller chains on each side of the machine. The rear end of the shovel is carried by a cross shaft having rollers on its ends which run in cam grooves. This gives the mouth of the shovel a motion quite similar to that of a shovel actuated by hand.

The front part of the shovel discharges into the rear section, which has auxiliary cam rollers engaging another cam groove and which turn the rear section partly over during each stroke. In this way the material is picked up and transferred to the belt conveyor at the rate of one shovelful for each rotation of the crank. This crank rotates at a speed of 12 to 13 r.p.m.

In making use of the shoveling machine, it is necessary to attend to some details more carefully and in slightly different manner than is done for hand loading. These embrace the following particulars:

1. The machine should have good solid tracks upon which to work, as no jacks or fastenings of any kind may be employed. The machine relies upon its weight and friction on the track to maintain its stability and to give the necessary force to shovel.

2. The coal should be shot down in such a way as to enable the shoveling machine to clean up the room without waiting for men to pick down standing coal. This is quite important as the machine will clean up a 40-ton room in about 1½ hours if it is not delayed by having to wait for coal to be broken down.

3. It is essential to arrange side tracks and trips with an ample supply of cars, so that a minimum of time will be consumed in moving out the loads and placing empties back of the machine. Under ordinarily good conditions this can be done readily in less than one minute per car. It should be realized that any more time spent in shifting cars is wasted and will reduce the output from the machine.

4. The machine is equipped with a 20-hp. motor and the power lines and supply should be amply large to furnish current power to this motor.

5. The machine is easily operated. An intelligent man can readily learn to run it in a few hours. The mechanism, however, should be inspected regularly, and although the machine is capable of operation by medium grade men, a competent mechanic should have charge of it and see that it is properly oiled and handled and that irregularities are promptly attended to. This, of course, is true of all mechanical devices and is not peculiar to the shoveling machine.

How Oil Saving May Be Achieved

These methods of saving lubricating oils are posted in the machine shops of Germany:

Use only closed oil cans, with spouts tha will deliver drops, or at most only a thin stream.

Use all lubricating apparatus strictly according to instructions and put the oil only where it will actually lubricate. If a machine has automatic droppers, shut off the supply while machine is standing.

Do not use cylinder oil on shafting or elsewhere when cheaper oil will answer.

Keep all rubbing surfaces in good condition. Rough surfaces and too tight boxes consume more oil. Worn and leaky bearings waste oil.

Always use drip pans, and arrange to filter and cleanse the oil so caught. It is as good as new.

Collect all greasy waste and wiping cloths, so that the oil may be recovered. Never burn them.

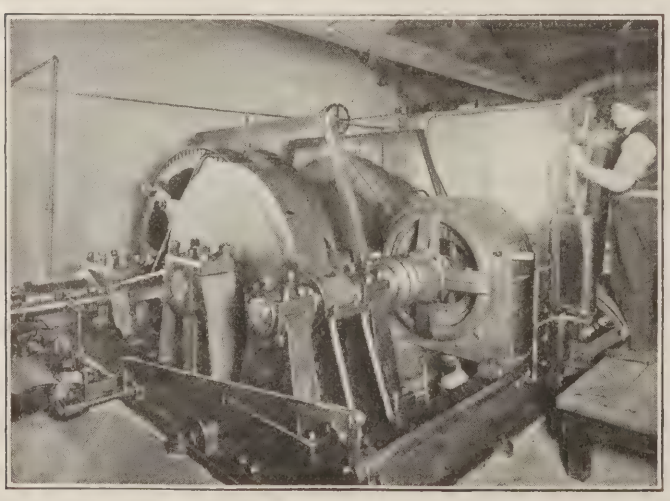
Be careful about using lubricating oil for cooling a bearing. Water will often do as well.

Be careful about using oil for cleaning and polishing. Never clean the hands with oil. A greasy cloth will do as well.

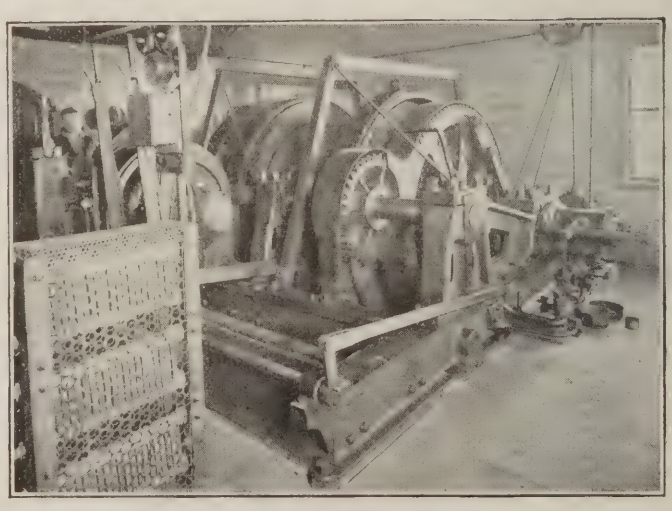
Electric Hoist at Alaska Colliery

DURING 1917 the Philadelphia & Reading Coal and Iron Co. installed at its Alaska Colliery, No. 10 Plane, located at Mt. Carmel, Penn., a two-speed electric hoist, manufactured by the S. Flory Manufacturing Co., of Bangor, Penn. This hoist was designed to operate on a power plane in the Mammoth Vein. The illustration at the head of this article shows the hoist building and mouth of the plane. The cars, however, are not hoisted to the surface. Figs. 1 and 2 show the hoist in operation. Fig. 3 shows a general plan of the plane and lifts.

This two-speed hoist was designed so that the power factor would be practically the same for hoisting the loaded cars from the lifts and pulling the empties up the plane. This means efficient hoisting.



The length of the plane (five levels) is 1400 ft., while the pitch of the plane is 26 deg. The load on the hoist is as follows: Cars per trip, 2; weight of loaded trip, 20,000 lb.; weight of empty trip, 7000 lb.; size of rope, 1⅛ in. (The weight of rope is not included in the foregoing figures.) The rope speed in hoisting the empty trip is 500 ft. per minute, while in hoisting the loaded trip it is 250 ft. per minute.



The cycle of operation is as follows: Accelerate empty cars at bottom, 5 sec.; hoisting empty cars on slope, 131 sec.; stop-accelerate to lower in lift, 5 sec.; lower empty trip in lift, 18 sec.; decelerate empty trip, 5 sec.; changing ropes, 30 sec.; accelerate loaded trip, 10 sec.; hoist loaded trip out of lift, 18 sec.; stop-accelerate loaded trip, 10 sec.; lowering loaded trip on slope, 163.7 sec.; decelerate loaded trip, 15 sec.; changing ropes, 30 sec.; making a total for an average trip of 440.7 seconds.

In order to perform the cycle given and the duty imposed, the hoist was designed with all cut-steel gearing, the gear ratios giving 500-ft. and 250-ft. rope speeds. The primary gear reduction, or that between the motor and countershaft, is accomplished through cut herringbone gears; the secondary reduction, or that between counter- and drumshafts, is through spur gears. The drum is cast iron, 60 in. in diameter and 36 in. long between the flanges. Each gear is provided with a Werner patented band friction, well known in the coal industry. The frictions are operated by patented air-thrust cylinders, giving the operator sensitive control. The drum has two brakes, each 8 in. wide, equipped with "vita-bestos" brake lagging. The machine is sectionalized throughout so that it can be taken into the mine in the future if desired. The hoist is driven by a 100-hp. continuous-duty rated motor with master control. This type of hoist is in use by a number of mine operators and in other lines of industry with universal satisfaction. Another hoist is under construction by the same manufacturer for the Philadephia & Reading Coal and Iron Co. for similar operation.

We are indebted to J. T. Jennings, electrical engineer of the Philadelphia & Reading Coal and Iron Co., for the data and drawing of the plane.

The machine here described and illustrated has been

FIGS 1 AND 2. INTERIOR OF HOIST HOUSE SHOWING BOTH SIDES OF THE HOIST ENGINE

in operation for some time and is giving excellent satisfaction. The impression created by the operation of this machine was well expressed by the man who runs it,

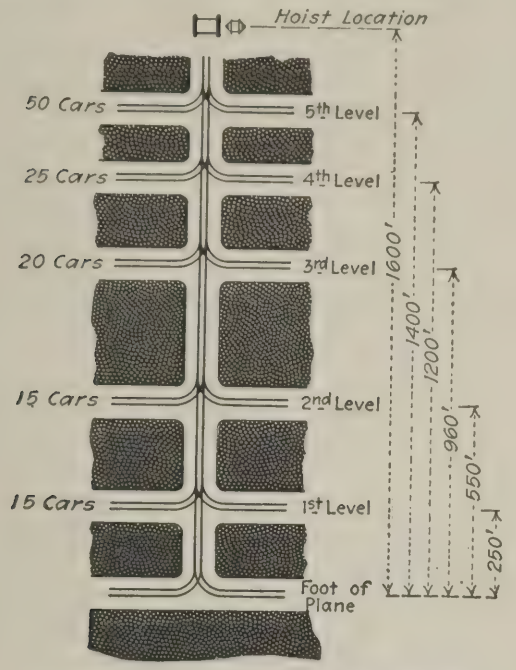


FIG. 3. GENERAL PLAN OF SLOPE

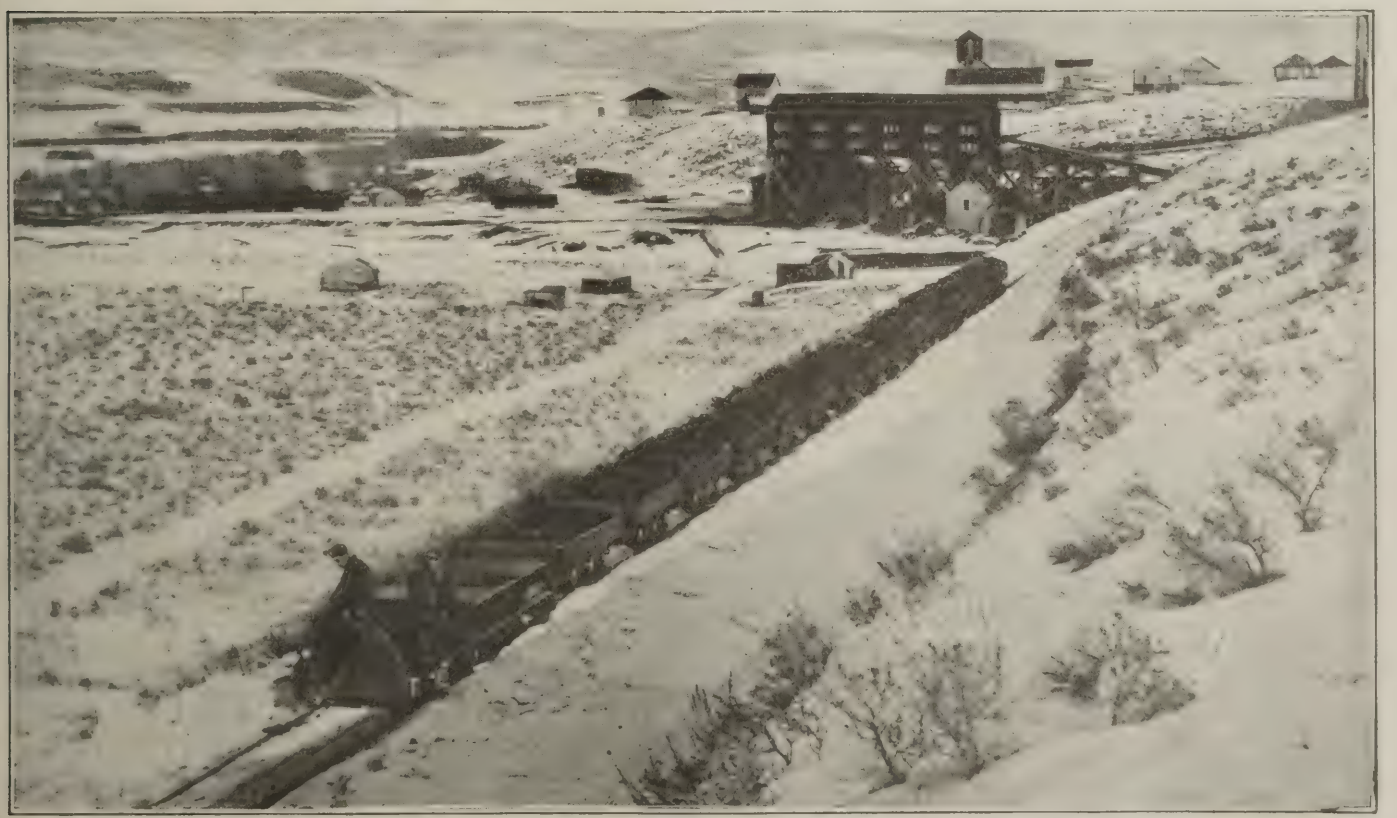
when he said in reply to the question of what he thought of its operation, "I think she works like a top!"

Many a man is wondering what hinders his success in life when it is all as easy as falling off a log. He is governing himself according to guesswork. Don't guess; know facts. Facts count and guesswork is no account!



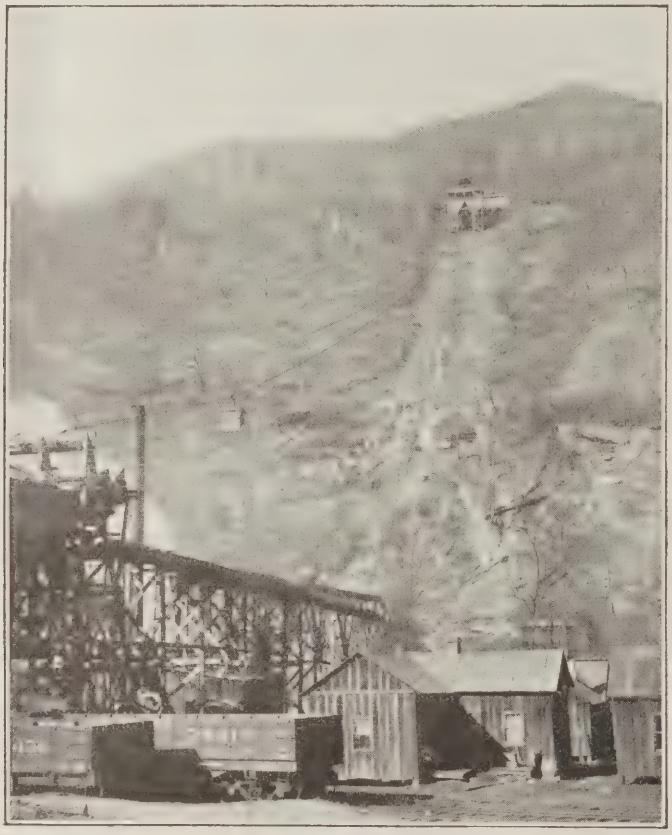
Every man who works uses his employment as either a meal ticket or an opportunity. If he looks upon it as a meal ticket to tide him over from day to day, he must never expect to travel very far or climb very high. If he looks upon it as an opportunity to open the door to something bigger and better, through expert service and the complete mastering of his task, there is no limit to the distance he may go.

Storage-Battery Locomotives Enter Colorado Coal Mines

The McNeil Coal Co. is, apparently, the first to introduce the storage-battery locomotive into coal mines in the State of Colorado. The illustration shown below is of an Ironton locomotive of this type in operation between the company's newly opened mine No. 2 and the tipple, at its property at MacGregor, Routt County. In opening this mine the company considered the various available methods of transportation over a line approximately 4000 ft. in length and having a grade averaging 1½ per cent. in favor of the load. Its decision, therefore, to apply the storage-battery locomotive is of unusual interest, although it is in line with well-established practice in the Eastern coal fields.

The locomotive is a 5½-ton low type, equipped with 48 cells of battery and a single heavy duty motor. It has single end-drum control, and in tests has demonstrated a satisfactory drawbar pull. The results thus far have been both encouraging and gratifying.

The Grand Junction Mining and Fuel Co., whose ownership is vested largely in the McNeil Co., has placed a 4½-ton Ironton in its mine at Cameo, Colo., for gathering purposes. Other Colorado operating companies have placed orders for similar storage-battery equipment.



IRONTON STORAGE-BATTERY LOCOMOTIVE IN OPERATION AT A COLORADO MINE

Aerial Tramway at a Coal Mine

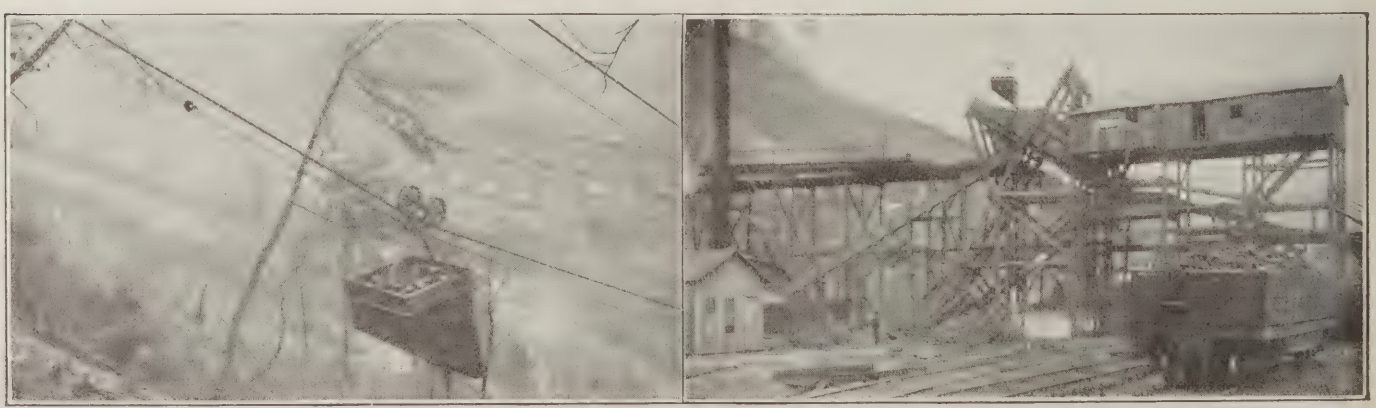
The accompanying photographs show a Broderick & Bascom Co. aërial tramway recently installed by the Rex Coal Co. at Kitts, Ky. This tramway is approximately 850 ft. in length with a fall of about 300 ft. in this distance. A capacity of 60 to 75 tons of coal per hour can be handled by this equipment from the loading station to the tipple at the railroad tracks.

The buckets, of 3000-lb. capacity, are of the automatic bottom-dump type. The trolley sheaves are fitted with

LOADING STATION AND TRAMWAY

Hyatt roller bearings. Only one attendant is required for the operation of this tramway. This man is located at the loading station and controls the filling of buckets as well as the brakes regulating the speed of the line. At the discharge station the buckets are dumped automatically.

The control sheave is of the three-groove type, 6 ft. in diameter, and equipped with two 4-ft. diameter brake rings. The brake bands are lined with asbestos. The track cables are $1\frac{3}{4}$ and the traction rope $\frac{9}{16}$ in. in diameter. The coal is brought out of the mine on mine cars, which are dumped into a 50-ton bin at the loading station of the tramway. The top of this bin is on a level with the mine tracks. The coal is then drawn into the tramway buckets through steel chutes, the flow being controlled by the operator by undercut gates.



The Rex Coal Co. reports that this tramway is in satisfactory operation, and from all indications it is capable of handling from 25 to 50 per cent. above the rating guaranteed by the builders.

How the Lehigh Coal and Navigation Co. Boosts the Liberty Loan

By W. G. Whildin
General Superintendent, Lansford, Penn.

The basis of our scheme for securing subscription for a Liberty Loan Bond is personal solicitation. We have a general committee, consisting of the heads of all departments, and officers and executive committee members of the mine worker's organizations, with the writer as chairman. Each of these heads of departments then acts as chairman of his district committee, which consists of all inside and outside foremen. At each mine the soliciting committee consists of the foremen, assistant foremen, loader bosses, night patrolmen, grievance committee men, safety committee men, and first aid and rescue men. Each of these members takes his own small district and personally talks over the question with his men. If a workman refuses to buy a bond, or gives some reason for not doing so which is not believed, his case is at once reported to other members of the committee, who take steps to bring the man into line—and they always succeed. It requires a strong valid excuse for exemption.

For the third Loan, we will follow out our policy of the two former loans, of having payments made in twenty installments deducted from each semi-monthly pay. The committee at each mine is being furnished with a complete list of subscribers, the amount of bonds subscribed for under the first loan, and also the amount subscribed under the second loan, and in addition information as to whether the subscriptions were completed before the final installment date, or whether cancellation of either or both subscriptions was made. In this manner each committee will have the facts before it, and it will be difficult for anyone to shirk.

VIEW OF THE 3000-IB. CAPACITY BUCKETS IN OPERATION AND THE MINE TIPPLE

Southwest Believes Its Fuel Difficulties Are Solved

Harry N. Taylor, one of the live wires of the Southwest and general manager of the Central Coal and Coke Co., writes us as follows:

In the Southwest the past winter's coal production and distribution went forward without the harrowing conditions experienced in the Eastern States. At no time during the entire winter was there any actual

HARRY N. TAYLOR

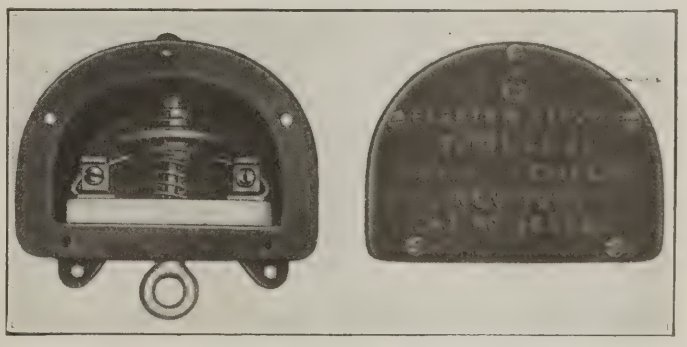
suffering and on no occasion was a general closing of industries necessary in any of the Southwestern or far Western states.

There were two reasons for this: (1) Because there are no congested manufacturing centers in that territory to make extraordinary demands on the railroads. For this reason the gateways to our manufacturing communities never became cluttered with an accumulation of materials gathered for the manufacture of war munitions. (2) Because as early as last May, through the Peabody committee, the closest working relations were established between the railroads and the operating interests and these relations were maintained even after the passing of the Peabody committee. As there was thus secured a close coöperation between the producing and the transporting interests the situation was greatly relieved.

There was, of course, a shortage of coal, and the movement at times was slow; but there was no more severe stress than has often occurred in past years during extraordinarily cold weather, such as we experienced the past winter. There were no heatless days, and early closing orders were more calls to do our bit than an actual necessity.

The zoning system as it is now established by the Fuel Administration will benefit both the operator and consumer in the Southwestern States. It will prevent coal from coming into that territory from far distant sources of supply, and render cars available for short hauls between the coal fields and the nearby consuming centers. This will greatly facilitate the movement of coal for the car supply will thus be made more adequate. As almost the entire shortage last year was due to lack of transportation, this will be largely eliminated by the zone system.

The labor situation in Iowa, Missouri, Arkansas, Oklahoma, Wyoming and Texas is entirely satisfactory. There is little or no friction between the operators and the men. In Kansas, there has been much idle time, caused by the unfortunate leadership of the miners in that district. It is hoped that the new penalty clause imposed by Dr. Garfield will eliminate local strikes in Kansas, and make available a large tonnage which has been lost during the year through labor troubles.



On the whole, the outlook for the Southwest and far West is brighter than it was at any time during the past year. There are three governing factors: the operators, the railroads, and the consumers. The first two are already thoroughly lined up. If the consumers will do their share by buying for early storage, so as to keep the mines in continuous operation, the problem of preventing a recurrence of last winter's shortage will be successfully solved.

Mine Signal Pull Switches

The Electric Service Supplies Co., of Philadelphia, Penn., has recently placed on the market improved types of mine signal pull switches for high- and low-voltage circuits. These are intended particularly for use on mine-signal systems operated by storage-battery or high-voltage circuits. They are designed for easy and quick operation, being fitted with plungers to which may be attached a cord, wire or chain to bring them into easy reach. They close the circuit only as long as the plunger is pulled down and held, and open the circuit on release.

Both types are inclosed in weather-proof iron boxes with covers fitted with rubber gaskets. The switch proper is mounted on a porcelain insulating base.

The battery-circuit type, illustrated, includes a circuit-closing mechanism which is simple and rugged

BATTERY-CIRCUIT TYPE PULL SWITCH

in construction and which produces a double break and rubbing contact. The circular contact disk is free to revolve, thus continually offering a new contact surface. These switches are 5 in. wide, 4 in. high and 3 in. deep over all. They weigh 4½ lb. each.

The high-voltage type is similar to the battery-circuit type except that the former is larger and fitted with a quick-break mechanism to take care of the higher voltage. The circuit-closing mechanism is insulated from the iron box and produces a quick-acting double break and rubbing contact. This type measures 6¼ in. in height, 5 in. in width and 3¼ in. in depth over all. The switches weigh 8 lb. each.

Annual Convention of Michigan-Ohio-Indiana Coal Association

THE most important feature of the annual convention of the Michigan-Ohio-Indiana Coal Association, held at the Hotel Sinton, Cincinnati, Ohio, on Apr. 9 and 10, was an address by J. D. A. Morrow, General Director of Distribution of the United States Fuel Administration.

Speaking before over 400 members, Mr. Morrow, introduced by R. A. Colter, president of the Cincinnati Coal Exchange, explained frankly the purposes of the Fuel Administration, stating that the distribution of coal under present conditions is essentially a matter of organization. He pointed to the vast industrial organization of Germany, perfected for 50 years for war purposes, in proof of this, and declared that this country must perfect as good an industrial organization behind its armies in order to win the war. Coal organization in Germany before the war was in the hands of three great syndicates, he said, and when war began the government forced all operators into these syndicates in order to have all distribution centralized in its own grasp.

What Fuel Administration Hopes to Do

Contrasting this compact government-controlled organization with the disorganized state of coal and other industry in the United States, Mr. Morrow declared that the Fuel Administration now aims to bring about organization in the coal trade with the aid of trade, and pointed out that in a real sense this country is at war not only with the German government but with the close-knit organization of the entire German industry as well. As to details, it is doubtful, he said, if the railroads of the United States, burdened with war freight, will be able to transport all the coal that the industries may ask for during the coming year. "It therefore becomes the duty of all of us," he said, "to see to it that coal goes first to those absolutely necessary uses on which the prosecution of the war primarily depends. That means in plain English that some of the less important consumers will be asked to go short, if anybody is to go short. The entire Fuel Administration must see that important consumers get their coal supplies."

Talking of essential and other industries, he referred to a conference with the War Board at which a list of important consumers was completed and stated that those consumers will get coal. Generally speaking, a decision has to be made between essential and non-essential industries by the War Board, in case of a shortage, referring to a case where a railroad recently confiscated coal consigned to a ship plate plant, thereby delaying ship construction. Domestic consumers were placed on the preferred list, he stated, subject to the arrangements of the zone system, and public utilities were similarly placed; but as to the latter, he emphasized the fact that storage facilities must be provided so that coal can be stored this summer, otherwise such utilities will be heard to complain next winter that they can get no coal. Also, should construction of such facilities involve heavy cost, he suggested that such cost should be considered by rating commissions as ground for increased rates, if necessary.

Mr. Morrow expressed appreciation of the work of the coal trade as a whole, especially in enabling the Fuel Administration to operate through trade associations to get to individual members in a mass. He gave an instance of a dealer who misrepresented facts to get coal and sold it to local industries, thereby depriving essential industries of fuel, and declared, "You are going to help me put that kind of dealer out of business until the war is over." The present policy of the Fuel Administration is to utilize the experience and ability of the coal men in handling problems confronting it, both by permitting business to remain in its usual channels and by direct aid of coal men in Washington.

The zone system, the speaker explained, was devised to meet the fact that the bulk of essential war industries is located on the Atlantic Coast, and that West Virginia and Pennsylvania coal must all go there, thus leaving Ohio, Michigan and the Middle West to be served by other fields. Similarly, Oklahoma, Arkansas, Kansas, Missouri, Wyoming and Colorado must use coal from their own or near-by fields and, moreover, must store it, if possible, during the summer, in order to enable those fields to operate to capacity, instead of on part time, as at present. This shifting of coal transportation threw new demands on the railroads in the sections indicated, and it was only after full consultation with them that the Fuel Administration announced its zone system, which in some respects must still remain tentative, awaiting developments, and subject to change accordingly.

Believes Production Will Fall Off

"It is not only possible, but quite probable, that the production of coal will fall off," declared the speaker, pointing to the increasing demands of the army and manufacturers, "and it is up to the domestic consumer to get his coal while he can." Mr. Morrow closed by emphasizing the seriousness of the situation, pointing to a partial failure of the United States to keep the industrial program to the mark in aiding the Allies, and asking the full coöperation of the coal trade in enabling the Fuel Administration to handle its vital problems, expressing complete confidence in obtaining it.

Noah Swayne, Commissioner of the National Coal Jobbers Association, now an assistant in the Fuel Administration, addressed the meeting of the jobbers in the morning on trade conditions and work at Washington, and spoke before the convention following a brief report by Secretary Nigh. Mr. Swayne declared that the legitimacy of the jobber's functions has been recognized, and that new regulations of the Fuel Administration are satisfactory to that branch of the trade. He said that Dr. Garfield is a big man, and that it was as well that a coal man was not made Fuel Admin-

istrator, as the appointment of a layman had disarmed suspicion and secured public confidence.

The speaker pointed out that Garfield's appointment occurred on Aug. 20, and that the coal year was far advanced then, so that the developments of the past winter could hardly be charged to the Fuel Administration. "Dr. Garfield has two sons in uniform in France," he said, "and a man cannot give his sons to a cause and then fail to give his best efforts to his own work in that cause."

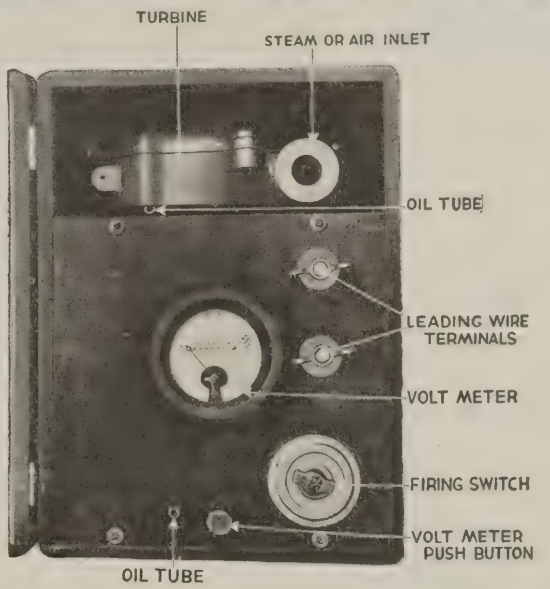
In reply to a question, Mr. Morrow stated that the distribution of anthracite would be announced May 1 on the basis of 1916 and 1917, and that it would be limited only by the prior needs of near-by Eastern consumers. On another inquiry as to confiscation by municipal authorities, he said emphatically that such confiscation tends to disarrange distribution plans and stops one gap to make another more serious. "Such wholesale confiscation as occurred last winter will not be permitted," he said. The convention was entertained Tuesday evening at a theater party.

Wednesday's session was brief, and the convention was concluded before noon with all business transacted. Moving pictures giving the members an idea of the tremendous ice gorges which recently blocked river traffic were shown, following which Samuel B. Crowell, of the National Retail Coal Merchants Association, addressed the convention.

Mr. Crowell said that Dr. Garfield, however inexperienced in the coal trade, is fair and honest, with no intention but to give the public and coal men alike a square deal, which has been apparently accomplished as to coal retailers, he said. That the national organization has been largely responsible for the satisfactory adjustment of the coal situation as between retailers and the Government was the opinion expressed by Mr. Crowell, advantages in having a representative in Washington being emphasized. He expressed hope that a representative of the retailers will shortly be placed on the Fuel Administration to give the Government the advantage of his practical experience, pointing out incidentally that the Administration is now following certain advice embodied in resolutions adopted at the coal meeting in Baltimore some time ago.

The essential need now is for more motive power, Mr. Crowell declared, stating that not more cars but more engines are needed to enable coal to be moved. Much therefore depends on Mr. McAdoo as director of railroads, rather than on the Fuel Administration, he said. The work of the Fuel Administration in investigating the cost of doing business was commended by the speaker, who declared that now is the opportunity of trade to get on a proper merchandising basis. He expressed the belief that the Fuel Administration will probably be a permanent, successful organization.

Nominations were presented and unanimously indorsed. Homer C. Gill was elected president, H. A. Bauknecht, vice president, and W. A. Gipson, treasurer. Resolutions adopted included assurance to the Fuel Administration of full support and coöperation. C. M. Moderwell, of Chicago, prominent in the work of the Peabody-Lane commission, outlined the history of the Government's handling of the coal trade, including the agreement of the operators to reduce their prices and the refusal of the authorities to accept the agreement then made, with the subsequent shortage, resulting from the drop after production had been raised to two million tons daily.

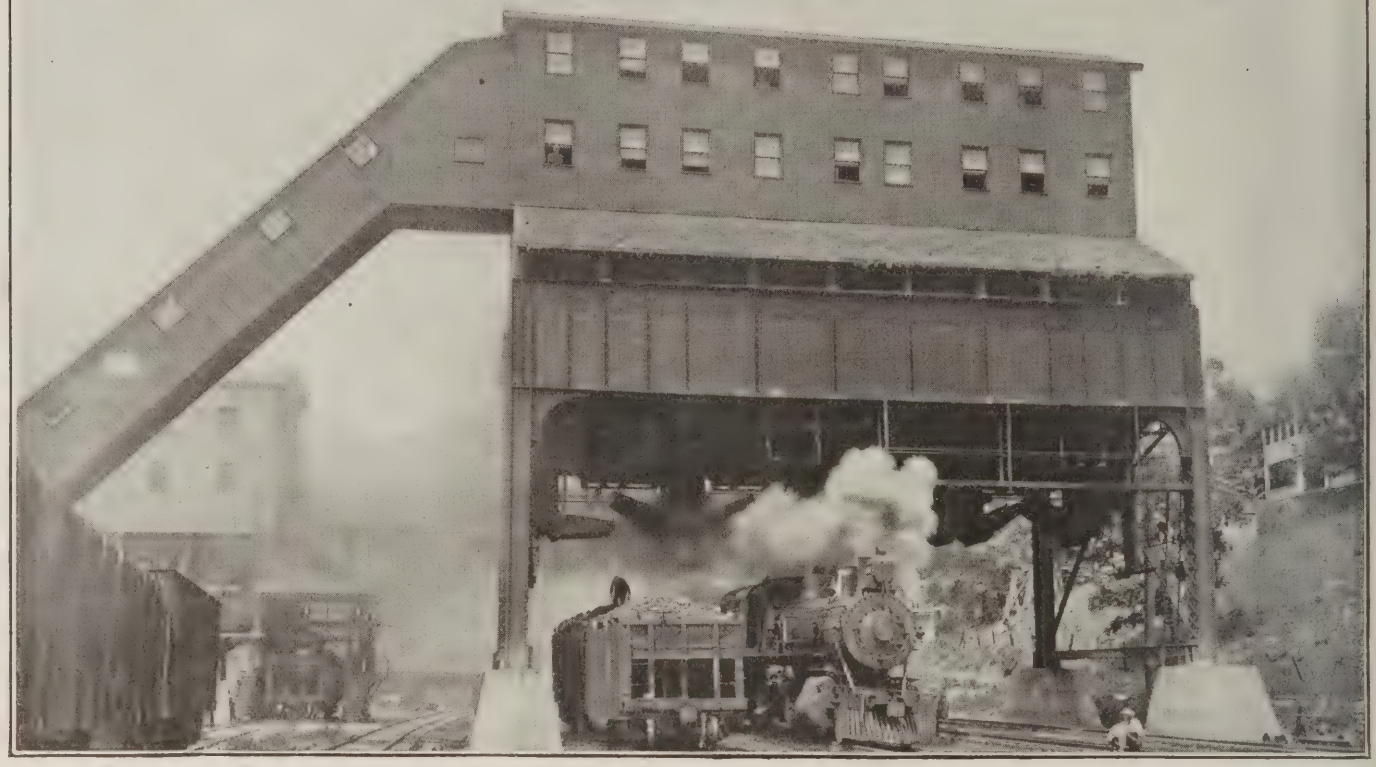


The subsequent price regulation by the Administration, the readjustment of the original basis adopted and the final adoption of substantially the same basis offered voluntarily by the operators, was recounted by Mr. Moderwell. He concluded with a warmly patriotic utterance, urging coal men to do their part as American citizens and declaring that business as usual is impossible, sacrifice being necessary to win the war.

Mason Turbine Blasting Machine

Something new in electric generating devices for firing explosives by electricity is found in the Mason turbine blasting machine. This was designed to fill a long-felt want in large blasting operations where steam or air is available.

The machine consists of an electric generator direct-connected to a turbine motor, which depends for its motive power on steam or compressed air. When operated at full speed the generator will produce a current of 10 amp. at 300 volts.

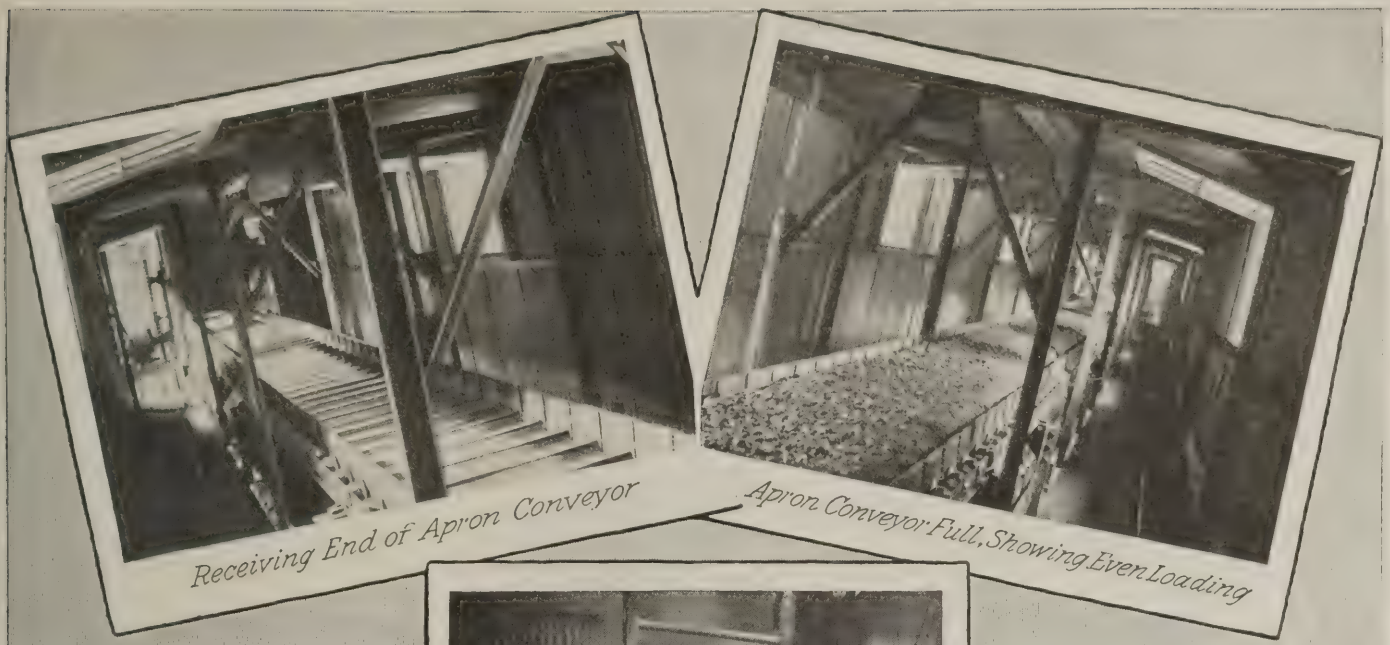


The machine is incased in a substantial hardwood case, the control board being located on the top of the

DETAILS OF TURBINE BLASTING MACHINE

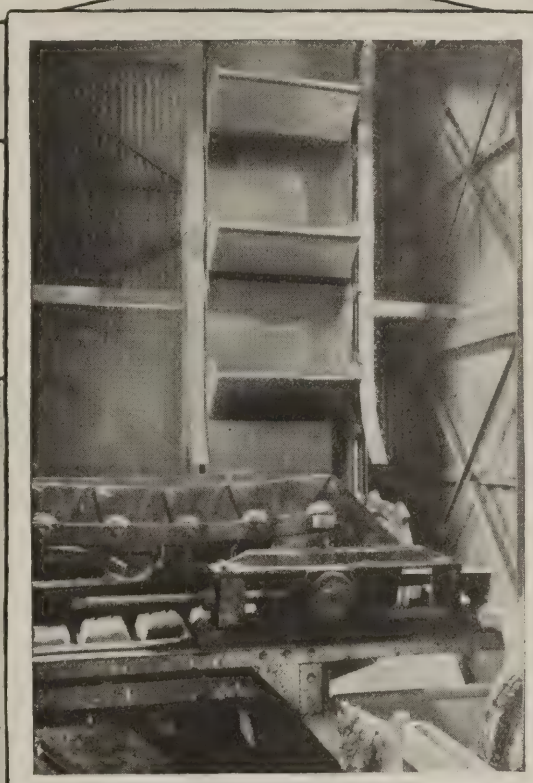
case and protected by a hinged cover. The operation is decidedly simple. The wires are attached to the terminals or binding posts and the air or the steam turned on. As the speed of the turbine increases the generator gradually picks up the voltage. The voltmeter push button is held down and when the voltmeter indicator moves to the firing point the firing switch is pressed and the connected charge is detonated. A spiral spring which the voltmeter push button compresses forces the push button back to its original position and thus keeps the circuit open. The machine is lubricated through oil tubes leading to the top of the case. On the lower side of the case is a corrugated-iron pipe outlet (not shown in the illustration) through which the exhaust steam or air passes. The size of the case is 14½ x 13 x 10¾ in. and the machine weighs 42 pounds.

Coaling Locomotives on the Norfolk & Western



SYNOPSIS—*For quick dispatch in coaling locomotives it is necessary to have the proper kind of coal stored ready to be immediately spouted into the locomotive tender. A coaling station is here described where the fuel passes directly by conveyor from the mine to the station bin. Transportation expense is thus avoided and locomotive fuel is always available.*

PROBABLY no two industries are so closely associated as coal mining and railroading. The mines depend on the railroads to distribute their output, while the railroads have to buy fuel before the distribution can take place. It still takes coal to haul coal, even though oil-burning engines and electric locomotives are increasing in number each year. The relationship between railroad and mine is so close and so important as to form the subject of much legislation, both state and national.



There are some roads whose chief business is that of handling coal. One of these is the Norfolk & Western, which gathers trainload after trainload from the mines in West Virginia and Virginia, carrying the loaded cars eastward to ships at Norfolk, Va., or north and west to Columbus, Ohio, where other roads take them over for delivery to the factories, mills and yards of our Central States. But the locomotives which draw the coal trains need fuel and accordingly each division of the run is provided with facilities for filling the locomotive tender with as little delay as possible. The newest coaling station is at Vulcan, W. Va., and is one which has received the approval of all those who have seen it as being one of the most convenient and efficient stations on the line. It has one marked advantage in that the coal here stored is taken directly from the mine tipple, which can be seen behind the inclined gallery at the left of the view reproduced in the headpiece.

The coaling station spans four tracks and has a storage capacity of 750 tons, although it is seldom called upon to deliver more than 200 tons in any one day. As stated above, the coal comes direct from the stationary screens in the tipple, passing into a bin from which it is drawn by a short double-beaded apron feeder and delivered to a 32-in. apron conveyor which transports it 116 ft., to a V-bucket carrier. The two upper views on the facing page show the apron conveyor empty and full, the right-hand illustration showing the even distribution of coal provided by the feeder. The center view shows the point at which the coal is delivered by the apron to the V-bucket conveyor. The buckets of the latter are 24 x 36 in., made of $\frac{3}{16}$-in. steel and mounted between two strands of 18-in. pitch steel-bushed roller chain. Their path is first vertical for 13 ft., then on an incline for 57 ft. (see headpiece), finally straightening out into a 60 ft. run over the bunkers (shown in the two illustrations at the bottom of the facing page.) There are two discharge gates which allow the coal to drop onto bar screens where it is divided into two sizes which are separately stored as run-of-mine and stoker coal. Each gate serves one screen and each screen supplies two pockets, one for each kind of coal. This division allows locomotives to receive either size of coal, on any track. All the equipment from the tipple to the bunkers, including the housing, was built and installed by the Webster Manufacturing Co., of Tiffin, Ohio.

Inherent Ability and Success

Brief Biography of Robert E. Hobart, Mechanical Superintendent Lehigh Coal and Navigation Company

WHEN a man receives a good round of applause after a service of many years with one concern—steady promotion from one of the lowest to one of the responsible positions in the active management of a big coal company—then it is not mere curiosity which makes men reflect on the reasons for this reward. It should not be difficult to read between the lines of this brief sketch of a life crowded full of endeavor and achievement—a struggle for place and position.

ROBERT E. HOBART
Started down at the foot of the ladder and climbed high by application and hard work

Robert E. Hobart was born in June, 1874. He comes of one of the old families of eastern Pennsylvania and lived in Tamaqua when a boy. His father was a Lehigh Coal and Navigation Co. man, and it is not surprising that the son should start his business career with the same company.

At fifteen years of age he became an apprentice in the Lehigh Coal and Navigation machine shops, and at the end of four years developed into a full-fledged machinist. He worked a number of years in this capacity and as a handy man at the shops. Rounding out his early training by a course in mechanics and as a draftsman, in a short time Mr. Hobart was made assistant general foreman at the Lansford shops. Later he became assistant mechanical superintendent, rising to master mechanic, and now holds the position of mechanical superintendent. He has jurisdiction over all the mechanical operations of the mining department of the Lehigh Coal and Navigation Co., including the Cranberry Creek Coal Co. and the Harwood Coal Co. The latter affiliated collieries are near Hazleton, Penn. All mechanical matters, steam, electrical and compressed air, and the extensive Lansford shops receive his attention.

It is most noteworthy that Mr. Hobart has come so rapidly to the front in the electrical end—in the development of electrical machinery as applied to mining. Further, that through it all his ideas in new applications of electrical machinery have proved in every case to be entirely practical and extremely successful. While he does not hold an engineering degree from a university, he intuitively grasps technical matters and goes through with them. The Lehigh Coal and Navigation Co. is one of the leaders in the electrical development in the anthracite field, which is largely due to the efforts and foresight of its organization, of which Mr. Hobart is an important part.

Big developments in the way of improved hoisting machinery, car-handling devices at shafts—also mine-car and headframe construction—in all these matters he has taken a prominent part. In the pump end he has labored to eliminate old, wasteful steam pumps of antiquated type, substituting modern, electrical centrifugal machines. All these efforts have tended to result in greater efficiency in the production of coal, decrease in costs—especially in the item of maintenance. Mr. Hobart is amply justified in priding himself particularly that serious breakdowns in machinery on the operating end are almost an unknown quantity.

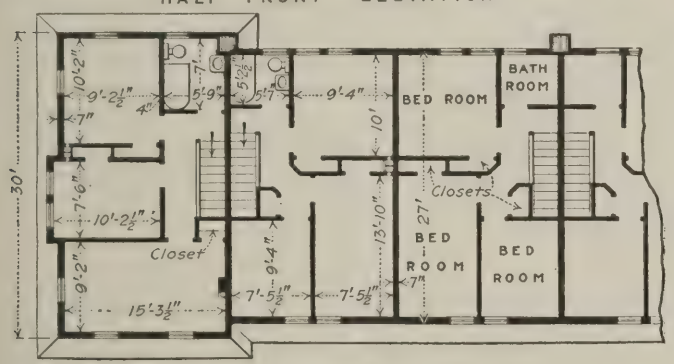
His practical knowledge of the mechanical end of the coal-mining proposition is such that he can always find his way out of difficulties. He knows where a thing is, what it is for and how it can be applied. He thoroughly believes in "yardmaster talk" and yardmaster action—going out on the work and getting things done. Mr. Hobart has an unusually strong personality and the saving grace of a sense of humor. This is attested by his popularity with his men and in the town in which he lives.

He is sometimes addressed as Captain Hobart, for he had a long connection with the National Guard of Pennsylvania. His military experience dated from 1896 until 1911, when he retired with the title of captain. At present he is treasurer of the armory board at Tamaqua. His contributions to engineering societies and technical periodicals in the way of papers and articles are valuable additions to mining and mechanical literature.

Mr. Hobart's extreme reticence to talk about matters connected with himself leaves many blanks—including his home life and many interesting personal reminiscences. His modesty is strikingly exemplified in the type of picture which we are obliged to publish of him—it is taken from a group—the only one obtainable and that without his knowledge or consent. Also were it not for the friendly enthusiasm of his associates, this sketch would be brief indeed. Of his 43 years of life, 28 were given to the company he now serves. His experience should be a wholesome inspiration to those who question whether conscientious, persistent well-directed effort brings success.

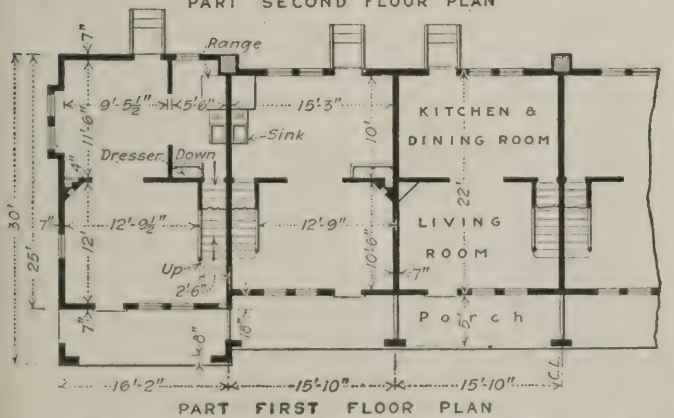
There is no fuel that will burn almost completely without any combustion space. No matter how much the volatile content of the coal is decreased, the combustion space cannot be decreased beyond certain limits except at the expense of completeness of combustion.—*Bureau of Mines Bulletin No. 135.*

Balloon Framing with Concrete



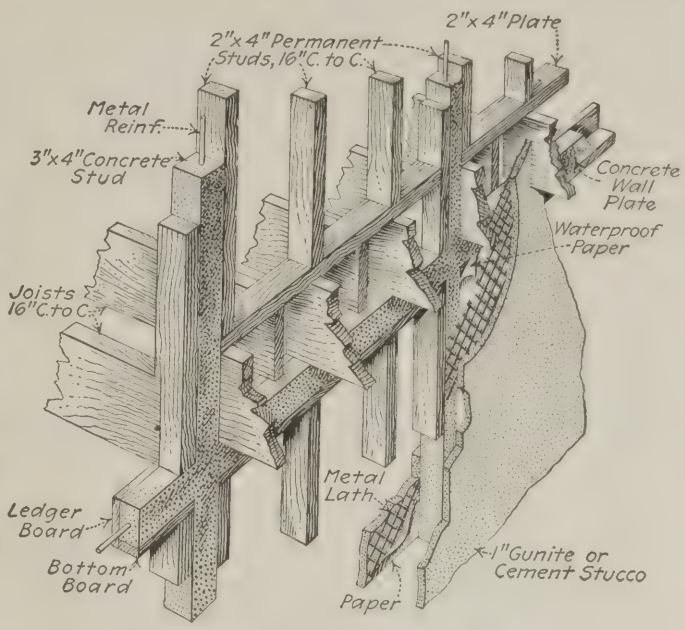
SYNOPSIS — *Concreting has been successfully applied to balloon-frame construction. All the wood used in the forms is left in the building, but little of such wood is needed. The building when completed is a shell of gunite or cement stucco supported on a concrete framework, the whole forming a monolithic unit. For the inside of the outer walls, the party walls and partitions either gunite, cement stucco or plaster may be used.*

THE value of concrete for resisting fire and keeping down vermin gives it a peculiar value as a building material. But there are difficulties in the casting of solid walls, and these difficulties make the building of all-concrete houses trying and expensive. Moreover, walls which are not double are apt to be wet. So some have sought an intermediate plan in which the framework is of wood and the outer and inner coating cement stucco with wire reinforcement.



Emile G. Perrot, of Ballinger and Perrot, architects and engineers of Philadelphia, Penn., has successfully schemed out a house with concrete studs, floor plates and caps as well as a wall surfacing of cement stucco. This sounds complicated, but the matter is comparatively easy. You have walls that do not shrink and are reasonably fireproof and you have floors which, though not fireproof, have the merits of springiness and comfort, qualities which are not afforded by the unyielding concrete floor, which is better suited to a factory than a dwelling. The plan and construction methods are under consideration for use in the large-scale housing work about to be started by the government.

HALF FRONT ELEVATION



PART SECOND FLOOR PLAN

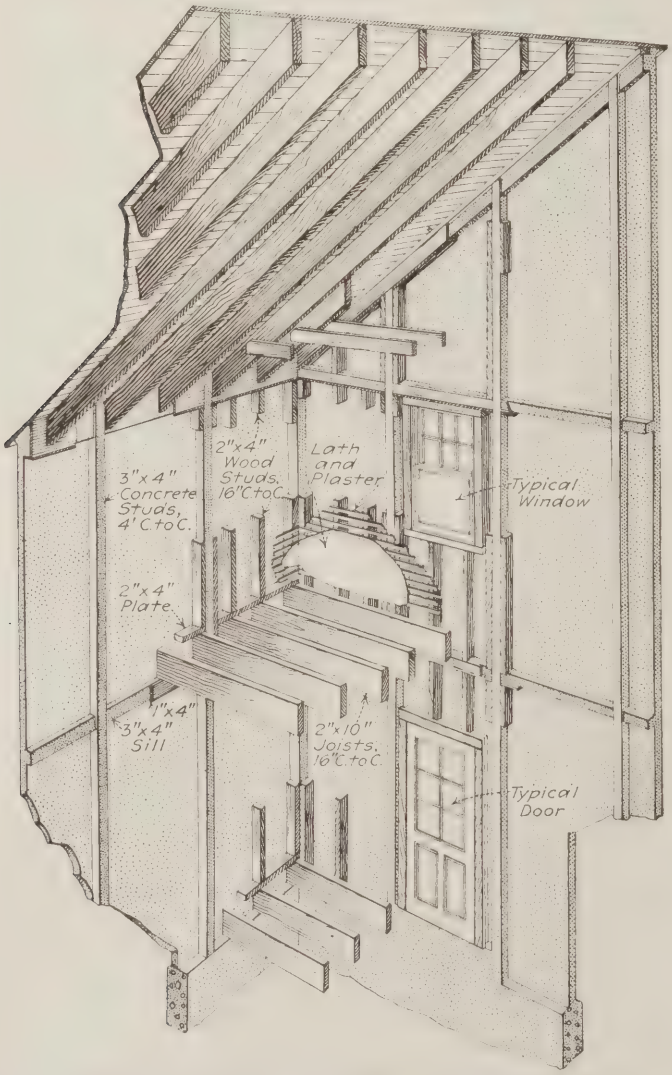
PART FIRST FLOOR PLAN

PART FRONT ELEVATION AND FLOOR PLANS OF TEN-UNIT HOUSE WITH CONCRETE STUDS

PERSPECTIVE SHOWING PARTY WALL

The bids which have been received show that houses, at present prices for labor and material, can be built in ten-unit rows, as sketched herewith, for $2500 per house of six rooms. This figure includes the cost of the hot-air furnace and of the piping for heating purposes. The price is as low as was bid for the construction of a precisely similar house of wood-frame construction and shingle covering and $100 lower per house than was asked for the construction of the houses when 8-in. brick walls were specified for exterior and party walls.

After the cellar is excavated a stone or concrete foundation wall is built in the ordinary way. The first-floor wood joists are then set in place on the foundation walls. On these joists a wood frame consisting of studs, joists and rafters is erected much in the manner customary when building the skeleton of a frame house.



Every fourth stud is doubled, a 3 x 4-in. space being left between the two parts. This space is to be filled with concrete to form a concrete stud, as soon as the roof of the building is in place. At the level of the second floor a ledger board (or board set on edge) is placed over the tops, of the wood studs, its outer edge flush with one side of the studs; either side will do, if a party wall is being constructed, but the inside must be chosen, if an outside wall is being built. A bottom board is also laid flat on these wood studs, its edge butting against the ledger board. When the concreting

reaches this point, the cement gun is directed at the angle between the ledger board and the bottom board and the beam is easily built up by the gun in the shape shown in the perspective view of the party walls.

Before concreting commences heavy waterproof paper is stretched all over the studs on the outside of the exterior wall which is then covered by metal lath. The gunite coating is built up on this metal lath and is made from 1½ to 2 in. thick. At the same time the studs and wall plates are concreted. If, for any reason, the cement gun is not available, the continuous vertical studs and wall plates can be poured with concrete and the exterior metal lath coated by hand with 1:2 cement mortar.

However, the work is not so good as if done by the cement gun for gunite concrete is 33 per cent. denser than ordinary poured concrete and about twice as strong. Color effects may be obtained by adding mortar stain to the concrete while it is being mixed. No further treatment of the exterior wall surface is needed.

In the illustration showing the details of the party wall gunite or cement stucco is shown as the material used. Where cement stucco is adopted the waterproof paper can be dispensed with, the cement stucco being readily built up on the metal lath. The architect will possibly prefer to use neither gunite nor cement stucco but plaster for the inside, party and partition walls.

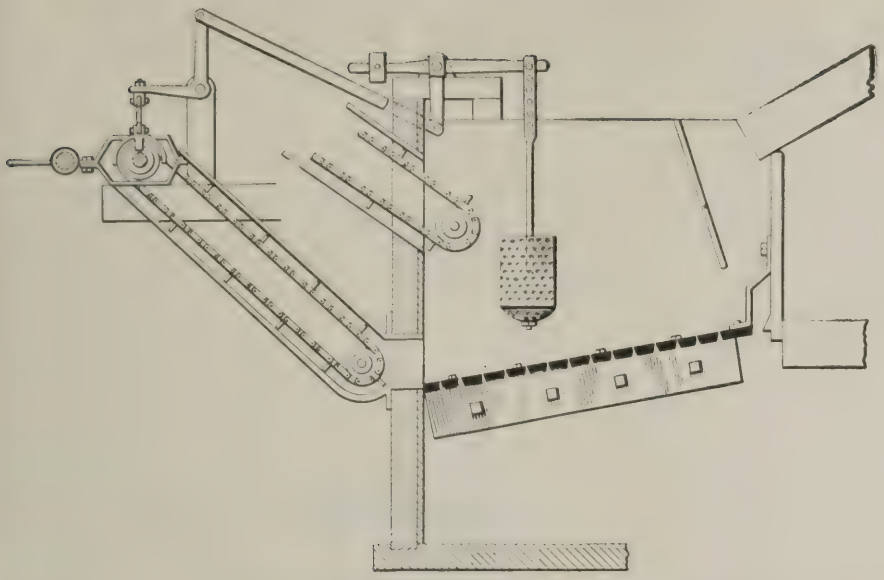
CORNER OF THE LAST HOUSE IN BLOCK OF TEN

Because only a few wood studs and all the concrete studs are shown it is not to be assumed that the wood studs are removed before the lath and plaster or cement stucco surface is placed.

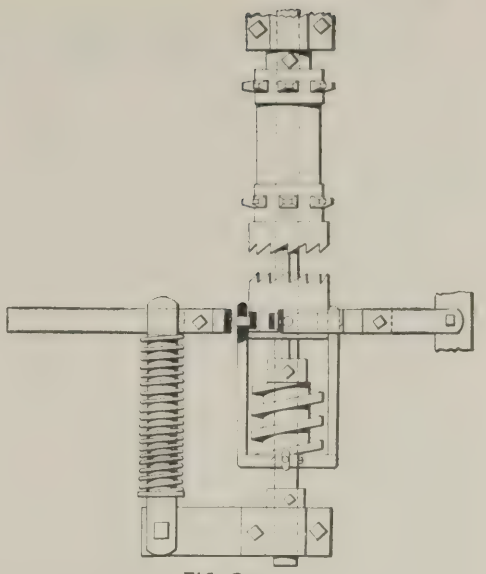
Plaster is not so hard as cement stucco and in consequence interior wood finish, picture moulds, etc., can be more easily nailed in place than they can be with cement surfaces. The plaster can be put on wood, instead of metal, lath if desired. Of course, with such plastered surfaces on the inside walls the dwelling is only semi-fireproof because a fire on the inside of the dwelling is not protected from spreading. The outside wall being protected by gunite or cement stucco is, of course, fireproof, and there is thus protection against exterior fire hazards, but not against those from within. Wherever, as in a factory, no wood trim is desired the cemented surface may well be found preferable.

In order to reduce the fire hazard the interval between the joists on the foundation wall and on the wall plate of the second-story floor may be filled with concrete up to the underside of the flooring, the thickness of the fire stop being the same as that of the studs, namely 4 in.

The rapidity with which this type of house may be erected is dependent only upon the number of cement guns put into simultaneous operation or, if the work is done by hand, upon the number of workmen employed at any one time. After the framework of any number of houses is erected the cement can be applied without any interruption. It is not necessary as in the concrete construction to shift the men and their materials forward and back till the work is completed.



Furthermore, the many cracks so common to all other forms of concrete construction are entirely eliminated because the vertical concrete studs carry all the load and consequently there is no shrinkage or settlement to contend with, the structure being monolithic.



Where the party walls are of stucco or gunite a skim coat of plaster is applied to the cement as a finish. This method of surfacing the walls of a room saves about 8c. per square foot over the usual plastered surface. Whether the interior is gunited, hand-coated with cement stucco or plastered in the ordinary way the methods of construction compete quite successfully with those used in building a frame dwelling, especially now when wood is expensive and difficult to obtain.

Automatic Anthracite Coal Jig Control

The accompanying illustration shows an automatic control for slate and refuse elevators as attached to the common types of anthracite coal jigs. As may be seen in Fig. 1, the device embodies a perforated cylinder or float, which in operation rides on the surface of the slate or refuse while in process of jigging, the object being that after the slate rises to any predetermined height in the jig chamber or compartment. this float rises with the slate and automatically releases a spring (Fig. 2), thereby engaging a clutch. This starts the slate elevator and so removes the slate in the jig chamber, allowing the float to settle again. This settlement causes a nut to come in contact with a worm gear, disengaging the clutch, and so stopping the slate elevator.

It will be readily perceived that the elevator will remain idle until enough slate or refuse has again accu-

FIG. 1

FIG. 2

FIGS. 1 AND 2. AUTOMATIC JIG CONTROL FOR SLATE AND REFUSE ELEVATORS

mulated to cause the float to rise, and thereafter automatically repeat the operation. An important economic feature of this device is that one operator is enabled to care for a battery of 15 jigs where in ordinary operation not employing a control of this character one man is required to attend each 2 or 3 jigs. Once installed and operative, the jigs become entirely automatic, and the device here shown is so simple and "foolproof" as to insure continuous operation at very low cost for upkeep.

This controlling device was invented and patented by Reynolds and Brown, of Forty Fort, Penn. Practical installations have been in operation at several collieries of the Temple Coal Co. for about one year, where they have proved entirely satisfactory. The results have shown an increase over the normal capacity of the jigs, and a greater general efficiency as compared to the operation of standard jigs not equipped with controlling devices. The Cross Engineering Co., of Carbondale, Penn., manufactures this control.

W. M. Chase

NO ONE has reason to expect success who does not connect himself from the first with concerns having a modern way of doing business. A broad view of any industry can never be formed by association with companies that hesitate to travel on a new high road and which begrudge the expenditure necessary to bring their properties up to date. Some persons start life in the deep rut of niggardly and narrow-minded methods, and from these methods and the habits of mind that go with them escape is usually impossible.

W. M. Chase, who was born at Lynchburg, Va., in 1881, was fortunate in having modern operations and competent leadership from the start of his career. In 1898 he started work with the Berwind-White Coal Mining Co. He stayed with them 14 years and then affiliated himself with the Lackawanna Steel Co.'s mining interests at Ellsworth and Wehrum. In the service of both these companies he had an opportunity to see coal-mining practice in the making. Not that progress in the coal industry is all the impatient would have it, but because the Berwind-White and Lackawanna were in many, many ways among the leaders in that progress in both mechanical and sociological lines.

From the Lackawanna interests he went to the Cambria Steel Co.'s mining department at Johnstown, Penn., another progressive organization. When Harry T. Meehan became managing partner of the firm of Cosgrove & Co., Mr. Chase was selected as general manager of the Union Coal and Coke Co., to succeed Mr. Meehan. In doing this Mr. Chase goes back to a neighborhood

W. M. CHASE

with which he is quite familiar. The Union Coal and Coke Co. owns the Marianna and Acme mines, the properties of which abut on either side the properties of the Ellsworth Collieries Co., with which Mr. Chase was for some years identified. The Hazel Kirk mines 1 and 2 are on the same line of road, somewhat nearer to Monongahela. At the latter town is another of the Union Coal and Coke Co.'s mines, the Schoenberger. The other two mines, Penn Manor No. 1 and 5, are in Westmoreland County at Manor and Claridge, Pennsylvania

Mechanical Mining Without Explosives

By N. D. LEVIN
Columbus, Ohio

SYNOPSIS—*A machine that cuts, breaks down and loads coal has been tried out in several fields and several coal beds. The use of this machine decreases the cost of entry driving, makes mining safer and secures a normal output in a short time after opening the mine.*

AT THIS time, when there is a larger demand for coal than ever before in the history of the world, a study of the performance of an entry-driving machine will be of interest. Since 1910 systematic research work has been carried on; experimental machines have been built and tested in several coal beds in various states. This work has resulted in the development of a machine that performs all the operations required in mining coal and loading it into the pit cars without the use of explosives or hand labor.

One machine has been in practically daily operation for two years, and additional ones are now being installed in the same mine. The coal in this mine is overlaid by a heavy layer of drawslate that comes down as soon as the coal is removed. The handling of this slate takes a large percentage of the time, and therefore the production is limited. Careful time studies have been made of the operation of this machine. Table I is an example of one of the daily reports made by an engineer whose duty it was to keep track of the time.

A short description of the machine will assist in understanding this report. Fig. 1 shows a front view of the machine. It operates on the same principle as a breast machine; the first or sumping cut being made at either rib, usually the left. It is fed forward in a stationary pan, making a cut 5 ft. wide, 7 ft. deep and of a height to suit the coal bed. The coal in the above-mentioned mine is 5 ft. 8 in. high. The machine has an undercutting chain with cutter head similar to that of a breast machine, and two shearing chains, one on each side. The frames carrying these shearing chains can be varied for different heights of coal. Between the shears is mounted a frame carrying a number of heavy punching picks. This frame is readily raised and lowered by the operator, who can cause the picks to strike at any height he desires. The coal falls onto a conveyor which is made thin enough to go into the kerf cut by the undercutting chain. This conveyor carries the coal to the rear end of the machine and dumps it into a second conveyor, which is mounted so that it can swing at any desired angle to the machine.

After a cut is made, the machine is moved sideways by means of a rope hitched to a jack at the opposite rib and then another cut is made. When slate is to be piled up at the side of the room the rear conveyor is swung sideways, the slate rolled onto the front of the machine and gobbed by the two conveyors.

If we analyze the daily report we find that on this particular day it took an average of 13½ minutes to make a cut, and about 3 minutes to move the machine to the next cut, or about 16 to 17 minutes time for each cut. There were 45 cars of coal loaded and 13 cuts made, therefore each cut gives about 3½ cars. The cars hold nearly two tons of coal, which means at least six tons per cut and 21 tons per hour. This rate of mining and loading can readily be maintained if conditions in the mine are such that the machine

FIG. 1. FRONT VIEW OF THE MACHINE

can be kept in steady operation, which is not possible with heavy drawslate. Where the roof conditions were good the machine has loaded 30 tons an hour in this mine.

Fig. 2 shows the machine ready to start a cut. The jack and rope for pulling the machine over for the next cut are plainly seen. This photograph shows the pipe posts that are used with the machine. These posts can be set in a small fraction of the time that would be required for setting wooden posts. As the machine advances, wooden posts are put in to take the place of the pipe posts.

Fig. 3 shows the coal being delivered to the swinging conveyor. Figs. 4 and 5 show the swinging conveyor delivering coal to a storage hopper. This hopper holds about three tons, and is provided with a conveyor that will empty it in about a minute. There is a separate motor on this hopper for operating the conveyor. A starting box for the motor is at the rear end of the conveyor, conveniently located for the driver who stops and starts the hopper conveyor as required in loading the car. There is also mechanism on the hopper for moving the car its own length so that the driver can load the car without assistance. The machine crew pay no attention whatever to this part of

the work. The storage in the hopper gives the driver sufficient time to change cars and keep the coal away from the machine. This hopper conveyor is of more importance than one would think.

TABLE I. DAILY REPORT

7:00 a.m. to	7:50 a.m.	Clearing slate and bottom coal
7:50 a.m. to	8:05 a.m.	Cutting and loading coal
8:05 a.m. to	8:17 a.m.	Move machine and set posts
8:17 a.m. to	8:30 a.m.	Cut and load coal
8:30 a.m. to	9:02 a.m.	Move and set machine for sumping cut; set bits; clear slate; dig up bottom coal and replace bent jack pipe
9:02 a.m. to	9:25 a.m.	Cut and load coal and pick out slate that fell on top of the machine
9:25 a.m. to	9:28 a.m.	Move machine
9:28 a.m. to	9:41 a.m.	Cut and load coal
9:41 a.m. to	9:51 a.m.	Cleaning slack out of teeth of crank gear*
9:51 a.m. to	9:56 a.m.	Move machine
9:56 a.m. to	10:07 a.m.	Cut and load coal
10:07 a.m. to	10:09 a.m.	Clean slack conveyor
10:09 a.m. to	10:16 a.m.	Move machine and set roof posts
10:16 a.m. to	10:27 a.m.	Cut and load coal
10:27 a.m. to	10:32 a.m.	Tighten brake band an pick drum
10:32 a.m. to	10:52 a.m.	Clearing slate and bottom coal
10:52 a.m. to	12:07 p.m.	Cut and load coal
12:07 p.m. to	12:37 p.m.	Dinner time
12:37 p.m. to	12:55 p.m.	Move machine and shovel loose coal and post room
12:55 p.m. to	1:06 p.m.	Cut and load coal
1:06 p.m. to	1:20 p.m.	Move machine and shovel loose coal
1:20 p.m. to	1:35 p.m.	Cut and load coal
1:35 p.m. to	2:00 p.m.	Move and set machine for sumping cut, clear slate and dig up bottom coal and reset roof posts
2:00 p.m. to	2:17 p.m.	Cut and load coal
2:17 p.m. to	2:20 p.m.	Move machine
2:20 p.m. to	2:33 p.m.	Cut and load coal
2:33 p.m. to	2:37 p.m.	Move machine
2:37 p.m. to	2:51 p.m.	Cut and load coal
2:51 a.m. to	2:56 p.m.	Move machine and oil crank gear gearing
2:56 p.m. to	3:10 p.m.	Cut and load coal
3:10 p.m. to	3:30 p.m.	Shovel loose coal and take down slate and post up room safe for night

*A guard has been provided to keep the slack away from the gear.

From July to October, 1913, the first machine of this type was operated in another district, driving an entry where the roof conditions were all that could be desired, but all that time there was no hopper conveyor used. It was found that regardless of every effort on the part of the machine runners and the mine foremen, there was an average of 5 minutes wasted each time a car was changed. Nevertheless an output of as much as 120 tons per shift of 9 hours was obtained with an average of 60 tons per shift for the three months that the machine was operated. Since that time many improvements have been made in the machine, and the hopper conveyor added, therefore a much larger output should be expected.

The use of mining and loading machines will materially change the coal-mining industry. A property that, with the present system, takes years to develop, can be opened up in a short time by the use of mining and loading machines. As soon as the overhead equipment, shaft or slope is ready, it is simply a question of putting in a sufficient number of machines to obtain the desired output. The work can be concentrated and the output obtained from a small territory.

Opening a New Mine

If we assume that a coal property of about 5000 acres averaging 6 ft. of coal located in the lower Monongahela River section of the Pittsburgh district is to be opened, the panel system of room-and-pillar mining would probably be decided upon as being the best adapted to the conditions to meet maximum recovery and safety in operation. It would probably be desirable to obtain an output of 3000 tons per day, which would exhaust the property in somewhat over 20 years.

To provide for the enormous volume of air that would be required as the mine advances it would probably be necessary to drive six face entries in the center of the property. If the entry work is pushed hard, and all entries worked double shift, it would probably take three years to develop the mine sufficiently to obtain an output of 3000 tons a day. On the other hand, if the same property were to be opened with a view of using mining and loading machines, it would probably not be necessary to plan for more than two or possibly three face entries. Two butt entries could be started immediately and worked to the end of the property, one machine to each entry.

The machine when driving an 11-ft. entry has averaged 20 ft. advance per shift of 8 hours under rather unfavorable conditions. There was a considerable

FIG. 2. THE MINING MACHINE READY TO START A CUT

FIG. 3. REAR VIEW OF MACHINE, SHOWING COAL ENTERING SWINGING CONVEYOR

amount of sulphur in the coal, and the machine was handled by a crew unskilled in the work of pushing the work; also, the personnel of the crew was frequently changed. It is safe to assume that if the machines are worked double shift, they will advance 40 ft. each 24 hours. This being the case it would be desirable to drive to the end of the property and work back. As soon as a pair of entries are given, as many rooms as desired can be turned off. In the meantime another pair of entries can be started. It is desirable to cut very few breakthroughs in the entries in order to save expense of building fireproof stoppings. The breakthroughs may be driven on 250-ft. centers. In this case air is supplied to the machines by canvas tubes and a small electrically driven fan placed in the nearest breakthrough. A tube of this kind is shown in two of the accompanying illustrations. These machines should be worked double shift. Between shifts they

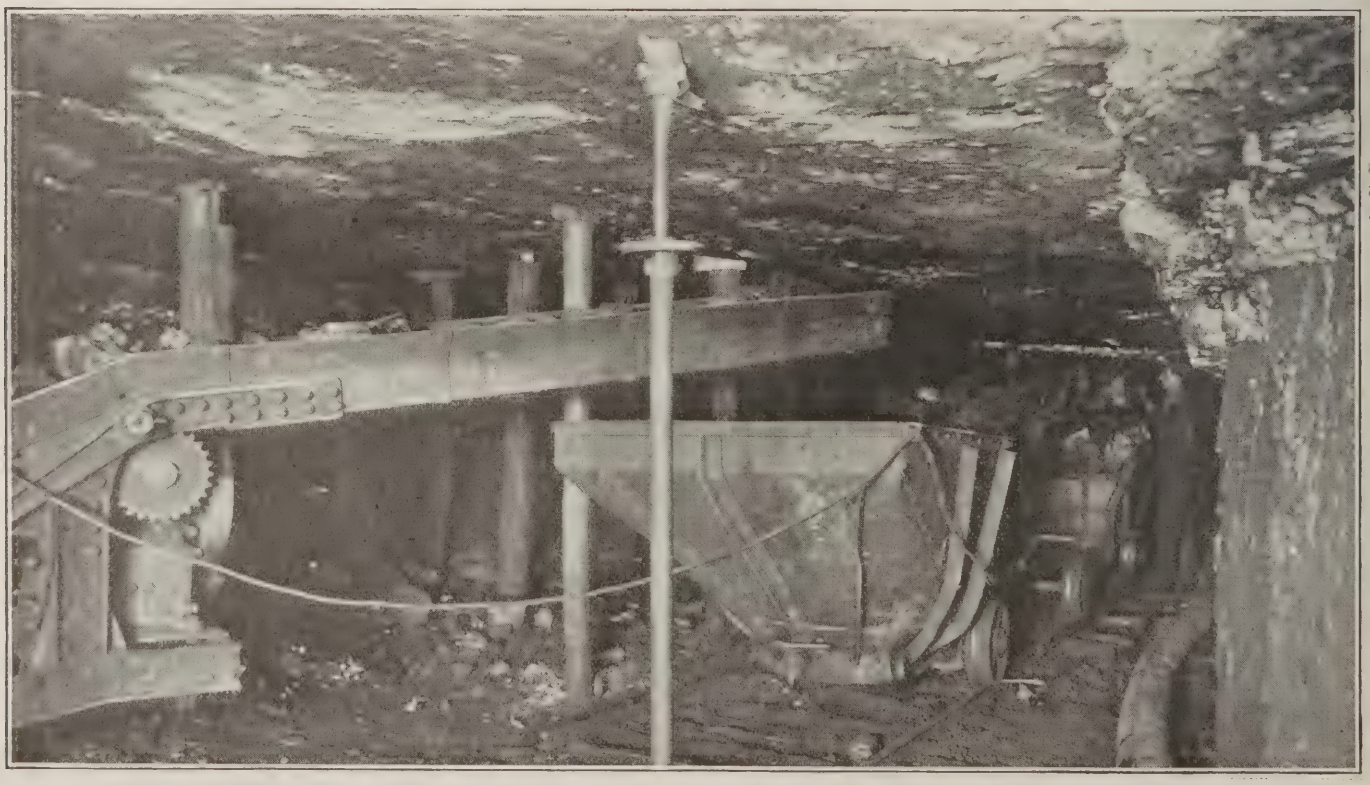


FIG. 4. REAR OF CONVEYOR, STORAGE HOPPER AND CAR

should be oiled, looked over in a general way and the bits reset.

If we assume that each machine working in a room produces 60 tons per shift, or 120 tons each 24 hours, and each machine on entry work produces 40 tons per shift, or 80 tons every 24 hours, there would be 22 machines required for room work and four machines for entry work for the mine in question. Consequently, to obtain 3000 tons per day would require only 22 rooms and four entries at one time. If the mine is laid out along the line of present practice about 350 rooms and 30 to 40 entries would be required to maintain an output of 3000 tons per day.

It can readily be seen that an enormous saving can be made in track and trolley material, overcasts, fireproof stoppings, turning room necks, timbering, drainage, ventilating equipment, locomotives, mine cars, mules, etc.

The crew for each machine consists of a machine runner, a helper and a driver. If the slate is heavy, it may require an extra man for handling this material. The same class of men that make good shortwall machine runners make good men for the mining and loading machine.

There is less danger of roof falling where the mining and loading machines are used. The machine stays in the room until it is worked out, which is a comparatively short time, probably three to four weeks. On account of this condition the expense of timbering should also be decreased to a marked degree.

In a mine of the kind outlined there would be few entries that they could be inspected frequently and kept in a safe condition. No explosives would be used in a mine equipped with mining and loading machines, and there would thus be no danger of blownout shots which often cause dust explosions. All accidents due to careless handling of powder and carelessness in shooting would be entirely eliminated.

When a section is worked out, it could be closed up permanently. Thus only a small section of the property would be worked at a time, making it easy to ventilate and keep down the dust.

To analyze the cost two mine maps were laid out, one for the mine using entry driving machines and the other the present system of room-and-pillar work. On these maps were marked the advance of working faces for each month until 3000 tons per day could be obtained. Equipment, track material, etc., were tabulated for each case and probable pay rolls were made up.

It was found that the outlay for equipment and the expense of opening a mine with mining and loading machines was about the same as with the present system, if it was assumed that the machines loaded only 60 tons per shift, in the rooms. Conditions must be unfavorable if the machines do not load more. If an output of 100 to 150 tons per machine is obtained, which is quite probable, then the saving in the first cost will be much in favor of the mining and loading machine. The figures show a saving of 32c. per ton by using the machine in entry driving.

In obtaining these figures it was assumed that conditions were unfavorable and that the machines produced only 40 tons per shift in rooms and 30 tons per shift on the entries. The machines have averaged much better than that where the slate handled was 2 to 4 ft. thick.

In a mine equipped with mining and loading machines the cost will not increase from year to year as the mine is being worked out, as is the case with the present system. The workings will always be concentrated. Only main haulage will become longer, and this will not materially affect the cost.

FIG. 5. COAL BEING DELIVERED TO THE STORAGE HOPPER

From Switchman to Coal Operator

Biographical Sketch of Frederick W. Lukins, President of the Southwestern Interstate Coal Operators' Association

GRAY matter, energy, a level head and a sense of proportion that provides an appreciation of the other fellow's point of view—these are the chief qualities that have characterized the progress of Frederick W. Lukins, from switchman on the Chicago, Burlington & Quincy, at Streator, Ill., in 1881, to coal operator and president of the Southwestern Interstate Coal Operators' Association.

Fred Lukins, with the commonest of common school educations, was a husky lad and naturally drifted into a switchman's job at home; but he had ambition. He edged his way into the freight office of the railroad; next he was made secretary of the Riverbank Coal Co., a producing concern. He joined forces with Jim Cavanaugh, who was also energetic and ambitious. They formed the coal-producing firm of Lukins & Cavanaugh and bought a drift mine on time. Cavanaugh looked after the operating end, hauling coal from the drift to the dump, from which it was hauled by wagon to the cars. Lukins looked after the business end of the company. After two years Lukins gave up his regular job with the Riverbank company. He and Cavanaugh bought another mine where they raised coal with a gin; they dumped it into a tram car in which they hauled it to the railroad.

F. W. LUKINS

Has gray matter, energy, level head—and appreciates the other fellow's point of view

In 1887, after three or four years of the hardest kind of work, they reached the climax of their efforts, opened another shaft, equipped it with a steam hoist and loaded coal into the cars direct. Meanwhile, however, they added other strings to their bow. They had a brick manufacturing plant and they also formed a partnership with Mulford, a contractor, whom they bought out.

In 1893 Mr. Lukins sold his interest to Mr. Cavanaugh, and with T. C. Loucks, of Chicago, organized the Chicago-Virden Coal Co. They bought a coal mine at Virden, equipped it with modern machinery, and went to work in earnest. The first year they would have made the record for the biggest output of the state, except for a railroad rate war in which their railroad did not participate. The second year they produced the highest annual tonnage in the state at that time, 350,000 tons. Then they bought out the Sugar Creek Coal Co. at Auburn and also a mine at Chatham. This gave them a total production of 5000 tons a day. They ran these properties until 1905, when they consolidated with the Pittsburgh Coal Co., whose properties were at Springfield, Virden, Litchfield and Sorento. Mr. Lukins had been vice president and general manager of the Chicago-Virden company; he was made general manager of the new combination, the Illinois Collieries Company.

On the first of April, 1907, Mr. Lukins resigned his position with the Illinois Collieries Co. to become the general manager of the O'Gara properties. These included the O'Gara Coal Co.'s thirteen properties in Saline County, Illinois, also the mines of the Vivian Collieries Co., the Imperial Mining Co. and the O'Gara Coal Mining Co., the latter companies having ten mines in Illinois, Indiana, Ohio and West Virginia. The O'Gara companies soon developed the largest output of any concern in the central west at that time. There were more than twenty mines scattered over four states. Production was greatly increased under Mr. Lukins' management. The Saline County property, for instance, rose in five years from 4000 to 15,000 tons daily. In another of the properties Mr. Lukins increased the production from 800 tons a day to 1200 within a month's time, without any increase in the day labor cost.

When the five-year contract was up, Apr. 1, 1912, Mr. Lukins was ready to take a rest. He had been thirty years in harness and he wished to give up the coal business, moving to one of his ranches in Colorado. He was there only a year when pressure was exerted to get him back into coal again. He finally took the general managership of the Waverly Coal Co., which has extensive interests at Waverly, Mo. These mines had been idle for some time and finally had been purchased by an English syndicate.

When Mr. Lukins had been back in Streator, Ill., as a young man, he had come in contact with the high grade coal from the east and with cheap coal from the south. He then resolved that eventually he would handle either the highest grade coal or the cheapest. Later, in the Virden company he had had a chance to mine cheap coal successfully. But out on the ranch he decided that what he really wanted to do was to handle a high-grade product. When he came to Kansas City in 1913, as manager of the Waverly company, he bought the properties of the Farmers' Fuel Co. at Higginsville, Mo., and reorganized it. This company had been selling Red Label coal for more than 30 years in its territory. Mr. Lukins, in 1916, bought another mine in the same field, which gave him control of that field and of the type of coal which had been sold as Red Label for so many years.

Coal men will remember the Virden riots of Oct. 12, 1898. These were the culmination of a strike on the Chicago-Virden properties which had lasted through that summer. That trying experience matured Mr. Lukins' sympathy as well as his judgment with refer-

ence to the unions and the general purposes of organized labor. This sympathy was not purely theoretical, but has been practically applied to dealings with unions over many years.

Mr. Lukins was one of the first members of the Illinois Coal Operators' Association, organized in 1898, and was on the scale committee from the beginning. He served two terms as vice president of that association and was continously on its executive committee. After coming to Kansas City he was continued on the scale committee because of his knowledge of practical mining matters and his faculty for getting along with the men. In 1917 he was vice president of the Southwestern Interstate Coal Operators' Association for Missouri, and this year is its president.

Mr. Lukins does not confine his sympathy for organized effort and for conservatism to miners' organizations. He believes that operators should consider the square deal. He is consistent. When the Chicago Virden company was organized, he had that same idea which he now represents as president of the Southwestern Coal Operators' Association. The Chicago Virden company raised the day wages from $1.50 to $2 and the miners' scale from 50c. to 55c. in the face of opposition of operators who did not believe in paying any more than they had to.

The question was asked Mr. Lukins, "What is the secret of success?"

"It's hard to say," he said, "why one man fails and another gets ahead. Two essentials to success are gray matter and energy. But there are plenty of smart fellows who work hard enough and yet do not seem to gain a permanent advantage. Perhaps it is because they lack balance."

Anyone knowing Mr. Lukins could hardly avoid observing that he never is apparently in a hurry; he always has time for anything that needs to be done; he goes straight at the task, and every move he makes and every word he says carry him closer to the accomplishment of the result aimed at. If one remembers the big things Mr. Lukins has done, the many phases of complicated industrial problems that he has so ably kept in hand, his competent grappling, not only with financial and operative, but with the human element of coal and mining and marketing, one can hardly fail to recognize him as a man of genius.

Success of the Coal Mining Engineer

By E. I. ROBERTS
Alberta, Canada

THERE is great diversity of opinion as to just what constitutes a mining engineer. If the question were asked, "What is a coal mining engineer, as commonly understood around a coal mine?" various answers will be received. The majority will probably say, "Why, he is the man who does the surveying." From others, "Well, he is usually around when there is some concrete work to be done." Still another explanation will be given by others.

As a general rule, however, the definition of "coal mining engineer," as it is usually given and understood around the various coal mining fields, does not give as complete or as full a credit to the name as it deserves. Wherein lies the reason for this? Is it with the coal companies, or with the mining engineer? The writer ventures the opinion that it rests with the engineers, as professional men, to change this general understanding. It is of course realized that mining engineering comprises a little of all branches of engineering; in some cases a lot of some particular profession. It is probably due to this diversity of engineering requirements around coal mines that the general engineer has confined his efforts to surveying. The primary requisite, then, is adaptability on the part of the engineer.

There is a decided trait among certain young college graduates to still cling to the college fraternities—too much Alpha Beta. This trait tends to injure their own future and also the future of coal mining as an engineering profession. This all tends to a waiting for opportunity—to a craving for the unearned respect of those who have never had the chance to be an Alpha Beta. Coal mining is too hard a game and contains too many strong, able men to give respect to a name alone. This brings us to the second requisite for success—push and initiative. The graduate, on first leaving college, encounters a cold, and sometimes unsympathetic world, particularly when he enters the coal mine. The guiding hand of his professor is withdrawn, and sometimes it almost seems to him as though the source of all his knowledge has been cut off. He may temporarily forget that his professors strove to impress on him the necessity to think for himself. College aims to make men think—textbooks are mainly for reference, after their contents have been mastered. This all tends to call attention to the third requisite, that of confidence in himself.

Many times training is not considered at all—it may be presupposed that this quality has been given to the young engineer during his college days. Further, it has been said that engineering is one part mathematics and nine parts common sense. In the mind of the writer, the training for any particular application of engineering can be acquired at the time necessary for the training to be applied. Provided, of course, that the foundation is there. It is rarely the case that a university gives any man more than a foundation, the rest comes from the continued application, built up on this foundation.

In the past the duties of a mining engineer too often have been largely confined to one or two small branches of the profession—that is, surveying and platting. Occasionally he may have been used to look after the construction of a concrete wall. Or, if he was out of work, he may have been instructed to help in the office or in any department where a little clerical work was needed. Finally, when the company retrenched, the mining engineering department was the one largely dispensed with.

A person realizes that to survey properly is a worthy attainment—to be able to make an accurate map, an actual necessity. But it seems ridiculous that it should require four years' technical training and subsequent practical knowledge to run accurately and plat neatly a simple traverse in a coal mine. Yet this is what is expected of the engineer by the majority of coal operators and officials. It would be quite as reasonable to expect an electrical engineer to devote his entire time to the splicing of cables, or a mechanical engineer to the firing of a boiler. Each of these duties is a necessity in the respective lines, but they do not constitute the professions of electrical or mechanical engineering. Still, a similar necessity in the mining engineering field is expected to constitute the whole. It is up to the mining engineer to change this view. And may it not be a lack of one or more of the requisites for success above mentioned which is responsible for this understanding of the profession?

Of all modern industrial organizations, coal mining is occasionally the least efficient. A coal mine power plant may still use fire-tube boilers, and most boilers are hand fired. Such devices as carbon dioxide recorders are the great exception, similarly with draft gages. The average coal company considers that the fuel used about the plant costs little. Again it is up to the mining engineer to present such matters to the company—show them the practicability of the devices in question—also that coal used at the plant should be an item on the cost sheet. All this before the company, waking up to the situation, sends for a mechanical expert to report to them on conditions which their own engineer might have pointed out.

Mine Engineer Should Investigate First

Before an electrical expert is demanded, let the mine engineer investigate how much leakage there is on the underground cables; whether the return is sufficient for the intake cables; is the bonding up to the mark. These are all matters that a bright, capable mining engineer can at least report upon up to a certain point—his investigations will be of value to his company. Again, a haulage accident occurs. What is the reason? Here is a chance for the mining engineer to make suggestions as to a remedy to prevent a recurrence.

In regard to the preparation of coal: Possibly matters are not progressing smoothly at the tipple. Slack may be going into the lump coal chute. There is too great a proportion of nut in the egg coal. Will the engineer measure up to this problem or shall the company send for an expert on such matters? Take the question of costs: If they are running high, is there a system in use which will spot the item causing leakage? If not, the engineer has an opportunity to show that a system of proper distribution of all expenses and revenues may change matters. He can anticipate the sending for accountants.

Is there labor trouble? What are the difficulties? Did the engineer make it his business to be on hand as a company representative? Efficiency engineers are being called from manufacturing fields to investigate, report and suggest methods that the mining engineer long ago should have investigated and at least partly remedied. Let us suppose that an engineer had installed definite time motion studies on the different operations of coal mining two or three years ago. This might have been of considerable value today.

It might be that the whole question could be summed up in the word "anticipate." Anticipate your own needs and sometimes the needs of the company will also be anticipated. All of this discussion points to the three qualities for success previously noted. Adaptability to the present needs, push and initiative to anticipate these needs and confidence to present the facts authoritatively.

To make a mistake once is pardonable; to repeat it, unfortunate; to let it happen the third or fourth time is to establish a habit. Bad habits are the stock in trade of weak-willed, self-indulgent, spineless individuals.

High Efficiency at Small Cost

By G. E. Alloway
Ironton, Ohio.

About one year ago C. O. Messenger took charge of the mine of the Eagle Gas Coal Co., at Vaughan, W. Va. At that time this operation had an output of about 50 tons per day. Mining was done by hand and hauling by mules, five of these animals being used to handle the output. A furnace was used to ventilate the mine—burning from four to five tons of coal per day.

As Mr. Messenger's capital for improvement was limited, he decided on the following equipment: One 25-hp. firebox boiler; one 22½-hp. engine; one 7½-kw. generator; one 6-ft. Stine disk fan; one 5½-ton Ironton storage-battery locomotive; one 3-in. suction 2-in. discharge electric-drive pump. His method of obtaining 100 per cent. efficiency from this small plant is as follows:

By using a pulley at each end of his engine shaft, he can drive the fan from one pulley and the generator from the other. He thus furnishes power for his pump during the day, and at night this machine is shut down and current is used to charge the storage-battery locomotive.

This equipment has eliminated all mules and has increased the output to 150 tons per day. The fuel consumed is really less than that formerly burned in the furnace. Besides these savings Mr. Messenger has been able to dispense with the services of a furnaceman, one man employed in bailing water and two drivers.

The 5½-ton locomotive is able to handle a train of 14 loaded cars (total weight of cars and load 27 net tons) over a grade 1500 ft. long and averaging 2 per cent. against the load. At some points for a distance of 25 to 50 ft. the grade is as high as 4 per cent. against the load. One man runs the engine and looks after the rest of the machinery during the day, while another during half a shift at night charges the locomotive and gets it ready for the next day's run. One motorman and a helper complete the force needed to operate this highly efficient little plant. Cars are of the plain bearing type, and 20 lb. rail is used on the main haulage.

I believe this is the most efficient plant in the coal fields of West Virginia, considering the small size of the initial investment.

Revolving Dumps at Docena and Edgewater

DURING the summer of 1906 it was decided to open a new mine in the Pratt seam lying due north from mines then in operation. The coal lay at a depth of 250 ft. from the surface, the average thickness being approximately 36 in. The operation is known as Pratt No. 12, or Docena Mine.

The standard Pratt car being too high for this thickness of coal, a new car was designed with an over-all height of 26 in. above the rail and a capacity of 2 tons; the usual swing door at the front end of the car was replaced by a solid end to prevent spilling of fine coal along the haulageways. This type of construction necessitated the use of a revolving dump.

The average output desired from the mine was 2500 tons in 10 hours. After due consideration it was decided to sink a two-compartment shaft, equipped with 6-ton capacity skips running in balance, and to install suitable dumping and loading arrangements at the bottom of the shaft.

After the plant had been in operation for some time, a test was made of the capacity of the revolving dumps, with the following results:

	Dumping Time	Tons per Hour
First trip—16 cars	5 min., 30 sec.	200
Second trip—18 cars	8 min.	165
Third trip—10 cars	2 min., 30 sec.	276
Fourth trip—22 cars	4 min., 45 sec.	318
ifth trip—36 cars	6 min., 45 sec.	368

The whole arrangement worked out satisfactorily, and when it became necessary to sink and equip Pratt No. 13, or Edgewater Mine, it was decided to use a similar arrangement. The following brief description refers to the Edgewater installation:

Referring to Fig. 2, the plan of the bottom shows the relative location of the car haul, car scales, revolving dump and hoisting shaft.

Electric locomotives deliver trips on the loaded sidetrack. After being uncoupled and passed over the scale by car haul, the cars acquire sufficient momentum by gravity to run into the revolving dump, displacing the empties therein. The car stop used is of the revolving type and is automatically operated by a reach rod from the incoming end by the loaded cars.

FIG. 1. THE THREE-COMPARTMENT DUMP IN OPERATION

As shown at *A*, the revolving dump has three compartments, each holding two cars, one-third of a revolution being required for each dumping operation. As it operates wholly by gravity, the cost of operation and upkeep is low.

The operation of the dump is controlled by a band brake on one of the spiders. Originally a positive stop was used to bring the dump to rest in the loading position, but it did not prove successful and was abandoned, the stop being now made wholly by careful operation of the brakes.

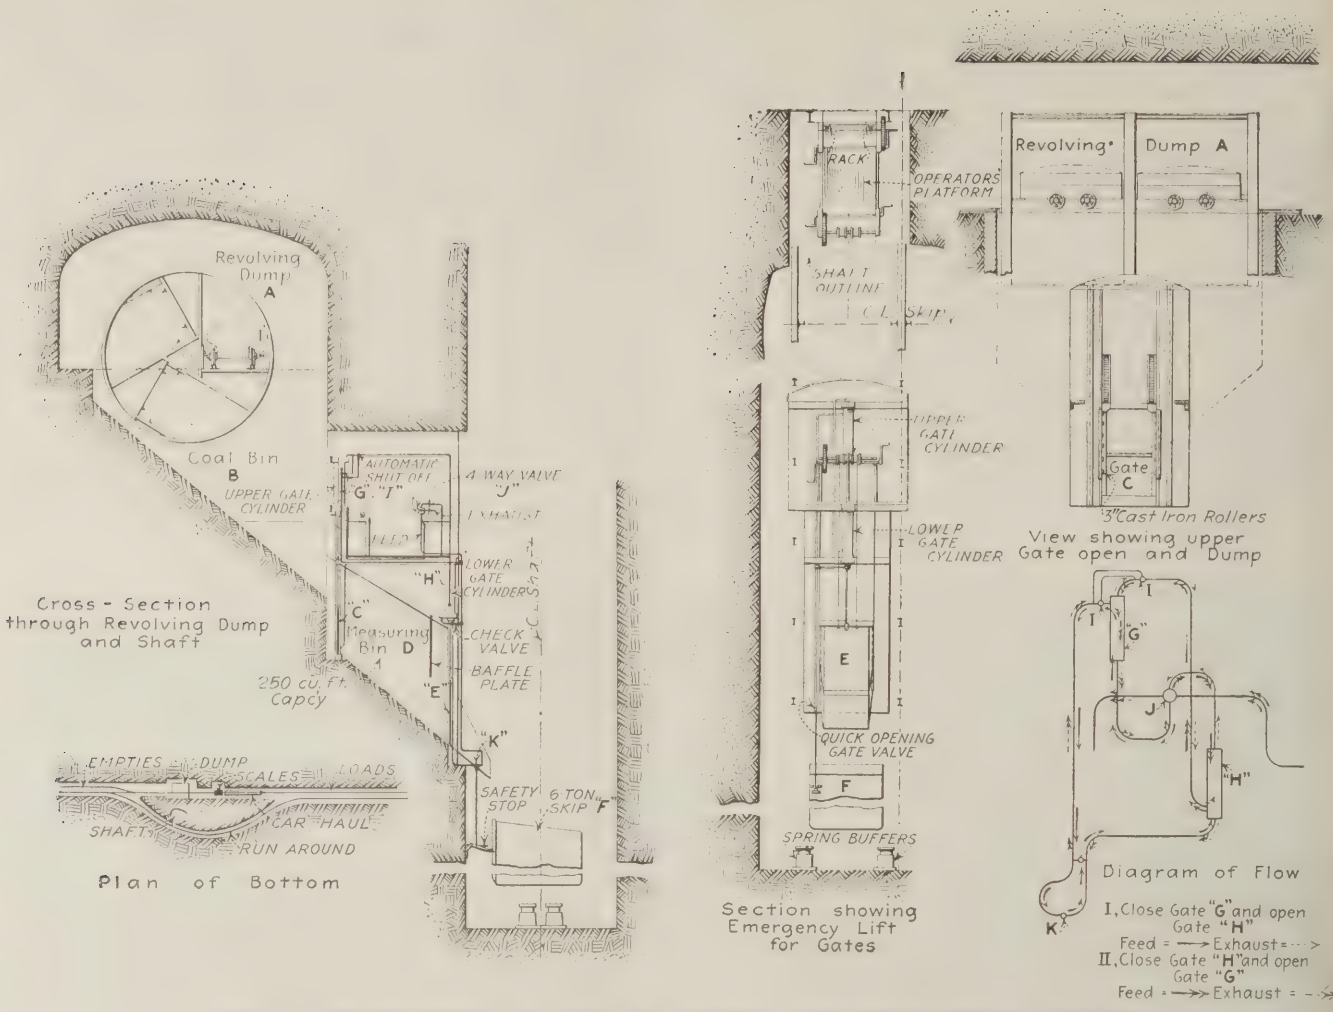

FIG. 2. ARRANGEMENT OF DUMP AND CONTROL DEVICES AT SHAFT BOTTOM

Fig. 1 shows clearly the construction of the dump and method of operation. The operator is shown on the right, his right hand on the lever controlling the operation of the dump, and his left hand on the controller of the car haul motor. Another lever is shown, which is used to operate the car stop for the removal of empty cars when no loads are available. The mechanism for automatically operating the reach rod to the car stop is also clearly shown.

The bin *B*, directly under the revolving dump, has a capacity of approximately 40 tons. To prevent overloading of the skip (6-ton capacity) and spilling of coal around the bottom of the shaft, a measuring bin *D* with a capacity of a skip load (6 tons), is built between the bin *B* and the side of the shaft. This is operated as follows: The skip being loaded and the bin *D* empty, the gate *E* is lowered and the opening closed. The gate *C* is then opened and coal flows into the bin *D*. When the bin is full, the gate *C* is raised to the closed position.

The arrangement of valves and cylinders is such that the undercut gate *C* cannot be operated while the dump gate *E* is open, neither can both gates be open at the same time; further, by means of the control valve at *K*, operated by the skip, the gate *E* cannot be opened until the skip is in position to receive the load. This eliminates any possible error by the operator.

The whole cycle of operation is controlled by four-way valves (marked *J* on the drawing); the operator at this point also controls the movement of skips in the shaft by signals to the hoisting engineer. The diagram of flow shows the course of the water through the cylinders and valves during the operation of opening and closing the gate. Hand-operated emergency lifts are provided in case of temporary failure of the hydraulic mechanism.

Efficient Pipe Covering

Coal means money. This applies just as forcibly to the operator as to the consumer. The old days of extravagance in fuel consumption around the mine are as out of date as the mine mule and the old horse-propelled hoist.

Small isolated steam plants—at the tipples, the hoist, the pumps and other outlying points—are among the most extravagant of fuel wasters. That they can be abolished with satisfactory results is shown by the experience of the Harleigh-Brookwood Coal Co. at Frackville, Pennsylvania.

Here 10 isolated steam installations, each with its own boiler house, involving all the heavy costs of fuel, labor, maintenance and overhead, have all disappeared. In their place one central boiler house supplies all the various operations both above and below ground.

Steam is generated at 175 lb. pressure and transmitted with but small loss from condensation, through a pipe line, extending in all for over 6700 ft., of which 4300 ft. is 10-in. pipe, 800 ft. of 8-in. and the remainder of 6-in. pipe. The greater part of this length is out-

doors, but some 900 ft. is carried underground, to supply triple expansion steam pumps.

The pipe line carries an ample supply of steam for two 20 x 30-in. double cylinder engines, the breaker machinery and all other outlying operations, in addition to the pumps mentioned. A detailed description of this plant was printed in *Coal Age* for Dec. 20, 1913, page 939. (See illustration below, which gives an excellent view of the pipe line at the Harleigh-Brookwood plant.)

All of these pipes are protected by a covering of 85 per cent. magnesia 1½ in. thick, suitably covered and protected from the weather. Over hill and dale, in all sorts of weather, they deliver an ample supply of steam, defying blizzards, storms and zero temperatures, of all of which there are plenty in this section of Penn-

It is of course the heat insulating powers of the covering that make such extreme lengths of pipe line possible. This is by no means an isolated instance. At the Kingston colliery, a few miles away, is a 2700-ft. line, and it is not at all uncommon for much shorter lengths than these to be used.

Thanks to the protection afforded by adequate pipe covering it is no longer necessary to figure on a separate boiler house for each extension of the plant. The first cost of a transmission pipe line, properly insulated, is far below that of even a cheap boiler. The reduction in overhead costs for one year often more than pays for the entire outlay.

There are many instances on record where magnesia coverings have been in service for 25 years and upward without showing the least sign of alteration, either in their structure or in their insulating value. On a cost per year basis it is the insulation that maintains its efficiency over the longest period, that is the cheapest, irrespective of its first cost. The coal saving is the measure of its efficiency. Multiplied by its years of life, this saving often far outweighs all other considerations.

Italy's Coal Mines Are Expanding

In 1917 the coal production of Italy was probably 15,000 to 20,000 tons of coal and 2,000,000 tons of lignite. In 1914 there were 46 active coal mines. This number increased to 59 in 1915 and to 137 in 1916. Evidently the new mines were smaller than the old ones, for in 1914 there were 4000 men employed, in 1915 5461 and in 1916 about 6000 men. Some of the lignite is of the pitch type and may be used as a gas coal, its quality being similar to that of Scotch "splint." This particular lignite comes from Ribolla in the Comune of Roccastrada in the Province of Grosseto, Tuscany. The mines generate gas.

GENERAL VIEW OF PIPE LINE AT HARLEIGH-BROOKWOOD PLANT, FRACKVILLE

Handling Coal and Ashes in the Boiler House

BY HENRY J. EDSALL
Philadelphia, Penn.

SYNOPSIS — *The plant here described, although not built at a coal mine, might well serve as a model for such installations. Both coal and ashes are handled by a single conveyor so designed that the chief wear comes upon hardened steel bushings and pins that can be cheaply and quickly renewed when appreciable wear has developed.*

IN THE last three years there have been a great many boiler houses built, and the majority of them have been of moderate capacity varying from 2000 to 10,000 hp. normal rating. As the boiler-room equipment has become pretty well standardized, it has been possible in numerous cases to follow a more or less standard design for the building and the arrangement of the boilers and other equipment.

Since I have been in touch with the design of quite a number of these boiler houses, starting with the first sketches of the plant, I have had a chance to follow the general tendencies in present-day design and to note the attitude of many engineers toward the various types of coal- and ash-handling equipment. There are, of course, certain individuals who are likely to be affected by prejudice or by lack of a sufficiently broad experience; but by considering the attitude of quite a number of engineers, most of whom base their conclusions on actual experience with certain types of equipment, it is possible to judge quite accurately of the general tendencies at the present time.

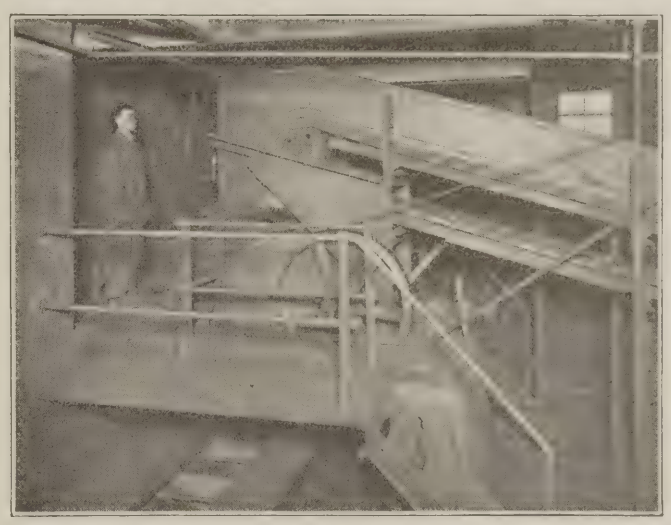
While the selection of a satisfactory coal-handling equipment is a comparatively simple matter, the handling of the ashes undoubtedly complicates the problem on account of their abrasive nature and their corrosive proclivities when wet. As a matter of fact, however, the difficulties encountered in handling ashes have been largely overcome in the best modern practice, though this fact is overlooked by many engineers and there is still a tendency among some of them to separate the coal- and ash-handling equipment so that the coal can be handled in one system and the ashes in another. This means several machines with several motors and driving arrangements to operate and maintain, and, unless the cost is excessive, these machines will be inferior in design and lasting qualities to a first-class combined system.

At the present time the general tendency is strongly in favor of putting in a single, first-class, pivoted bucket carrier to handle both the coal and ashes. By so doing the simplest possible equipment is obtained along with the least amount of driving machinery and other complications. The best of these carriers have been so carefully perfected and improved, and have given such excellent service with low operating and maintenance costs, that it is fast becoming standard practice to use one of these machines for handling both the coal and ashes in all except the large central stations, where the coal-handling requirements are so great that it is practically a necessity to have separate coal-handling equipment because it is imperative to operate it the greater part of the working day.

The handling of ashes in the same machine as the coal does, of course, somewhat increase the wear. The best modern carriers, however, are built so that this wear is confined to small parts, which are of the best possible wear-resisting materials and which are renewable at small expense. Thus the increase in maintenance cost due to handling the ashes is comparatively small, much less than the increase in the cost of maintenance incurred by adding a separate ash-handling equipment. Furthermore, the use of a first-class carrier reduces the operating costs and the delays to a minimum.

A CAR BEING UNLOADED AND A VIEW OF THE TRACK HOPPER OUTSIDE THE BUILDING

An excellent typical example of a carrier-equipped boiler room, designed according to best modern practice, is the one built a little over a year ago by the John A. Roebling's Sons Co., at Trenton, N. J. This plant, although not built at a coal mine, might well serve as a model for such plants, since the chief difference in design would be in the method of receiving the fuel. This boiler room is designed for six 600-hp., Babcock & Wilcox boilers set in batteries of two and equipped with Wetzel stokers, with short extended furnaces. Each battery of boilers takes up a length of 31 ft. 6 in., and there is a 6-ft. space between each two batteries. The building is about 135 ft. long, and the front part is high enough to accommodate a 1300-ton overhead steel bin of the suspension type, with spouts from its bottom direct to the stoker magazines. At one end of the bin, and also inside the building, there is a 100-ton overhead ash bin with spouts leading out to railroad cars on the siding.



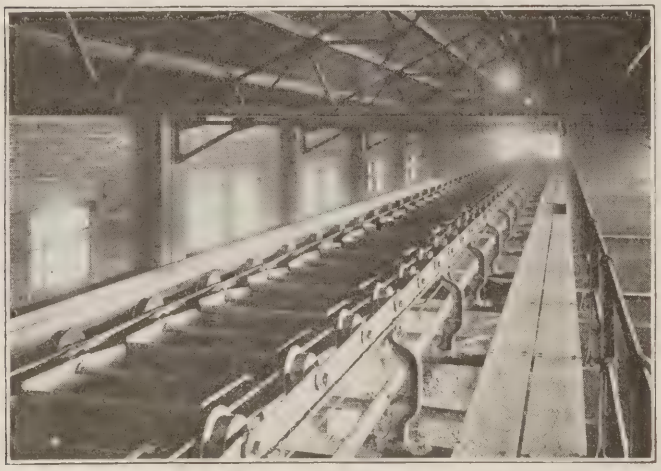
The rear of the boiler room is built with a sloping roof—that is, one of the lean-to type—and is considerably lower than the front of the building. The bin is supported on steel columns set 28 ft. center to center sideways and 19 ft. center to center longitudinally. The bottom of the bin is 22 ft. above the floor; the bin is 18 ft. deep to the top of the girders, and the cross beams which support the conveyor are 12 ft. above this point. Light roof trusses span the columns at a height of 6 ft. 6 in. above the cross beams. This makes the eaves about 68 ft. above the floor level, whereas the eaves at the rear wall of the lean-to are only 31 ft. above the floor level. The total width of the building, center to center of columns, is 50 ft. The walls are brick and the roofs are covered with corrugated iron supported on steel purlins. An ample light supply is obtained by windows at the front and back, also opposite the conveyor on the upper run. There is a ventilator at the upper part of the lean-to roof close to where it joins the higher part of the building.

The railroad track comes in at ground level, which is nearly the same as the boiler-room floor level. This track runs at an angle of about 20 deg. with the side of the building and comes quite close to one corner. The track hopper is located at this corner and, since the siding is a dead-end one with little room for shifting cars, it was especially desirable that the track hopper should be made large enough to make it possible to unload the largest cars without moving them. Since, therefore, the overall dimension from outside to outside of doors for the 140,000-lb. coal cars is about 22 ft., it was decided to make the track hopper 22 ft. long by 12 ft. wide.

The coal- and ash-handling equipment consists of a double reciprocating feeder underneath the track hopper, an apron conveyor extending to the crusher, which is located directly over the carrier. A standard two-roll crusher is employed, and a 24 x 24-in. Peck pivoted bucket carrier, following a rectangular path, having a horizontal center of 131 ft. and a vertical center of 61 ft. This carrier encircles the overhead bin and has the lower run in a tunnel, or basement, below the boiler-room floor so that the ashes can be handled entirely in the basement and raked out directly into the buckets of the carrier. This equipment has a capacity of 60 tons of coal per hour, or an equivalent volume of ashes with the carrier running at the speed of only 45 ft. per minute. There are three electric motors for driving the machinery, a 5-hp. motor for the double reciprocating feeder, a 15-hp. motor for the apron conveyor and crusher, and a 10-hp. motor for the Peck carrier.

The coal is dropped through the bottom doors of the railroad cars into the track hopper, from which it is fed to the apron conveyor by the double reciprocating feeder. The apron conveyor then delivers it to the crusher. After it passes through the crusher, it goes directly into the carrier buckets, which elevate it and distribute it by means of a tripper which tilts the buckets at any desired point along the horizontal run, thereby discharging the contents into the bin. From the bin the coal feeds by gravity through the spouts to the stoker magazines. The ashes are raked out of the ash pits underneath the furnaces and directly into the buckets of the carrier on the lower run. They are elevated and discharged into the ash bin from which they can be delivered to railroad cars by means of gates and spouts.

The equipment in detail is as follows: Each rail of the railroad track is supported across the track hopper pit by means of a 15-in. 73-lb. Bethlehem girder beam. These girder beams are supported on the pit walls at



APRON FEEDER, CRUSHER AND LOWER RUN OF CARRIER

the ends and on a 20-in. 120-lb. Bethlehem girder beam at the center, this cross beam being supported on the pit wall at one end and by means of an 8-in. 32-lb. Bethlehem column at the other end. The double track hopper is made up of $\frac{1}{4}$-in. steel plate, properly braced and stiffened. It has two openings at the bottom. Underneath these openings are the reciprocating feeder plates of $\frac{3}{8}$-in. steel, about 34 in. wide by 6 ft. long each. These plates are connected together and stiffened by means of 4 x 3 x $\frac{5}{16}$ in. angles. They are supported on rollers attached to the feeder sides underneath the hopper openings, these feeder sides being really a part of the track hopper. The reciprocating motion is obtained by means of an eccentric driven by a countershaft running at 25 r.p.m. which is connected to the motor by means of spur gears through an intermediate countershaft. The length of throw of the eccentric is adjustable from 4$\frac{1}{2}$ to 6 inches.

The apron conveyor is about 30 ft. long center to center of head and foot wheels, with a short horizontal run at the foot and the balance at a slight incline to a

point over the crusher. This apron conveyor is made up of a double strand of 9-in. pitch, steel bushed, steel strap chain with 3½-in. single flanged rollers at the joints. The corrugated steel pans are attached between the chains so as to form a continuous apron 30 in. wide. The chains pass around 18-in. sprocket wheels at the head and foot shafts. The speed of the apron is 54 ft. per minute. The rollers travel on steel angle tracks

UPPER RUN OF CARRIER OVER COAL BUNKERS

on the carrying and return runs. These tracks are supported on angle frames resting on the concrete foundations. The head shaft is driven by means of a chain from one of the roll shafts of the crusher.

The crusher rolls are 28 in. in diameter by 24 in. long and revolve at a speed of 56 r.p.m. The shafts are carried in babbitted cast-iron bearings resting on a cast-iron frame. One pair of the bearings has relief springs, which allow one roll to move back and avoid a breakdown if a foreign substance gets between the rolls. The coal is crushed to a size of about 2 in. and under. The crusher is set on steel beams resting on concrete piers and is driven by means of a belt from the motor to a countershaft, which in turn is geared to one of the roll shafts. The roll shafts are geared together by means of spur gears with special long teeth, to allow for the possible backward and forward movement of one of the rolls. The rubber driving belt is 6 in. wide and runs upon a 44-in. flywheel pulley on the crusher countershaft This belt drive is an additional safeguard to the crusher in case something other than coal enters the machine.

The Peck carrier has two strands of heavy malleable-iron chain of a pitch of 24 in. Between the chains are suspended the 24 x 24-in. malleable-iron buckets cast in one piece with a thickness of metal of about $\frac{3}{16}$ in. and with overlapping lips to prevent the coal and ashes from spilling between them. The buckets are pivoted on cross rods carried by extensions of the inside links and, on account of the pivot points sweeping around the turns in a larger circle than the path of the chain joints, the buckets lap and unlap properly at the turns without the aid of any auxiliary device.

At each chain joint there is a high-carbon steel pin fitted into one pair of links and a case-hardened steel bushing fitted into the other pair of links. Both pin and bushing are keyed into the links, so that the only movement, when the chain bends around the wheels, is between the hard steel surfaces of the pins and bushings. This gives large bearing surfaces of the most excellent materials for resisting wear at the joints. The links are thus relieved of all wear, and the pins and bushings are easily renewable at small expense when they finally become worn.

On the outside of each bushing there is a 6-in. single flanged roller with a hard chilled tread. This is cast with an oil chamber holding, under ordinary operating conditions, about a three weeks' supply of oil. The oil is injected into the roller through a Bennett oiler and filters slowly through a felt washer to the bushing and on through a slot in the bushing to the pin. This arrangement insures a well oiled joint and reduces the friction and wear to a minimum. Also the oil coming from the inside and working out tends to force the dirt out of the joint rather than into it.

The carrier is driven by means of sprocket wheels at the driving turn, the driving shaft being geared by means of equalizing gears to the first countershaft, thus effectually eliminating the irregular motion usually accompanying long pitch chains and securing a uniform motion to the carrier. This countershaft is geared by means of spur gears to a second countershaft, which in turn is driven from the motor by means of a silent chain drive.

On the horizontal runs the chain rollers travel on regular T-rails supported by cast-iron rail chairs, at-

GENERAL VIEW OF BOILER ROOM

tached to the steel supporting framework on the upper run and to the concrete floor of the tunnel on the lower run. On the ascending and descending runs the chain rollers travel between double T-rails, supported by cast-iron rail chairs, these chairs being attached to the steel casings which inclose both vertical runs.

On the upper run the cast-iron chairs also support the rails on which the discharger travels. This movable discharger is arranged so that it can be moved by the buckets themselves in the direction in which they travel and can be pulled back with a cable which winds upon a drum operated by a hand crank.

LOWER RUN OF CARRIER WHERE ASHES ARE RECEIVED

The carrier chains travel around sprocket wheels at all four corners. The lower turn shafts are supported on cast-iron stands resting directly on the concrete foundations. The upper shafts are supported on the steelwork over the bin and the driving shaft, countershaft and motor are all supported on unit-cast iron stands which keep the shafts in proper alignment and the gears in proper mesh. Where the ashes are fed to the carrier buckets on the lower run there are continuous curved steel guard plates which effectively protect the chains from ashes and deliver them to the center part of the buckets, thereby avoiding spillage.

It can readily be appreciated from the foregoing description that the construction of this type of coal- and ash-handling equipment has been carried to a high degree of efficiency, so that it stands up wonderfully well under the service for which it is designed. With proper oiling and a little general care these machines operate with but few delays and require few repairs, so that the maintenance cost is low and the coal and ashes are handled at a minimum labor expense. Aside from getting the coal out of the cars into the track hopper and feeding the ashes out of the ash pits, the operation is entirely automatic. The feeding of the ashes to a carrier is also a much easier and more rapid operation than it is with various other systems. This part of the work is thus less laborious.

Cause of "High Mica"

By F. W. Blackwell

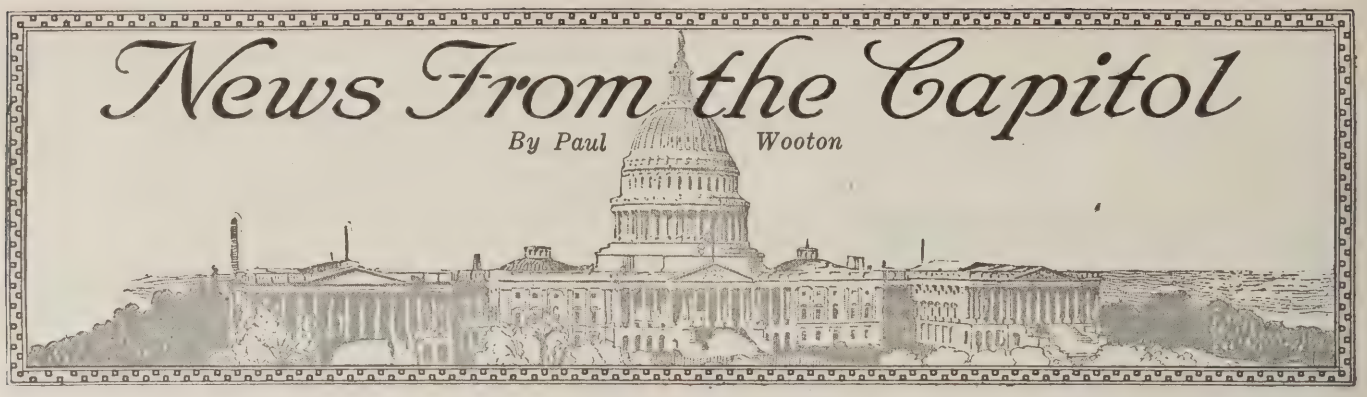
Most people seem to think that high mica is due to the mica insulation getting loose and working out between the commutator bars. This may be true in some cases, but in most instances high mica is caused by the soft copper commutator bars being worn down, allowing the mica to extend up beyond them. The obvious correction for high mica is a returning of the commutator. "Undercutting" will prevent the frequent occurrence of high mica troubles.

New Electric Air Heaters

The recent coal shortage caused industrial men not only to use their available supplies of coal primarily for power production, but to look at the same time for supplements for use in heating.

The Cutler-Hammer Manufacturing Co., of Milwaukee, Wis., foreseeing this tendency, developed and is now marketing a new and improved line of electric air heaters designed to supplement the furnace or steam-heating system in the home, office, store, factory, shop or industrial plant.

Electric air heaters are found useful in heating crane cabs, outhouses, valve, pump and meter houses, exposed remote corners or rooms, watch or signal towers, theater ticket booths as well as for many miscellaneous applications. In such uses they effect a distinct saving in coal. Flexible electrical conductors will carry heat cheaply and efficiently to remote points.



The new electric air heaters are self-contained, easily moved from one point to another and possess the inherent advantages of all electrical heating devices: namely, heat under perfect control and absolute freedom from dust, ashes, soot, unpleasant odors and vitiation of the air. The perfect control possible allows efficient use of the heat; as soon as a location is warmed, a turn of the switch cuts off the current and the heater can be moved to warm another part.

Users find the new electric air heaters convenient supplements to their existing heating systems. In some central stations and other great industrial establishments maintaining large generating plants and deliver-

HOW ELECTRIC AIR HEATER IS INSTALLED

ing current at a cost not exceeding 1 or 2c. per kw.-hr., it has been found economical and convenient to use electric heaters entirely. These new heaters are made in various shapes, sizes and capacities and a heater to fit almost any space or condition of mounting may be selected.

New Price Regulations

New prices, effective Apr. 5, have been fixed by the Fuel Administration as follows:

Kentucky—Harlan, Perry and Letcher Counties and operations in Pike County on the Levisa Fork of the Big Sandy River: Run-of-mine, $2.20; prepared sizes, $2.45; slack or screenings, $1.95. East of the 85th degree of longitude, except Harlan, Perry and Letcher Counties and operations in Pike County on the Levisa Fork of the Big Sandy River: Run-of-mine, $2.65; prepared sizes, $2.90; slack or screenings, $2.40.

Tennessee—All except Overton and Fentress Counties: Run-of-mine, $2.20; prepared sizes, $2.45; slack or screenings, $1.95.

Virginia—Lee, Wise and Dickinson Counties; Russell County west of Finney on the Norfolk & Western Ry.: Run-of-mine, $2.20; prepared sizes, $2.45; slack or screenings, $1.95.

Iowa—Marion County: Run-of-mine, $2.70; prepared sizes, $2.95; slack or screenings, $2.45.

Georgia—Run-of-mine, $3.25; prepared sizes, $3.50; slack or screenings, $3.20. The Georgia field covers a limited area and was not included in former prices regulating the coal industry.

Wyoming—(Sub-bituminous.): Egg run, $2.15; nut run, $2.

Weekly Coal Production

For the week ended Mar. 30 bituminous coal production was 10,832,000 tons. Anthracite forwardings were 43,642 cars. Beehive coke production totaled 622,000 tons. Byproduct coke production amounted to 474,610 tons. The figures used are those compiled by C. E. Lesher, of the United States Geological Survey.

A decline in the production during the week ended Mar. 30, along with the knowledge that a still further decrease took place during the week ended Apr. 6, is regarded seriously by authorities on coal in Washington. Those factors which have been limiting production during the winter now are much less potent. The new factor entering into the situation is the uncertainty as to the price the Government is going to pay for fuel for its railroads and ships. With the taking over of the railroads, the Government takes a large percentage of the entire coal production of the country.

With the uncertainty as to the price which the Government will pay, each mining district in the country has properties which have suspended operation pending an adjustment. The situation, however, is much more serious in the West, where "no market" is a serious limiting factor. During the latter half of March, the Western mines lost one-fourth of their working time due to this fact. The railroads are not making purchases and it seems to be difficult to get the public started in the purchase of its next winter's supply.

To Conserve Domestic Sizes of Anthracite

Domestic sizes of anthracite coal are not to be used for industrial purposes where it is to replace bituminous coal. An order to this effect has been sent by the Fuel Administration to the state administrators. The order follows the discovery that domestic sizes of anthracite are being used at times for steaming purposes. Such procedure the Fuel Administration defines as absolutely unfair to the domestic consumers. Each community will receive only its allotted tonnage. Use of anthracite by factories simply will make it impossible for the domestic demand to be met. Five per cent. has been added to the basic price of coke manufactured east of the Mississippi River and sold west of the Rocky Mountains. The order reads as follows:

"That in all cases of sale of coke, manufactured east of the 94th meridian, to consumers located west of the 115th meridian, where the seller assumes the responsibility for the quality and delivery of such coke, and extends credit to and carries the account of the purchaser in accordance with the usual trade practices, there may be added 5 per cent. to the established price of coke f.o.b. cars at the point of manufacture."

More District Representatives Appointed

D. F. Hurd has been appointed district representative of the Fuel Administration at Cleveland. He succeeds J. B. Zerbe, who resigned because of ill health. The district, which will be under Mr. Hurd's direction, embraces the coal fields of eastern and central Ohio and the Panhandle counties of West Virginia.

Julian B. Huff has been appointed a district representative with headquarters at Greensburg, Penn. With the exception of those on the Sewickley branch, he will have charge of the mines of the Pennsylvania R.R. north of Ruffsdale in Westmoreland County.

W. L. Byers, with headquarters at Uniontown, Penn., has been named district representative in charge of the mines in Westmoreland County on the Pennsylvania south of Ruffsdale, and of the operations on the Sewick-

ley branch of that road. In addition, he will have jurisdiction over operations in Fayette County south and west of a line from Banning through Whitsett junction to Brownsville, with the exception of the mines on the Baltimore & Ohio at and east of and connecting at Indian Creek. His jurisdiction will extend along the Baltimore & Ohio in Westmoreland County and on the Mount Pleasant branch of that road. His district, however, does not include the mines on the Baltimore & Ohio along the Youghiogheny River or river mines on the Youghiogheny River.

Charles M. Means Heads Inspection Division of Fuel Administration

To enforce its clean coal order and other regulations, a large number of inspectors soon are to be appointed by the Fuel Administration. Charles M. Means, a mining engineer of Pittsburgh, who is known nationally, has been made manager of the inspection division of the Fuel Administration. To start with, one inspector is to be named in each district representative's territory. As the work becomes more thoroughly organized other inspectors will be appointed as may be found necessary.

Railroad Fuel Question May Disrupt Fuel Administration's Plans

Overtopping interest in any other coal matter last week was the railroad fuel question. Loath to give up their former practice, the railroads are insisting on obtaining their fuel at much lower prices than those specified in the official schedule. While the Fuel Administration is insisting that coal should be furnished all consumers, whether large or small, at the same price, railroad officials do not accept this view and apparently have won over Director General McAdoo to their way of thinking.

At the Fuel Administration, the generally held opinion is that domestic and industrial consumers have paid a portion of the railroads' fuel bill long enough. While in the past, conditions may have been such that it would be difficult to prevent the railroads from securing coal at cost or below, now that the United States Government is running the railroads it is contended that no such advantage should be taken of a considerable portion of the public. This policy, however, is not being followed by the railroads, who, in numerous instances, have refused to supply cars to mines until prices satisfactory to them have been quoted for railroad fuel. That the United States should be a party to any such questionable methods is a cause of great surprise. If it is persisted in, the demoralization of the whole coal scheme—the consummation of the whole effort of the Fuel Administration—is threatened. The condition precipitated by the railroad fuel matter will have the same effect on the situation this year as did Secretary Baker's letter last year. The effects, however, will be more immediate, since the railroad fuel matter has such a direct bearing on the labor situation.

Social life is one thing; business is another. True friendships may count in business, but it is a mistake to think that cheap, social popularity is a business asset. Sterling integrity, progressiveness, reliability, service and quality goods all count as nothing else can.

Brief Washington Notes

Coal lands in the Nenana field of Alaska and in the Fort Peck Indian reservation in Montana have been reserved by Presidential order.

Five per cent. more coal was mined in February, 1918, than in the corresponding month of 1917. The poor showing in January, however, still holds the production for the first two months of 1918 a full 3,000,000 tons under the production the first two months of 1917. The calculation on which the figures are based was made by C. E. Lesher of the Geological Survey.

All operators in central Pennsylvania who have collected five mills per ton for the proposed fund to meet the expense of a pooling arrangement have been instructed to refund such collections. A plan which was under consideration for the facilitation of distribution has been rejected by the Fuel Administration.

A suit to test the constitutionality of a raid by the Department of Justice at the request of the Fuel Administration has been instituted in the Supreme Court of the District of Columbia by the Cambria and Eastern Coal Co. The offices of the coal company in Washington were raided Mar. 1 by agents of the Department of Justice who seized papers and other matter in the offices in an attempt to secure evidence to prove that the coal company had violated the Fuel Administration's price rulings.

EDITORIALS

Nearing a Crisis

JOHN SKELTON WILLIAMS, financial man for Mr. McAdoo, and at present in charge of fuel purchases for the railroads, has flatly refused the right of the Fuel Administration to fix prices and establish conditions under which railroad coal shall be bought. Mr. Williams maintains that the railroads are privileged to purchase coal where they please and at the best price they can force the operators to accept. In making such contracts for fuel, the railroads propose to continue to use their control of car supply as an effective weapon to force price concessions.

Fuel Administrator Garfield is determined that the railroads shall not be exempted from the operation of fuel regulations. He points out that to permit such a practice would be to sanction the establishment of a Government policy of great injustice. A few mines and a few miners will prosper at the expense of the remaining two-thirds of the industry. Mines producing commercial coal and working only a part of the time will necessarily have to shut down, or get more money for their product. Therefore, in the final outcome the public is obliged to pay all that the railroads save.

It is wholly unlikely that the President will sanction a plan that is sure to stir up serious labor unrest through its inequitable operation. He cannot indorse action that permits one Government department to deliberately violate the rulings of another Government administration. He cannot fail to see that if nearly one-third of the total bituminous production is exempted from Government restrictions, outlined by the Fuel Administrator, the remaining tonnage cannot be distributed in an efficient and satisfactory manner.

The railroads are a vital link in our industrial life; they must have a full supply of coal, of the quality best suited for their purposes. This can all be accomplished in an orderly manner and in strict conformity with carefully established plans of procedure. It is far more necessary that the Nation as a whole shall be provided with an adequate supply of coal in the present world crisis than that John Skelton Williams, or any other Government official, shall gain a reputation for efficient railroad management through increasing the net revenue of our transportation systems, and thus proving the benefits of Government ownership.

Steel Breakers and Washeries

THE late Eckley B. Coxe in the '90's attracted the attention of mining men—particularly anthracite coal operators—to his experimental iron breaker at Drifton, Penn. During the next few years Coxe Bros. & Co. built another iron breaker at its Oneida colliery. Unfortunately this latter breaker was soon destroyed by fire. As one of the strong arguments for iron construction was immunity from fire with consequent decrease in insurance rates, the new policy was viewed as an experiment requiring further demonstration as to its practicability.

However, the new scheme remained latent only awaiting favorable circumstances to spring into life. Such conditions came about gradually. There was a growing tendency to introduce cast-iron columns and iron beams in breaker frames. Finally the Lehigh Valley Coal Co. built its Buck Mountain breaker in 1911 almost entirely of structural steel. During the succeeding years this type of construction received such an impetus that at present there are 18 steel breakers and washeries in the anthracite coal region—built, under construction or being designed. The leading article in this issue of *Coal Age* is a discussion of this whole matter.

The design, fabrication and erection of steel breakers require special knowledge and experience. The multiplicity of sheaves, belts, shakers, jigs, chutes and conveyors tends to make the designer's task a most complicated one. The stresses are so involved and difficult to determine, that to secure a well-balanced structure requires the judgment attained from experience to a greater extent than in practically any other type of structural steel work—provided economy in metal is a consideration. From a coöperation standpoint, it is especially important to have the design, fabrication and erection handled by one organization, thus tending to obviate the mass of misunderstandings and contentions, with their unavoidable delays, which frequently attend operations where different branches are handled separately.

The advantages which steel possesses for breaker construction are pronounced and definite. From the operator's point of view, perhaps speed of construction stands out preëminent, neglecting advantages accruing to the use of a modern building material. A steel breaker can be tapped out in less than one-half the time it would take to build a wooden structure. Again, slow depreciation, smallness of members, progress of construction in rough and freezing weather all speak volumes in favor of steel.

Citing a few instances of rapid construction we turn to the Markle breaker. This structure was completely designed, fabricated and erected in 88 days, including an unavoidable delay of 20 days in the erection work. This was in response to a hurry call on the part of the coal operator to replace a wooden breaker suddenly wiped out by fire. The Buck Run breaker at Minersville, Penn., was designed, fabricated and erected in 68 days. But a record of special significance is that of the recent Alliance breaker of the Lehigh Coal and Navigation Co. Throughout a period unprecedented in the history of the steel business, the work on this breaker has gone ahead notwithstanding workless days, railroad embargoes, government restrictions including changes in rollings, shortage of labor, etc. Further, at the site of the Alliance building during erection there was experi-

enced the most severe winter "within the memory of the oldest inhabitant." In addition there was inaccessible location, treacherous ground on which to operate locomotive cranes, also a number of minor occurrences—all of which delayed erection at least four weeks. The contractors expect to complete this job in 103 or 104 days. Their contract time was 100 days. Formerly a wooden breaker of any size was a six-month proposition.

A unique feature which has been taken advantage of by several operators in the case of working over old culm piles is that of the bolted washery. Structures of this kind set up with all field connections bolted can be operated for a time at one bank and then be taken down and reset on another site. This scheme is being used in erecting the Markle No. 4 washery, at Jeddo, Penn., at the present time. The Thorne-Neale washery near Ashland, Penn., was similarly handled last year, being set up complete in eight working days.

The question of moving a washery to another bank or of transporting a bank to the washery, is a problem involving a nice balancing of factors affecting its solution. It suggests the case of Mohammed and the mountain. Will it be a better policy to move the bank to the washery with the necessity of a steam shovel to load the bank into cars which have to be hauled to the washery—coal freezing en route possibly on the long hauls in severe winter weather? Or will a saving be effected by moving the washery to a new bank with attendant expenses of railroad tracks for shipping the washery product, a water supply for cleaning and sizing the coal, and power to run the plant?

A final word as to speed construction. Commenting on this feature, a successful steel breaker builder notes, "Service of this kind more than offsets the increased cost of steel construction."

Peace Without Victory

SOME time in the clash of 1914 when the Teutonic troops had not committed all their many crimes and when the truth about those they had committed could still be questioned because the crimes had not been investigated or when we could still explain them away as the outcome of a drunken orgy, some time when we did not know all that we know now, if the Germans had been willing, they could have had peace without victory.

Today there could not be peace without victory without an indictment of the peacemakers. When a city has a terrible crime committed in its midst and fails to punish the perpetrators that city is shamed. The world is but a big city. Over a million murders of Armenian, Belgian, British, French, Arab, Serb, Russian and American civilians have been committed, not in the prosecution of war but out of a sheer lust for slaughter. Cathedrals and property of all kinds have been destroyed in the hope that the burden of the war might perdure till long after the war was ended.

Unless we, the citizens of the world, punish these acts we discredit the government under which we live. We proclaim that we give way to force and violence and are not determined on justice and right. Let us proclaim peace without victory when we have government without jails. The crimes of the Germans and their allied nations must be expiated by defeat. They may not like the sound of the word, but nations and parts of nations just as sensitive and far, far more honorable have had to suffer it. Into the valley of humiliation the destroyers of civilization must pass, or civilization will itself be destroyed.

Let us not be squeamish. There are people in America who say it would be wicked to shut out, or put a heavy duty on German goods, yet we have for years been trying to arrange special concessions to those nations which shut out our goods, making no concessions at all to those who gave us free entry into their ports. The sin we are urged to avoid is only the crime of treating Germany as we would have treated Great Britain before the war could we have arranged reciprocity with the other European powers. Perhaps we shall do unrestricted business with Germany after the war, but if we decided not to do it no one could utter any complaint. The fear is not that we will be too severe in our actions to Germany, but that we shall be guilty of coddling the unrighteous, of compounding with Germany's villainy, of acting as "accessory after the act" by protecting Germany from the majesty of offended law. Violence, murder, theft and war must be proved unprofitable. The business of the soldier must be proved to be disgraceful to all those who do not use it in the interests of peace and justice. The profession of arms for glory, aggrandizement and pelf must be made as dishonorable as the business of burglary. This can only be attained by a peace with victory. Till it arrives let us go on buying Liberty Bonds as fast as they are offered.

Two Culm-Bank "Iniquities"

A FEW years ago the public when visiting the anthracite region very piously regretted the large piles of waste coal known as culm banks and urged that something be done—just what, the public did not say—to recover the values in those mountains of fuel.

Just of late the operators have been preparing fuel from culm banks and the public is beginning to suggest that there is something morally wrong in making use of the rejects of past operations and of obtaining, as it were, something for nothing. The public is in a querulous mood. It has discovered two iniquities, to store culm and to use it.

Because a piece of coal has lain for years by a piece of slate is no reason why the two should not be separated

and the coal placed on the market no matter what bad company the coal kept for many years it should not be spurned, so long as it appears alone at the consumer's cellar. It is no more to be condemned than meat which has grown near the bone if the bone is cut out before delivery at the consumer's larder.

The trouble is, however, that the public has grown leary because too often the culm of past days has been shipped indiscriminately or only partly cleaned. A sample which has recently come into our hands is apparently the culm from a most efficiently conducted modern washery. The slate above the Pittsburgh or Freeport coal would, from a cursory inspection of the culm, seem to promise a higher thermal value. This "fuel" was sold as "culm," it is true, but it was a scandal to waste even the time of the shoveler over the handling of such rubbish.

Happy Mean in Cleaning Coal

IT IS a bad time to decry the consumer for being over particular about clean coal, for he is sore about the treatment he has recently received and with good reason. In too many cases the operator has taken advantage of the coal shortage and shipped him coal far below the standards of former years.

But the consumer, so recently beridden by certain unscrupulous operators, has been in his time the beggar on horseback, and he has ridden the coal operator to death. Edwin Ludlow, vice president of the Lehigh Coal and Navigation Co., told the American Institute of Mining Engineers about a firm that demanded coal having 14,600 B.t.u. per pound. Yet that firm was only evaporating 9 lb. of water per pound of fuel whereas about 11 lb. should have been secured.

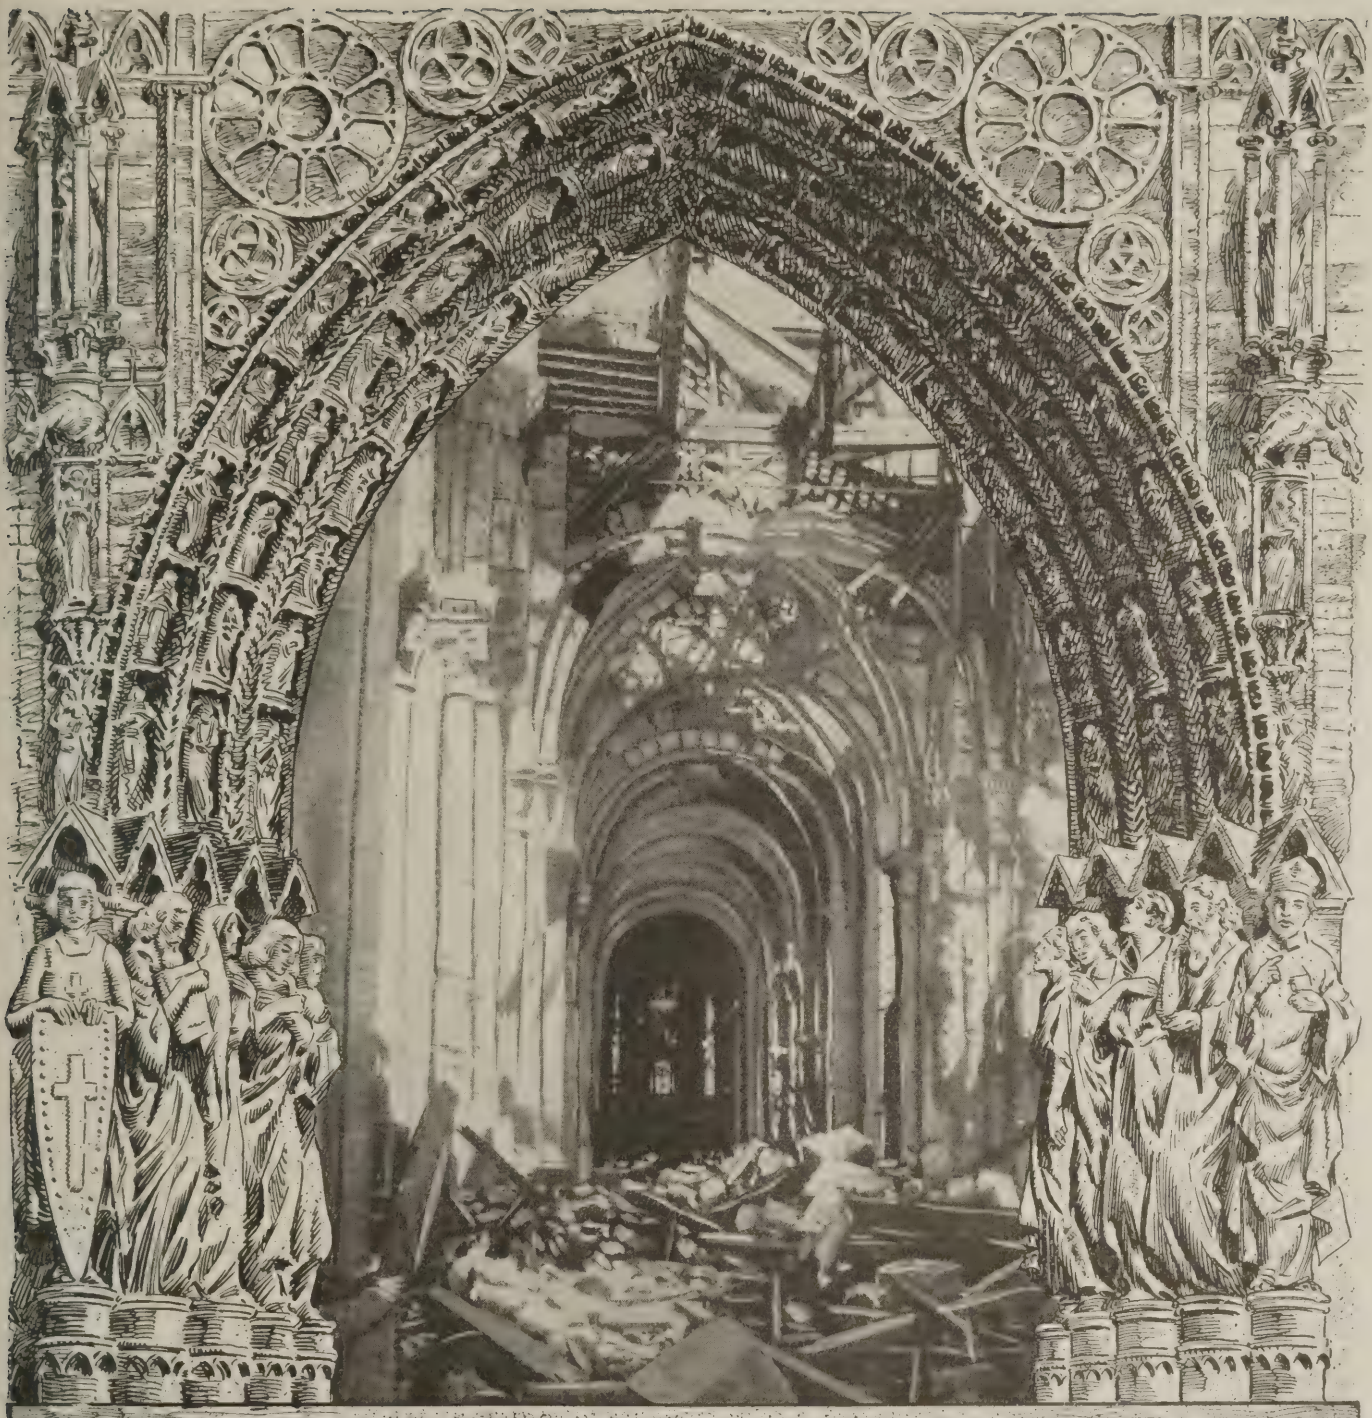
Consumers have caused many a ton of passable fuel to be thrown away in order to get an excessively high fuel value. Some mining concerns, it is true, could fill the bill without loss, but others only met it by a waste of fuel. When the war is over we shall probably drop back into the old ways of coal testing, and the operator with coal of lower thermal power will continue as in the past by a finical preparation to make up for defects in the coal he is mining. If he crushes and burns under his boiler the material thus thrown out no loss will result, but if the fuel rejected is used for railroad ballast and highroad surfacing the loss will be considerable.

Team-Track Mines Less Numerous

REDUCTIONS in the price of coal have caused a high mortality rate among such wagon mines as supply coal for rail haulage—"team-track mines" as they are termed. The ending of contracts by regular expiry, by zoning restrictions, and possibly also later by a general order is the last blow. Is it unfair to say that the industry hopes it will prove sufficient to end the existence of these team-track mines?

They destroy the efficient operation of both railroads and collieries. The railroads find their side tracks cumbered by cars placed for the team-track loaders. They find the time of loading is much greater and more uncertain than when the coal is loaded direct from a railroad tipple.

The team-track mine takes men who otherwise would work more productively in large and more efficient operations, which are now short of men. But the chief count against the team-track mine after all, is that it does not take all its men from the big mines. Some it takes from farming work, which is far more grievously undermanned than mining. The closing of the team-track mines will release a number of farmers for their proper work.



Today, or till recently, many farmers and farm laborers were digging coal and hauling it. When conditions are readjusted they and their teams will be employed in raising food. When winter comes they may, to advantage, go back to mining and hauling coal, not, however, for rail transportation, but to supply local needs. Such wagon mines have existed for years. They work mainly when no farm work is possible and they deliver coal when it can be sledded and when, in consequence, the expense of delivery is at a minimum. They give the farm hand an extra two or three months of congenial work.

These winter mines are always welcome. Under the Fuel Administration's regulations there is no likelihood that it will be found impossible to operate them. They will continue to supply the farmers with fuel for domestic consumption and for lime burning and help to save the wood lots on which the future operation of coal mines so much depends.

They will, by supplying winter work to the farmers help to lower the overhead cost of the production of farm products. Moreover, the lessening in number of the inefficient team-track mines will assure to the larger coal operator a supply of props in the winter without which his mines cannot be safely conducted, for the farmer who cannot haul coal will make and haul props.

The team-track mine decays! May its activities draw rapidly to an end! The farmers should not go to the mines. The tide of labor should rather flow the other way. Idle miners should be encouraged to plant gardens and work on the farms whenever nothing else can be done. Many of the best men around the mines were farmers in earlier days, here or in some foreign land. They are more adaptable to the needs of the farm than are professional men, boy scouts, and city school children, who have been suggested as possible agricultural laborers, but who at best could do little but hoe and who could not hope to be strong and skillful enough to do a man's work at that.

Concentration, mixing, temperature and time of contact are interrelated and each of these factors is essential for good combustion. Consideration of these four factors indicates the conditions necessary to obtain good results. These conditions are: (1) Enough air; (2) air and the combustible gases thoroughly mixed; (3) a furnace temperature above the ignition point of the gases; (4) enough time for combustion to be complete. In practice an excess of air is required, but the amount of excess air can be small if the mixing is thorough. Mixing is probably the most important single factor and the one most frequently responsible for poor combustion. A large excess of air and high temperature will do no good unless the air is mixed with the furnace gases and the oxygen and combustible gas brought into contact.—*Bureau of Mines Bulletin No. 135.*

Shall the Civilization of the Ages vanish before the Devilization of the Hun?

One hundred million freemen answer

NO—

THE LABOR SITUATION

EDITED BY R. DAWSON HALL

General Labor Review

The best news of the week is that the Central Pennsylvania mine workers decided on Apr. 5 to leave the wage question with the Fuel Administration, asking that body to investigate wage conditions and appoint mine workers on the investigating committee. The Fuel Administration declared that it had already made a most careful investigation and had satisfied itself that the price of coal set by the Administration was such as the wage justified and indeed made necessary. The matter is therefore settled.

John P. White on Saturday, Apr. 6, declared that the mine workers were satisfied. They had a stormy meeting, it is true, and condemned their leaders liberally, but after their steam was all blown off they realized that the price fixing was in competent hands and was based on the wages paid and on the other expenses incurred by the operators. Some time ago the operators in Central Pennsylvania, in common with other operators, had two decreases in price, one at the suggestion of Francis S. Peabody and the other on the demand of the Fuel Administration.

The mine workers did not suffer by these price revisions even though they were downward. The operators, however, suffered severely from the last cut. By increasing the price of the coal produced in central Pennsylvania the Fuel Administration now proposes to do justice and nothing more, but the mine workers do not see it that way. They declare that the advances in wage for which they are asking can be paid by the operator. If that could be proved Dr. Garfield, we may feel sure, would not raise wages but restore the old price or one somewhat lower than the one he has just set.

CENTRAL PENNSYLVANIA SPECIALLY FAVORED

There is no call for a revision of wage in central Pennsylvania. The mine workers have fared a trifle better than other regions as to wage increases and as to wage rates and they have gained also the abolition of pushing. What, after the war, will happen to the miners in the areas containing only thin beds is a matter of grave question. These areas of thin coal are in overwhelming majority. Perhaps such beds can be worked after the war despite the handicap of the pushing provision, and all the brushing it entails. But it is certain that they could not be worked if a wage differential against the district, such as the mine workers are asking, were added to the difficulties created by the necessity for brushing.

Let it here be said that to the higher officials of the union belongs all the credit for the patriotic resolution of the delegates. These officials threw all expediency to the winds and jeopardized their standing with their followers by a patriotism so sincere that it did not permit them to seek their private advantage. There are few men in public or journalistic life who could not take a lesson from these fearless fellows who were minded to tell the truth no matter what it cost. Accustomed to seek the suffrages of the men it required no small exhibit of backbone to get up and set themselves directly athwart the current of the convention.

Leading credit must be given John P. White, who though a member of the Fuel Administration, is in the pay of the miners and is so poor that he needs their financial support. He would probably have to resign his position were the support withdrawn. It was he that reminded them that the Illinois operators were getting a 45c. decrease and that on Apr. 1 the Montana and Wyoming operators got a decrease of 70c. per ton. If the price of coal were to determine wages, the mine workers in those states would get decreased pay, but no such reduction is proposed.

He told the men that when the miners make $5 a day and cannot pay house rent it is not because the wages are inadequate, but because the running time of the mines is too slow. He said that in some districts the men get only 6 and 8 days work a month.

But even after Mr. White's speech the convention voted 138 to 15 in favor of the policy of the special committee, which committee urged that the 60c. increase in price be shared or rather all given to the mine worker and that the mine workers be given place on the Federal wage investigation committee by which some such recommendation was to be made. U. E. Swartzentruver, the secretary of the policy committee, however, declared against a strike. Charles T. O'Neill, the district vice-president, also said he was an American first and therefore opposed to any

SUPPORT HIM BY BUYING LIBERTY BONDS

cessation of coal production. George Bassett added "There is not a man in this house who would not lay track or drive mule for six months and live on bread and water, if doing so will whip the Kaiser."

One delegate named Brown struck a discordant note. He called on the delegates to fight as hard and as long for $1.20 a ton coal "as the men in the trenches are doing."

Another recent event of interest was the lynching of a baker whose only proved offense was that he desired to continue work in an Illinois coal mine. The detais are given in another article in this department. There seems to have been inadequate evidence against the man, so that there was not even evident guilt to excuse the action.

But it is easy to criticise the action of the miners unjustly. It must be understood that there has been a panic fear that a mine explosion, or mine explosions, would be successfully started by some miscreant, and this fear was not without ample excuse.

At the Shoal Creek mine near Panama, Ill., 25 sticks of dynamite were found in an airshaft, and it is believed that only the failure of a percussion cap prevented an explosion. Then again in the Prairie mine two kegs of powder were exploded about half a mile from the bottom of the shaft. A fuse about 20 ft. long was found in the entry and a stone had been placed on the kegs. There was clearly a

conspiracy. Fortunately the coal dust of the mine did not aid the explosion, and the results were far feebler than its perpetrators expected. But it is quite possible that at some time just what the miners fear may happen.

Lynching is wrong and must be ended. It frequently is directed against innocent men. It is peculiarly American. Perhaps we have reason to be proud of the fact even though lynchings are far too numerous, are participated in by people who should know better and are rarely punished. Where other countries have a massacre, a pogrom, a vespers or mob violence on a large scale, we usually specialize on one man who really may be guilty. We in general require a certain semblance of guilt. We almost never destroy all those who happen to part their hair, grow their beards, or write their names in the same way as the real criminal. We never destroy a race for the shortcomings of some one of its members.

But the mine workers must never forget that action like that at Collinsville, Ill., is quite likely to result in reprisals in Germany. As that country has no citizens of America who are above all suspicion of virulent pro-Germanism it is quite possible that reprisals would be taken on our soldiers.

The growth of patriotism in the main leaders in the union has been so marked that it is surprising to find that "Mother Jones" has not come under the influence. On Labor Day that agitator with Congressman M. M. Neely spoke at Moundsville, W. Va. The Congressman advised the miners to load every empty as soon as it arrived and argued against any dissatisfaction here till after the war, contending that any trouble which arose "over here" was infinitesimal as compared with what would result if the United States were not on the winning side "over there." But Mother Jones, after making a strong plea for patriotism, contended that all the fighting should not be done "over there." She announced that she was going to Charleston and would in the immediate future make her headquarters in the unorganized fields of West Virginia.

A strike at the mines of the Pittsburg Coal Mining Co., of Pittsburg, Okla., which commenced September, 1916, has not yet been settled and it is announced that all negotiations are ended and the strike will continue indefinitely. The miners demand more pay for the removal of rock.

Lynching of a Miner by Miners

A man, R. P. Prager, who according to his own account had worked in the mine for four years mostly as a timberman, but who had been more usually employed as baker, was lynched by a mob of 350 miners at Collinsville, Ill., in the early hours of April 5. He appears to have been innocent, but the rumors of the corner saloon loafers about him may be repeated to explain the cruelty with which he was treated.

It was said that when he was working at the Donk Brothers Coal and Coke Co. mines at Maryville quantities of powder were stolen during a period of weeks. The miners accused Prager of stealing this powder and alleged that his purpose was to blow up the Maryville mine. Prager endeavored to join Local Union No. 1802 at Maryville, but the president of the local, by name J. Fornaro, apparently opposed his admission. It was said that he was a Socialist and had made disloyal remarks at a meeting, but the evidence is that the only thing wrong with Prager was that he was a German and the feeling against him appears to have been spread by some of the leaders of the local union for their private purposes. His letter to his parents shows he spoke in broken English with German idiom, and in this way exposed himself to suspicion.

On Apr. 3 he was paraded through the Maryville streets as a German spy. He vehemently denied, however, that there was any element of disloyalty in his behavior. Escaping, he remained in hiding until he came to Collinsville on the night of Apr. 4. Arriving at Collinsville, he went to his room. The men in a nearby saloon saw him and, gathering a mob, went to his quarters and ordered him out.

The police rescued Prager and took him to jail, but the mob broke in and found him hidden under some material in the basement. They led him through the town, barefoot, and made him sing patriotic songs. He requested to write a letter to his parents and by the glare of an auto lamp and with a mud guard of another auto as a desk he wrote a short note beginning, "I must on this the 4th day of April, 1918, die." His tormentors finally hung him to a tree.

Prager was registered in St. Louis as an enemy alien. It is said that he tried last summer to enlist in the United States Navy. According to his statement he had declared his intention to become a citizen and was expecting to apply for full citizenship. Walter Clark, the superintendent of the Maryville mine, declares that he believes Prager was "all right" and says he is convinced that Prager did not steal powder. Local authorities have started an investigation and it is to be hoped that inquiry will result in conviction. The whole section needs cleaning up. Maryville is not far from East St. Louis, a town where local ruffians and some miners recently killed several negroes.

Would Import Mexicans Into Texas

The coal operators in the Eagle Pass, Tex., section desire the Federal Fuel Administration to give them permission to import coal miners from Mexico on the same basis and under the same conditions as agricultural workers are now being admitted. The lack of Mexican labor to operate the coal mines has caused many operators to shut down their mines, and the output of coal is now very limited.

L. M. Lamar, vice president and general manager of the Olmos Coal Co., has been delegated to take the matter up with the Federal Fuel Administration in an effort to get a modification of its rulings as to the admission of Mexican coal miners. In his letter to the Fuel Administration Mr. Lamar says:

"It may be true that there are idle mines and coal miners in certain parts of the United States at this time, due to the severe weather, crippled transportation service, etc., but there are few, if any, coal operators or other well-informed persons who will state that we have a surplus of coal miners anywhere in the country. Quite the contrary is the case. Even so, the idle miners of the North will not come to and work in this section, as the climate and other conditions are not attractive to them.

"We are absolutely and exclusively dependent on the Mexican miner, and the same state of affairs applies to all other lines of industry based on manual labor, such as farming, construction, etc. There is practically no other labor here in the unskilled line. The industries must either utilize Mexicans, and get more of them, or the work will be left undone. Unless we are permitted to secure Mexican coal miners at Eagle Pass our output cannot be increased. This will mean that coal must be hauled, in some cases (for the San Antonio cantonments, for instance) from other points of production, involving sometimes about five times the amount of transportation service and loss of time to equipments."

The scarcity of Mexican labor in the United States is due to the fact that when conscription was established the Mexicans in Texas got the idea that they were to be drafted into the military service. They thought, or were told by evil influences, they were to be given preference as to conscription—that is, taken first, and placed in the front of all battle lines. "This absurd idea is amusing to all who know better," says Mr. Lamar, "but the ignorant took it in earnest, and thousands, including our coal diggers, stampeded back to Mexico."

Now, these Mexicans want to come back to the United States. They are starving over in Mexico, but are unable to return because of the strict immigration laws, which require a head tax of $8 and bar all illiterate ones. It is to enable farm laborers to come to the United States that the immigration laws were modified, but this does not apply to coal miners. These Mexicans left the United States last summer and fall with all their belongings, flattering promises being held out to them. Since then, it has been learned, most of their cattle starved to death. It is estimated that at least 10,000 Mexicans have left Texas.

Engineers Discuss Labor Problem—II

The closing remarks of Walter Douglas of the Phelps-Dodge Corporation before the New York Section of the American Institute of Mining Engineers had reference to the company store and hospital, on the defects or alleged defects of which the labor agitators had laid much stress. He showed that the company's store reduces the cost of living and that only recently 90 per cent. of the employees at Ray, Miami and Globe had petitioned the company to establish company stores at those places.

He felt that the hospital is a different problem and that if the company does not run it, it will not be run right, and the men will not receive adequate attention. The charge for this service is nominal and yet the agitators always find much fault with both the company's store and the hospital in spite of the fact that both institutions are for the good of the employees.

Socialistic Trend of British Thought

J. Parke Channing, consulting mining engineer, said that while the United States had been efficient as far as methods are concerned it had not been efficient in the utilization of its man power. He cited the change which has taken place in England since the beginning of the war, and showed that it had become a socialistic community which was highly efficient with the government doing almost everything. He said that the English laborers were not going to be content to return to the old order of things.

He admitted that the problem in Great Britain was simpler than in the United States on account of the fact that practically all of England's laborers are English, while the United States has a mixture of unassimilated foreigners. He felt that if we are to carry the war to a successful conclusion and increase our efficiency after the war we must Americanize our foreigners and give them our own point of view.

He outlined the proposed program of the British labor party which has four principles, namely, 1. The universal enforcement of the national mimimum. 2. The democratic control of industry. 3. The revolution in national finance. 4. The use of surplus wealth for the common good.

If these four demands are carried out, England will be a socialistic state, and Mr. Channing did not presume to say how much this program could or should be carried out, but cited it as showing the trend of thought in England. He said that the British workman has seen his wages increase and that he was more than ever convinced that in the past he had not been getting his fair share of the products of his toil. He also believed that the workman was realizing that he had not done his proper share toward increasing the wealth of the country.

State Socialism Successful in Britain

Generally speaking, Mr. Channing thought that the workman had seen such good results obtain in the democratic control of industry that there was no reason why this control should not be just as efficient after the war. Mr. Channing distinguished between the English labor party and the Bolsheviki of Russia, saying that the former did not believe that the working class should manage the country. The English laborer realized the importance of brains and education and the necessity of these things in bringing the country to the highest state of development.

He felt that a similar program was likely to come up in the United States and that we should be on our guard lest the pendulum swing too far if the employing class does not give more attention to the laborer and see that his condition is improved. He felt that engineers were the best instruments for carrying out the necessary work. He spoke of the growing tendency to give engineering students some training in human engineering and cited such courses at Columbia University.

In discussing trade unionism he said that Professor Hoxie's work on trade unionism in the United States would clarify anyone's ideas of that subject and he advised all engineers to study the book carefully. He urged that laborers be educated to a proper point of view rather than coerced into any line of action. He spoke favorably of the human engineering work of the industrial department of the Young Men's Christian Association.

Edwin Ludlow, vice president of the Lehigh Coal and Navigation Co., agreed with Mr. Schwab that "labor is now in the saddle." He said that the time had come when we must have captains of labor as well as captains of industry, and that both these factors must get together if industry is to be developed to its utmost possibilities.

He reviewed conditions in the anthracite fields of Pennsylvania, beginning with the strikes some years ago which were settled by Mr. Roosevelt, and he said that the most important feature of the method of settling disputes was the establishment of a board of conciliation, the final arbiter in all disagreements. He added that pending the adjudication of disagreements, there should be no suspension of work, either by lockout or strike, and the agreement between the mine workers and operators called for this provision. Mr. Ludlow thought that we made a mistake if we did not encourage the better class of men into the union so that those organizations would be directed by the best thought among the laborers.

Psycopathy to Cure Disease of Discontent

A physician who is one of the directors of the Psychopathic Hospital of Boston spoke of the possible use of the psychologist in handling labor for large organizations. He felt that there was a good field already developed for this type of scientist. Such men could assist large concerns to get the right men for the right jobs and could analyze many conditions which were purely psychological in their character.

R. J. Young, of the Illinois Steel Co., explained the elaborate care the organization has taken toward the establishment of harmonious relations between the workers and the company. He laid much stress on the value of an employment manager whose function it was to secure a desirable labor supply. He advocated the ownership of industrial stock by employees and suggested that when a certain percentage of the stock was so owned these stockholders should have representation on the board of directors of the company.

Pensions Based on Employee's Ethical Value

With regard to pensions he raised the question as to whether the amount paid should be based on the wages of the man or on his ethical value to the company. He thought that basing a pension solely on the wages previously earned was not a fair basis for pension. Mr. Young then outlined very briefly the numerous activities engaged in by the steel corporation in an effort to create good working conditions and establish harmonious relations between the company and the men.

Among these efforts were medical supervision, dental clinics, shop sanitation, industrial canteen, domestic science instruction for the laborers' wives, proper illumination of shops and homes, fire prevention, proper ventilation, recreation for the workmen and their families, education for the children, housing and insurance. He laid considerable stress on the value of picking proper individuals for foremen because he said that they represent the management to the men and hold very important positions in the organization.

He felt that they were the closest point of contact and as an organization increased in size it grew more and more important to pick the right sort of foremen. After a man is placed in a foreman's position he should be constantly educated and trained in the duties of the place and in the importance of his job, and Mr. Young felt that the necessity of this training would come to be realized to such an extent that there would be established in this country an institute of human engineering to which these foremen could go from time to time.

LIBERTY BONDS are certificates of good citizenship. Have you received your certificates, or at least taken out "intention papers" this April? If not, any bank will accept your subscription and will help you to suit the payments to the abilities of your purse.

DISCUSSION BY READERS

Success in Mine Management

Letter No. 1—Since the recent discussion of the efficiency of mine foremen and firebosses, in *Coal Age*, I have been asked repeatedly to express an opinion in regard to what constitutes a thoroughly reliable and successful mine manager. I am not referring, now, to the use of that term made in Illinois to indicate the foreman of a mine, but am considering the man who fills the office of manager for the company.

In my opinion, the manager of a mine must have a clear and exact understanding and knowledge of what work can be done and how it can be executed most economically, and the time required for its performance. To secure this knowledge, I do not believe that it is necessary for a manager to have dug coal, driven a mule, set timber, or performed other work required in a mine. He should, however, have so closely observed the performance of this work by others as to be able to discriminate between men who are efficient workers and those who employ unpractical and costly methods.

An important feature or characteristic of a successful manager is the ability to provide the men and material that are most useful for his purposes, with the ultimate aim of reducing the cost of production. This will require, on his part, a broad knowledge of the industry in all its branches, from the digging of coal to its transportation, loading and shipment to market where it must meet the competition of other coals.

In addition to his practical knowledge of mining operations, the success of a manager depends just as largely on his consideration of the welfare of all the men employed by the company. He must consider these men and their families as having human necessities and provide for them suitable houses surrounded by all that makes life useful and enjoyable, such as schools, churches and means of recreation and entertainment.

Ultimate Test of a Man's Ability

The ability of a manager is often severely tested when an accident occurs in a mine and the lives of the men underground are endangered by reason of an explosion or fire in the mine, or an inrush of gas or water into the workings. His ability to quickly grasp the situation and provide the necessary means of rescue and other needed help is an unquestioned indication that he possess important elements of a successful manager. Indeed, the ability of a man to organize and direct the work of rescue when the emergency suddenly arises is a true index of equal ability to successfully manage the daily affairs of the company who employes him.

In my talk with young men, I have always tried to impress on them the importance of combining a knowledge of theory with the practical experience they are gaining, from day to day, by the work they perform in the mine. I have urged that such a knowledge will some day gain for them a higher position in the company and, perhaps, will find them seated, eventually, behind the manager's desk, occupying his chair and performing the important duties of that office.

Young men are much harder to train than young animals. A little dog can be taught to perform certain tricks, because he is willing to obey and recognizes his master; but this is not the case with the average young man. The giving of instructions successfully, involves the willingness and desire to learn on the part of the one taught. I believe this is the common experience of many of our older mine officials who have endeavored to teach the young men growing up around them and must, in time, assume their duties and perform their work.

R. W. LIGHTBURN.

American citizens should buy LIBERTY BONDS *because they will give the Government the means to bring the war to an early close, and to put an end to suffering and slaughter.*

Success in Superintending

Letter No. 1—Not everyone engaged in the coal-mining industry will agree with me that the position of mine superintendent is the most important position in the company. It is my belief, however, that such is the case. It is a position that requires a man of ability, tact and diplomacy, and one who is capable of dealing fairly and squarely with everyone and showing no favoritism or preference.

The superintendent of a large mine, like the foreman of a smaller operation, is the real link between the men and the corporation who employs them. He stands before the men as the representative of the company, and his actions, unconsciously it may be, are responsible for the likes and dislikes that form and grow in their minds.

In previous discussions, it has been argued that the official who is able to gain the confidence of his men is fostering in them a spirit of loyalty to the company and their interests. In doing this, he is gradually but successfully paving the way for the earnest and hearty coöperation of every worker in and about the mines. This, in my opinion, is one of the chief characteristics of a successful superintendent, but it is a feature that requires large self-control and a thorough knowledge of human nature, together with a careful study of every individual workman in his employ.

The successful superintendent who has gained his position through hard work and continuous application is in a position to appreciate the viewpoint of his men. He understands their way of thinking and is able to form a good judgment of their opinion regarding the various questions that are constantly arising in the daily operation of the mine.

Such a man's previous experience in the ranks enables him, now, to understand better the difficulties that con-

front him in his official capacity. The same experience will dictate to him tactful methods of dealing with his men; and, as a result, he is generally able to effect a just compromise. To the company, the services of such a man are invaluable.

Contrast, for a moment, the man I have just described with one whose rise from the ranks has given him an exaggerated idea of his own importance and a desire to use his authority in ways that are overbearing and unfair. The company that employs him comes to realize when it is too late the untold and almost irreparable damage such a one has been able to do by virtue of his position.

Not only should the superintendent be willing to listen to both sides of a controversy and decide impartially, but having reached a decision, he should be capable of impressing his view of the situation on others in a manner that is just and fair to both parties. His knowledge and insight into human nature should make him willing to allow for human weaknesses to a certain extent, and to exercise patience and forbearance while, at the same time, enforcing obedience.

The successful operation of a mine is dependent on the amount of work done by the men employed, and no one will deny that a satisfied worker will do more and better work than one who is dissatisfied. For this reason, a superintendent who commands the respect and confidence of his men will be able to show more material progress than one who deals unfairly and rules by reason of the authority of his position.

I'm buying LIBERTY BONDS *because buying them is the first, last and only duty of every American at this time.*

Climbing

Letter No. 2—Reading a letter on this subject by "Kappa," *Coal Age*, Jan. 26, p. 209, followed by the brief note on "Getting Ahead," Mar. 9, p. 459, set some thoughts running in my head to the effect that the principal reason why men fail to *get ahead* is their habit of *holding back*.

The man who begins to think that he is giving more work than the worth of his daily wage is at the point of proving that he is drawing more money than he is worth. No one ever heaped the measure of his performance while his eye was constantly on the clock. Truculent self-interest invariably defeats itself.

The surest way to advancement is the promotion of the boss' welfare. Minute-counting employees create penny-weighing employers. Where there is a stingy worker there will soon be a stingier boss. A man's mind cannot brood and breed at the same time. Where there is discontent there is little action, and a worker that is not satisfied with his lot will not be satisfying to his employer. No! *One never gets ahead by holding back.*

Granted, for sake of argument, that there are merchants and manufacturers whose dollar-vision is obstructed by their dime-voracity; and many concerns that fail to see per cent. in profits, because they look too close and too long at cents in expenditures. Such institutions are failures in the making. Large purposes and great undertakings are not evolved from contracted policies. A mean man performs no courageous acts, and, as must be expected, falls short of his possibilities. In trade and industry, risks and gains are inseparable bedfellows.

The man who wears the thorny crown of success has come into its possession because of his persistent courage. Finding one's self in the wrong sort of organization calls for increased effort to secure recognition by the exercise of greater willingness and efficiency. In serving a responsibility one but serves himself. A half-hearted service not only reduces an employer's profits, but likewise the future prospects of the delinquent worker.

PERSISTENT EFFORT WINS RECOGNITION

Self-deception is folly, and stifled faculties eventually become dwarfed and unresponsive. Keep in trim; strive for *the man within* and your record will attract *the man without*, because competence in a worker does not pass unnoticed. Competitors in the world's trade know everyone who is contributing to a rival's strength. Practice to be steady, willing, earnest and eager to serve, in the little corner where you are, and some keen judge of human values will before long pay market price for your merits.

The man who limits his endeavors to the things he is specifically appointed to do; displays no interest in matters outside his immediate duties; arrives on the hour and quits on the stroke of the gong; figures the minimum equivalent for present salary, caring nought for what happens about the mine as long as it does not bear directly on his own activities—that man is stunting his own growth. He hurts no one so much as he injures himself. But the one who delivers the goods, raises his average, while he who insists on sticking close to his own base, merely caring for what comes his way, will end the race where he began. It is the willing spirit and the active mind that climb. G. W. CARLSON.

Logansport, Penn.

I'm buying LIBERTY BONDS *because a Liberty Loan button with a gray head above it is a full service uniform.*

The Key to Success

Letter No. 1—One seldom reads the story of the promotion of a friend, or the rise of one who has attained success by extraordinary efforts, without being strongly impressed with a desire to unravel the mystery and discover, if possible, what was the key to the man's success. Many such instances were brought out in the discussion that occurred some time since in *Coal Age*, entitled "Merit vs. Favoritism."

It is not my intention to discuss that particular phase of the subject but only to add a few words that will suggest to the thoughtful man what is the true key that will unlock the door of fortune.

Speaking of the promotion of men to the position of mine foremen, I believe that it is true that favoritism is often shown in making the promotion. However, it is my belief that few men who have been thus favored continue to hold their positions for any length

of time, unless their promotion has stimulated them to unusual activity.

It is only natural that those who invest their capital in an undertaking should demand results, and *results* can only be secured through the efficiency of the workmen employed. These are true business principles and require that the man who is to succeed in the end must be one who is willing to make the necessary effort for his own advancement. The man who is looking for promotion must be willing to forego the pleasures that would otherwise absorb his time and consume his idle moments, and devote himself to study and improvement. Looking at successful men, one realizes that they are what their efforts have made them, and this conclusion develops in a man a determination to set himself to the task of securing like success.

In our state of West Virginia, candidates for the position of mine foreman must hold a certificate of competency granted them by an examining board, after they have successfully passed the required examination. While most men appear anxious to obtain a position as mine foreman, few are willing to devote themselves to the task of preparing to take the examination. When told that they must spend some of their evenings and idle hours in study, they appear to lose their interest. For such there is little hope of advancement.

A Lost Opportunity

One instance that I recall is that of a mine foreman who held only a second-class certificate. His superintendent, anticipating his own promotion, urged the foreman to prepare himself and take the examination for a first-class certificate, which would put him in line for promotion to a superintendency. Although he promised to help the foreman in the work of preparation, the latter gave no heed to the suggestion. As a result, a new man was brought in and appointed superintendent to fill the vacancy.

Had the foreman, in this case, tried and failed he would be worthy of our sympathy and future success would still be within his grasp, but the failure of the man to try excites only one's contempt. I am convinced if there were more men who were willing to try for higher positions, there would be more promotions from the rank and file of the laboring classes.

Let me not be understood as saying that passing the examination gives assurance that a man is competent to take the position of mine foreman. He must have experience to go with his technical knowledge. Neither is the man who has spent several years digging coal at the face fitted for the position of mine foreman. He must have experience in the working, drainage and ventilation of mines, and possess the ability to handle men and economize in all matters of time and material.

This does not mean that a man, to make a good foreman, must be a technical graduate who has acquired most of his knowledge from textbooks; but the successful mine foreman must possess a knowledge of the theory and principles of mining, in addition to his practical experience in the operation of mines.

In closing, let me say again that the true key to success is the willingness of men to prepare themselves for advancement. Let us put aside all ideas of "favoritism" and base our hopes of success on the efficiency of our own efforts, and, above all, let us remember that he who builds his own fortune on the wreck of another's prospects will not long survive.

Bluefield, W. Va. D. H. Perdue.

I'm buying Liberty Bonds *because I don't want to hang my head in shame every time I meet a man in his country's uniform.*

The Handling of Men

Letter No. 7—I have been particularly interested in the several letters regarding the successful handling of men, and would like to add a word on this topic myself. To be able to deal successfully with a body of men and secure results that are at once satisfactory to them and to their employers is, in my opinion, one of the most important requisites of a mine foreman. I would add, though he possess all the other qualifications required to fit one for that office and lack the patience, tact and initiative necessary to secure the desired results, he would prove a failure in the end.

A foreman in charge of men must be able to judge correctly in regard to their individual qualities. Otherwise, he will make many mistakes by placing men in positions that they are not fitted to fill, or giving them work that they are ill-adapted to perform. By way of explanation, let me say a man who is a model miner may be wholly incapable of driving a mule or running a locomotive. A good mule driver may make a poor man to operate a machine for cutting coal.

Something more than willingness in the worker is necessary for the proper performance of different kinds of work. Some men are natural miners; others natural mechanics; while still others have skill in the handling of a horse or mule. It is these characteristics in men that adapt them to different classes of work, and the mine foreman must be able to determine by his observation and by questioning to what class a man belongs.

Need to Study Human Nature

Besides these physical qualities possessed by men, there are the human elements that go to give individuals different dispositions, and it is important for the mine foreman to discover the nature of each man he employs. Some men will respond with their best efforts to a kind word; others are won by flattery or praise; many require to be encouraged; while still others must be compelled by the use of rough language or severe measures. The foreman must be all things to all men. He must, of course, provide the proper material and tools for doing the work, or he cannot expect the best results.

When instructing a new man how the work must be performed, a foreman's patience is frequently severely tried. A workman will often do the opposite from what he has been told, not because he means to be contrary but through his lack of understanding the instructions given him. It is up to the foreman, then, to explain himself, so that the man will understand fully what is expected of him.

As an arbitrator, the foreman is often obliged to settle differences between his men, and sometimes even family troubles are brought to him to be adjusted. It

is in the settlement of such disputes that the foreman often shows his greatest tact.

The successful handling of men requires, moreover, initiative on the part of the man in charge. He must be able to do the right thing at the right time, and not be under the necessity of consulting the man above him. He is the one in charge of the work and should be capable of its proper performance. He should be held responsible for the results, and if these are not forthcoming, he must expect to give place to another man who is better fitted for the position

Pride in Performance of Work

An important element in any operation is that the man in charge and the men under him must have a love for the work, and display an interest in its performance. Not only must the foreman take pride in the manner in which the work is performed, but he must have the ability to make every man feel the same pride. In this way only can the men be brought to feel that they are a real part of the business. Every worker should feel it his duty to do his part to establish a reputation for the place. The reputation of the company is as much to every worker as the wages he receives, since these will ultimately depend on the success of the business.

Finally, in addition to his other requisites, the foreman must have the welfare of his men at heart. His treatment of them must be such as to make all feel that their efforts are appreciated. At the same time, his discipline must be such that every worker will know what is expected of him. Disobedience of orders or violation of mining laws, mine rules and regulations cannot be tolerated. In this way only will the men come to have respect for the foreman, which is essential in securing the highest efficiency in the work. A lax discipline is sure to breed trouble. In the handling of men, the old adage is true "Take care of the little things and the larger things will take care of themselves."

I'm buying Liberty Bonds *because my negro elevator boy has bought one out of his $10 weekly wages and I don't want to feel ashamed in his presence.*

Mining Equipment

Letter No. 2—I have been a much interested reader of the letter signed "Progressive," which appeared in *Coal Age*, Mar. 9, p. 468, regarding the securing of accurate information in respect to the performance of mining equipment in actual use.

The writer has drawn attention to conditions that would cause many operators to hesitate in regard to giving publicity to the results they had obtained in the use of different types of equipment. Most of us will agree with "Progressive," however, that the coal mine operator who has used certain equipment in the operation of his mine is the one who could, if he would, give the most valuable information in respect to its performance.

Assuming, for example, a certain type of coal-cutting machine or haulage locomotive has been in use for three or four years in a mine, working under certain conditions, with the result that the records show a considerable saving since the installation was made, there can be little doubt that to spread that information broadcast would be of great assistance to the coal-mining industry and would be welcomed by all coal operators. The suggestion is made that such publicity might "take an unfair advantage of advertisers, by making comparisons of similar equipment under widely varying conditions," which might not appear or be comprehended by the writers.

It would seem, however, that the real difficulty in the way of disclosing information in regard to the performance of certain equipment, by operators using the same, is the fear of giving valuable information to competitors. At the present time, I fear that comparatively few operators will be found willing to voice their opinions relative to the results obtained in the use of various equipment installed by them at considerable expense. It is therefore necessary for the manufacturers to advertise the performance of their own equipment, which is done through the advertising columns of journals or by mailing descriptive catalogs and circulars direct to consumers. It is true, as "Progressive" has intimated, that mine operators often feel they are "fed up" with such information coming from the man who has the equipment to sell and they would welcome information from users of the same.

In closing, let me express the hope that a new era is already dawning and that mine operators will soon take a broader view of the situation and recognize the value of the information they can give in respect to the actual practical performance of mining equipment to the coal industry at large of which they are a part. The general adoption of this policy will in the end bring its reward to every operator.

——, Ala. "Checker."

Letter No. 3—Speaking of mining equipment and the results obtained in its use, there is one feature regarding the treatment of the steel used in construction that cannot fail to be of far-reaching importance and interest to all coal operators. I refer to the heat treatment of steel, particularly the steel used in mine-car axles and haulage locomotives.

Some eight or ten years ago a few railroads in this country began experimenting with heat-treated axles of various kinds, and they also had some of their engine truck frames undergo the same treatment, as well as the crosshead guides of their locomotives. The result was that when the material so treated had been in service for a considerable time, it proved so far superior to the steel formerly used, that few of the roads now, I understand, would permit any vital part of their locomotives to escape this treatment. I believe that the success achieved in the use of heat-treated steel, in railroad practice, can be largely attributed to the hearty coöperation of many members of the Master Car Builders Association.

In this connection, let me suggest that there are a number of associations connected with the coal-mining industry; but, to my knowledge, none of them have given any serious consideration to the necessity of the heat treatment of mine-car and locomotive axles. This is a matter that does not as vitally concern the mine-car builders as it does the users of such equip-

ment. If my information is correct, however, there are a large number of heat-treated axles now in use in the anthracite region and the same can be said with regard to alloy steels of various kinds, such as chrome steel, vanadium steel and many others.

It is important to say, here, what many already know, that the tensile strength of a heat-treated axle, or even an axle of alloy steel, is seldom, if ever, less than 1½ times the tensile strength of the ordinary hot-rolled steel so largely used in the manufacture of much mining equipment. Indeed, the tensile strength of the former will often reach three and four tims that of the latter.

I understand, further, that a low-carbon steel is quite generally used in the manufacture of mine-car axles, the carbon in the steel often being as low as 0.1 per cent., the steel being hot-rolled. This quality of steel was used by a large coal company during a long period, until they were advised of a better axle steel, which they have since used with increased satisfaction.

Quality of Steel in Mine-Car Axles

To my mind there is nothing more important in connection with a mine car than the quality of the steel in its axles. An inferior quality of steel will cause the axle to bend easily, and the metal will often crystallize under the repeated vibrations incident to its use. The crystallizing of the steel will cause an axle to break suddenly and, perhaps, cause a serious wreck on the haulage road and tie up the mine until it can be cleared. The result, in such a case, is not only the damage done to the cars and the expense of clearing away the wreck and making the necessary repairs, but of even greater importance is the loss occasioned by the temporary shutting down of the mine.

Since *Coal Age* is regarded as the national organ of the coal-mining industry, at the present time, the discussion of this subject in its columns will prove of untold interest to coal operators, especially those who are thinking of bettering their equipment. I, with others, will welcome a recital of the experiences of operators in respect to the quality of steel they are using in their mine-car and locomotive axles. It may be possible, also, to show specimens of microphotographs of the right kind of heat-treated axles, together with microphotographs of inferior axles, as this would enable many to understand the technical use of these terms in a more thorough manner. P. K. Howard.

The Mine Gatehouse

Letter No. 3—In reading the letter of W. H. Noone, *Coal Age*, Feb. 2, p. 256, explaining the advantages of the mine gatehouse, I was reminded of the time when I started the same system in an Alberta mine of which I had charge as superintendent and mine manager. The system worked well and is still in use, after 14 years, having undergone little change.

A large board was prepared, about 30 in. wide and 5 or 6 ft. long. The board was ruled with lines and holes ¾ in. in diameter were drilled at regular distances apart on these lines. Each hole was numbered, besides being marked with the name of the miner and his working place. If the man had no contract number, his name and place only appeared on the board. These names were put in a separate section by themselves. Drivers, motormen, timbermen, etc., were kept in their respective divisions underneath the others.

Operation of Checking System

The practical operation of the system was quite simple. A man called the "checker" was in charge of the board and placed a small wooden peg in the proper hole as each man, on passing the window of the checking office, called out his number or name. The checker became so expert in putting the pegs in the holes that the men were able to pass the window in a steady stream and be registered correctly. At times, the checker would use both hands and place the pegs in their proper holes with almost the same dexterity as a typewriter would handle the keys of her machine. When the men returned from the mine they would again pass the window and check out, the checker removing the pegs from the board as the numbers were called.

In the use of this system we scarcely ever had any trouble at the end of a period. Each man's time was made up from the board. The checker was stationed in the office, or "gatehouse" as it has been called, and if a man quit early the time when he came out of the mine was marked on the timebook correctly. Not only did the adoption of this system save much expense in keeping the time of the men working in the mine, but it enabled the mine manager to see at a glance what men were at work in the morning and to fill the places of those who had not come to work.

Plan to Insure Uiform Output of Coal

It was our custom, in that mine, to keep 10 or 12 men who were called "open-link miners." These men had no regular working places, but were sent to rooms where a man's buddy had failed to come to work. The rule at this mine was that no man was permitted to work alone, an extra man being sent to his place when his partner was not on hand. This plan had a good effect in maintaining the output of the mine more uniformly than would otherwise be possible.

Comparing this system with those I have observed in mines in Washington, Montana, Colorado and Kentucky, where brass checks were used and these were put on the board when the miners went into the mine and taken off again at night, I am convinced that it is of great advantage to have a competent man in charge of the checking board, whose duty it will be to mark the time that each man works, correctly.

This also serves to keep men in their places for the entire day, unless they have a good excuse for quitting, as the checker is obliged to note the cause of each man who comes out of the mine early. When the men realize that there is a close watch kept on their coming and going, it has a marked effect on keeping them in their working places until the end of the shift.

Moreover, as has been pointed out, a good checking board when properly kept is of great value in showing who is in the mine, in case an accident should occur that would make this information of importance.

Cassidy, B. C., Canada. Agar.

INQUIRIES OF GENERAL INTEREST

Sinking Shaft Through Quicksand

I have been much interested, recently, in the study of the problem of sinking a shaft through quicksand: and am anxious to secure what information I can in regard to methods that have been used successfully in sinking shafts through such strata. I have heard of some shafts being given up, because of the inability of the sinkers to control the inflow of water and sand struck at varying depths below the surface.

In one instance, a shaft had reached a depth of 80 ft. when it penetrated a 4-ft. bed of quicksand. Continued bailing and pumping produced no effect and the shaft was finally abandoned, because of the sinking of the surface over a considerable area surrounding the excavation. I would like to ask whether it would have been possible to save this shaft by any practicable means.

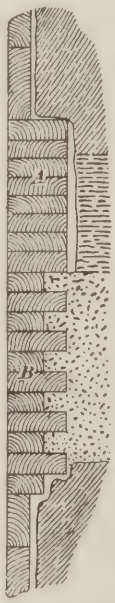
Although I have had little practical experience in sinking through quicksand, my study of the problem has suggested a method that appeals to me as bidding fair to be successful. It has the advantage of being more simple than any arrangement of steel shoes and tubbing, which are generally recommended when sinking through such measures.

Without attempting to give my own ideas, I would like to ask one or two questions: Does quicksand rise above its own level in a shaft? Is it possible to control the inflow of quicksand into a shaft excavation by the use of cement grouting, and how should this be accomplished?

JOHN A. RURY.

ercy, Ill.

Some sections of the Illinois coal field are famous for the extensive beds of quicksand, representing old river bottoms and lying anywhere from 25 to 50 yd. below the present surface. Much difficulty was experienced, a few years ago, in sinking the Ladd shaft, in Illinois. At that time, the writer devised a plan that proved successful in penetrating a thick bed of quicksand lying at a depth of 150 ft. below the surface.



As shown in the accompanying figure, which is a cross-section through the curbing, the shaft was timbered with alternate 10- and 12-in. planks laid flatwise, which presented a corrugated surface at the back, the effect of which was to choke the drainage behind the shaft timbers, as the excavation proceeded downward. By the use of cross-buntons, the curbing was tied to heavy truss-beams at the surface, by means of steel rods inserted in 10-ft. sections.

When the excavation had reached a sufficient depth below the surface to permit of hanging the uppermost section of the curbing the first set of four steel rods, 1½ in. in diameter, were suspended from two heavily trussed beams, so as to hang in the four corners of the shaft, respectively. The four rods passed through and supported two cross-buntons on which the curbing rested. By means of screw couplings other sections were added as the depth increased.

In this manner, and by the use of a steel shoe at the bottom of the shaft, it was possible to pass through the quicksand, after having experienced the loss of five shafts sunk successively in the same locality. In that instance, the surface had sunk 4 or 5 ft. over a large area surrounding the shaft when the coal was finally reached in the sixth shaft.

The pressure on a bed of quicksand will depend much on the nature of the overlying strata. When the quicksand is finally reached, in sinking a shaft, there frequently occurs an outburst of sand and water, which comes without warning, and rises in the shaft to a point equal or corresponding to the head or water level in the strata.

The character of the quicksand bed is quite variable. At times, it may consist almost wholly of fine sand, and, again, the sand may be mixed with boulders or lumps of mud or clay. The water permeating this bed may have its source in a watery stratum lying some distance above the quicksand, and this will explain how it is that the water and sand frequently rise to a great height in the shaft.

SECTION THROUGH SHAFT CURBING

While the use of cement grouting has proved of great value, in many instances, it is often the case that quicksand flows so freely that it is impossible to control or even reduce the inflow into a shaft excavation, after this has once started. In every case, where there is reason to expect an inflow of water or quicksand, test borings should be made at the proposed location of the shaft, and this should be done before the sinking is commenced. The results of these borings will determine both the head and the quantity of water to be encountered in sinking. The borings will also show if quicksands are present and give the depth and thickness of the bed besides showing the character of the strata.

Where a freely flowing quicksand is to be encountered in the sinking of a shaft, it is advisable to resort to what is known as the "freezing process." This consists in sinking a series of boreholes around the proposed excavation and freezing the strata by forcing a freezing mixture through pipes into these holes, till the ground is frozen.

Another method that has been successfully applied is to force a good grouting of hydraulic cement into the holes, until it has permeated and largely solidified the bed of quicksand for a few feet surrounding the shaft. When this method is used, the work must be done before the excavation is started and the quicksand is dormant, as it will not be easy to solidify the quicksand when a flow has once started.

EXAMINATION QUESTIONS

Illinois Mine Managers' Examination, November, 1917

Ques.—The main entry in a mine is driven due east from the bottom of the shaft. There are three pairs of entries turned south off the main east, known as the 1-, 2-, 3-, 4-, 5- and 6-S entries. Fifteen men are at work in the 1-S, 15 men in the 2-S, 15 in the 3-S, 15 in the 4-S, 22 in the 5-S and 15 in the 6-S. Two men are at work in the main east entry and one in the main return entry. How much air should be required to pass through the last open crosscut in each pair of entries?

Ans.—Assuming a nongaseous mine and not estimating on the number of animals required in these entries since no mention is made of them, it will be sufficient to allow 100 cu.ft. of air per minute, for each man employed in each pair of entries. In estimating the quantity of air flowing through the last crosscut, however, it is necessary to consider whether this mine is ventilated by a continuous current or whether the split system of ventilation is employed.

Assuming, then, that each of the three pair of south entries are ventilated by a separate air split that is conducted at once into the main return airway, the quantity of air passing through the crosscut at the face of the 1- and 2-S will be $100(15 + 15) = 3000$ cu.ft. per minute. The same quantity will be required in the 3- and 4-S entries. The quantity required in the 5- and 6-S entries is $100(22 + 15) = 3700$ cu.ft. per minute.

The air passing the face of the main east and return airways, in order to comply with the law, need be only $100(2 + 1) = 300$ cu.ft. per minute. This quantity of air, however, would give a velocity of but 5 or 6 ft. per minute, which would not be sufficient for the ventilation of these places. It is, therefore, better to assume that the air split ventilating the 5- and 6-S entries is conducted to the face of the main east entries, instead of passing directly into the return airway. In that case, however, the quantity of air passing through the crosscut on the 5- and 6-S and the crosscut at the face of the main east entries would be $100(22 + 15 + 2 + 1) = 4000$ cu.ft. per minute.

In case this mine is generating gas, the Illinois coal mining laws require 150 cu.ft. per minute for each man working in the mine. This would increase the quantity of air passing through the several crosscuts mentioned, and make the quantity half again as great.

Ques.—What advantages and disadvantages would you expect by connecting the underground workings of two or more mines, and what dangers are likely to arise therefrom?

Ans.—The advantage of connecting the underground workings of two adjoining mines is that such a connection will afford means for the escape of the men from the workings, in case of emergency arising from a sudden outburst of gas or an explosion occurring in one of the mines. The disadvantage of having such a connection is that, should an explosion occur in one mine and the division doors are blown down, the effect would be felt and the explosion possibly transmitted to the workings of the adjoining mine. Another disadvantage may be experienced in the possible disarrangement of the ventilating current, owing to the setting open of the division doors or the difficulty of preventing the leakage of air from one mine into the other, especially if one is ventilated under the blowing and the other under the exhaust system of ventilation. Unless the doors between the two mines are kept locked, some trouble might arise from the men employed in one mine, paying their visits to the workings of the other mine, which would afford an opportunity for shifting the blame of accidents and making it impossible to determine the responsibility for the same.

The dangers of connecting adjoining mines are those mentioned relating to the possibility of explosion in one mine or the flooding of one mine affecting both mines alike.

Ques.—Is coal dust explosive and, if so, under what conditions?

Ans.—Experience and experiment have both proved that the fine dust of inflammable coal is explosive. The conditions favoring a dust explosion are the fineness of the dust, the inflammability of the coal from which it is formed, the volume and intensity of the flame causing its ignition, and the suspension of the dust in the air. While the presence of methane, even in small amounts, will greatly assist the ignition of the dust and render its explosion more violent, the gas is not a necessary constituent of an explosive atmosphere, which may be due wholly to the presence of a sufficient quantity of fine inflammable dust.

Ques.—What precautions would you adopt to prevent the accumulation of gas on top of falls where it was difficult to remove the gas with the air current?

Ans.—In this case, a special brattice should be erected in such a manner as to deflect the air current to the top of the falls and cause it to sweep the gas coming from the cavity in the roof strata.

Ques.—Should a fall occur on the main intake airway, and a large amount of gas be given off from the roof, what steps would you take to prevent an explosion and rescue the men at work inside?

Ans.—The men should be notified at once to extinguish their lamps. They should be withdrawn from the mine by the shortest and most practicable route to avoid their contact with the gas. It may be possible to short-circuit the air current inby of the fall so that the gas will be carried at once into the return airway and conducted out of the mine. No open light should be permitted under any conditions, and the only safety lamp permitted to burn should be in the hands of the fireboss, who should lead the men out of the mine, to insure their safe escape.

COAL AND COKE NEWS

What Happened in March

Mar. 1—Joint committee appointed by Government officials, eastern railroad representatives and mine operators of Pennsylvania, Maryland and West Virginia to apportion cars to meet the railroad-fuel demand.—Price of coke manufactured in Preston County, West Virginia, between Tunnelton and Grafton and at Meriden, Barbour County, was fixed at $6.75 for blast-furnace coke and $7.75 for selected 72-hr. foundry coke, a rise of 75c.—Flat top or Pocahontas, W. Va., coke is placed at $8, instead of $6 for furnace coke and $7 for foundry coke.—Selected foundry coke, manufactured in Indiana County, Pennsylvania, from washed coal mined from the lower bench of the upper Freeport, is placed at $8 per ton if ash exceeds 10 per cent or the sulphur 0.9 per cent and $8.50 if the ash is less than 10 per cent and the sulphur less than 0.9 per cent.—Byproduct coke at Chattanooga Tenn., is set at $8.25, run of oven, crushed coke over 1-in. in size $8.75 and selected foundry coke $9.25.

Mar. 2—Bill introduced by government of British Columbia for the establishment of an 8-hr. day, bank to bank.

Mar. 4—Public Service Commission holds a hearing relative to the request of A. H. Wiggin, state fuel administrator, that all private power plants in the city of New York be closed down and power requirements supplied by public-service corporations.

Mar. 5—Judge Lovett appointed director of Division of Betterments and Additions in Railroad Administration.—New prices established by Fuel Administration in Wayne County, West Virginia (part of Kenova and Thacker fields). The increase is 40c. per ton making run-of-mine $2.40, prepared sizes $2.65 and slack or screenings $2.15.

Mar. 6—War Industries Board is reorganized, and Bernard M. Baruch is made chairman of National Defense.—Priority given to coal by order of Jan. 17 is removed in all states east of the Mississippi except Pennsylvania, Maryland, West Virginia, Ohio and Eastern Kentucky.—Priority is given to New York Central and Hudson R.R. Co. railroad coal over all other coal contracted for.—Prices granted to certain mines in Preston County, West Virginia, on Feb. 7 made applicable to all mines in county.

Mar. 8—Fuel Administration makes regulations for retailing. Before Apr. 1 all consumers should place orders for one year's fuel requirements in writing. In the case of anthracite, dealers shall proceed to deliver coal till two-thirds of the requirement is supplied. However orders of 6 tons or less may be filled in full. After all consumers willing to accede to deliver till two-thirds of requirement the dealers may supply coal till the full quantity requisitioned is delivered. The dealer may deliver bituminous coal at once up to the full declared requirement. Where the consumer has coal on hand that coal is to be deducted from the annual requirement. No domestic consumer shall purchase or receive more coal and coke than he will need in the year ending Mar. 31, the coal on hand being figured in the receipts. No dealer may sell him more, alone or with other dealers. No dealer may deliver to any one who has not filed with him a statement of the amount of coal on hand, the amount already ordered and the name of the person from whom ordered, the coal used in the year ending Mar. 31, 1918, and the coal required in the year following.—Prices are set by Fuel Administration for Colorado coal. Bituminous domestic coal from the domestic field: Run-of-mine $2.25; prepared sizes $3.50; slack or screenings $1.25. Bituminous steam coal, Trinidad district: Run-of-mine $2.35; prepared sizes, $3.25; slack or screenings, $1.65; Lignite; run-of-mine, $2.25; prepared sizes, $3.25; slack or screenings $1. These figures for bituminous domestic coal shall be reduced 70c. on April 1; 50c. on May 1; 35c. on June 1 and 15c. on Aug. 1 and for bituminous steam coal shall be reduced 40c. on Apr. 1; 30c. on May 1; 20c. on June 1 and 10c. on July 1. To all these figures 45c. may be added where compliance is made with the terms of the Washington Agreement. The order reduces prices considerably.—The Fuel Administration sets the price of run-of-mine at Montana, Wyoming and Utah mines at $2.65; prepared sizes at $3.30; slack and screenings at $1.50. To these figures the 45c. granted in consideration of compliance with the Washington Agreement may be added.

Mar. 9—The Fuel Administration announces that the prices of anthracite will be reduced 30c. per ton from Apr. 1 to Sept. 1 instead of the usual reduction of 50c. in April, 40c. in May and so on till August when only 10c. is usually deducted from the winter circular. It also announces a system of inspection. The coal which proves below standard must be sold for 50c. less than Government prices. Parts of the mine producing coal of inferior value must be closed with due regard to conservation or else provision must be made to clean the coal.—Summer reductions in Colorado will apply only to prepared sizes on both domestic and steam coal. It shall not apply to lignite.—Maximum prices for coal in Marion, Boone and Appanoose fields, Iowa, areas are set as follows: Run-of-mine $2.75; prepared sizes, $3.10; slack or screenings $2.90.

Mar. 10—British government announces that on Mar. 21 it will proceed to the enlistment of 50,000 miners.

Mar. 21—The Somerset coal price field in Pennsylvania is enlarged by adding operations on the Baltimore & Ohio Ry. and from the Somerset County line to and including Indian Creek and the Indian Creek Valley branch of the railroad. The prices are: Run-of-mine, prepared sizes and slack, $2.60 with 45c. added if compliance is made with terms of Washington Agreement. The old prices were $2, $2.25 and $1.75 respectively—Several orders dating back to the order of Jan. 30, 1915, relating to the freight rates on anthracite are vacated by the Interstate Commerce Commission and an increase in rate not to exceed 15c. per long ton is added to the freight rate on anthracite. The freight rates on live stock and fresh meats, petroleum, grain and grain products, brick, clay, cement, lumber and forest products and some other materials are also increased.

Mar. 16—Rules and regulations governing the distribution of coal and coke by persons, firms, corporations and associations subject to license are formulated by the Fuel Administration.

Mar. 20—Manufacturers of box board, paper board, straw board, etc., who reduced their fuel consumption by running 5 days a week resume their full schedule.

Mar. 22—The Fuel Administration announces a new price classification for the entire state of Illinois and for large coal fields in Ohio, Pennsylvania, Virginia and West Virginia.

Mar. 28—New prices are named for Washington, Oklahoma and Arkansas mines.

Mar. 29—Companies and individuals using special means for eliminating impurities from their coal will be permitted to add 20c. to the Government price at the mine.

Mar. 30—United Fuel Administration advises the public to store coal or otherwise there will be a shortage next winter.

Harrisburg, Penn.

Holding that it would be a harsh rule to require corroboration of an accident when it is known that the workmen in mines are frequently employed at isolated points, where accidents cannot be witnessed by others, Judge Strauss (Luzerne County) made an order on Apr. 4 in the appeal taken by Mary Zadwick from a decision of the Workmen's Compensation Board, in which he sustains the appeal of the claimant, reverses the order of the board which set aside the finding of the referee and directs the board to grant a hearing de novo in accordance with the provisions of the act.

The husband of the plaintiff, Joseph Zadwick was taken ill on his way home from work on July 12, 1916, and died Aug. 7. It was claimed his death resulted from a sprain received while he was at his work on July 12, lifting a heavy weight. There was no witness to the lifting or injury, and the Lehigh & Wilkes-Barre Coal Co. appealed from the decision of the referee because there was no relation shown between the accident and the cause of death.

A. Mitchell Palmer, Federal custodian of alien property, has filed more than 50 petitions for reinstatement of claims of nonresident enemy aliens for compensation for deaths of workmen in Pennsylvania, many of whom were subjects of the Austro-Hungarian empire. These claim petitions had previously been disallowed by referees throughout the state because of the failure of claimants to attend hearings and prove their cases.

Arguments on the petitions will be heard on Thursday, Apr. 25, at Philadelphia, and it is expected that Mr. Palmer will appear personally in behalf of the United States Government. It is also anticipated that representatives of coal corporations and insurance companies interested in compensation cases will protest.

The petitions are expected to serve as precedents by which the custodian of alien property will endeavor to have the claims of nonresident aliens in compensation cases tolled until the end of the war. The insurance companies are opposed to this as it will require them to carry a reserve fund in each case. It is estimated that more than a million dollars is involved in the proceedings before the board and most of the cases are said to come from the coal regions.

Birmingham, Ala.

The names of four new coal firms were placed on the incorporation books in the probate office during March, according to a report filed Saturday. The combined capital is $117,000. The new concerns are the Sandstone Coal Mining Co., capital, $2000; The Wabash Coal Mining Co., Inc., capital $10,000; the Cullman Coal Co., capital, $5000 and the Black Warrior Coal Co., capital $100,000. The Wabash company filed its first papers early in March with a capitalization of $5000 and later increased this stock to $10,000. These four companies are included in a list of seventeen new companies incorporated in March with a total capitalization of $344,000.

Among the improvements in the fuel field announced during the week is the opening of a new mine three miles west of Leeds, in the northeastern part of this county. The development is under the direction of T. P. Berry, J. M. Donaldson and Tom Stobert and will be known as the Mary Anderson mines. It is officially stated that the company is counting on producing several hundred tons of coal a day within the next few months. The Central of Georgia R.R. has made a survey for a spur track to reach the new mines, which are located in Section 7, Township 17, Range 1, east in Jefferson County.

Another important announcement is that of President George Gordon Crawford, of the Tennessee Coal, Iron and Railroad Co. The company announces the immediate construction of 154 additional byproduct ovens at its immense plant at Fairfield. This development is intended primarily to increase the production of toluol, ammonia and benzol needed in the manufacture of ammunition and also to bring about a saving of hundreds of thousands of tons of coal for coke making in the byproduct plant as over the beehive oven system. The development will entail an outlay of $2,500,000. The company now has 280 byproduct ovens at Fairfield.

In the mining section of the district there is much activity. Labor is needed in every direction. While it is a fact that there are some negroes returning to the district who left here during the past two or three years in the big exodus that carried hundreds of them to Ohio, Pennsylvania, Illinois, West Virginia, Michigan and other states, the demand for labor comes on at a pace that makes a shortage

keenly felt. In all parts of the district the eight-hour day is in operation at the mines, or will be before the end of this month; the semi-monthly pay is in effect and many other concessions have been made to attract labor. Bonus is being allowed at many of the mines for extra work or tonnage, and every effort is being exerted to hold the output of coal up to the maximum.

Reports reaching the office of State Inspector of Mines show that coal production this week was the heaviest ever seen in the state for a similar period, and records indicate that production through new mines this year will be increased by not less than 500,000 tons.

Fairmont, W. Va.

A glance at the figures showing the production of coal for the fiscal year ending June 30, 1917, in the Fairmont district, which is the Monongah division of the Baltimore & Ohio R.R., shows that it is the mines which have been providing railroad fuel which have been prosperous, accepting that the mining of coal means financial success, a proposition on which all coal people stand agreed even though a request was made recently for an advance in selling price.

The leading producers of the Fairmont district did not get out as much coal as could have been mined but the showing is creditable to the district. The Consolidation company mines in the Fairmont district (it has mines in other regions) could have turned out 2,000,000 tons more readily. The Jamison mines in this district (that company also has mines outside the district) were capable of putting out 800,000 tons more. The Hutchinson Coal Co. (which also has mines outside the region) could have turned out 500 000 more tons in the Fairmont district. The Federal Mines at Grant Town, owned by the New England Fuel and Transportation Co., had an over supply of cars part of the time, but the output could have been increased some in the last year. The Wendel mines, which are fourth in the list, supply Baltimore & Ohio fuel, as does the Century Coal Co. and in fact all the operations which are named below, whose production last year is given in net tons:

Consolidation Coal Co., of Fairmont	4,313,624
Jamison Coal and Coke Co., of Fairmont	914,546
Hutchinson Coal Co., of Fairmont	719,179
Maryland Coal and Coke Co., of West Virginia (mines at Wendel)	701,160
Federal Coal and Coke Co., of Grant Town	688,668
West Virginia Coal and Coke Co., of Elkins	666,188
Elkins Coal and Coke Co., of Morgantown	631,197
Century Coal Co., of Century	490,489
Virginia and Pittsburg Coal and Coke Co., of Kingmont	402,277
Four States Coal Co., of Worthington	337,960
Davis Coal and Coke Co., of Baltimore	302,198
Marshall Coal Co. of Mt. Clare	297,081
Fairmont and Cleveland Coal Co., of Rivesville	243,192
Dawson Coal Co., of Clarksburg	241,085
Madeira-Hill-Clark Coal Co., of Wilsonburg	238,501
Monongahela Valley Traction Co., at Baxter	203,894
Virginia-Maryland Coal Corporation, at Shinnston	201,820
Rosemont Coal Co., of Rosemont	179,086
Merchants Coal and Coke Co., of Pennsylvania (mines at Tunnelton)	153,127
Austin Coal and Coke Co. at Austin	135,849
Stafford Coal Co. at Baxter	134,400
Pittsvein Coal Co. at Flemington	132,693
Harry B. Coal and Coke Co. at Clarksburg	128,148
Francois Coal and Coke Co. at Clarksburg	126,317
Central Fairmont Coal Co., of Clarksburg	118,795
Whyel Coal Co., of Monagh	122,783
Lambert Run Coal Co., of Meadowbrook	112,598

T. W. Arnett has varied mining interests with a large output, the total of which would make a good showing in the list, but he operates them under different corporate names. His total tonnage is certainly more than 300,000.

The Clark interests have the Madeira-Hill and Harry B. in this table while they have three other mines, the total of all reaching something like 400,000.

The Lambert Run Coal Co. is one of several interests in which Clarence D. Robinson is prominent. If his three or four other interests were combined the total tonnage would be in the neighborhood of 350,000.

The poor and irregular car supply reduced the output considerably. Some mines got an 80 to 100 per cent. car supply while others only had 20 to 40 per cent. The mines unfortunate under the assigned car policy favored by the railroads lost many men, who scattered with work dull, and this reduced the output where there was a full car supply.

For instance, the Jamison concern has three mines in this district any one of which could probably have equaled the Federal if the car supply had been as good. It is reasonable to estimate that the Jamison mines in this region could have doubled their output with a full car supply.

Charleston, W. Va.

Though expecting official advice from Washington at almost any moment as to the decision of the National Fuel Administration on the selling price of coal in this state, no orders had been promulgated up until the time this was written. Operators are living in hope that their request for a general increase may be complied with, though of course without any definite assurance that such will be the case. The impression seems to prevail that the New River district may be allowed increases but that the Kanawha District will not be given an increase.

Advices from Fairmont during the early part of last week were to the effect that the car supply in that region had been ample during the early part of the week, though it was said the prospects for the remainder of the week were not very encouraging. The lifting of the embargo on eastern shipments also contributed toward easing the situation in the Fairmont territory where it is estimated the regional supply is about 6000 cars short.

Operations at most mines in West Virginia were suspended last Saturday afternoon at the request of the Governor, to permit miners to participate in the parades and patriotic celebrations held throughout the state which signalized the beginning of the Third Liberty Loan campaign. Miners turned out in force at Charleston.

The Marting War Savings Society, consisting mostly of miners, at the organization of their society last week pledged at the first meeting $6100 to be invested in War Savings Stamps. They have set $12,000 as the goal for January 1, 1919.

Looking ahead to the end of the war, a number of the coal associations, representing West Virginia operators have, through their officers, responded to Governor Jno. J. Cornwell's invitation to attend a conference in this city, some time in May, for the purpose of making plans to extend the export trade to South America. While some of the operators take the view that the present is not the time for action, the Governor has urged that it would be short-sighted to wait until the war is over before making plans to establish a market for West Virginia coal in the countries to the south of North America. It was decided not to hold the conference until the end of the present Liberty Loan Campaign.

PENNSYLVANIA

Anthracite

Wilkes-Barre—Voluntary subscription of funds for the Wyoming Valley Chapter of the American Red Cross has netted $5791 from miners and breaker boys in the employ of the Lehigh & Wilkes-Barre Coal Co. Lately the Red Cross has been hard pressed for money, so many have been the appeals and so great the volume of relief work. Mine workers have attempted to tide the organization over until the next Red Cross campaign.

Nanticoke—Anthony Waicik, a miner at the Loomis Colliery of the Delaware, Lackawanna & Western RR., Coal Department, has been taken into court by Mine Inspector Frank Kettle, charged with violating the anthracite mine law by lighting a match in a forbidden place and against orders of the mine foreman. The place where Waicik was employed was very gaseous and the men worked with safety lamps. The defendant was discovered on Jan. 19 smoking a cigarette, thus endangering lives and property through a possible explosion of gas. The case will be tried before a jury.

Pottsville—The barrier pillar case, involving $300,000 lost in coal when the court directed that an immense barrier pillar be left standing between Morea and New Boston collieries, was heard before Judge Bechtel, on Apr. 3. Dodson & Co., who would have mined the coal if not prevented by an injunction, have sued the Delano Brothers for damages, claiming that the right to mine the prohibited pillar of coal was included in their lease and the land owners failed to make it possible to complete the terms of the lease. Intricate legal questions are involved.

Scranton—Anthracite operators have actively enlisted to aid the work of the nation to produce more food. They are making available for war gardens lands which have gone largely unused. The Delaware, Lackawanna & Western and the Delaware & Hudson Coal companies have set aside a big acreage in their region for this utilitarian purpose. The fields are several hundred acres in extent and have a soil, with the proper tilling and enrichment, to produce abundant crops, which will largely supply local needs.

The Lehigh & Wilkes-Barre Coal Co. printed at its own expense thousands of recipe leaflets, teaching the mine workers the different uses of cornmeal as a substitute for wheat and wheat flour. The recipes include other bread substitutes and a bean loaf. The anthracite operators are also teaching the mine workers the ruling of the food administration in food savings.

Coxton—Owing to the present unsatisfactory manner of mixing anthracite and bituminous coal, and loading it on engines, the Lehigh Valley Railroad Co. has started work on a coal crusher and mixer that will cost about $40,000. The new structure will be modern in every particular and will also have a storage department of 1000 tons capacity, from which the mixed coal will be loaded automatically into engine tanks. The company is at present using a great amount of small sized anthracite, and under the existing plan it was found hard to mix this with the lumps of bituminous, while the loading of it at present is done with the aid of a steam crane. Aside from this the company is experiencing all sorts of trouble, as the automatic stokers on the engines will not distribute the fuel properly in the firebox. The new building will be similar to the one the company has at Hazleton.

Nanticoke—During the 26 working days in March the miners in the Truesdale colliery of the Delaware, Lackawanna & Western Railroad Co., Coal Department, produced 141,282 tons of coal, or an average of 5469 tons per day worked. In March, 1917, the colliery produced 125,122 tons but the output for last month exceeds this figure by 16,160 tons, in one day less time worked. This colliery holds the daily, monthly and yearly record for the hard coal field. The one day record is 8513 tons, which required 208 railroad cars.

Shamokin—The fire at the Corbin slope of the Excelsior Coal Co.'s twin collieries was placed under control by washing great quantities of water and culm down the heavy pitching slope in which the fire broke out. This procedure had the effect of closing a tunnel at the bottom of the slope. The fire, however, will continue to rage in the slope proper until the culm is banked high enough on the slope to reach the flames. Culm is being poured into the workings at a rate of 15 tons an hour.

Bituminous

Chambersville—The Shannon Coal Co. has purchased the Kinter mine here and is making large improvements. A concrete bridge has been erected across the creek and the coal will be hauled to the tipple of the Seneca Coal Mining Co. and loaded with the Seneca output on the Buffalo, Rochester & Pittsburgh Railway.

Rosmoyne—The McCombs Coal Co. has installed a set of boilers, air compressor, rope haulage engine and mining machines at its mine here. The output will be greatly increased. The coal is shipped over the Buffalo & Susquehanna Railroad.

Indiana—The Leydic Coal Co., operating a mine on the Clymer branch of the Indiana County street railway, and supplying fuel for the street car company, has leased the Guthrie siding between Indiana and Homer City and has erected loading platforms and a tipple. It has a car rating from the Pennsylvania R.R. The coal is hauled from the mine to the siding, a distance of about 10 miles, on a large electric coal car.

Connellsville—On Monday Apr. 15, the wage increase of 15 per cent. recently announced by the H. C. Frick Coke Co. will go into effect. More than 20,000 coke workers will benefit by the increase.

East Butler—Many farms in the coal region are being offered for sale because of the migration of boys to the munition works and the operation of the draft, al-

though under a recent ruling the Government eligibles engaged in agricultural work are not to be sent to camp until after the harvests. Hundreds of Slavonian and Polish miners are buying land, and it is predicted that they will be the farmers of the future throughout the anthracite region of the state. Most of these persons lived on farms before they came to this country and are more experienced as farmers than as miners.

Uniontown—An early adjustment of the J. V. Thompson affairs now seems probable, as the Hill Syndicate options will either be taken up or abandoned by Apr. 21. It is considered likely that the West Virginia and Pennsylvania coal properties would be purchases, which would mean the final winding up of the debts and affairs of Mr. Thompson, who will see his estate, figured conservatively at sixty million dollars in value, wiped out to pay debts of about thirty million dollars. The Hill Syndicate if it comes into possession of the vast acreage held by Thompson, will become the chief factor in the eastern bituminous coal reserves of the nation.

Pittsburgh—Industrial corporations which have been securing part of their coal from wagon mines have notified the owners of these mines that in the future they intend to purchase their coal from larger operators. This action has called forth expressions of disappointment and dissatisfaction from the wagon mine owners who have appealed to district representatives and the Fuel Administration.

WEST VIRGINIA

Elm Grove—The Century Coal Co., headed by David H. Thomas, of St. Clairsville, Ohio, is getting both openings at its plant here in shape for loading. Grading for the sidetracks is now going forward.

Morgantown—The New England Fuel and Transportation Co. has transferred all the Pittsburgh vein of coal and mining privileges in 157 acres of the tract recently purchased, to John F. Phillips and C. D. Robinson, of Fairmont. This tract was originally known as the Elkins tract and was purchased by the New England Fuel and Transportation Co., which has resold a great quantity of the coal, nearly every company in this section acquiring more or less of it.

Elk Garden—A new opening is being developed by the Mapleville Coal Co., which recently took over a large tract of coal land, consisting of 340 acres of the old No. 15 mine on Elk Garden branch. At present mining is being carried on in the Bakerstown bed, with the expectation that the Freeport bed will be worked by the Abraham Creek Coal Co. by May 15.

Shinnston—A coal storage bin recently completed at Owings, near here, is of frame construction on a concrete foundation. The bin, which is 35 x 100 ft., has a capacity of about 1800 tons of run-of-mine coal. It is constructed of longleaf yellow pine which has been thoroughly treated with preservative. Coal is dumped over the tipple in the usual way, going from the chutes into a conveyor by which it is carried to the top of the bin and deposited where desired by gates which can be opened or closed. The machinery employed is electrically driven.

Farmington—The Jamison Coal and Coke Co. has installed a coke machine for the 120 ovens at the No. 8 mine. About half of the ovens are already being pulled.

Weston—The Lynch Coal Co. will open a tipple mine here at once, having acquired 500 acres of Redstone vein of coal and 200 acres of surface.

Beckley—With C. R. Stahl, assistant general manager in charge of the work, the E. E. White Coal Co. is building a concrete road and making other improvements at Stotesbury.

Fairmont—The Hope Natural Gas Co. is branching out in the coal business, having perfected plans to develop its 500 acres of coal land in Marion County, the coal to be utilized in making byproducts.

Charleston—Traffic on the Ansted Branch of the C. & O. was only resumed within the last week, it being impossible to operate trains on that branch since the flood of March 14.

Fayetteville—The installation of several new motors by the Price Hill Colliery Co. will enable that concern to produce its maximum tonnage within the next few days, the tonnage having been limited to about 100 tons daily up to this time, because of insufficient equipment.

Wheeling—Water shipments will be discontinued by the West Virginia & Pittsburgh Coal Co., the company having signified its intention of disposing of its river craft and of shipping coal from its Gilchrist and Colliers plant by rail. The company owns two river steamers and a fleet of barges.

Wellsburg—Suit for $10,000 has been instituted against the West Virginia-Pittsburg Coal Co., operating in Brooke County, by Samuel Logan, father of Ray Logan, who was killed at the Gilchrist mine of the company a few weeks ago. As Logan was the miner's checkweighman, it is said that his death does not come within the purview of the Workmen's Compensation Act.

INDIANA

Petersburg—Coal mines along the E. & I. R.R., on Apr. 2 closed down, claiming that prohibitive freight rates made it impossible to operate profitably in competition with other lines. About 800 miners were released, many of whom are leaving the field.

ILLINOIS

O'Fallon—Joseph Schmit has been arrested by Deputy State Fire Marshal Richards in connection with the explosion of two kegs of powder two weeks ago in the Prairie mine. Schmit, who was employed at the mine, was the first man to reach the surface after the explosion. More than 100 miners have quit work at the Prairie mine on account of the adoption of resolutions by the employees providing that every foreign-born man must show naturalization papers before being permitted to enter the mine. Formerly 380 men were employed at the mine. Now there are less than 275. The company operating the mine has contracts for furnishing fuel to several munitions plants.

Lebanon—The People's Coal Co., which has operated the Lebanon mine for the past eight years under a lease, turned the property over to the owners, the Premier Coal and Mining Co., on Saturday Mar. 29. The Premier company also purchased the machinery and equipment, and will operate the mine in the future. The People's company, of which H. C. Chapple is president and General Manager, will continue to operate the Devil's Hole mine near Caseyville, which was purchased last year. William Kolb, head of the Premier company, announces that repairs will be made and the capacity of the shaft increased. Thomas Jones, for several years a mine examiner, has been employed as pitboss.

OHIO

Martin's Ferry—The Pursglove-Maher Coal Co., one of the largest producers in eastern Ohio, will open a large mine west of its Maher plant at Glencoe. It is expected work will be started as soon as material is obtained. The new mine will tap the coal owned by the Pursglove-Maher interests between Glencoe and the Crambers schoolhouse, just south of St. Clairsville.

Adena—The Stellar Coal Co. expects to begin cutting coal this week. Its mine taps the W. B. Francis coal, which is to be mined on a royalty basis. The Costanzo-Monaco interests, which sold their Wheeling Valley Coal Co. to Goodyear Rubber Co. men recently are the owners of the Stellar.

KENTUCKY

Wheelwright—The Elkhorn Coal Corporation is now shipping coal from its mines here at the rate of 1200 tons a day, and this volume is to be substantially increased during the coming season. The coal is said to be of a high grade, and contracts for future delivery cover the output for the remainder of the year. The company is now operating 22 mines.

Whitesburg—The Kentucky Elkhorn Coal Co. had filed amended articles of incorporation increasing its capital stock from $10,000 to $75,000 in order to start the big development work that is scheduled.

Dawson Springs—The Dawson Hotel Corporation, which is planning a large resort hotel, has been forced to give up its plans, the Government holding that the work is not a necessity. The company has decided to begin work at once on development of its coal properties and start several mines instead of building the resort.

Frankfort—The State Legislature recently passed a law under which the chief mine inspector will be required to furnish maps of mines to owners of adjoining property who file affidavits to the effect that the mine is encroaching upon their property.

Pineville—The Kentucky Ridge Coal Co., a corporation, on the first day of April dissolved, action having been taken at a directors' meeting at Straight Creek on Mar. 1. The company has transferred property to E. W. Pittman, of Straight Creek; A. G. Stith, of Louisville and J. A. Swarts, of Straight Creek, who under a partnership will continue operating the mine as the Kentucky Ridge Coal Co.

COLORADO

Cowie—The coal mine here has been developed and equipped and is now producing from 6 to 8 tons per day. The seam is about 5 ft. thick and is a good grade of lignite. It is planned to haul the coal in wagons a distance of about 5¾ miles to the Boulder market, where it will be retailed direct to consumers. The operators estimate that they will be able to produce 100 tons a day after about six months further development.

Foreign News

Montevideo, Uruguay—Experiments conducted here to discover the practicability of bituminous schist as a substitute for fuel oil in electric plants show that there are 9500 calories per cubic meter in the oil recovered from schist as compared with 10,000 in fuel oil. According to Craig W. Wadsworth, chargé d' affaires in Montevideo, the oil obtained from bituminous schist has been tried with good results in semi-Diesel engines.

Personals

Tipton Stillwell, of St. Louis, Mo., formerly with the Johnston City Coal Co., has accepted a position with the Boehmer Coal Co. as sales manager.

John N. Powers, of Frostburg, Md., has been made the new mine inspector for Maryland, having been endorsed by the state central committee of Allegany County.

Charles Carrol, chief electrician of the Iselin mines of the Pittsburgh Gas Coal Co. Iselin, Penn., has been made superintendent of the Coy mines of the Brush Creek Coal Mining Co. at Homer City, Penn.

William Slater, superintendent of the Blaine (Ohio) mine of the Lorain Coal and Dock Co., of Columbus, has resigned to take charge of a mine at Brilliant. Mr. Slater's successor has not been named.

Irving Cox, of Mill Creek L. I., has been appointed fuel administrator for Nassau County on Long Island, succeeding Anton G. Hodenpyl, who resigned. Mr. Cox was the fuel administrator for the Oyster Bay section by appointment of Mr. Hodenpyl.

Robert S. Blake, formerly connected with the Condit Electric and Manufacturing Co., of Boston, representing it in Pittsburgh, is now district manager for the Duquesne Electric and Manufacturing Co. in its Chicago office, located at 230 So. LaSalle Street.

W. Guy Srodes, of Wheeling, W. Va., has been promoted from the position of general superintendent of the George M. Jones coal interests in eastern Ohio, to the position of assistant general manager of all the operatives of the same company, with headquarters at Toledo, Ohio.

Edward de V. Tompkins, Mem. Am. Soc. C. E., consulting and constructing engineer, who has for the past seven years had offices in the Professional Building, 17 East 38th St., New York City, has moved to Chicago to take the general agency of the Cement Gun Co., Inc., of Allentown, Penn., in charge of the Midwest territory, with headquarters in the Fisher Building, Chicago, Ill.

Obituary

Thomas Masters, a coal operator of East Bernstadt, Laurel County, Kentucky, was killed in a boiler explosion on Apr. 30. The explosion followed a cyclone which swept the city.

Alexander Bradley, aged 60, of Mt. Olive, Ill., died on Apr. 1 at the hospital here after an illness of six months. He gained nation-wide fame as a leader of Illinois coal miners when during the strike of 1897 he marched with an army of 500 miners through many Illinois counties. He was since his illness taken care of by the miners' union.

James Edmund Rutledge, 56 years old, president of the Rutledge and Taylor Coal

Co., of Chicago and St. Louis, died suddenly at Chicago on Apr. 6. Deceased was born at Bloomington, Ill., Oct. 30, 1861, and was a prominent figure in commercial circles in St. Louis and Chicago. He was interested in mines at Duquoin, Nokomis, Livingston and Taylorville, Ill. He was also president of the Standard Briquette Fuel Co., of Kansas City.

Industrial News

Connellsville, Penn.—Coke production in the Connellsville region for the first quarter of 1918 showed a decrease of 662,774 tons, when compared with production for the same period of 1917.

Wheeling, W. Va.—The Industrial Coal Co., which has holdings at Uniontown, in Belmont County, Ohio, turned down seven offers for its disposal after a two days' session of the stockholders.

New York, N. Y.—During February there were exported from the Port of New York, 1184 tons of anthracite; 2157 tons of bituminous and 44 tons of coke. To Canada was sent 945 tons of anthracite, and Cuba received 1776 tons of bituminous.

Washington, D. C.—The Colorado Midland R.R. recently applied to the Interstate Commerce Commission for increases of from 25 to 50c. a ton on bituminous coal from points on its line in Colorado to destinations in Kansas, on the Rock Island.

Charleston, W. Va.—An organization of coal shippers on the line of the Kanawha & Michigan Ry. has been formed, with J. W. Dawson, of Charleston, for president; W. K. Bridges, of Smithers, secretary-treasurer and H. L. Warner, of Longacre, vice president.

Louisville, Ky.—Western Kentucky coal operators who have in the past been delivering considerable coal in New Albany and Jeffersonville, Ind., directly across the river from Louisville, under the new zone ruling which recently went into effect are cut off from these two towns entirely. It is believed that the order will be modified shortly.

Louisville, Ky.—A bill which was in the State Legislature, and which recently became a law, will require the approval of the county judge of any district before mineral rights to property in that district, held in trust, may be leased. Leasing of property held in trust has caused much trouble in the past, and the new regulation may improve conditions materially.

Princeton, W. Va.—Rumor is rife to the effect that a move is on foot to embrace the Norfolk & Western, the Virginian and the Chesapeake & Ohio railroads in one district under one management. The reason assigned for a districting of this kind is the alleged troubles of operations in this field in getting a supply of cars, particularly in the Virginian and Chesapeake & Ohio fields.

Cincinnati, Ohio—John S. Jones, president of the Sunday Creek Coal Co., has filed in the United States District Court a petition for confirmation of the alleged sale by the Hocking Valley Railroad Co. of bonds of $2 506,000 of the Sunday Creek Co. to him. He alleges that the railroad company agreed to sell him the bonds for $625,000, but that the agreement has not been carried out.

New York, N. Y.—Charles S. Thorne, who recently organized the New River Fuel Co., of which he is the president, has opened offices at 50 East 42d St. The offices of the Black Band Fuel Co., of which Mr. Thorne is also the president, will likewise be located at the same address. Mr. Thorne resigned recently as vice president of the Pocahontas Consolidated Collieries Co., Inc., of which he was vice president, as well as from several other concerns.

Logan, W. Va.—The Guvan Valley Coal Operators Association has been recently reorganized under the name of the Logan Coal Operators Association, with headquarters at Logan, W. Va. A. R. Beisel, general manager of the Main Island Creek Coal Co., has been elected president; J. J. Ross, vice president; A. H. Land, secretary, and C. W. Jones, treasurer. P. J. O'Riley has been appointed president of the Labor Committee and H. S. Gay, Jr., secretary.

Cleveland, Ohio—A stiff fight resulted at the meeting of the Ore & Coal Exchange at this place Apr. 4, when efforts were made to exclude Hocking and Pomeroy mine-run from the classifications of pool numbers. In fact action had been taken to exclude such numbers, but through efforts of P. A Coen, president of the Buckeye Coal and Railway Co., and W. D. McKinne commissioner of the Southern Ohio Coal Exchange, such classifications were provided for.

Frankfort, Ky.—The Union Coal Co., of Mercer, Ky., with a capital stock of $100,000, has been incorporated by J. R Collins, P. J. Billings S. H. Fraser and S. C. Eaves. Other companies recently filing articles at Frankfort were: Clinton Coal Co., Jett, Ky., capital $30,000, D. C. Coombs, A. M. Gross and others; Clay County Coal Co., Manchester, Ky., $10,000, G. B. Mays, W. C. Black and others; Frost Coal Co., Wilton, capital $10 000, John Frost, Charles Frost and others.

Columbus, Ohio—Bids have been requested by George A. Borden, president of the Columbus Board of Purchase, for 4800 tons of nut, pea and slack for the garbage and refuse disposal plant; 10,000 tons of nut, pea and slack and 30 tons of lump for the waterworks department and various smaller amounts for other city departments. The bids are to be opened Apr. 22. It is believed that some bids will be submitted, although at the last advertisement a month ago no bids were filed.

Pittsburgh, Penn.—The Pittsburgh Coal Producers Association, representing about 95 per cent. of the coal mines in the Pittsburgh district has made a vigorous protest against the proposed transfer of the Bureau of Mines from the Department of the Interior to the War Department. They argue that the bureau has been efficiently handled by the Department of the Interior and that it would be a mistake and likely impair the efficiency of the bureau were the authority given over to the War Department.

Roanoke, Va.—The Virginia Iron, Coal and Coke Co. has issued its report covering the fiscal year ended June 30, 1917, and the six months ended Dec. 31, 1917. Net profits for the twelve-month period amounted to $1,024,364, equivalent to $10.24 a share on $10 000,000 of stock, as compared with a deficit of $248,094 reported for the preceding fiscal year. Gross earnings for the six months ended Dec. 31 last amounted to $5,314,323 and net earnings were $1,283,820. The net profit for the period was $873,179 after all charges, including $216,650 for taxes and $121,099 for bond interest.

Pittsburgh, Penn.—The United Coal Corporation held its second annual dinner, including heads of departments, superintendents and mine clerks, at the Fort Pitt Hotel, Pittsburgh, Penn., Saturday evening, Apr. 6. Covers were laid for about 40. Edward H. Coxe, general superintendent, acted as master of ceremonies and toastmaster, and the principle talk of the evening was made by President W. Guthrie, who made a strong appeal to all present to do not only their bit, but their utmost in every way possible to help win the war. Talks were also given by a number of other officials.

Columbus, Ohio—The Akron-Gauley River Coal Co., recently incorporated with an authorized capital of $250,000 by Columbus and Akron men, has been organized by the election of H. W. Jenkins, of Columbus, president and general manager; B. M. Moody, Akron, vice president, and Charles A. Coakwell, Akron, secretary and treasurer. The main offices will be at Akron but the operating office will be in Columbus. The product will be sold through the H. W. Jenkins Coal Co., of Columbus. The company has taken over a mine and 1500 acres of coal land on Gauley River on the C. & O. and the K. & M. railroads. The present output of 300 tons daily will soon be doubled.

New York, N. Y.—M. F. Burns, president of Burns Bros., is the chairman of the coal trade division of the Liberty Loan Committee; Harry T. Peters, of Williams & Peters, director of speakers, and Joseph W. Chambers is the secretary. Committees representing the retail dealers have been appointed in the various boroughs. The wholesale committee consists of Thomas Dickson, of Dickson & Eddy; J. F. Birmingham, president, Delaware, Lackawanna & Western R.R., Coal Department; H. E. Meeker, of Meeker & Co.; John W. Whiteley, Whitney & Kemmerer; Robert B. Baker, Sterling Coal Co.; George M. Dexter, Dexter & Carpenter; and G. N. Wilson, president, Lehigh Valley Coal Sales Co.

Denver, Colo.—At the annual meeting of the stockholders of the Midwest Coal & Iron Co., held here on Mar. 14, 1918, the stockholders authorized the directors to issue its negotiable coupon bonds to the amount of $125,000 bearing 7 per cent, interest, bonds to mature in five years and optional after two years at 105, interest and principal payable at the First National Bank of Denver, Colorado, which is acting as trustee for the bondholders. These bonds will be handled by local brokers, as well as brokers in Chicago Illinois and Lansing, Mich. The money derived from the sale of these bonds will be used for the purchase of additional property and for additional machinery at the company's coal mines in Palisade, Colo. These mines are being put in shape to increase the tonnage, considerably.

St. Louis, Mo.—Jackson Johnson, president of the Chamber of Commerce, has written to Director General McAdoo urging the appointment of a regional director of railroads to be stationed in St. Louis, under the direction of Regional Director Aishton of Chicago. The letter points out that five trunk lines terminating in St. Louis extend to the southwest and do not reach Chicago, and it is argued that to place these under a regional director with headquarters in Chicago is an awkward and unnatural arrangement. It is contended that the resources of the Southwest would be utilized more efficiently for the benefit of the Government and the commercial interests would be better conserved if a regional director were placed in charge of the southwestern railroads and the switching district of St. Louis.

Weekly Review

Anthracite Output Encouraging, Though Field Is Short of Labor—Bituminous Production Discouraging—Railroad Fuel Situation Menaces Industry—Zoning Plan Not Strictly Adhered To—Fuel Administrator Slow in Approving Contracts

FROM the anthracite fields come encouraging reports of increased outputs, notwithstanding the shortage in labor, which promises to become more serious because of the new draft call the latter part of this month. The available labor supply in the hard coal regions is so utterly inadequate that operators are asking for the exemption of their workers on the ground that their services are urgently needed to keep up production. Anthracite is now moving freely to all points of consignment. To further aid in the distribution of coal and to prepare for what will surely be a record-breaking summer, some of the anthracite operators are building new washeries and rearranging old breakers to permit of the loading of 50-ton cars instead of the 25- and 30-ton cars formerly loaded.

As yet there has been no decision regarding the prices of steam coals, and all sales of these grades are being made at the prices which prevailed last year. It is generally believed that the Government will fix the prices on these coals and that this decision will come when the contracts which have been drawn up and sent to the Fuel Administration for approval are acted upon.

Production of bituminous coal continues to be disappointing. To such an extent has the car shortage interfered with the operation of the mines that the miners are becoming restive over their reduced working time. It was hoped that the elimination of most of the priority orders in the central Pennsylvania region would favorably affect the car situation, but this is not proving to be the case.

Another factor, and one fraught with grave consequences, has entered into the situation; and unless immediate steps are taken to prevent it, the country will witness the demoralization of the bituminous coal-mining industry. It is no mere shadow at which these remarks are aimed, but at an actual, menacing reality that bids fair to set at naught the careful plans of the Federal Fuel Administrator and bring about a crisis that will hamper the nation in its efforts to push its war activities to their maximum.

This condition has been precipitated by John Skelton Williams, in charge of purchases for the railroads, who insists that the roads be permitted to distribute cars where and how they please, and to use such control of shipping facilities for the purpose of forcing price concessions from coal producers. Thus we are confronted with the amazing spectacle of one Government activity setting at naught the edicts and rulings of another Government activity.

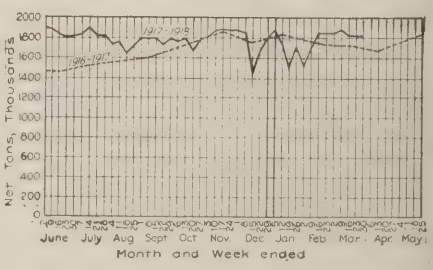
The Fuel Administration asserts that coal should be furnished all consumers, whether large or small, at the same price. The railroad officials refuse to accept Dr. Garfield's ruling under the specious plea that to do so would add millions of dollars to the railroads' coal bill, something that Mr. McAdoo and Mr. Williams do not wish to do, as they are evidently desirous of showing a large saving in Government operation of the railroads.

In the past, conditions were such that the roads, which take a large percentage of the entire coal production of the country, could not be prevented from securing their coal at cost, or below cost, and industrial consumers paid the difference. Now that the railroads are under Government control no valid reason exists for an adherence to the old policy. However, this practice is still being followed by the railroads, which in many instances have refused to supply cars to mines until "satisfactory" prices have been quoted for railroad fuel.

Unless the mines get cars in which to ship coal to market, they can not operate; and if they do not operate our many vital industries will find themselves clamoring for coal which is still in the ground. Already a number of operations in each mining district have suspended pending an adjustment of this difficulty, and this at a time when the output of soft coal for the first three months of this year is far behind the output of the corresponding period of 1917.

This is stimulation of production with a vengeance. Unless Mr. Williams' demand for cheap coal is withdrawn, it is apparent that more and more mines will be financially embarrassed and production seriously curtailed. The Fuel Administration and the railroad authorities are deadlocked in the matter, and it is likely the President will have to decide the question. That President Wilson will not be a party to any such questionable plan as that proposed by Mr. Williams is a foregone conclusion.

Though the zoning plan is now in effect it cannot be said that all shipments are being made strictly in accordance with its requirements. Occasions arise wherein the need for fuel is so urgent that the provisions of the plan cannot be lived up to fully as yet. However, shippers are of the belief that the zone plan will eventually be the means of avoiding and overcoming many of the difficulties of distribution.



There is a little contract activity, though only the larger concerns are afforded the opportunity of closing contracts, which are made as a matter of policy. On such agreements as have been closed the Fuel Administration is slow to mark its approval, a fact which is causing some uneasiness among consumers who have closed in this way.

COAL PRODUCTION

The output of bituminous coal decreased slightly during the week ended Mar. 30. The total production (including lignite and coal made into coke) is estimated at 10,832,000 net tons, an average production per working day of 1,805,000 compared with 1,833,000 net tons, the average production per working day during the previous week.

The total production of behive coke is estimated at 622,000 net tons or 104,000 net tons, per working day, as against 111,000 net tons for the week of March 23.

During the week ended Mar. 23 the 3984 mines reporting produced 7,763,482 net tons, or 69.3 per cent. of their full-time capacity, compared with 66.8 per cent. reported for the week ended Mar. 16. Losses attributed

to lack of coal cars amounted to 20.6 per cent.; those due to labor shortage 2.3 per cent.; and those due to mine disability to 3.4 per cent. All districts in Pennsylvania (with the exception of the western) report greater losses in production, due to car shortage. The Irwin gas district reports a decline in production from 71.2 per cent. of full-time capacity during week ended Mar. 16 to 56.3 per cent. during the week of the 23d. The Hazard field in Kentucky also reports a decline in production. The southern Ohio district and the Panhandle district in West Virginia show better working conditions due mainly to improved car conditions.

Beehive Coke—Operators in the beehive coke regions of the Connellsville, Greenburg and Latrobe districts of Pennsylvania report the production of 283,745 net tons of coke during the week ended Mar. 30, or 63.7 per cent. of their full-time capacity. Losses due to shortage of yard labor amounted to 81. per cent. of capacity. Losses

due to lack of cars are reported as 24.3 per cent. as against 23.4 per cent. for week of Mar. 23. The same operators produced 178,750 net tons of coal.

Byproduct Coke—Byproduct coke output during the week ended Mar. 30 showed a slight improvement over the previous week. The ratio of tonnage produced to maximum capacity rose from 87.6 to 88.7 per cent. The improvement was effected by a better supply of coal. Losses due to that cause declined from 6.6 to 5.2 per cent., while losses due to repairs to plant increased from 4.1 to 4.7 per cent. The ratio of production to capacity declined slightly in Kentucky, Minnesota, New Jersey and Ohio. West Virginia reported the greatest improvement, ratio of production to capacity rose from 82.7 per cent. during week of Mar. 23 to 98.9 per cent. during the present week.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS

	Week Ended: Mar. 9	Mar. 16	Mar. 23	Mar. 30
Bituminous shipments, 123 roads..	200,239	190,298	191,127*	189,252†
Anthracite shipments, 9 roads...	41,807	42,265	42,487*	43,642†
Beehive coke shipments, 4 roads...	13,032	13,218	13,643*	12,768†

* Revised from last report. † Subject to revision.

Anthracite shipments increased from 42,487 to 43,642 cars.

BUSINESS OPINIONS

Bradstreet's—Good trade, activity in essential industries, increased outputs, improved transportation facilities, less unrest in labor circles, favorable crop news, some further ease in foodstuffs, the drive to make the third Liberty Loan successful, the rush to pay income taxes, and the ready adoption of the daylight saving plan, are leading features. But the single factor that looms largest is Governmental domination, which is extending, is bound to spread as the country gets more and more to a war basis, and which tends to become more controlling in respect to prices.

Iron Age—Steel mills have been under pressure from Washington in the past week in an effort to have January and February shortages made up, particularly those in plates. The mills have had the help of a better car supply, which in the Pittsburgh district has been especially fortunate in view of the large proportion of output required by the Government. The leading producer there has turned nearly 90 per cent. of its recent production into Government and war contract channels, and several plants in the same district that lately have given 60 to 75 per cent of their production to such business are now considerably exceeding these figures.

Atlantic Seaboard

BOSTON

Outlook unchanged; no developments of any consequence. Congestion increases at New England gateways and embargoes are effective on several of the connecting lines. Bituminous distributors, however, for the most part have little or no coal. Anthracite houses little better off. Tidewater shipments seriously handicapped by lack of tugs and rail deliveries are alarmingly in arrears.

Bituminous—A week of April has passed and there is still no effective move toward speeding up production. State administrators in New England are besieged with inquiries as to contracts, and for a very large proportion of the consumers there is no answer; as the operators are not committing themselves. The less scrupulous producers are making no secret of "premium" coal, and it is queried how long such practices will be permitted to continue and other operators who are following regulations in good faith put to such an unwarranted disadvantage. For a time such sales of "spot" coal were understood to be confined to parts of the Pittsburgh region, but now it is common rumor that illicit sales have spread to central Pennsylvania.

The outlook is as complicated and unsettled as ever. Nobody knows what to do. To the buyer there is abundant advice to make contracts, but the parties with whom customary contracts have been made are unable to get an assurance from the operator who has the coal, and the latter is trying to get some inkling of the Government's plans for distribution. Should consumers seek to buy greatly in excess of their needs through fear of shortage, it would take minute policing to adjust equitably the deliveries made.

There is increased congestion at Maybrook and Harlem River, the New York, New Haven & Hartford gateways to New England. Embargoes have been placed by connecting lines against the Baltimore & Maryland, although the Boston & Albany is as yet unaffected. At Harlem River alone there is an accumulation of 3000 freight cars, with just about the same number being hauled east each day as reach there from the mines. The New England railroads are sending empties to the mines now in the effort to increase receipts of engine coal, and one result is the scarcity of cars at rehandling wharves where coal is sent inland.

After the reduced volume of coal moving to Hampton Roads of last week receipts showed an increase. So much coal was routed for Chicago and other points which were embargoed Apr. 1 that there was much congestion at the scale points. Lack of motive power is another factor; in some cases the movement on one of the roads was hardly in excess of 300 to 400 cars daily. On this basis there would be no chance of doing a normal business over the Virginia piers, let alone an increase of two to three million tons for New England. There are rumors of Kanawha coal being reserved to eastbound movement, but as yet this is without confirmation.

There are practically no barges available from Hampton Roads that are not already under charter. It develops also that several of the coal agencies have in sufficient coal to load promptly all the vessels that report for cargo. The "Ulysses" a Panama collier, had to wait an undue time last trip and it was partly to avoid such situations that Mr. Storrow ceased loading coal on his own account and asked the regular shippers to furnish cargoes. The result is that practically all the water-borne coal is now coming through the usual channels and is distributed by the coal factors under the fuel administration. All-rail "Storrow" coal is still coming forward, although the tonnage is now reduced far below the allotment. In one or two districts the number of cars is placed through the deputy distributor, and so far this system seems to be working satisfactorily. It is of course an expedient for doing away with assigned cars and for regulating distribution.

Houses who have been in business for a generation are still telling their customers they see no prospect for contracts. One firm that had 20,000 tons weekly due on 1917 obligations actually got shipped 3018 tons in January and February. Instances of this can be multiplied. Meanwhile there seems to be no definite understanding about railroad coal. Effort is being made at Washington for a lower price for railroads because to a considerable extent they furnish cars independent of the usual distributive share and then, too, there is a feeling that being Government-controlled there ought not to be any commission paid by the railroads. These are only a few of the problems now arising.

Jobbers' licenses in this territory have now been received for the most part, although the way is not yet smooth. The regulations are by no means clear and there is uncertainty over the invoicing of coal by parties not the actual owners thereof. And then besides there is the difficulty about getting the coal to bill. If it comes forward no faster than during the first week in April there will not be so much occasion for worry over the heavy penalty prescribed. A lot of unnecessary inconvenience will result from sundry interpretations of the rules, and yet there are practices strictly within the regulations that are recognized by the trade as glaring abuses. Take for instance two rehandlers having wharves of their own, coal, and all the facilities for transshipment inland. One's price is $8.13 f.o.b. cars and another's is $11.20, both selling the same grade and similarly placed with regard to receiving coal and selling the same consumers to greater or less extent. Both are selling, presumably, in strict accord with rulings of the fuel authorities. What is the answer? A little attention to matters of this kind would be a welcome sign.

Last week the Hampton Roads situation was almost acute due to lack of coal to load bottoms that were waiting. This is now somewhat improved although the number of cars under load has not increased to the extent necessary to clear steamers and barges without undue delay. Shippers frequently find themselves with actually no coal available, notwithstanding they have ample tonnage standing to their credit in the Tidewater Coal Exchange.

Anthracite—Both all-rail and by water April shipments are disappointing. Water movement is seriously hampered by the lack of tugs, and rail deliveries are held up by embargoes. The freight congestion at Harlem River shows signs of clearing up, it being understood that for the present the New Haven Road will accept from each shipper 25 cars per day. Eastern retailers are getting alarmed over the outlook but are powerless to act.

NEW YORK

Anthracite market continues active with heavy demand. Dealers to heed Garfield's warning. Mines are working steadily but further labor shortage is feared. Efforts of railroads to make contracts below Government prices cause agitation among operators. Some mines are favored while others work hardly half time. Government intervention hoped for.

Anthracite—The situation continues to be active with the demand heavy, but lacking the urgency for shipments that existed a few weeks ago. There has been a heavy booking of orders which indicates that the tonnages that will come here will be easily taken care of. Some relief in the situation is expected in the warning sent out from Washington that dealers should not supply domestic sizes of anthracite for industrial purposes where it is to replace bituminous.

No regular order covering the reduction of 30c. per ton in the price of domestic coals has been received from Washington, but the shippers are billing all coal above ground on Apr. 1 at the new price.

Reports from the mining regions are encouraging. Notwithstanding the labor shortage which is in danger of becoming more serious because of the new draft call the latter part of this month, the mines in some quarters were able during March to increase their output. The seriousness of the labor situation has become such that operators are asking for the exemption of their men on the ground that their services are badly needed to keep up the coal production.

Stocks of the domestic coals at the loading piers show no apparent increase. Receipts have been about the usual quantity and the coal is moved quickly. There was some fear that there would be a suspension of water shipments due to threatened labor troubles, but this has been avoided, at least temporarily.

The only easiness in the steam hard coal situation is in rice and barley. These two sizes are plentiful but far from a drug on the market. Quotations remain firm and dealers meet with little difficulty in getting rid of their supply. A freer movement of bituminous would result in a freer movement of rice and barley.

The real estate interests in announcing an increase in rentals state as one of the reasons the cost of coal, which they say is nearly three times what it was two years ago.

Current quotations, per gross tons, f.o.b., Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.15	$6.90
Egg	6.05	6.80
Stove	6.30	7.05
Chestnut	6.40	7.15
Pea	4.90	5.65
Buckwheat	4.45@5.15	5.10@5.85
Rice	3.90@4.10	4.10@4.85
Barley	3.40@3.65	3.10@4.10
Boiler	3.65@3.90	.....

Bituminous—The efforts of the railroads to get their fuel supply from certain operators at prices under those fixed by the Federal Fuel Administration are taking considerable attention in and out of the trade. The agitation is keen and shippers are being urged by some operators to write the President, Dr. Garfield, United States Senators and Congressmen protesting against such efforts. It is argued that the railroads, which themselves are now under Government control, are taking undue advantage of the operators and are denying proper distribution of cars to those operators who do not agree to give them coal at the lower prices. Unless the plan is stopped it is apparent that the operators who do not favor the railroads will either be forced out of business because of not being able to get cars or will have to get more for their coal to make up for the lack of production, which means that the consumer will have to pay more for his coal. Shippers claim that unless the authorities intervene and insist upon a proper

and equitable distribution of cars the situation next winter will be more serious than it was last winter. In addition to getting enough cars to supply the requirements of the railroad, the favored operator is getting sufficient cars to enable him to take care of his regular trade. This permits him to operate his mine nearly six days a week while the less favored operator is hardly able to work half time.

Taken as a whole the car supply along the Pennsylvania Lines last week averaged about 55 per cent., of which only about 5 per cent. was for regular business, the remaining 50 per cent. being for priority orders. Along the Baltimore & Ohio and the New York Central the car supply was reported somewhat better.

Shippers early this week received notice that the Government will permit the replacing of the cars seized by it during the past winter at the prices then in vogue if the same is desired by the consumer. This will result in much additional tonnage to many shippers, some of whom lost many cars through Government confiscation.

With nearly all contracts ended shippers expect that there will be more free coal available here.

BITUMINOUS PRICES

	F.o.b. New York Gross	Mine Price Net	Gross
Central Pennsylvania	$5.06	$3.05	$3.41
Maryland:			
Mine-run	4.84	2.85	3.19
Prepared	5.06	3.05	3.41
Screenings	4.50	2.55	2.85

PHILADELPHIA

Anthracite prices announced for April. Individual differential retained for present. Some evidence of zoning. Receipts of coal light. Dealers book many orders. Authorities reduce consumers' orders. Distribution plans still hazy. New freight tariffs. Expect fixed steam prices. Bituminous price rumors have not materialized. Supply still short. All a matter of cars. Zone plan slowly developing. Little contract business.

Anthracite—The new anthracite prices have finally been given out after several vexatious delays. The holding back of the prices caused much confusion and dissatisfaction among the retail trade especially. On the afternoon of Apr. 1 the largest shipping company verbally announced to all inquirers that the new prices had been decided upon and then quoted the March or winter rates less 30c. per ton on broken, egg, stove, nut and pea sizes, with no change in buckwheat and the smaller steam sizes. The next day these figures were withdrawn, then given out again, only to be followed by another withdrawal. Finally on Apr. 5 the prices were given to the trade as official, with the exception of broken, on which the 30c. reduction does not apply, but which remains at the price of $4.90 at the mines.

While dealers fully realize that sales were to be based on prices fixed by the Fuel Administration, many were unable to do business without a price and could not persuade their trade to order until they were definitely assured of a reduction from the winter rates.

The independent shippers continue to book orders at prices 75c. above the so-called company circular, and their trade apparently expect to pay that figure; but to date we have been unable to learn of any firm who confidently claims the 75c. premium will stand until Sept. 1. In fact all shippers seem to feel that their present rates are subject to further adjustment.

Another cause of much anxiety is the delay in starting April coal to this market. Practically little coal has been received here during the first week of the month, and one big company with large trade connections here has shipped none at all. There is a feeling that a new system of shipping on the zone plan is being seriously considered and that an entire readjustment of the sources of supply is being quietly worked out and placed in operation. It would appear that shippers whose coal does not reach this market by the most direct routes have hesitated in consigning here until a definite policy has been decided upon.

Uncertainty exists as to whether retailers will have their gross margin reduced, as it is understood was done in New York. When the present $2.50 margin was adopted here the Fuel Administration claimed it was a temporary arrangement; now it is pointed out that the $2.25 margin allowed in New York applies to a "short" ton of 2000 lb., while the margin here is on a "long" ton of 2240 lb. In proportion they are about equal and, although in an adjoining county it was reduced to $2.25, it is not believed there will be any change here for the present.

Dealers, most of whose business has increased since Apr. 1, 1916, are alarmed at the possibility of not receiving more coal during the present coal year than they did from Apr. 1, 1916, to Mar. 31, 1917, as it is understood to be the intention of the Committee of Fuel Distribution to figure on this basis.

As yet there has been no decision on prices of steam coals and all such sales are being made at the prices in effect for the last year. It is generally believed that the Government will fix the prices on these grades for the first time and that this decision will come when the contracts which have been drawn and sent to them for approval are acted upon.

The prices per gross ton f.o.b. cars for line shipment and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$4.90	$6.05	Buckwheat	$3.15	$3.75
Egg	4.50	5.70	Rice	2.65	3.65
Stove	4.75	6.05	Boiler	2.45	3.55
Nut	4.85	6.10	Barley	2.15	2.40
Pea	3.45	4.35			

Bituminous—Prior to the first of the month there were many rumors of a change in the mines price, which served to further unsettle the trade. Even the fact that we are well into the second week of April does not serve to remove the uncertainty as to the price situation. The rumors were quite insistent that a reduction would be made, though it is hardly believed the Government would make such a move.

BALTIMORE

Many orders pouring in on retail anthracite men, but deliveries are light. Bituminous shortage again looms up. Jobbers still rather uneasy.

Anthracite—Under the public urging by the Maryland fuel administrator to purchase coal early, and the work of a number of coal men who are asking that customers place their orders, sending around agents to get old customers to sign up the Federal application blanks necessary before coal can be delivered, considerable business is going on the books of the fuel men. At present, however, there is little coal being delivered as the receipts here remain comparatively light and stocks are not such as to warrant hurrying of fuel to cellars. There is still some complaint over the fact that the new price schedule is a decided advance over the spring figures of last year, but the fact that the prices have the stamp of Government approval and sanction is saving the coal men much in the way of dispute and complaint.

Bituminous—The soft coal situation here is far from satisfactory. Many important industries are short again, and jobbing and mining interests have been asked in many cases to apportion the coal they are getting through irrespective of contract obligations. While the railroads are not as congested, apparently, the supply of empties at the mines except on priority orders is so far short of necessities that ordinary consumers are getting rather short shrift. Bitter complaint continues that many mines are left far short of requirements under the priority plan of distribution. Jobbers continue uneasy, as they are finding that they can not make the necessary mine contracts to fill the orders they have on their books as purchasing agents. While this situation may adjust itself in part, it seems sure already that all the business on the books of the jobbers will not be taken care of through ordinary contracts, and that fuel administrators will be called upon to fill some gaps for every public utility and emergency concern purchasing agents.

Lake Markets

PITTSBURGH

Zoning system being placed in operation. Byproduct coke ovens and steel mills well supplied with coal. Jobbers doing little thus far.

As a result of frequent conferences between representatives of the fuel administration and of the operators the new zoning system is becoming well understood, and a number of details applying to the Pittsburgh district have been settled. On account of its peculiar position, and the variety of coals produced in the district, it is given particular latitude in the matter of distribution.

The fuel administration has been laying particular emphasis upon the necessity for furnishing the byproduct coke ovens with full supplies of coal, results being quite satisfactory as with scarcely an exception the byproduct plants are in full operation. In practice the zoning system does not apply to the regular distribution of byproduct coal, as exceptions are made in the case of all regular movements. This is desirable because the byproduct ovens had already picked out the particular mixtures of coal they required for their best operation.

There have been no important complaints from the steel industry for several weeks as to supplies of coal, and it appears that on the whole the steel mills are receiving adequate supplies of both gas and steam coal. The mills are not operating at capacity in all cases, but restrictions are due to scarcity of cars for shipping finished steel rather than scarcity of either fuel or pig iron. Shipments of finished steel are approximately one-half greater than in January and February. A moderate amount of free coal is coming into the market. Jobbers are trying to get their business in shape under the new regulations but thus far have not had much opportunity to act. On the one hand, it has proved difficult so far to make arrangements with consumers whereby the jobber may charge them a commission for securing coal for them, while on the other hand operators have been indisposed to make concessions to jobbers, to give them a margin on sales they might make at the Government limits. The market remains quotable as follows: Slack, $2.20; mine-run, $2.45; screened, $2.70, per net ton at mine, Pittsburgh district, jobbers being permitted to charge 15c. extra when regularly constituted by consumers to make purchases for them.

BUFFALO

More bituminous, less anthracite in this market. Situation otherwise not much changed. Jobbers getting licenses. Anthracite price uncertain.

Bituminous—The contention of the local trade and especially of the jobbers is that if the car supply is made adequate all the regulations in regard to zones or anything else can be laid aside. The many rules sent out bewilder the shippers, and they are often so indefinite that the shipper is afraid to put a construction on them lest he make a mistake and lay himself liable to arrest.

The licenses are coming in, but so far only a few jobbers have them. The Government is exacting. If a shipper has had any connection with a mine as agent he must furnish absolute evidence that the connection has been given up before he can get his license. So it often happens that the application is held up till further evidence is furnished.

There is more and more likelihood, as the situation is sized up, that more bituminous is going to be needed in the anthracite trade than ever before. The difference in prices, allowing the Allegheny Valley thin-vein mines to charge more than Pittsburgh, is selling the latter coal much more freely than the valley coal; and it may make it necessary to reduce the latter prices voluntarily before long if the supply is increased much. As it is some shippers are getting quite as much coal already as they can sell.

Anthracite—The supply is adequate in small sizes only. The furnace sizes are always scarce at this time of the year, but they are almost wanting entirely now. This means that the consumers are trying to lay in a winter supply and are not able to get it. Prices are still uncertain, so that some shippers do not dare to take any orders for a definite price. No coal of any account is coming this way for the spring trade. The result is that the town is full of Canadian retailers, as eager for coal as they were last winter, but they are told to wait

DETROIT

Movement of bituminous coal into Detroit continues in good volume. Anthracite is not plentiful. Preparations for lake shipments under way.

Bituminous—Shipments of bituminous coal are now coming into Detroit freely. The movement maintains a volume, which offsets to a rather satisfactory extent the requirements of consumers, though practically all the coal is sold en route or before leaving the mines, and free coal on tracks continues wholly absent as a market factor.

With many of the city's large manufacturing plants working overtime on war

orders, the consumption needs of steam plants are large. Demand continues steady for steam coal. Few of the buyers have been able so far to make much of a start on acquiring reserve stocks, though the railroads and some of the utility companies are reported to be exerting an effort in that direction.

Slack is reported to be not as plentiful as some of the jobbers would desire, in order to provide for their customers' requirements. Lump is more plentiful, but complaints are heard that its quality is not as satisfactory as in previous years. Operation of the Federal Government's zone system of distribution has not been in effect during a sufficient interval for the dealers to have arrived at any definite conclusion as to merits of the plan. Some are inclined to believe that the district from which Detroit is entitled to receive bituminous coal will supply sufficient variety to meet the needs of most consumers, except in the matter of smokeless coal. Both Pocahontas and New River are eliminated from the city's supply and each was popular here.

Anthracite—Though reports received from the anthracite districts have been of an encouraging nature, and the Federal Fuel Administration is reported to have promised a good supply of anthracite, incoming shipments continue light. Many of the household consumers are now endeavoring to avoid next winter the troubles experienced in the last few months, but few of the retailers are able to fill orders for stove or egg sizes of anthracite. There is apprehension that the opening of navigation and resumption of lake coal shipments, within two weeks or so, will cause still further reduction.

Lake Trade—Plans are being arranged for handling a large volume of coal over lake routes early in the season. It is expected many cargoes will be afloat when navigation opens.

COLUMBUS

Considerable weakness in domestic grades has developed as the result of large production. Steam grades continue quite strong, and the market is expected to resume its wonted strength after the lake season opens.

The coal trade in central Ohio continues to show some weakness, especially in domestic sizes. Steam business is about as strong as usual, although a small tonnage is being peddled around which indicates a weaker condition than prevailed several months ago. With the opening of the lake trade at hand this condition is expected to pass away rapidly, and coal is expected to be in good demand all along the line. Prices are generally well maintained at the Government figures. Prospects are for an active lake trade and a good production from all Ohio fields.

The domestic trade is showing weakness because of the inability of some dealers to stock up to any great extent. Their storage space is limited and practically all have accumulated the desired excess stocks. Some dealers are also waiting for Pocahontas and West Virginia splints, which is especially true in sections where those grades have been popular in the past. It is believed that some of both grades will come into the local market, and some householders are waiting to see if they can get the fancy grades. Other users are stocking up for the coming winter on the basis of last year's consumption. On the whole the domestic trade is as active as usual for the time of the year.

Steam business is strong, as manufacturing plants are still stocking up to guard against emergencies. Railroads are taking a large tonnage, as many are accumulating surplus stocks. In fact many users, having learned a lesson from the past winter, are trying to get all the fuel possible. Public utilities are especially anxious over their future fuel supply.

Production has been quite good, although some falling off is reported due to lack of cars. This is explained by the fact that the Government has requisitioned many cars to move ore on the lower lake docks to mills prior to the opening of the lake trade. As a result the output in the Hocking Valley has been reduced to about 75 per cent. and the same percentage of reduction applies to other producing sections.

Prics of short tons f.o.b. mines are as follows:

	Hocking	Pomeroy	Eastern Ohio
Sized grades	$2.70	$3.05	$2.70
Mine-run	2.45	2.80	2.45
Screenings	2.20	2.45	2.20

CINCINNATI

Arrangements for supplying industrial demand occupy attention of trade, Federal control being a difficulty. Domestic storage promises to be unprecedented.

The beginning of another coal year, on April 1, and the desire of large industrial consumers of fuel to protect themselves more extensively than usual for their supply, has made the problem of the jobbers' and operators' agents that of arranging for means of satisfying their customers, rather than that of selling coal. Few operators are now in a position to promise anything definite, and most of them have already committed their normal output to customers under contract, although they have necessarily refrained from stipulating prices other than those which may be promulgated by the Government, and have also protected themselves by the usual provisions against uncontrollable circumstances. For one thing, the fact that favored industries will have prior claims to fuel should it be necessary to choose between consumers, regardless of contract, has to be considered in making contracts. Coal is now coming forward in increasing quantities, and the retail trade is taking more than usual, dealers reporting that consumers are ordering for immediate and early future delivery in greater numbers than ever before.

LOUISVILLE

Demand for all grades good, with supplies short and production light. Car supply causing much worry and showing no improvement. Labor scarce.

According to information received from Washington on Apr. 5 through the Federal Fuel Administration, prices have been set for the eastern and southeastern sections of the state, and while not quite so high as had been expected, are expected to influence summer stocking and result in some contract making. No prices have been made on western Kentucky coal as yet, but they are expected in a few days. Coal in the Harlan County district was reduced about 20c. a ton, whereas an increase had been expected which would have placed it on about the same basis as Blue Gem, which was reduced to the same price as other coal in the same district.

There has been a steady demand for domestic coal, which has improved somewhat due to a spell of cool weather. There has also been a good steam demand. Local dealers report that the efforts of the fuel administrators to get consumers to stock early is resulting in orders coming in which never came in before fall or midsummer. Due to the continued car shortage labor is steadily becoming scarcer, with production lighter, and supplies coming in only about equal to the demand, with very little surplus for stocking yards.

BIRMINGHAM

April ushers in renewed activity in the domestic market. Steam demand holds good, inquiries being plentiful and sufficient to prevent any accumulation. Production on about the normal basis of the past few weeks.

Retailers are beginning to get into the market more actively with the advent of April and a noticeable increase is seen in the stocks being accumulated on local yards. Secretary Duncan, of the Jefferson County fuel board, has furnished every dealer in the county with blanks on which to report his reasonable requirements of domestic coal for the 1918-19 season, based on his average sales for the past three years. With this information in hand the fuel board will lend its aid in seeing that yards are supplied with the tonnage needed.

There has been little if any easing off in the steam trade, reports indicating that there is a demand for the maximum tonnage now being produced, Government prices prevailing.

Complaint is heard at some operations that the change in the hours of the working day, effective Apr. 1, caused considerable loss in tonnage the past week, this trouble being particularly in evidence where miners lived some distance from their working places and arrived at the mines too late to make a full shift.

Coke

CONNELLSVILLE

Car supplies improved. Coke supplies now almost adequate. Large byproduct capacity coming in shortly. Market offerings light.

Car supplies were better last week than the preceding week, when they had dropped off somewhat, and this week has opened fairly well. Many operators had their output cut down last week by celebration of Easter week by foreign-born workmen.

For five weeks Connellsville coke shipments have been much greater than in the early part of the year, averaging about 75,000 tons a week more, or between 20 and 25 per cent. increase. As the coke takes various lengths of time to reach destination the furnaces have had improved supplies for different lengths of time, but all have been working much better for several weeks past. There are now few furnaces actually banked, but a number that are operating are not producing full tonnages, and there are a few furnaces entirely out of blast that would be blown in if a full supply of coke were absolutely assured.

Operations of byproduct plants are practically at capacity, and the attached furnaces have full production of pig iron. It should be noted that the increase in the production of pig iron is somewhat greater than the increase in the supply of coke, because with irregular and intermittent operation of furnaces the consumption of coke per ton of pig iron was above normal.

There has been particular difficulty in shipping Connellsville coke east, the Pennsylvania having rigid restrictions in force most of the time. For four days of last week operators were permitted to ship only 25 per cent. of their output east. Eastern consumers who are not being helped by the Government find themselves particularly short, as operators must first take care of the shipments decreed by the fuel administration.

The large increase that is to occur shortly in byproduct coking capacity is important. The Steel Corporation now expects to be making some coke at the Clairton plant by July 1, with full production from the plant a short time thereafter. This plant, now nearly completed, contains 640 ovens, and on the same schedule are the Cleveland and Lorain plants, with 180 and 208 ovens respectively, making 1028 ovens for the Steel Corporation, with fully 75,000 tons coke capacity a week. Independent interests will probably complete in the next few months fully 600 ovens, but some of these are out of the district supplied until now by the Connellsville region. There will be, in the country at large, a large excess of coke-making capacity, as the new ovens, with those completed since Jan. 1, 1917, involve a capacity of about 11,000,000 tons a year, while the increase in blast-furnace capacity requires only about 4,000,000 tons a year coke in addition to what was being produced in beehive and byproduct ovens prior to Jan. 1, 1917.

Offerings of coke in the open market are still limited and are usually only of coke in "restricted" cars. The market remains quotable at $6 for furnace, $7 for 72-hour selected foundry and $7.30 for crushed, over 1-in., per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Mar. 30 at 352,435 tons, an increase of 12,855 tons, and shipments at 383,708 tons, an increase of 50,171 tons. The increase in shipments was due to belated weighings at railroad yards, the coke having left the coke works in the previous week.

Birmingham—There continues a strong demand for every ton of coke that can be produced in this district, the only trouble being the lack of capacity to produce the greater tonnage needed and the difficulty in securing box-car equipment sufficient for its prompt movement. The Government prices of $6.75 at $7.50 for Big Seam, and $8 at 8.75 for the beehive product from the Blue Creek, Black Creek and Brookwood districts prevail. The construction of 154 byproduct ovens at the Fairfield works of the Tennessee Coal, Iron and Railroad Co., work upon which is to begin immediately, will add immensely to the producing facilities in this territory. This company now has 280 byproduct ovens in operation at the above point.

Middle Western

GENERAL REVIEW

Market quiet. Railroads refuse to buy at Government price and try to buy at less.

The position taken by the Middle Western railroads is that they should have their fuel supply at less than the Government prices. They decline to buy any coal or make contracts, and operate trains on the coal they have in stock or what they are able to get on contracts made last year that do not expire until April, 1919.

Regardless of the failure of the railroads to give any assistance to the operators, there has been little or no complaints, except in cases of mines that heretofore sold their coal for railroad fuel. Any high-grade, well-prepared Illinois or Indiana coal is sold without difficulty, at the Government figures, and the mines that have washers

and special preparation devices, such as conveyors and hand-picking tables, and are giving their attention to the cleaning of their products, are able to get the 20c. per ton premium for such service.

Market conditions as a whole have been easier for the past week than for some time, owing to the milder weather and the lessened congestion on the railroads. Retailers are receiving shipments faster than they can move the coal into their customers' bins. If the present policy of the railroads is long continued, no doubt there will be a decrease in production instead of an increase, for in order to keep up maximum tonnage throughout the spring and summer it will be necessary for the transportation companies to do their buying early and assume quickly the tonnage needed.

The car supply in Illinois for the week has been 70 per cent, and less for Indiana. The average for Illinois does not indicate that similar conditions prevail on all coal-carrying roads. In many instances mines have been able to run almost full time, in other cases less than half time has been noted.

CHICAGO

Market dull on all grades except the best Illinois and Indiana.

Any coal that is well prepared from southern Illinois is much in demand in this market and is taken readily by either the dealer or consumer, but some difficulty is experienced in marketing central Illinois and Fulton County Illinois. The limited car supply during the past week in Indiana has kept any large volume of coal from that state off the market, thereby preventing what would have otherwise been a troubled situation had mines been able to load to their full capacity.

Dr. Garfield's order granting the operator 20c. per ton advance on all coal that was cleaned by washing, picking tables or loading booms makes a spread of from $2.65 to $3. per ton on the sizes covered by the order. The Fuel Administration directs that in order to get the 20c. advance until Aug. 1, operators must obtain a license and place in the cars specially prepared two cards indicating that all the provisions of the rule have been complied with. It will not be possible for mines to charge the extra 20c. until they are able to show that they have proper cleaning facilities. In order to stimulate early buying, the Illinois fuel administrator, John E. Williams, has written to dealers at all Illinois points urging them to buy coal early and thus avoid a reoccurrence of last winter's hardships. He states that the dealer who buys in April will be more likely to get a choice connection than if he should delay until later.

Quotations in the Chicago market per net ton f.o.b. cars at mines, are given in the table above.

	Williamson and Franklin	Saline and Harrisburg	Fulton and Peoria	Springfield	Carterville	Grundy, La Salle, Bureau and Will

MILWAUKEE

State fuel administration office institutes a spring drive for coal. Orders being booked without regard to price. Coal receivers getting ready for business.

The spring coal drive is now in full swing at Milwaukee. Refusal of some coal dealers to accept orders for future delivery on the ground that they wished to ascertain what conditions they were to be called upon to face caused temporary confusion among consumers, who sought to follow the advice of State Fuel Administrator Fitzgerald to place orders for next winter's fuel by May 1 or as soon after as possible. The matter has been adjusted, however, and orders are now being booked by all dealers. The matter of price is left for future determination by those having the fuel situation in charge.

The coal docks are being put in readiness for the rush of coal which will follow the opening of navigation. Hoists are being repaired, channels dredged, and everything put in shape for prompt and efficient service in unloading cargoes. Yards which did not receive a pound of coal last year are expecting consignments this season.

Conferences have been held between coal receivers and grain shippers with the purpose of bringing about, if possible, some adjustment of freight rates which will lead to the shipment of more grain by way of the lakes during the season of navigation and thus furnish return cargoes to steamers which may bring coal to Milwaukee. The lack of return cargoes has deterred owners from sending their vessels here on that account.

ST. LOUIS

An unusually quiet market with no demand and prices far below Government maximum on some coals. Both steam and domestic sizes heavy. No new retail prices as yet. Car supply short. Anthracite shipments fair.

The market here is an extremely easy one. There is an abundance of coal from all fields, with no market to absorb it, and prices have gone to pieces on Standard grade. Certain restrictions on shipment of coal from the Standard field, partial embargoes against Chicago and the north, and the consuming zone orders in effect, have had a tendency to flood the local market. Coal in the past that has moved out into the Northwest has to find a market closer to home, and on account of failure to fix domestic prices there is no domestic buying and business is almost at a standstill. The steam market is being pushed and can not take up anywhere near the tonnage offered.

Some time during the present week the prices will be fixed for St. Louis, and this will have an effect on the entire state. Gregg & Co., who have been making a trade survey of retail conditions here for the last three months, show that it costs $1.45 per ton to sell coal at retail. This covers the cost of handling coal from the time it arrives at the dealer's track. The dealers are asking for an advance of 50c. a ton on all grades and a net profit on each ton of 51c., and it is expected that they will get about one half of what they are asking for. Fuel Administrator Crossley of Missouri and the St. Louis Fuel Committee are hearing the evidence in the case now.

Conditions in the Standard field are about normal. There are car shortages on the Illinois Central and M. & O., and the usual transportation troubles on some of the other lines, with considerable unbilled coal at some mines and other places idle on account of no orders.

The Mt. Olive field conditions are much better than anywhere else. The railroad contracts continue to take the tonnage, and such surplus tonnage of domestic sizes that are mined readily find a market in Chicago and the north to the preference of coal from the Standard field. Car supply in this field is good and working conditions splendid.

In the Duquoin field there is a car shortage on the Illinois Central, but considerable railroad equipment for railroad coal is furnished and this has kept the mines going fairly good.

In the Carterville field of Williamson and Franklin Counties there continues to be a car shortage on the Iron Mountain R. R. There has at times been a little unbilled coal at some mines on account of foreign equipment and restrictions, but in a general way this tonnage finds a ready market. Working conditions are good and many mines are sold up for a considerable time ahead.

The prevailing prices here are the circular, which is:

	Williamson and Franklin County	Mt. Olive and Staunton	Standard
6-in. lump	$2.65@2.80	$2.65@2.80	$2.65@2.80

Williamson & Franklin County rate is 87½c.
Other fields, 72½c.

General Statistics

BALTIMORE & OHIO

The following is a statement of the coal and coke tonnage moved over the Baltimore & Ohio system and affiliated lines during the month of January, 1918, as compared with the corresponding month of the previous year:

	1918 Tons	1917 Tons
Coal	2,712,573	2,959,434
Coke	213,250	290,986
Total	2,925,823	3,250,420

CHESAPEAKE & OHIO

The comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for the month of February, 1918, and the two months ending Feb. 28, 1918, is as follows:

COAL

TO	February 1918	February 1917	Two Months 1918	Two Months 1917
Tidewater (bituminous)	484,631	512,951	816,086	1,025,903
East (bituminous)	358,153	250,925	680,703	524,395
West (bituminous)	1,142,958	856,479	1,982,372	2,041,895
Company's fuel (bituminous)	181,849	186,464	369,857	394,168
From connections (bituminous)	99,806	115,147	212,283	283,825
Total	2,267,397	1,921,966	4,061,301	4,270,186
Anthracite	2,792	626	6,262	1,344
Total coal movement	2,270,189	1,922,592	4,067,563	4,271,530

COKE

TO	February 1918	February 1917	Two Months 1918	Two Months 1917
East	24,124	12,127	45,662	27,623
West	18,246	22,137	36,443	47,649
Total	42,370	34,264	82,105	75,272

COAL AGE

Volume 13 NEW YORK, APRIL 20, 1918 Number 16

A Serious Coal Situation

By Floyd W. Parsons

THE present is not a time for disputes among ourselves. We have an enemy without who threatens our very existence. Victory in our Nation's fight for freedom is only delayed by such dissensions as have arisen between Government officials in charge of the railroads and the Fuel Administration.

John Skelton Williams, lieutenant for Mr. McAdoo, in charge of purchases for the country's transportation lines, is responsible for the National railroad policy of demanding coal at prices less than those fixed by the President. Mr. Williams started with the idea that this saving to the roads was $209,000,000 each year. He knows now that the actual saving is approximately 25 cents per ton on 150 million tons, or about $38,000,000 annually.

There is no doubt that President Wilson will be compelled to render a decision. Whatever this conclusion may be, his verdict must be final and must be faithfully observed by all, no matter what sacrifice it entails.

It is already evident that the President recognizes the absolute necessity of an equitable car supply. He knows that the great problem of coal distribution will break down if one-third of the country's production is exempted from operation of the rules promulgated by the Fuel Administration. He knows also that mine labor will not serve the Nation faithfully in this hour of need if the Government sanctions a plan that permits one-third of the miners to work full time while the other two-thirds barely earn a living.

On the other hand, President Wilson appears inclined to favor a saving for the roads. Two ways to accomplish this end have been suggested. The first would permit the railroads to buy their fuel on a cost-plus basis. This scheme is impractical, for it would mean that settlement for this coal would be pending in the courts one hundred years hence—not a pleasant heritage to bequeath to the next generation.

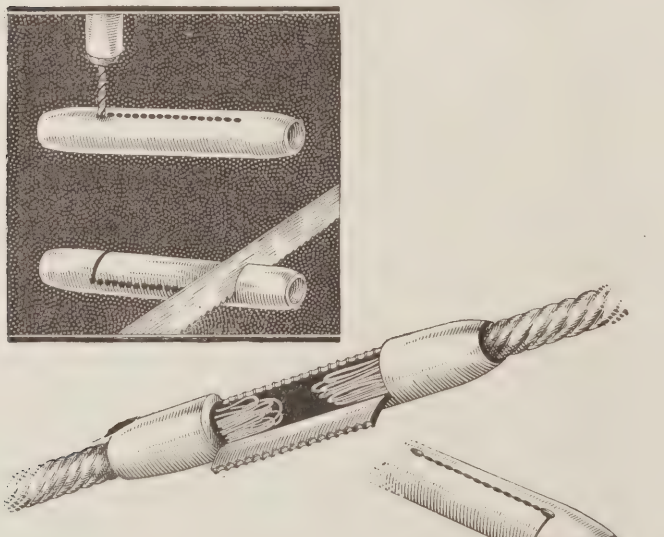
The only other plan is to tear away the camouflage that surrounds the problem and call it what it is—a direct tax of nearly forty million dollars on the whole bituminous industry. The burden must be distributed evenly. Every producer of bituminous coal in such event must sell his entire output at a tonnage price 7c. less than he now receives, this difference to be paid into the Treasury of the United States. The total amount can be handed to the railroads later for their operating expenses. It should, however, be tax exempt.

Mr. Williams says he wants to save for the people, and denies that his primary aim is to show favorable results under government ownership. That being the case, let it be done directly so everyone will understand. In the past the mine owners who sold coal to the railroads at a reduced price at least had an opportunity by skillful management to even up on other sales. Today this opportunity is denied them, for the maximum price they may receive is fixed. The present situation has no parallel in the past.

Since this Nation entered the War, the railroads in many localities have demanded a grade of coal for their locomotives that was not necessary, and that was specially adapted for use in munition plants. The result has been deplorable, for in many cases the production of war supplies has been hampered by manufacturers having to use coal unsuited for their purposes, but which coal burned in locomotives would have met all requirements.

Any man in Washington today who places personal ambitions above his country's welfare is certainly unworthy of high office. When such a man denounces everyone who opposes him as a profiteer and a traitor, he is assuming an attitude of superior virtue that must arouse suspicion.

The coal industry must have confidence that justice will ultimately prevail. Dr. Garfield is a man not easily turned from his course. The President has a faculty for getting to the basic facts in matters of importance. Let us therefore have hope, and whatever the outcome, let coal men prove that the highest patriotism is evidenced by loyal action and not by noisy declarations.



IDEAS AND SUGGESTIONS

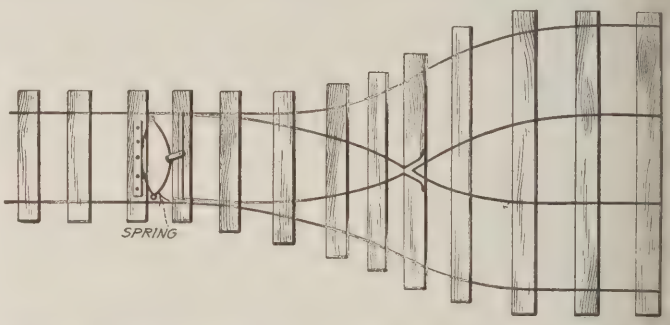
Substitute for a Rope Splice

BY L. V. LOUTHER
Guttenberg, N. J.

To neatly splice a wire rope is apt to be a long and somewhat difficult job for a novice. In many instances where the splice need not be the same size as the original rope and the conditions of service do not demand flexibility of the puncture a substitute similar to the one shown in the accompanying illustration may be used to advantage.

To make this kind of a "splice" proceed as follows: Secure a short piece of pipe slightly larger in internal diameter than the external diameter of the cable. Swedge down the ends of this pipe until the wire rope can just be inserted therein. Drill and saw one longitudinal and two transverse cuts, as shown, folding back the "leaf" thus formed. Thoroughly clean the inside of the pipe and treat with acid or soldering salts, also cut out the hemp center of the cable, if any, for a short distance at the ends where it enters the pipe sleeve. Clean the individual wires and treat with acid. Now insert the cable in either end of the pipe sleeve and bend the wires separately back upon themselves. Bend the leaf back into place, heat the whole sleeve slightly and pour in hot zinc, or, if this is not at hand,

NOVEL SUBSTITUTE FOR A ROPE SPLICE



hard babbitt, through one of the drill holes, filling the entire sleeve. When cool the splice is complete and ready for use.

Of course the sleeve and cable should be thoroughly dry before the zinc or babbitt is poured. A splice of this kind has the decided advantage that it requires less cable than does a regular rope splice. It is however entirely unsuited to passing around pulleys or sheaves.

Automatic Spring Switch Throw

BY J. A. SMITH
Albert, W. Va.

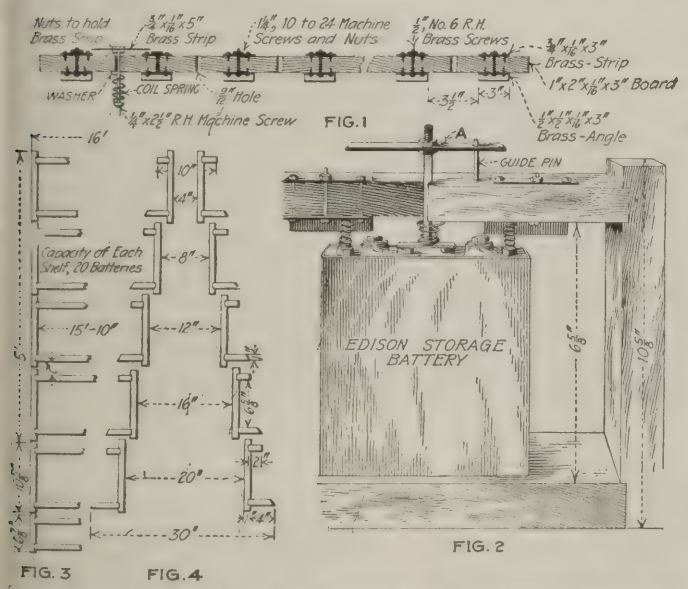
The accompanying illustration shows an automatic spring throw for switch points on the lower end of the passing place on a gravity inclined plane. The spring and the connecting piece from it to the bridle

SWITCH THROW FOR LOWER END OF PASSING PLACE ON A GRAVITY INCLINED PLANE

hold the switch points securely against the rail. A loaded trip coming down the plane forces the points over, depressing the spring until the connecting piece is past the center line of the track. Then the spring rebounds and holds the switch points against the other rail. Thus the switch is always in proper position for the ascending trip, with the switch points resting securely against the rails.

Charging Rack for Edison Batteries

BY FRANK HUSKINSON
Lafayette, Colo.



A company with which I was connected decided to put in a lot of the Edison electric safety mine lamps. Not having any storage battery charging facilities at the mine it was necessary to build a suitable charging rack.

Having noticed some crude and unsatisfactory charging racks at some of the neighboring mines, I decided to build a first-class and convenient one, to take care of the Edison portable batteries. In this I had the hearty coöperation of the mine superintendent. I constructed a 200-battery rack which was automatic in operation; that is, 100 or 200 batteries could be charged on it without difficulty. The rack took up a small amount of space and was both convenient and ornamental.

In Fig. 1 is shown the details of the top contact board. In making up these boards I used clear Oregon pine, 1 x 2 x 16 in. These boards were all given two coats of shellac varnish before attaching the parts to them. The contact plates on the bottom part of this board are pieces of brass angle, $\frac{1}{2}$ x $\frac{1}{2}$ x $\frac{1}{16}$ x 3 in. These pieces are spaced $3\frac{1}{2}$ in. apart and are fastened to the board with $\frac{1}{2}$-in. wood screws. On the top side of the board are placed pieecs of brass strip, $\frac{3}{4}$ x $\frac{1}{16}$ x 3 in

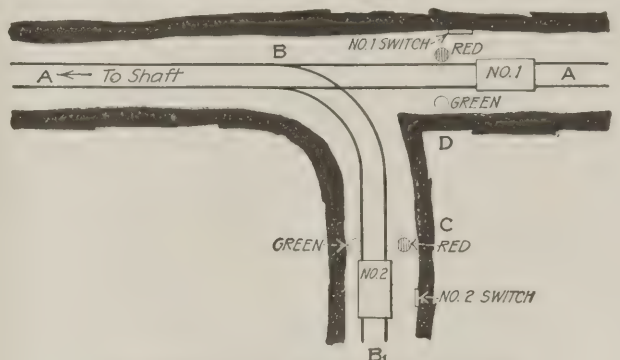
These pieces are spaced the same as the brass angle pieces and are bolted to the latter by a 10-24 x 1¼-in. machine screw. In the center of the space between the brass angle piece and strip there is a $\frac{9}{32}$-in. hole bored in the board. A ¼ x 2½ in. machine screw passes through this hole. On the bottom part of this screw is a coil spring and a washer. On the top side is fastened the brass plate *A* (Fig. 3) or strip, ¾ x $\frac{1}{16}$ x 5 in. The object of this brass plate is to close the circuit across the brass angle and strip pieces, on either side. When the batteries are removed, the coil spring holds this brass plate in contact with the brass strips on either side. These strips are in electrical contact with the brass angle pieces through the 10-24 x ¼-in. machine screws. The movable brass strip on top is held from moving out of place by the guide pin.

In Fig. 2 is shown a detail of the movable strip, etc., while Fig. 3 shows the action of the rack. When inserting a battery receptacle the head of the large machine screw comes in contact with the cross-connector on the Edison battery, and at almost the same time the contact springs on the battery come in contact with the brass angle pieces on each side. The battery is pushed up into place, and the large machine screw is forced upward. This screw, with the brass strip attached to the other end, is pushed up far enough so that the brass strip clears the brass pieces on each side. This opens the circuit at this point and allows the current to pass through the accumulator by means of the brass angle pieces and the contact springs on the battery. The back board of the rack is spaced 1 in. from the center of the brass angle pieces, so that the batteries are in proper place whenever they are pushed up in the rack as far as they will go. It only takes a second to insert

FIGS. 1 TO 4. DETAILS OF A RACK FOR CHARGING EDISON SAFETY MINE LAMPS

or remove a battery from this rack. There is no changing or making of electrical connections.

In Fig. 4 is shown a front view of the charging rack. This is built in sections which are assembled and spaced as shown in Fig. 1. The dimensions given in Fig. 4 allow for 20 batteries for each section. The completed rack contains 10 sections, making a rack that will take care of 200 batteries or of only one battery if desired.



In. Fig. 1 is shown a detailed end view of this rack with all dimensions. When completely assembled the charging rack takes up a space 16 ft. long by 2½ ft. wide and a total height of 5 ft. All of the woodwork is treated to at least two coats of shellac varnish, giving it a pleasing and durable finish and one that is easily kept clean.

Signal Lights at Entry Junctions

By O. H. Hampsch

Washington, D. C.

Considerable annoyance and confusion of signals are frequently created at entry junctions where two or more motors use the same main entry to the shaft. This often results in loss of time through accidents. A simple

AN EFFECTIVE SIGNALING SYSTEM

and effective arrangement (employing red and green incandescent lights on each entry) whereby each motorman knows the relative position of the other is shown in the accompanying drawing.

An alternate switch (marked 1) on entry *AA* is used by the motorman operating No. 1 motor. Throwing this switch forward lights the red light at *C* when going out, and reversing it upon returning, lights the green light at *C*. The motorman operating No. 2 motor then knows before entering the entry *AA* whether No. 1 motor is in or out, and if the track is clear, by the kind of signal shown.

The red and green lights at *D* are operated by No. 2 motorman from switch 2 upon passing in or out of entry *BB*, thus giving his relative position to No. 1 motorman. The lights can be controlled by an alternate switch so located as not to inconvenience the motorman in operating it from his locomotive.

This forms a simple and effective signal that can be read at a distance and can be installed by the mine electrician with small expense of time and money.

Watts per Cubic Foot Required To Heat a Room

By R. G. Flavius

Experiments indicate that, for average conditions, a power expenditure of 1½ to 2 watts per cubic foot of air space will heat a room satisfactorily. For example, what wattage would be required to heat a room 10 x 12 x 9 ft.? The cubical contents of this room would by $9 \times 10 \times 12 = 1080$ cu.ft. Hence, the wattage required would be (assuming an expenditure of 2 watts per cu.ft.) 2160 watts; that is, 2.2 kw., or about 2.9 horsepower.

Recent Dwelling Construction in Pennsylvania

By DEVER C. ASHMEAD
Tarrytown, N. Y.

SYNOPSIS—*Tile bungalows at Rossiter, Penn. Two-story tile houses at Clymer, Penn. Single-family framehouses at Coal Run, Penn., capable, with some small changes, of being used for either a miner's or a superintendent's house. Two-family houses at Coal Run, Penn. Some illustrations of houses at Ebensburg, Penn. Bills of materials and working drawings for the first four houses.*

A NUMBER of houses of new design, of which this article covers only a few, have been erected in Indiana County, Pennsylvania, during the last few years. The Clearfield Bituminous Coal Corporation seems to have concentrated all its efforts in the erection of tile dwelling houses, of which it has two distinct types—a small three-room bungalow and a six-room two-story dwelling.

The bungalows, illustrated in Figs. 1, 2, 3 and 4, and shown in working drawing in Fig. 5, are being built at the Rossiter mine. Seventy-two of these are now either partly or wholly finished. These bungalows have over-all dimensions of 24 x 28 ft. They contain a front porch 7 x 12 ft., a living room 12 ft. by 15 ft. 6 in., a bedroom 11 x 14 ft., and a kitchen 11 x 14 ft. The houses are well lighted both by night and by day. They have three windows in each room. Each room has an electric light as has also the front and back porch. The kitchen door opens on a back porch 6 x 12 ft. Running water is provided in the kitchen. The rooms are heated by coal stoves furnished by the tenants. The use of tile in the construction of these houses tends to keep them cool in summer and warm in winter.

At the Sample Run mine of the Clearfield Bituminous Coal Corporation, at Clymer, Indiana County, Pennsylvania, the second type of house already mentioned is being used. This house is built of tile, is two stories in height and contains six rooms—three upstairs and three down. The house is not so attractive as the bungalow, but it is much better adapted to the needs of large families. These houses have a small front and back porch.

The front door opens into a large living room 10 ft. 6 in. by 17 ft. 6 in. To the rear of this is either a dining room or bedroom 9 ft. by 14 ft. 6 in. and also a kitchen 11 ft. 6 in. No running water has been provided within the houses. Upstairs there are bedrooms and a small hall. The front bedroom is 10 ft. 6 in. by 17 ft. 6 in. and has an angle closet in the

FIGS. 1 TO 4. VIEWS OF THE TYPE OF BUNGALOW BEING BUILT AT THE ROSSITER MINE

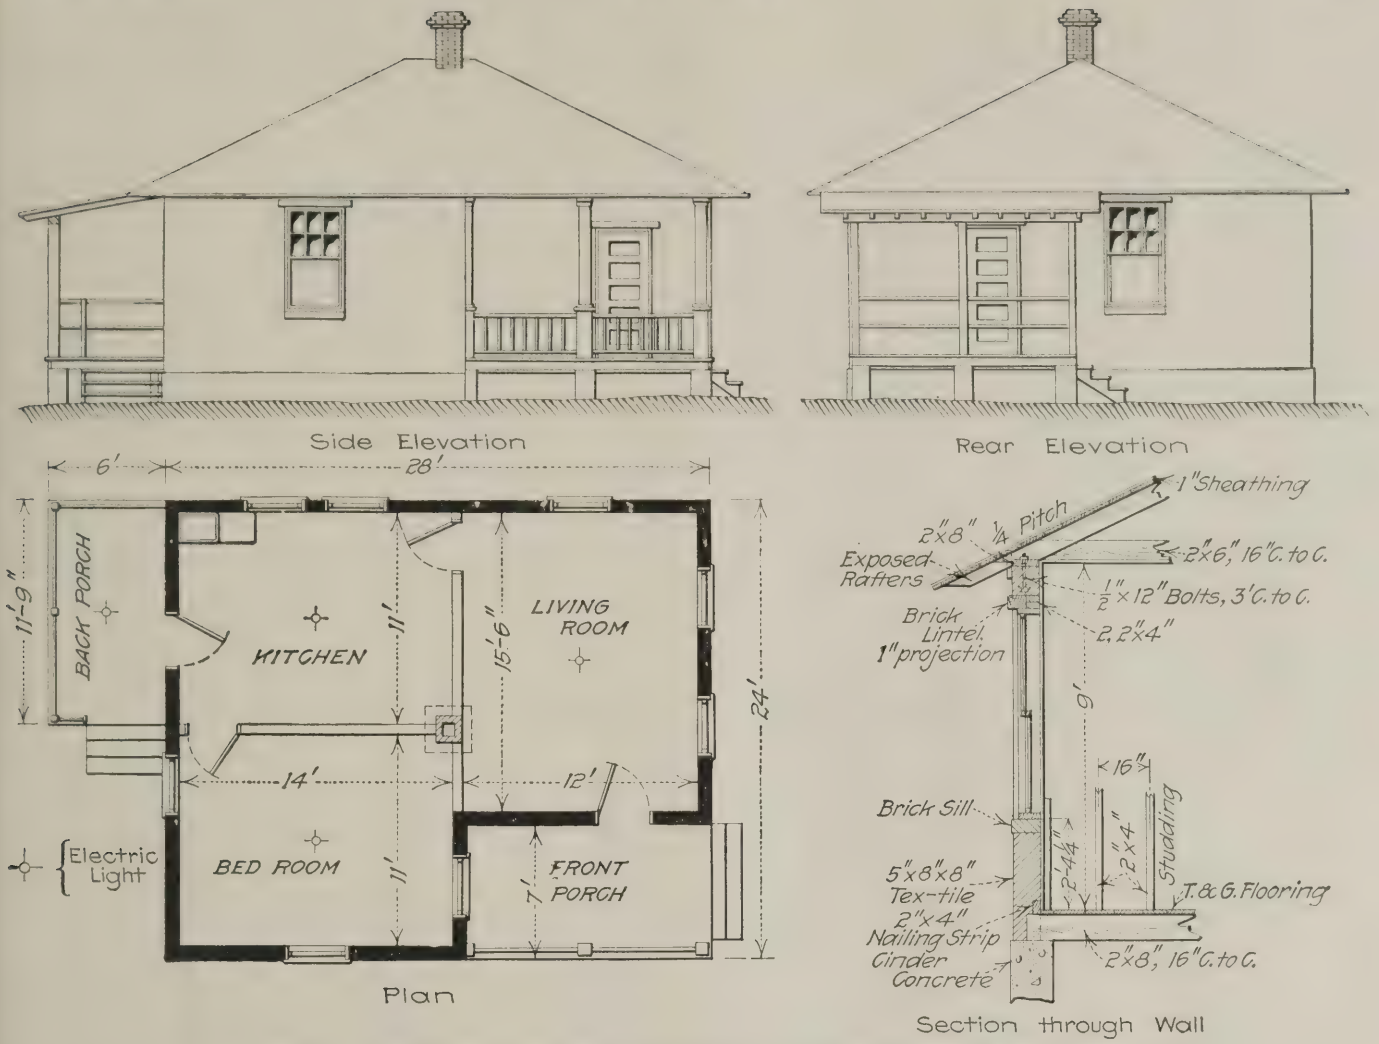


FIG. 5. WORKING PLAN OF BUNGALOWS ILLUSTRATED IN FIGS. 1 TO 4

rear. The bedrooms are 14 ft. 6 in. by 9 ft. 9 in. and 11 ft. 3 in. by 10 ft. 3 in. The chimney is in the center of the house. The roof is covered with Johns-Manville asbestos sheet roofing. The details of construction are shown in Fig. 6.

The following bill of material is approximately correct. In fact the amounts are slightly in excess of what would probably be required.

BILL OF MATERIAL, THREE-ROOM BUNGALOW, CLEARFIELD BITUMINOUS COAL CORPORATION, ROSSITER, PENN.

Finished Lumber

2 outside doors, 2 ft. 8 in., by 6 ft. 8 in., by 1¾ in.	5 panels
2 inside doors, 2 ft. 6 in., by 6 ft. 8 in., by 1⅜ in.	5 panels
8 windows, two sash to window, one 30 x 28-in. light in lower sash and six 10 x 14 in. lights in upper sash glazed	
8 window frames for above sash	
2 outside doorframes	
2 inside doorframes

Brick Tile, Etc.

2,100—5 x 8 in., by 8 in. tile
450—4 x 5 in., by 8 in. split tile
1,500—standard size trimming brick
500—standard size chimney brick
1,150—sq.ft. of roofing
200—sq.yd. of plaster

Estimates for foundations are not included

A rather interesting type of single house is being built by the Coal Run Coal Co. at Coal Run, Penn. This house is entirely frame, is two stories in height and is covered with Johns-Manville Brooks brand roofing. The house has a front porch 6 x 16 ft. and a smaller back porch. There are six rooms and bath in the house and a cellar excavated under the entire dwelling. Fig. 7 shows the details of construction while Fig. 8 shows the houses under construction.

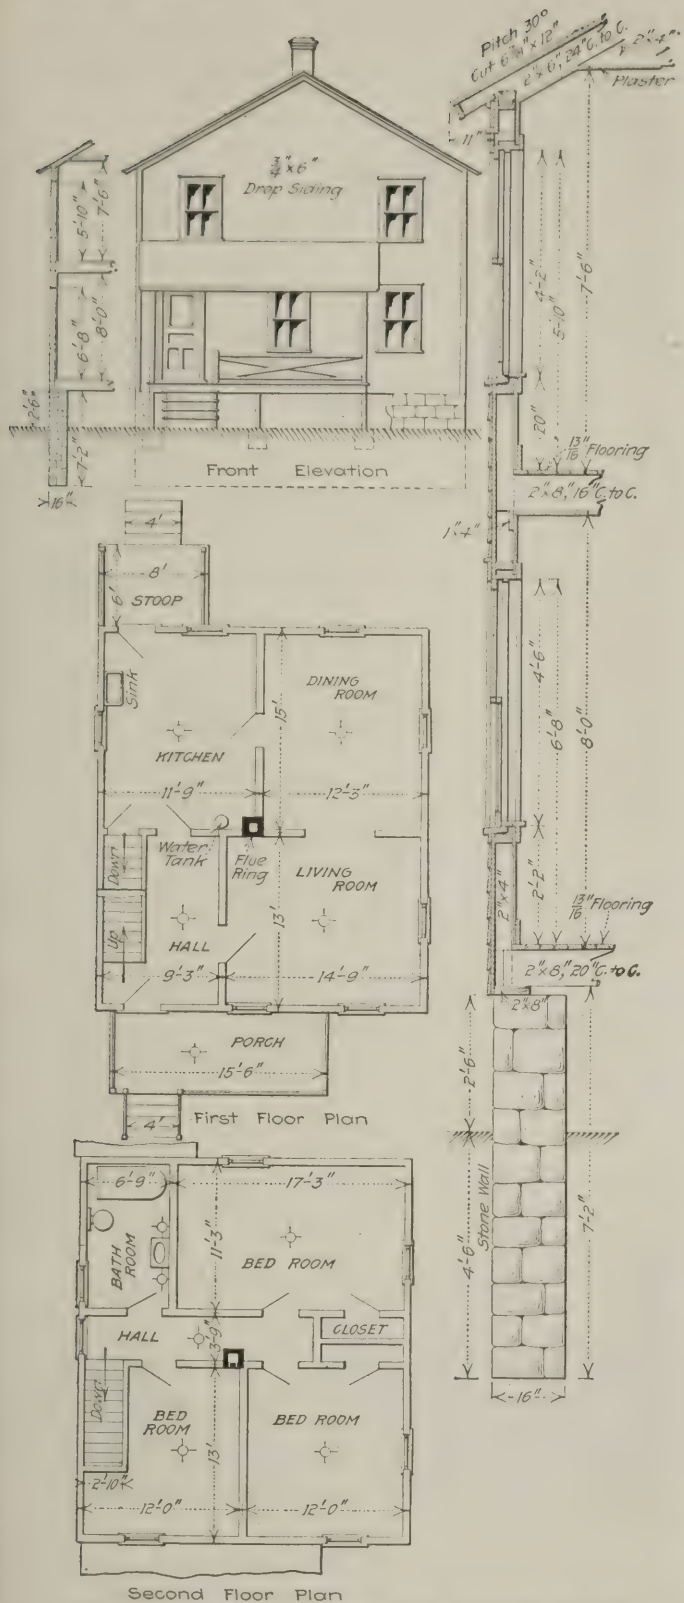

FIG. 7—DETAILS OF TWO-STORY SINGLE HOUSE

On the first floor is an entrance hall 9 ft. 3 in. by 13 ft., in which the stairway is located. There are two doors from this hall, one into a well-lighted living room which measures 13 ft. by 14 ft. 9 in. The other door from the hall opens into a kitchen 15 ft. by 11 ft. 9 in., provided with hot and cold water. A door from the kitchen opens into the dining room, and a large double door connects this latter room with the living room, which room measures 12 ft. 3 in. by 15 feet.

Upstairs there are three bedrooms, a hall and a bathroom. Two of these bedrooms are across the front of the house and have the same dimensions—namely, 12 x 13 ft. In the rear of the house there is one large bedroom measuring 11 ft. 3 in. by 17 ft. 3 in. The bathroom is of ample size—6 ft. 9 in. by 11 ft. 3 in. Between the back bedroom and the two front bedrooms is a hall 3 ft. 9 in. wide. At the end of this hall are two closets.

An exceedingly interesting feature in this design is the ease with which the house can be converted either into a superintendent's house or into a residence for the mine foreman. To prepare for the latter all that is necessary is to change the front porch by adding turned balustrades. For a superintendent's house about eight changes are necessary: (1) Use shingles, instead of drop siding, on the roof gables. (2) Use asbestos shingles on the roof. (3) Use large posts and turned balustrades on the porches and lattice the spaces below the porch floor. (4) Use a two-light instead of a four-light window. (5) Provide a steam-heating plant. (6) Cut a cellar door in the foundations so as to give an outside entrance. (7) Replace the closet space on the second floor by a bathroom; then convert the space in the rear of the house into two bedrooms of equal size, thus giving the house seven rooms and a bath. (8) Decorate the inside of the house to accord with its more elaborate construction. The bill of material is shown in the table on the next page.

At its Coal Run mines, Coal Run, Penn., the Coal Run Coal Co. has erected for its miners 72 double houses of two-story construction and is proposing to build many more in the spring. These double houses

FIG. 8—HOUSES IN PROCESS OF CONSTRUCTION

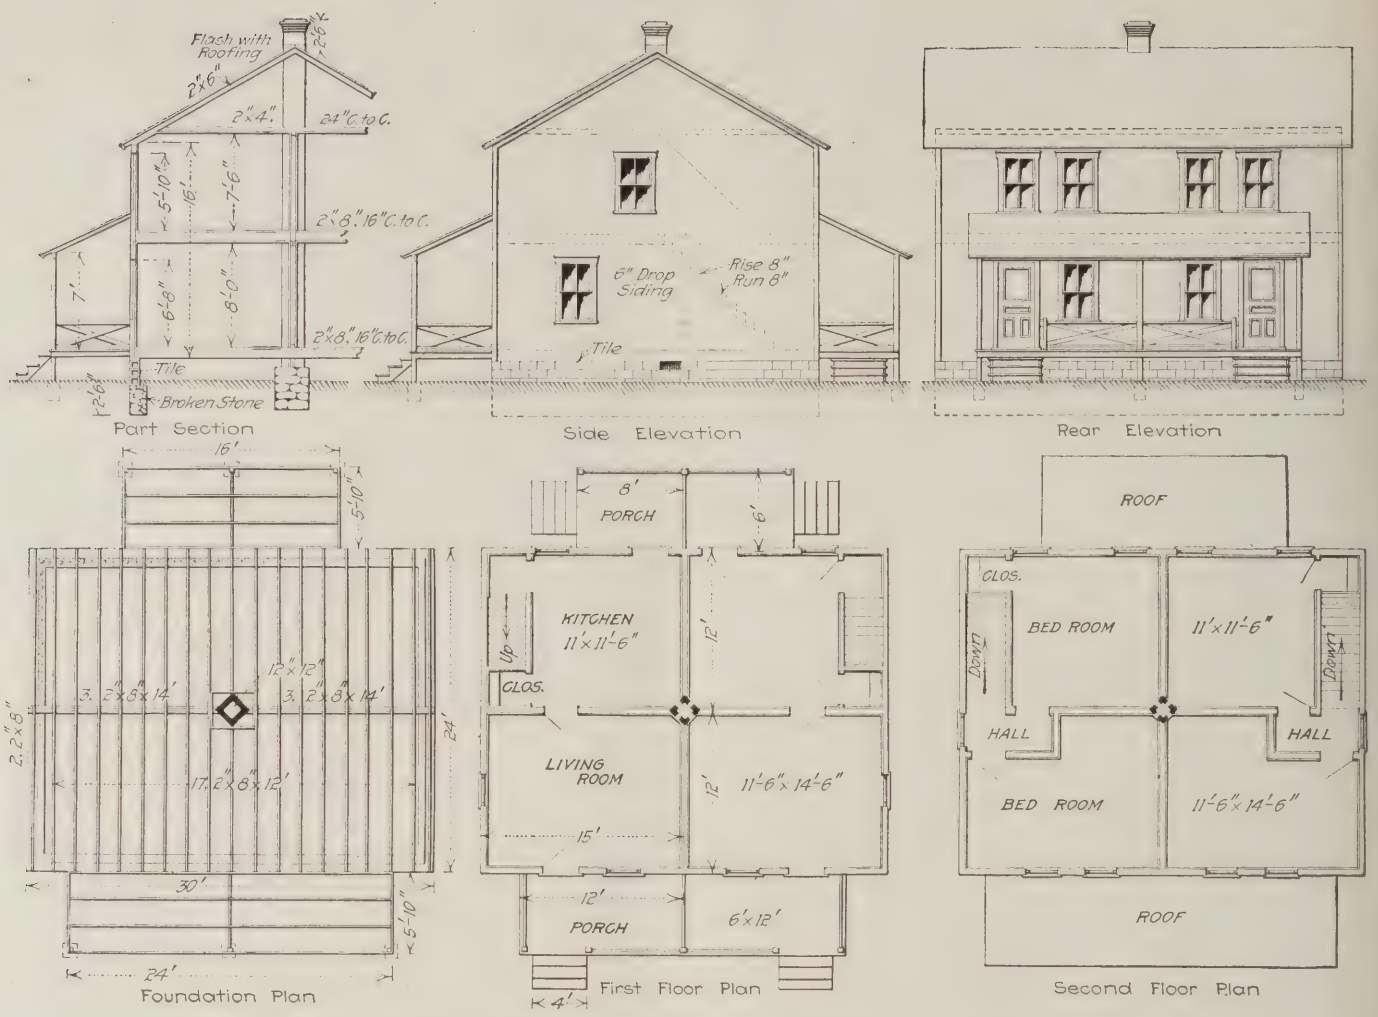

FIG. 9—DETAILED DRAWING OF DOUBLE HOUSES BUILT AT COAL RUN, PENN.

are neat and attractive in design. They are constructed of wood and painted a dark gray. The roof is covered with Johns-Manville Brooks brand roofing. There is

When the rate of combustion is doubled the quantity of the volatile matter distilled per unit of time is doubled. However, to burn this double quantity of volatile matter with the same excess of air to the same completeness, the combustion space is increased only about 20 per cent.—*Bureau of Mines Bulletin No. 135.*

The Ross Meridiograph

By J. T. BEARD
Senior Associate Editor "Coal Age"

SYNOPSIS — *Need of a simple means of making a quick and accurate determination of the true meridian at any suitable time and place. The "meridiograph" devised for this purpose. Description of the instrument, its use explained. Diagram for ascertaining at a glance the actual change in declination from that given in the Ephemeris for Greenwich noon, to that for any suitable time and place of observation at any longitude east or west of Greenwich.*

IT IS a rare privilege to be able to present to the readers of *Coal Age* the description of a successful practical device whose need has long been felt by mining and civil engineers and surveyors, but which has heretofore defied many ingenious attempts to construct in a simple and compact manner.

All engineers and surveyors realize that the quick and ready determination of the true meridian of a place is not only a matter of first importance but is, at the same time, a most troublesome feature of the work in hand. As is well known, the indications of the magnetic needle are wholly unreliable. Astronomic methods for determining the true north are not only inconvenient and difficult, but require more knowledge of the heavens than is possessed by the average mine foreman. Such determinations are rarely attempted, even by the more skilled United States deputy mineral surveyors, the accuracy of whose work depends on the correct determination of the true meridian.

The so-called "solar attachment" of the engineer's transit has served the purpose till now of determining true north and has been used very largely by engineers and deputy mineral surveyors throughout the country. The delicacy of the adjustment of this device, however, required a degree of mechanical skill that few possessed; and this fact, together with the added expense of the attachment, is fast rendering its use obsolete in present-day practice.

The meridiograph is a new instrument, designed by Louis Ross, a former United States deputy mineral surveyor of San Francisco. Mr. Ross is to be congratulated on his mechanical ingenuity and the success that has attended his efforts. With the aid of this device, the engineer or surveyor is enabled to locate a true north and south line, in a few minutes, at any time of the day when an observation of the sun for this purpose is practicable.

As in the use of the solar attachment, the observation with the meridiograph will give the best results when made in the early morning or late in the afternoon, at which time the sun's altitude is changing more rapidly. An observation for azimuth taken in the hours approaching or following noonday are naturally unreliable. Observing the sun's altitude at noon, or when it is crossing the meridian, serves to determine the latitude of the place when this is not known. The altitude of the sun at noon is always the co-latitude of the place.

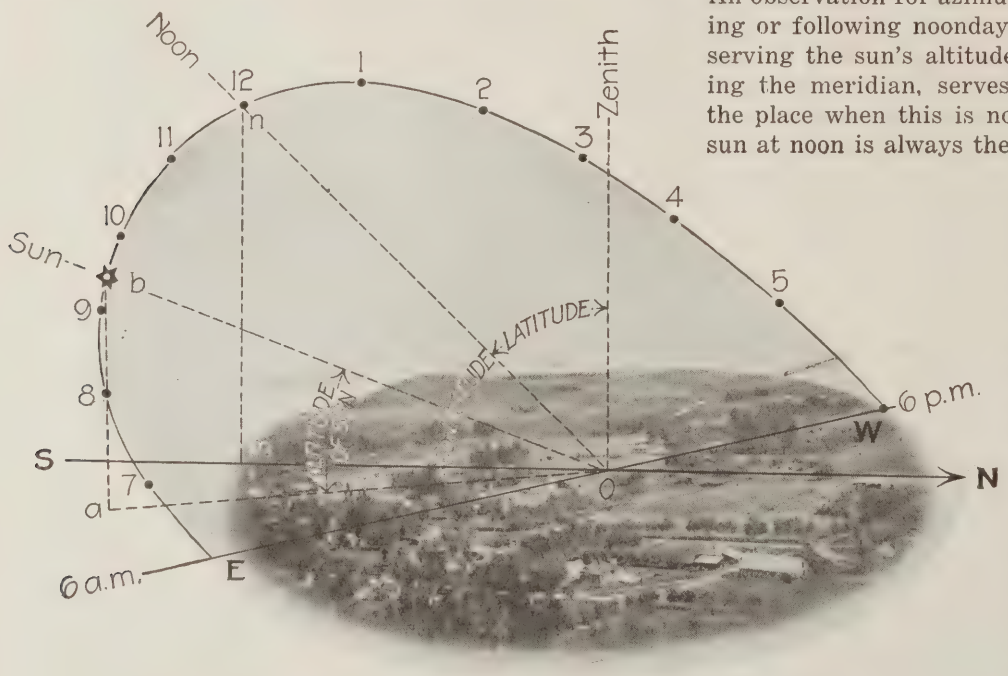

FIG. 1. ILLUSTRATING THE USE OF THE MERIDIOGRAPH IN THE FIELD

The accompanying illustration (Fig. 1) shows an observation taken at the crossroads at *O*, in the center of a landscape. The hour circle, or path of the sun, is described in a plane corresponding to the sun's declination at the time the observation is taken. The meridian to be determined is indicated, in the figure, by the line *NS*, which is the center line of the north and south road, in the landscape. The line *EW* represents the east and west line and is the center line of the crossroad, also shown in the figure.

At the moment of observation, the altitude of the sun, as measured by the transit at *O* is the angle *aOb*. The bearing of the sun, or its angular distance from the meridian *NS*, is indicated by the angle *aOS*. This angle is read on the meridiograph when the latitude of the place and the sun's altitude are set to correspond to each other on the respective scales of the instrument.

The manner of finding this angle of the sun's bearing, by means of the meridiograph, will be described later, but it may be stated here that the latitude of the place, if not previously known, may be ascertained from the co-latitude, indicated by the angle *mOn*, in the figure. This angle is measured by the transit when the sun has

attained its greatest altitude at noon when crossing the meridian. The latitude of the place is always the complement of the co-latitude, or 90 deg. minus the co-latitude. As indicated in the figure, the latitude is the angular distance of the sun at noon from the zenith.

The meridiograph instrument is shown in Fig. 2. It consists of two graduated disks and a reading arm equipped with a magnifying glass adjustable to any

FIG. 2. THE MERIDIOGRAPH

focus. The two circular disks are concentric, the outer graduated circle having a diameter of 7 in. This scale is engraved on a silvered surface, while the inner dial is finished in gunmetal. The arrangement of the scales is such that, although the diameter of the graduated circle does not exceed 7 in., the angular graduations are as open as a protractor 60 in. in diameter.

One has but to use the meridiograph once or twice, in the field, for the purpose for which it was intended, to be convinced of its practical value as a time saver and a guarantee against casual error in calculations. None realizes this better than the engineer who is familiar with common practice in the use of a solar.

There are several scales on the two disks of the meridiograph, the principal ones being known as the A scales, of which there are two, and the B scales, the same in number. There is, beside, a scale for determining sun time, by observation, if desired.

Manner of Using the Meridiograph in the Field

Briefly described, the operation of the meridiograph depends on two steps, assuming that the latitude and longitude of the place are known and that the sun's altitude has been measured with the transit, the first step is to ascertain the declination of the sun at the time of observation. The Ephemeris, or Nautical Almanac, used by engineers and surveyors, gives the sun's declination for each year, at Greenwich mean moon.

An inspection of the Ephemeris shows that the sun attains its greatest declination (23° 27′) twice a year; namely, at the solstices, about June 21 and Dec. 21, the declination being north in the former case and south in the latter. Again, the declination of the sun is zero when crossing the equator, which is twice a year; namely, at the equinoxes, about Mar. 21 and Sept. 22.

Further inspection of the Ephemeris shows that the daily change in declination is greatest at the equinoxes when it is approximately 23.7 min. in 24 hr. At the solstices when the sun attains its greatest declination

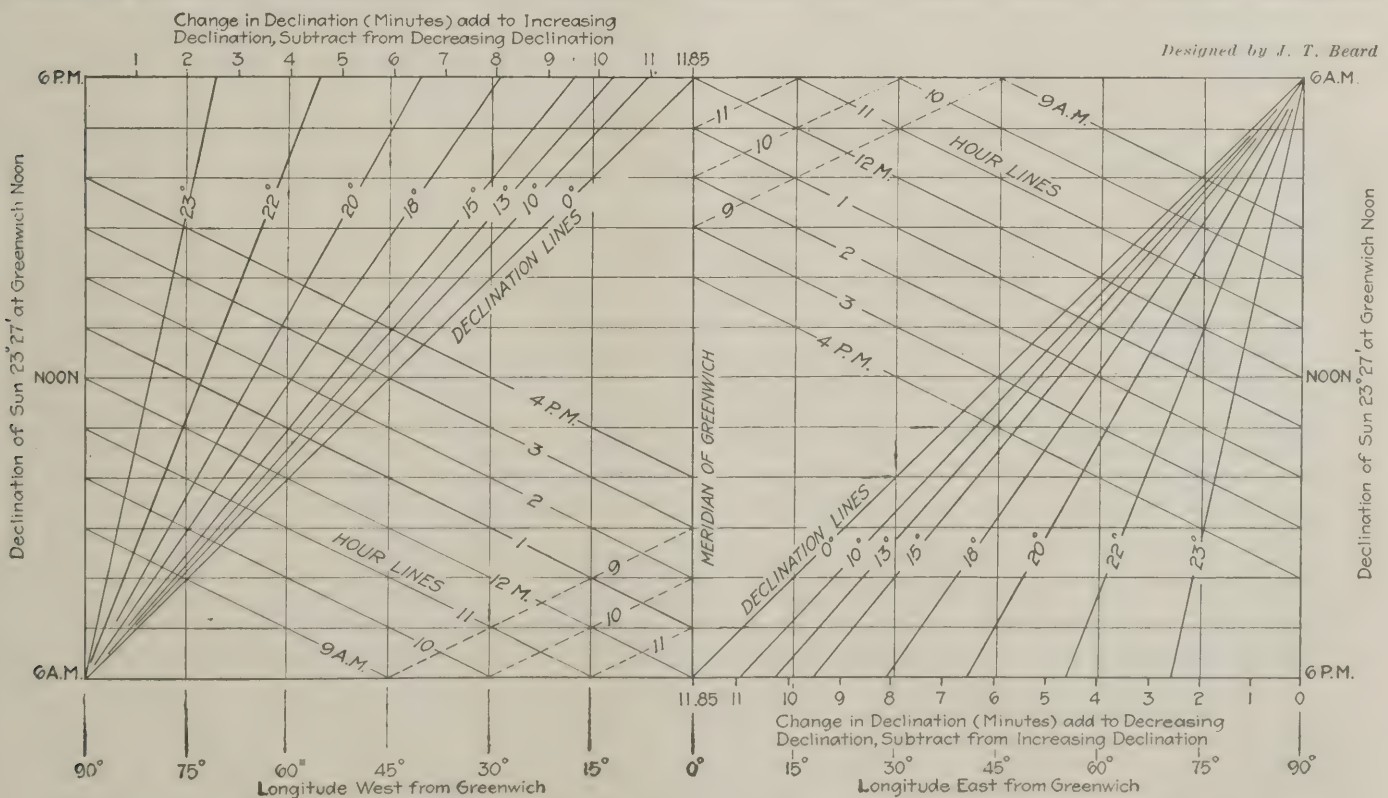

FIG. 3. DIAGRAM FOR ESTIMATING THE APPARENT DECLINATION OF THE SUN, FOR ANY LONGITUDE AND TIME FROM 9 A.M. TO 4 P.M., BY ADDING OR SUBTRACTIN G THE CHANGE TAKEN FROM THE DIAGRAM TO OR FROM THE DECLINATION AT GREENWICH NOON, AS GIVEN IN THE EPHEMERIS

either north or south, the daily change is least, being approximately one or two-tenths of a minute in 24 hours.

The diagram shown in Fig. 3 is based on the varying change in declination, for various altitudes of the sun, and shows at a glance the actual change that must be added to or subtracted from the declination at Greenwich noon, as taken from the Ephemeris. The amount of such change will depend on the difference in time as determined by the longitude of the place of observation east or west of Greenwich, and varies also with the declination. It is important to observe that, for all places north or south of the equator, the declination *increases* from the equinox to the solstice, and *decreases* from the solstice to the equinox. It is necessary, of course, to add the estimated change in declination to that given in the Ephemeris when the declination is increasing to obtain the correct declination at any given time for places west of Greenwich and subtract such change for places east of Greenwich. On the contrary, for a decreasing declination, it is necessary to subtract the estimated change from the declination given in the Ephemeris, for all places west of Greenwich, and to add the change for all places east of Greenwich.

The diagram (Fig. 3) makes it possible to ascertain the amount of change in declination for any longitude east or west of Greenwich, and any mean sun time at which an observation is taken, having due regard to the declination of the sun at that time.

To Find the Declination With the Diagram, Fig. 3

Follow the diagonal hour-line corresponding to the time of taking the observation to its intersection with the vertical line corresponding to the longitude of the place; and project this point of intersection horizontally on to the diagonal corresponding to the declination at Greenwich noon, as taken from the Ephemeris. Then, follow this declination-line to the scale at the top or bottom of the diagram, as the case may be.

The reading of the scale at the point indicated by the said declination-line will give the estimated change of declination, in minutes, which must be added to the declination at Greenwich noon when the declination is increasing, or subtracted from the same when the declination is decreasing, for all longitudes west of Greenwich. For longitudes east of Greenwich, the estimated change in declination must be added to the Greenwich noon declination when the declination is decreasing or subtracted from the same when it is increasing.

It will be observed that when the diagonal hour-line would have to be extended below or above the horizontal lines of the diagram, in order to intersect longitudes less than 45 deg. east or west of Greenwich, such hour-line is extended, as a dotted line, upward or downward, as the case may be, so as to cross these longitudes. The procedure, in that case, is the same as before, the intersection of the dotted hour-diagonal with the given vertical longitude-line being then projected horizontally onto the given declination-diagonal, whose intersection with the scale, at the top or the bottom of the diagram, will indicate the change in declination for the given time and place.

This diagram is somewhat different from the diagram proposed by the inventor of the instrument. It is one I have devised as being a more logical and simple presentation and one that will be more readily used in practice. Fig. 4 shows the leather should bag for carrying the meridiograph, together with ample pockets for field notebooks. As a simple, complete and practical device for finding the true meridian, I can strongly

FIG. 4. BAG FOR CARRYING THE INSTRUMENT

recommend this instrument for field use. It is a remarkable time saver, which will be well appreciated by those whose daily work compels the use of the solar attachment for ascertaining the meridian of a place. The possible error in the use of this device will not exceed one or two minutes at the utmost. Full instructions for its use accompany each instrument. As is well known, the best time for taking observations on the sun, for the purpose of determining a true meridian, is in the early forenoon or later in the afternoon when the error of the determination will not exceed one minute. When the observation is taken closer to noon, the error may reach two minutes. Owing to the increased refraction of the sun's rays, it is inadvisable to take an observation before 9 a. m. or after 4 p. m., if this can be avoided.

Coal Carbonization in Gas Retorts

The present heavy demand for benzol, toluol and other byproducts of coal distillation has modified the gas engineer's methods. A high yield of gas is a prime necessity to meet the demands for gas for its various services. But certain elements enriching gas are reduced to increase the supply of benzol which is of such prime importance in the manufacture of explosives.

At the Macclesfield gas works in England the gas yield per ton of coal is said to have been increased and at the same time to have obtained largely increased yields of tar and ammoniacal liquor, the latter furnishing fertilizers so urgently needed. This result has been attained by injecting steam into the base of the retorts, thus generating blue water gas. This method removes the last trace of gas from the coal and washes out the tarry matter before the tar has been subjected to destructive distillation. No deterioration has been noticed in the retorts as the result of steaming, and scurfing has been reduced to a minimum.

Strip Mining Where Bad Roof Prevails

By RALPH W. MAYER
Connellsville, Penn.

SYNOPSIS — *A considerable area of the Pittsburgh bed of coal near Burgettstown, Penn., has comparatively shallow cover and an extremely bad roof. This is being profitably recovered by means of stripping. Because of the nature of the overlying rock blasting must be extensively practiced and carefully executed.*

A LARGE area of coal at Burgettstown, Penn., about 25 miles west of Pittsburgh, has a poor roof, one that it is almost impossible to hold up without lagging between timbers placed close together. The cover is shallow. The coal worked is the Pittsburgh bed, is of good quality and varies from 5 to 7 ft. in thickness. The same district contains a considerable amount of coal which has a good roof and is easily secured by the usual methods of underground mining.

The Harmon Creek Coal Co. is successfully mining out large areas of this coal which has a poor roof by means of stripping. Six-inch holes are drilled from the surface down to the top of the coal. These are placed 25 or 30 ft. apart. Keystone steam drills and gasoline drilling machines are used. These are self-propelled, moving from place to place under their own power. The covering on the coal is from 20 to 40 ft. thick and consists of soil, shale, slate, and in some places a harder rock closely resembling limestone.

After the machines have finished drilling the holes, they are sprung three times to form a chamber above the coal to hold the final charge of powder. The first springing charge consists of six or eight sticks of dynamite. This shoots the mud out of the hole and slightly enlarges the bottom. The second charge consists of about half a box of dynamite, and for the third springing charge about a 50-lb. box is used. It is unnecessary to clean the borehole after each charge. The shots throw the dirt up through the borehole onto the surface.

After the holes have been sprung three times they are given the final charge, which consists of black powder. Twenty to thirty 25-lb. kegs of FFF black powder are used for each hole. The tops of the kegs are cut partly off and the powder poured from the keg directly down the borehole.

The powder is exploded by using No. 6 electric detonators with 30-ft. wires. Two detonators are placed in each hole, so that in the event of the failure of one a second could be fired. Each detonator is placed in the end of a stick of dynamite and two half hitches of the lead wires of the detonator are taken around each end of the stick. Thus the stick of dynamite with the detonator in it hangs vertically in the borehole when it is lowered into it by means of the 30-ft. lead wires. This prevents the dynamite from catching on the sides of the hole and refusing to go farther. One or two kegs of powder are then poured on top of the dynamite sticks which contain the detonators. After the explosives have been placed in the hole it is filled with tamping, the soil surrounding the hole being used for this purpose.

A stick about 25 ft. long and 2 or 3 in. in diameter is used as a tamping tool. A ½-in. rope is fastened to the end of this stick, so that it hangs perpendicularly in the hole when supported by the rope.

One man continuously uses the tamping stick while the powder and tamping is being put into the hole, pounding both firmly into place. He also holds the lead wires of the detonator to prevent them from dropping into the hole. He does this by taking a couple of turns of each lead wire around each of his feet, thus holding the wires against the side of the hole. He has free use of both his hands for tamping the hole. Two men usually pour out the powder, while a fourth man occasionally helps and in general oversees the work of loading and tamping. It is necessary to exercise care in filling the holes with tamping and not introduce the soil into the hole so fast that it chokes and gets clogged.

Holes Fired at One Time by Electricity

When 10 or 15 holes have been loaded and tamped they are all fired simultaneously by means of an electric current. The resultant explosion has the effect of lifting the rock for a considerable space or area up off the coal and dropping it back again, thus shattering it but causing little disturbance upon the surface. The charge of explosives for a hole is of course varied according to the depth and nature of the overburden.

Where the rock is unusually hard, or the hole a trifle moist, four or five boxes of dynamite in the bottom of the hole, then 15 to 20 kegs of powder and three or four boxes of dynamite on top of the powder may be used. The holes are almost all dry after being sprung. Occasionally a wet hole will occur. In such a case a hanging charge of dynamite is exploded at the top of the water in the hole. This cracks the rock so that the water drains off, leaving a dry hole. The dynamite used is of 40 per cent. strength.

As a protection in inclement weather for the persons loading the holes and to keep the explosives dry, a V-shaped shelter is used. Each side of this shelter is about 6 ft. wide, and 6 ft. high. It is set on its end over the hole to be loaded, the point of the V facing the wind. The top of the V is covered with a flat roof affording protection from above. This shelter is made strong and light in weight so that it can easily be moved from hole to hole.

The drilling machine has a small blower or fan which is placed just in front of the flywheel of the engine. The fan has a pulley of small diameter fastened to its shaft and is mounted on a small swinging platform which may be swung so that the pulley of the fan comes into contact with the circumference of the revolving flywheel of the engine, thus rotating the fan. A 2-in. hose leads from the fan to a forge, which is used for heating the bit of the drill when it is necessary to sharpen it. The hose terminates in 3 ft. of iron pipe which finally leads the blast to the forge. This pipe is buried

a few inches underneath the ground and over its end a simple forge made. The air from the fan coming through this hose and pipe makes a good fire.

A few loose bricks set up on edge, two high and others laid loosely across their top and across one end, and covered with dirt, leaves an opening large enough for the bit of the drill. This makes an effective forge, and one that is quickly built and easily moved from place to place. It has only the opening at the bottom where the air enters through the 2-in. pipe and the opening at the end which receives the bit. Into this the coal is fed, and from it the smoke issues. A few small lumps of coal will quickly heat the bit of the drill.

This forge is made two brick lengths long. These two bricks are placed on edge and two more are placed on edge on top of them. Four bricks thus form one side. The two sides are so placed that bricks can be laid lengthwise from one side to the other. The top and end are built up in this manner. They are covered with dirt to give the entire structure firmness.

When the overburden has been broken by the use of explosives it is shoveled back off of the coal and deposited upon the ground from which the coal has been removed. A strip of ground across the coal field is drilled and loosened by explosives. This strip is then cleaned of its overburden and the coal underneath removed. The strip from which the coal has been removed makes room for depositing the overburden of the next adjoining strip.

Waste Shoveled Back by Steam Shovels

Four Marion steam shovels, Model 300, are used for stripping or shoveling back the waste. The buckets range in capacity from 6 to 8 cu.yd., and the booms are from 85 to 95 ft. in length. Each shovel runs on short lengths of rail which are removed from its rear and placed in front as the machine advances. The track for the railroad cars is placed immediately upon the coal and on the side of the stripping next the virgin ground, or on the opposite side of the strip from the waste pile or dump.

These works are on the main line of the Pennsylvania R.R. Panhandle route. The railroad cars are left on a siding. The Harmon Creek Coal Co.'s locomotives take them from this siding and haul them directly into the pit or onto this track laid upon the top of the coal. Here they are loaded by means of a Marion steam shovel, Model 36. This model is provided with a caterpillar truck, and can travel over the inequalities of the floor with ease. It works in the lowest part of the cut into which the water drains if any is present and where it might be troublesome to lay track. This type of truck gives it great freedom of movement.

The shovel moves by its own power, but in a hard place where this is insufficient the power of the dipper engine is also utilized. This is done by means of a piece of cable or sling having an eye spliced in each end. This cable is passed underneath the top half of the caterpillar belt a few feet back from its front end. The eyes on the two ends of the cable are then hooked over the teeth of the shovel. When the dipper is raised or pushed ahead the cable tightens and pulls on the belt, thus helping to move the machine ahead. The coal in the seam is not shot, the shovel being powerful enough to loosen it.

This shovel runs upon the floor of the coal bed and loads the coal directly into the railroad cars. The shovels work in pairs, each stripper being accompanied by a digger. Each stripping shovel works two 10-hour shifts per day, while each loader works one shift.

Several men work ahead of the loading shovel, sweeping off the top of the coal with wire brooms and throwing back the sweepings. Three men also work in the car while it is being loaded, throwing out slate and refuse. Picks are here used to break the pieces of slate loose from the coal when necessary. They also signal the shovelman not to dump a shovelful of coal when they have not all the slate thrown out of the car. The craneman dumps the coal into the car in such a manner that it is spread out so that the slate may be easily seen. The slate is thrown off the car on the side opposite the shovel or between the railroad track and the face of the next stripping. The stripping shovel throws this slate back along with the waste when it makes its next cut.

Locomotive Works in Conjunction With Shovel

A locomotive constantly serves the loading shovel to shift the cars to the proper position for easy loading and to take away the loads and return with empties. Only a few minutes are required to take out the loads and return with empties from the sidetrack. While the locomotive is doing this the shovelman is loosening up the coal for loading succeeding cars. The company has its own locomotives and sidetracks.

The coal seam lies practically level and high so that the water drains off into the valleys, which cut the seam where it outcrops. Where there are swamps or depressions the water is pumped out with gasoline pumps. Box drains made of planking are laid on the floor and covered with the waste piles where the deposits of waste would dam back the water from flowing out of the pit or open cut.

The water-supply for the boilers of the steam shovels and locomotives is obtained from a reservoir made by damming a small creek. The face of the dam is riprapped with flat stones, and a concrete spillway takes care of the overflow. A pumping plant at the reservoir forces the water through pipe lines to the different works, connections being made to the steam shovels by hose. The locomotives fill their tanks from stand pipes placed at convenient points.

Part of the field carries another seam about 2 ft. thick, overlying the Pittsburgh bed but separated from it by several feet of rock. This bed (known as the Rooster seam) also contains a good quality of coal, but aside from being used in the steam-shovel boilers, where it can be conveniently secured, it is wasted as the cost of its recovery would be prohibitive.

Several men are employed to keep the waste shoveled up to the face in front of the stripping shovel on top of the coal. This top of the coal seam forms the floor upon which the stripping shovel operates. The stripping shovels easily handle any pieces of rock which they encounter without difficulty.

The company began stripping operations in February, 1917, and commenced loading coal in September, 1917. In this short time the shovels have uncovered a large area of coal a mile or more in length.

The Harmon Creek Coal Co. also has underground operations in this same vicinity. At present the output

from these workings amounts to about 300 tons per day, but eventually it is the intention to secure at least 1000 tons from below ground. Power for underground mining and haulage will be purchased from the West Penn Power Co. It will be received at 22,000 volts and stepped down and converted before application to the various motors. At present power is supplied by a Western Electric generator direct connected to a three-cylinder gas engine working on natural gas.

The Coal Problem*

By E. G. Bailey
Boston, Mass.

The biggest and most important question before the American people today is the coal problem. The abnormally high percentage of ash and impurities in the coal is like sand in the bearings of transportation and of industry, slowing them down at the most critical time in our history. The less ash and impurities in coal, the less the number of tons required. The greater the demand for coal, the higher the price and, under present conditions, the poorer its quality. The price has been regulated; but the quality has run riot.

Why have we allowed this to happen just at the time when we need heat in concentrated form? Why are the railroads burdened today with hauling millions of tons of utterly worthless dirt? To say that this excess of ash in the coal is worthless, does not describe the situation. The price paid for this dirt is only a small fraction of the damage. The rest lies in the decreased efficiency, the lowered capacity, the increased labor and the excessive repair bills involved in the combustion of this coal—and in the necessity of closing down industries because of the lack of the coal which might have been shipped in place of these so called "worthless," but really exceedingly costly impurities.

Results show a 10% decrease in the amount of coal delivered to many plants during the past year. Considering that the Navy and other Government requirements receive a greatly increased tonnage of the best coal, a conservative estimate of 5 per cent. is made as representing the increased demand for coal due solely to the poorer quality of that received. This means that 30,000,000 tons of utterly worthless slate and dirt were loaded into railroad cars and delivered to the consumer, where it caused additional trouble in burning the coal with which it was mixed.

On the basis of the average price of coal delivered to the consumer being $4 per ton, this excessive amount of impurities has cost the country $120,000,000 during the past year. Adding to this the various estimates made of the cost of our heatless holidays, ranging from $1,000,000,000 upward, it is obvious that this question of impurities in coal is of such tremendous importance that an effective remedy must be found immediately. Manufacturers would be glad to pay a dollar per ton more for coal if they could get what they need and of standard quality.

Competition normally compels the mine operator to clean his coal, but when the coal shortage began, in 1916, manufacturers were so anxious to get fuel that they offered and gladly paid prices of $5 to $6 per ton at the mines and took anything that was black. For this reason quality went from bad to worse. Under the present system of paying the operator prices fixed by the Government, no distinction whatever is made between the best and poorest grades of coal. They both command the same price, so why should one operator go to additional expense of shipping clean coal when he receives no more pay than his competitor who loads dirt?

To simply appeal to the miners and operators, even on the grounds of patriotism, is not sufficient. To increase the Government price on the present basis of control of $5 per ton at the mines would not reduce the percentage of impurities in the coal one iota. We must apply a remedy that has some economic foundation.

The remedy suggested is to establish standards of quality and pay a premium for clean coal. The price paid to the operator should be based on standards established by the Fuel Administration according to different mining districts, etc., with premiums based almost entirely upon percentage of ash, and especially the free ash such as slate and rock which can and should be eliminated at the mines.

Coal-sampling stations should be established by the Government at certain central points where large quantities of coal are received direct from mines. Each station should be equipped with machinery for obtaining representative samples from as many individual cars as necessary to determine the average quality of coal shipped from each mine during each month.

The operator would not know what cars were to be sampled, for the Fuel Administration could consign or reconsign any cars in transit to the coal piers or power houses where the sampling stations were located. The mine operator would therefore have a real incentive to load every car with as clean coal as possible.

The car distribution at the mines, which is an important point to the operator, should also be based upon the quality of coal produced so that there would be an added incentive to load clean coal, and the market would always be supplied with a greater proportion of the better quality of coal than if the empty cars were prorated equally as at present.

Actual knowledge of the quality of coal would also be of great benefit to the Fuel Administration in classifying various mines into pools so that the consumer and particularly the railroads would receive coal of uniform quality, thereby enabling them to obtain maximum capacity and efficiency in the combustion of this coal.

There is sufficient labor at the mines to clean the coal, and the railroads can haul enough good coal, but they cannot get the necessary heat units to the consumer if they must be burdened with 30,000,000 tons of unnecessary dirt. We have our choice of either building thousands of locomotives and a hundred thousand cars and adding to the terminal facilities of our railroads within the next few months or removing the excessive impurities from the coal. The latter can be done quickly and effectively.

It is also urged that all power plant engineers put forth every effort to obtain maximum efficiency from the combustion of coal. A few simple points in regard to improving the work of the fireman by observing the appearance of the flame from the boiler furnace, and

*Abstract of a lecture delivered at the Johns Hopkins University, Baltimore, Md., Feb. 27, 1918, as one of the J. E. Aldred lectures on Engineering Practice.

maintaining boilers and baffles in good condition will secure worth-while results.

Are we going to have enough coal to see us through the coming winter? The present indications are that unless some radical steps are taken immediately, the coal shortage will be much worse than it has been. To be satisfied with preferential shipments and permit many of our basic industries to close down, is to be a quitter; when, by concentrating our efforts on loading clean coal at the mines, and improving the efficiency of its combustion in furnaces we can have ample coal for all.

We have heard the argument that we should be patriotic and be content with inferior coal—old culm banks and other refuse fuel—the same as we are with wheat substitutes in our bread. But the food and fuel problems are different.

Economy in the use of these commodities applies equally to both, but the neck of the bottle of the food question is production, while the weakest link of the coal problem is transportation. It is a crime to burden our railroads with hauling dirt when it is within our power to ship clean coal and supply heat in concentrated form.

It is as important to be on time for a business appointment or a business schedule as it is to meet a train or be prompt at a wedding. It's all a matter of habit and calculation. The man who never calculates to meet his appointments will be equally lax about his bills. Form the habit of arranging your affairs so as to be prompt or even a little better than prompt.

Increase in the Output of French Coal During the War

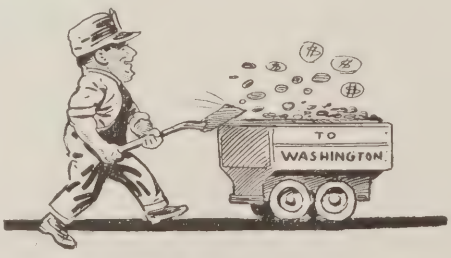
In spite of the difficulties caused by the submarine war, and the occupation by German troops of several important centers, the Chamber of Commerce of Paris states that the production of French coal is continually progressing, as will be seen by the following table giving, in tons, the whole monthly output of the different coal fields.

	1916	1917
January	1,691,399	2,011,377
February	1,689,566	1,903,179
March	1,879,527	2,367,090
April	1,710,394	2,181,172
May	1,904,478	2,296,950
June	1,751,180	2,345,251
July	1,771,769	2,410,039
Output for first 7 months	12,398,313	15,515,058

The monthly output, in France, rose in a year from 1,771,769 to 2,410,039 tons, making an increase of 36 per cent.

Each of the coal-fields has taken its part in the common effort. The Pas-de-Calais mines, some of which are in the hands of the enemy, have increased their output by 50,000 tons a month since May last. The Loire coal fields yielded, from 1916 to 1917, about 400,000 tons more than the previous year. In the Gard coal fields the increase from one year to another exceeds 33 per cent. The secondary fields of the Tarn, Saône-et-Loire, are also helping with the increase in the general output, which enables us to conclude, judging by the figures for the last four months, that the total yield for 1917 will be over 28 million tons, whereas in 1910 it hardly realized 20 million tons.

Dig!



Written Expressly for "Coal Age"
By Berton Braley

Blast away your selfishness, sink a shaft of light
Deep into the chambers of your heart;
Make your vein of loyalty plain to all men's sight
Mine it for your country—do your part!
Drill into your pocketbook, shoot the dollars free
(Even if the seam is not so big);
Trade them to the Nation for the Bonds of Liberty
Dig—the way a miner ought to dig!

Shoot the Dollars Free

Make a proper job of it, pick your pockets clean,
Don't leave any dust, a single pinch;
Bring up every particle that your eye has seen,
Uncle Sam can use it, that's a cinch.
Undercut extravagance with the chain of thrift,
Shovel up the savings, neat and trig,
Ship them into Washington, give the war a lift,
Dig—the way a miner ought to dig!

Shovel Up the Savings.

Tilt your spendthrift tendencies over on the dump,
In the test of war they're only slate;
Strip your purse and bank account—collar down to sump—
Do it now! Don't lallygag and wait.
Miner, trapper, engineer, checker, clerk and boss,
Hoist up all you've gathered, small or big.
Buy the Bonds of Liberty, smile and come across,
Dig—the way a miner ought to dig!

The Byproduct Coke Oven, Its Coke and Its Byproducts—II

By WILLIAM HUTTON BLAUVELT
Consulting Engineer, Syracuse, N. Y.*

SYNOPSIS—*The use of coke for domestic purposes has become widespread. Coke is now made from coals that formerly were considered unsuitable when the beehive oven was still the recognized medium for coking. Observations are made by the author on the recovery of ammonia and benzol and the use of coke-oven gas. Tar is used as a fuel in metallurgical furnaces.*

In addition to the iron blast furnace, foundry cupolas afford a steady market for coke, and in recent years the domestic market has grown to importance. Before the war, sales of coke for domestic use amounted to over 1½ million tons per annum, although these sales really rather demonstrated the value of coke as a domestic fuel than showed what were the ultimate possibilities of the trade. Foundry coke is usually made on a somewhat slower coking time than furnace coke, as cupola practice calls for larger and tougher pieces.

The production of domestic coke is now a greatly different industry from what it was in earlier days, when most of the domestic coke was produced in gas works. At that time it was often regarded as something to be got rid of with the least trouble, rather than as a regular and important source of income to the works. Great care is now taken in the sizing and preparation of domestic coke and the complete removal of breeze and dirt. The following table shows approximately the usual sizes produced:

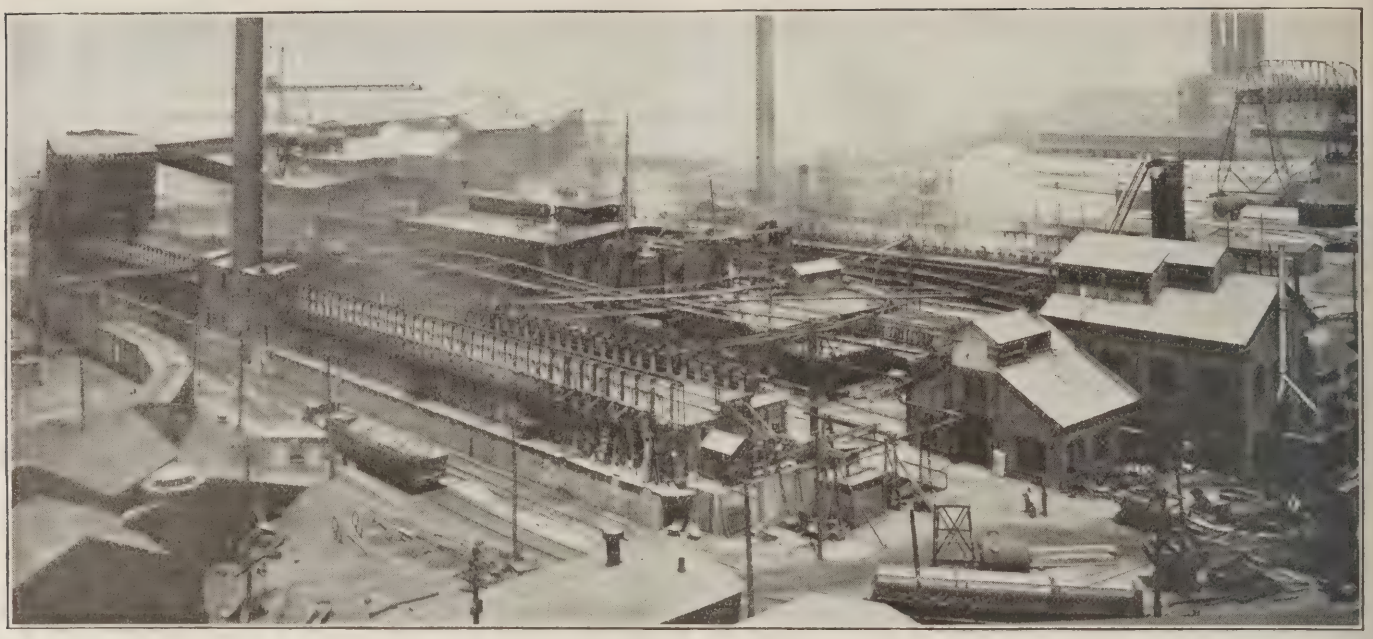
	Size of Square Through, In.	Opening on Screen Over, In.
Egg coke	3.5	1.5
Nut coke	1.5	1.0
Pea coke	1.0	0.5
Breeze	0.5	...

These screens are varied locally to meet market requirements. It would be desirable to have a standard for each domestic size throughout the country, but where the demand for one size is large relative to another, it is natural for the operator to modify his screen openings accordingly.

In American practice, where domestic coke competes mainly with anthracite, a hard structure is generally regarded as desirable. This is contrary to English practice, where familiarity with bituminous coal as a domestic fuel makes quick inflammability a desirable quality, so that coke containing a considerable amount of volatile matter is often sold successfully. Even the partially coked coal, known as "Coalite," which is produced by a low-temperature distillation, is preferred to the hard clean coke which is becoming familiar to the American consumer.

*By an error the author of this paper was said in the previous instalment, which appeared Apr. 6, to be the coke expert of the United States Fuel Administration, thus confusing him with Warren S. Blauvelt. This paper was presented at the New York meeting of the American Institute of Mining Engineers, Feb., 1918.

The practice of locating American ovens at the point of consumption of the coke has made it easy to bring together several coals of different qualities, and this has in many cases permitted the production of a better coke by admixture than could be made from either of the coals used alone. For example, a coal of excellent coking qualities but high in ash can be mixed with a low-ash coal of poorer cokability, or an excess or deficiency in the coking quality of the main coal supply can be corrected by mixture with another coal.



Except in cases where the source of coal supply is fixed, it seems desirable to arrange the plant for the preparation and mixing of as many as three kinds of coal. Means permitting the accurate proportioning of the different coals are, of course, essential in such a plant. The mixture of coals generally calls for their being ground quite finely, in order to bring the particles of the different qualities of coal closer together. The general practice is to grind so that from 70 to 80 per cent. or more will pass through a ⅛-in. screen. This fine grinding is also often advantageous where there are many pieces of slate of considerable size in the coal, since a large piece of slate in the coke is usually a center of cracks that tend to shatter the structure.

Use of Coals Formerly Considered Unsuitable

Various degrees of fineness in grinding are often adopted to improve the structure of the coke, but in some cases, especially where only one coal is used, a better structure is produced from considerably coarser coal. Fine grinding reduces the weight of the coal mass per cubic foot, and consequently the capacity of the oven. With ordinary coals the weight per cubic foot of charge is generally taken at from 40 to 43 cu.ft. per ton, depending somewhat on the coals, and largely on the degree of fineness.

The byproduct oven, with its control of heats, coking time, mixture of coals and fineness in grinding, has permitted the use of many coals for making metallurgical coke which would not have been suitable with the beehive oven. As the best coals are being progressively exhausted, this point becomes more important. Owing to the extraordinary conditions caused by the war, some coals hitherto considered entirely unsuitable for making metallurgical coke have been successfully used; for example, the unwashed coals of southern Illinois.

To use these hitherto unsuitable coals successfully it is necessary to make a careful study of the coking qualities of each one in order that any deficiencies it possesses may be supplied by the proper selection of the coals forming the mixture. Very satisfactory furnace results have been gotten when using important percentages of coals heretofore considered unsuitable, and these results are encouraging on account of the progressive disappearance of the best of the coking coals now available. The distillation of coking of coal in closed retorts,

LARGE SEMET-SOLVAY OVEN PLANT AT DETROIT, MICH.

now generally known as byproduct ovens, was first introduced for the purpose of saving the several valuable products contained in the volatile matter of the coal, which were all destroyed in the beehive process. The advantages in the production of coke outlined above were not then realized. In fact it was often thought that a sacrifice of coke quality must be accepted in order that the byproducts might be recovered. Fortunately it has developed that the best oven conditions for the production of coke are, in general, the best for the production of byproducts also.

The composition of the volatile matter in bituminous coal is very complex and the changes through which these compounds pass during the process of distillation are also complicated. It is not appropriate here to attempt to trace out these changes or to discuss the method of formation of the ammonia, benzol or other byproducts. It is well known that only about one-fifth of the nitrogen in the coal combines with hydrogen to form ammonia, and that the remainder is found in the coke and gas.

Attempts have been made to obtain higher yields of ammonia by blowing steam into the coke, somewhat after the manner followed with the Mond producer, which recovers from three to four times as much ammonia, but none of these processes have been developed commercially. Higher coking heats tend to break down the combinations to their ultimate elements.

For example, the gas produced from high-temperature coking will contain more hydrogen and less marsh gas, and a larger volume will be produced of lower calorific value. When coking at very low temperatures, as in the production of "Coalite," practically no benzols are produced and the hydrocarbons recovered are of the aliphatic series. At high coking temperatures the tendency is for the toluol, the more complex hydrocarbon, to break down into benzol, and at very high temperatures the yields of both are reduced. The temperature conditions to which any particular particle of hydrocarbon is submitted in its travel from the original piece of coal up to the hydraulic main are so complicated and so varied that a theoretical discussion of these reactions would be of little value to the coke manufacturer. The gases passing off from the oven are heavily laden with various hydrocarbon vapors and with water vapor and consequently carry a large amount of latent heat. So the cooling of the gas and the condensation of the vapors require efficient condensing apparatus and large amounts of water. The gas-works manager of early days used to deal gently with his gases in removing the tarry vapors and cooled them very slowly in order to prevent their taking up the benzols from the gas, with injury to its illuminating power, but in coke-oven practice this precaution is not considered necessary.

Much improvement has been effected in the efficiency of the condensing apparatus since the early days of the tubular cooler, in which the gas circulated around the tubes of an apparatus similar to a vertical boiler, while the cooling water flowed through the tubes on the countercurrent principle. I have in mind one single-stage condensing apparatus 10 ft. in diameter and 45 ft. in height of effective cooling surface in which 12,000,000 cu.ft. of gas per day is cooled on the average from 80 degrees to 20 degree C.; in which the cooling liquor enters the apparatus at a temperature 5 degrees below the exit temperature of the gas, and leaves it at not more than 10 degrees below the entering gas temperature. In such an apparatus very little condensate separates from the gas at a low temperature, and as a result the benzols remain in the gas and the separation of tarry matter from the ammonia liquor is sharp and easily effected.

A small quantity of the lightest tar vapors remain in the gas with the benzols. These may be removed by some efficient form of the old Pelouse and Anzin tar extractor, or where the gas is washed with water to remove the ammonia in the indirect process of ammonia recovery, these light tars are efficiently washed out. An efficient system of removing these light tars in a high-tension electric field has been developed by F. W. Steere, the plan adopted being similar to that used in the well-known Cottrell system, except that the special conditions permit the use of an alternating current of the necessary high voltage, since the problem is merely the agglomeration of the minute globules of tar to permit

their effective removal by tar extractors of the usual type. This process has been worked out commercially and is simple and effective.

One of the interesting developments in the operation of byproduct ovens in connection with steel plants is the growing use of tar as a fuel for metallurgical furnaces. I have in mind one plant producing over 20,000,000 gal. of tar per year, in which the entire amount has for years been utilized as fuel in open-hearth and heating furnaces, where its value as fuel is much higher than its value in the ordinary tar market. Generally speaking, the tar used in steel furnaces is handled in the same manner as ordinary petroleum fuel oil, having about the same viscosity, and its use presents no difficulties after the details of its application have been worked out. It has a higher fuel value per gallon than ordinary petroleum fuel oil.

It was formerly the universal practice to extract the ammonia from coke-oven gas by scrubbing with water, which has a large capacity for absorbing ammonia at moderate temperatures. This was the old gas-works method, and the processes as used in oven plants are the same except as modified to meet the conditions of large volumes and efficient recovery. The ammonia is recovered by these absorbing processes in the form of a crude liquor, usually containing from 0.5 to 1 per cent. of ammonia.

This liquor usually contains practically all of its ammonia in the free state, whereas the condensate from the coolers carries considerable amounts of fixed ammonia, sulphate, carbonate, chloride and sulphide. After removal of the tar by decantation the combined liquors are distilled with steam, after setting free the fixed ammonia by means of lime, the product being the crude ammonia liquor of commerce. In other plants the vapors from the still are passed through a sulphuric-acid bath and sulphate of ammonia is formed.

The so-called direct and semi-direct processes for the manufacture of ammonium sulphate have been very generally applied to oven plants in recent years. The direct process requires only the removal of the tar from the gas without any more cooling than is necessary for this purpose, after which the gas is passed through a bath of sulphuric acid and the sulphate recovered. The direct process has been applied to a considerable extent in Europe, wherever the percentage of chlorides in the coal is small, but where the amount of chlorides is relatively large it is necessary to remove them before the acid bath is reached.

This introduces the "semi-direct" process, in which the gas is cooled to remove the chlorides and then reheated and passed into the acid. The fixed ammonia condensed out in the cooling process is distilled and generally the ammonia from the stills is returned to the gas before it reaches the acid bath. The percentage of ammonia that has to be distilled in the "semi-direct" process depends upon the amount of fixed ammonia in the gas and varies from 15 to 40 per cent. of the total ammonia.

Sulphate of ammonia was formerly the only source from which pure ammonia in the form of *aqua ammonia* or anhydrous ammonia was produced. This process consists in the distillation of the sulphate of ammonia using lime to free the ammonia from the sulphuric acid,

BLOCK OF BYPRODUCT OVENS WITH THE PUSHER BY WHICH THEY ARE DISCHARGED

BETHLEHEM STEEL CO.'S SEMET-SOLVAY BYPRODUCT OVEN PLANT AT LEBANON, PENN., COMPRISING 90 UNITS

the small amount of hydrocarbons remaining in the sulphate being removed by charcoal filters or other similar means.

If anhydrous gas is to be produced the gases in the top of the still are dried by means of quicklime or other desiccating material, and the pure gas is then compressed and pumped into the steel cylinders so familiar to the trade. *Aqua ammonia* is produced by absorption of the pure gas in distilled water. This process is essentially a simple one, but the purification of the ammonia gas and the necessity for providing against the blocking of the apparatus by accumulations of calcium sulphate scale somewhat complicate the work.

In recent years by refinements in the distillation process it has been made possible to produce pure ammonia direct from the crude weak liquor and this product is quite equal in quality to that produced from ammonium sulphate as above described. These processes have the advantage of avoiding the waste of sulphuric acid inherent in the ammonium-sulphate process.

Effect of the War on the Ammonia Market

The war has introduced many unprecedented conditions to the ammonia producer. Before the war the price of sulphate of ammonia varied, in general, between 2½ and 3c. per pound. Official quotations are now running from 7.25 to 7.35c. While these high figures do not represent the average of actual transactions, any more than the $55 per ton frequently quoted represented prices at which the pig iron of the country was moving last summer, yet they illustrate the unsettled conditions of the market. Recently the Government has asked for very large amounts of ammonia for war purposes, and this call for ammonia has introduced much discussion as to the best methods for producing it.

In times of peace the great bulk of the ammonia goes into sulphate for fertilizer purposes, and most oven plants have been built for supplying this product. The Government's needs have caused many inquiries regarding the changing of these plants to produce other forms of ammonia, but this is usually practically out of the question on account of the great time and expense involved. Large parts of the recovery plants would have to be entirely rebuilt in order to change the product. Fortunately there are several practical methods for the conversion of ammonium sulphate into ammonium nitrate, and the synthetic ammonia plants will soon have a large production directly available for this purpose. The total ammonia from all oven plants now built or building is estimated at somewhat over 130,000 tons of NH_3 per annum.

In the earliest European byproduct ovens the gas distilled from the coal in the coking process was not sufficient in amount to heat the ovens properly and had to be supplemented with solid fuel. As the efficiency of the heating increased, the surplus, which was rather unreliable, was utilized for raising steam. As the supply became still larger it began to be introduced as one of the regular sources of fuel in metallurgical and manufacturing plants.

Oven Gas Used for Domestic Purposes

In America oven gas has long been used for domestic purposes, and now over forty important cities and towns are wholly or partly supplied with oven gas, and a number of years ago the daily sales for domestic purposes had reached 50,000,000 cu.ft. Europe has lagged far behind America in this application of oven gas.

Since the first introduction of byproduct ovens into America many experiments have been made in the use of oven gas for metallurgical furnaces, and several experiments have been recorded describing unsuccessful efforts to apply it to open-hearth steel furnaces, although it has long been used in heating other furnaces, soaking-pits, etc. During the last few years, however, the whole subject of using oven gas in openhearth furnaces has been successfully worked out, and it is now in regular operation in several important steel plants. Since the benzol is now generally extracted from oven gas, it is usual practice to burn a certain amount of tar with the gas to give it luminosity and higher radiating power.

From 12 to 16 gal. of tar, together with from 8000 to 8200 cu.ft. of gas, the quantity depending upon its calorific value, are required per ton of ingots produced, and it is found that furnaces fired in this way can be depended upon to produce from 10 to 15 per cent. more steel than when heated with producer gas. These figures are based on work at stationary furnaces. On the basis of these figures it may be stated that the surplus gas and the tar obtained in the production of a ton of coke will furnish the necessary fuel to produce a ton of ingots from an open-hearth furnace. This statement shows how important as a source of fuel the byproduct oven is to a blast furnace or steel plant. Furthermore the value of the byproducts, other than the gas, should never be overlooked as a source of revenue.

Early in the development of the byproduct oven in America the principle of the separation of the richer portion of the gas, which comes off during the early part of the coking period, from the leaner portion was developed in a practical way. The chart showing analyses of gas [appearing in a previous installment of this article] were made when the oven was coking at the rate of about 1.15 in. of width per hour. That chart shows plainly the progressive decrease in the percentages of methane and the progressive increase in hydrogen and carbon monoxide, as the coking proceeds.

The separation of the rich from the lean portion of the gas is probably not advantageous when the surplus is to be used for fuel purposes, as, of course, separation introduces some complications into the apparatus, but where a higher calorific value than the average is desired, the separation method is of great value.

Before the general use of the byproduct oven, benzol and its homologues, toluol and xylol, or solvent naphtha, were produced from the distillation of tar, which usually contains about 3 per cent. of these compounds. Now, the main source of supply is coke-oven gas, from which the benzols are scrubbed by bringing the gas into contact with a heavy oil of petroleum or tar. This process is usually carried on after the removal of the ammonia. The benzolized heavy oil is distilled to drive off the benzols and the heavy oil is cooled and returned to the heavy-oil scrubbers. The benzols are recovered in the form of a "light oil," containing usually about 60 per cent. of benzol, 12 per cent. of toluol, and 6 per cent. of solvent naphtha, although these percentages vary considerably with the details of the coking process and the light-oil recovery.

Before the war the light oil produced was used largely for enriching illuminating gas, and the refined products were employed in the manufacture of paints, varnishes and in other similar industries. At that time many plants were not equipped to recover light oil. Since the beginning of the war the enormous demand for the high explosives, picric acid and trinitrotoluol, familiarly known as T. N. T., has resulted in the equipment of practically all the plants in the country for the recovery of these products. It is estimated that the plants now built or building have a capacity of 101,500,000 gal. of light oil per year. For the production of these explosives the benzol and toluol have to be thoroughly refined by washing in sulphuric acid and by accurate fractionation, which processes require skillful supervision. The removal of the light oils from the gas practically destroys its luminosity, but the reduction in calorific value is relatively small, about 10 B.t.u. per cubic foot per gallon of light oil recovered per ton of coal.

When the demand for high explosives ceases after the war a large amount of the benzol now produced will probably be sold as motor benzol. This product is usually a mixture of benzol, toluol and solvent naphtha in the proportions in which it occurs in the light oil, and it is obtained by a comparatively simple process of refinement from the light oil. Motor benzol has a fuel value from 18 to 20 per cent. higher than gasoline, and may be used alone with the ordinary carburetor if a somewhat larger proportion of air is used, or it may be mixed with gasoline in any proportion. Pure benzol freezes at 5.18 degrees C., and toluol at—180 degrees C. No trouble is experienced from freezing, even in the coldest weather, when proper percentages of toluol or gasoline are mixed with the benzol.

The dye and color industry in the United States has greatly expanded during the war, and it will flourish after peace has returned if given proper Government protection. This will furnish a large market for benzol which is the raw material for aniline. Also it seems not improbable that trinitrotoluol will be widely utilized as an industrial explosive. It is claimed that it can be manufactured more cheaply than nitroglycerine, and as a commercial explosive it has many advantages over nitroglycerine compounds.

Trinitrotoluol is very stable and ignites only at high temperatures, and even then it does not explode. It does not freeze, as does nitroglycerine, and on many counts it has advantages on the side of safety and convenience. When used alone it produces large amounts of carbon monoxide; but this can be entirely prevented by combination with other bodies, such as ammonium nitrate for example, if these are added in proper proportion to produce complete combustion.

From the above brief discussion of the development of what has grown to be one of the important American industries, it will be seen that the byproduct oven has given this country something which is much more than merely a cheaper method of producing coke.

PLANT AT CLEVELAND, OHIO, WITH BLAST FURNACE ON LEFT AND SEMET-SOLVAY BYPRODUCT PLANT ON RIGHT

Should New Coal Mines Be Opened?*

By GEORGE S. RICE
Chief Mining Engineer, United States Bureau of Mines, Washington, D. C.

SYNOPSIS — *There has been no increase for several years in the number of men employed at coal mines, but a large increase in daily and yearly productivity, but this gain approaches a limit. The coal tonnage required per year is increasing, and the mines are continually being worked out. If no new mines were opened for two or three years the industry would cease to have the capacity for production necessary to supply the nation.*

DURING the coal famine of last winter an interesting and important question arose as to whether the opening and development of new mines should be discouraged, the purpose of those favoring the restriction being to save the large amount of labor involved in the construction and development of new mines. This action was urged because of the scarcity of labor and more especially because the existing mines appeared to have a greater capacity than the consumption of coal made necessary. The question was referred to me for my comments and led to a study of the statistics relating to the development and production of coal.

The essential results of this study are indicated on the accompanying chart, which illustrates, among other things, the increase in production and consumption, and the estimated maximum production capacity of bituminous coal based on data published in the "Mineral Resources" of the United States Geological Survey. It covers the period from 1900 to 1916 inclusive.

The following curves have been drawn from the data secured: 1. Average number of days that the mines worked. 2. Yearly total production of bituminous and sub-bituminous mines. 2*a*. Yearly production of machine-mined coal. 3. Average annual production, equivalent to consumption, for a period of 17 years. 4. Number of coal-mine employees for each year. 5. Estimated capacity of mines, on basis of 300 working days in the year. 6. Estimated drop in capacity if no new mines are opened.

Considering these curves and the data from which they were constructed, it will be noted that the average number of days the miners worked varied from 193 in 1908 to 234 in 1900, the average being 217. The reasons why there is such a large proportion of idle days to the total number of working days in the year are well known, namely: (*a*) Lack of business; (*b*) lack of cars. Taking the country as a whole, lack of business is the important factor and this might otherwise be viewed as being an excess of productive capacity.

The yearly production of the mines, which practically equals the consumption, has shown on the whole a steady increase. An average line has been struck which indicates that the average annual increase of production has been 18 million short tons.

*A written discussion on the article entitled "Review of the Coal Situation of the World" read by the same author, George S. Rice, at the New York Meeting of the American Institute of Mining Engineers, February, 1918, and recorded in Bulletin No. 133, Jan. 1918, pp. 131 to 141.

The number of employees steadily increased until 1910; then for the succeeding 6 years it stood practically still. Fortunately, however, there has been a steady increase in the individual daily output of the bituminous and sub-bituminous mine employees, from a low point of 2.94 tons per day in 1901 to 3.91 tons in 1915. There was an insignificant falling-off to 3.89 tons in 1916. This increase in the individual capacity is unquestionably due to the larger use of undercutting machines and labor-saving devices.

Curve 2a, which shows the production of machine-mined coal, indicates that there has been a steady increase in the proportion of coal so mined. It remains

1914	195	583,506	3.71	423	218	652
1915	203	557,456	3.91	443	243	655
1916	230	561,102	3.89	503	284	656

*If mines worked 300 days at same rate. (*a*) Statistics not collected for year 1909.

to be seen whether the mine employee will continue to increase his production per day as in the past. It has been alleged that the tremendous increase in the unit prices paid for labor has caused a drop in efficiency. If this is true, it may prevent any further increase in the daily output per employee and may militate against the increased use of labor-saving machinery. In this way the total production might conceivably be curtailed until additional miners and laborers became available.

In estimating the maximum capacity of the mines in which labor and mechanical equipment are factors, it is possible, assuming ample transportation facilities, to work the mines 300 days in the year. Some well-situated mines, especially mines owned and operated by railroads for their fuel supply, have done better than this, 310 days or over being reported. On the assumption that the rate of output for the days actually worked could be maintained for the remainder of the 300-day working year, curve 5 has been constructed. This indicates that the total possible productive capacity of the mines of the country rose steadily at the rapid rate of about 32 million tons annually, until 1910. From then to 1914 the rate of increase fell to 15 million tons, and for the years 1914, 1915, and 1916 it was practically stationary. In the chart I have assumed that it was practically stationary in 1917.

An attempt has been made to obtain figures for the number of mines which are worked out and abandoned

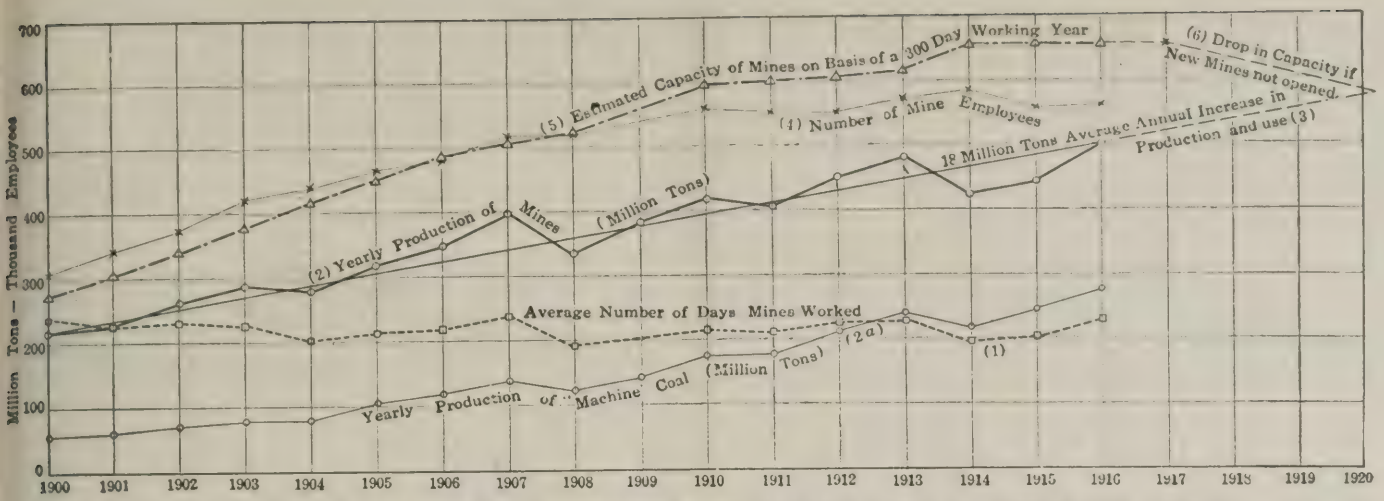

CHART SHOWING WHAT MIGHT BE EXPECTED TO HAPPEN WERE NO NEW MINES OPENED

each year but the statistics gathered have been considered unreliable. In order to arrive at certain approximate results, I have had to make an assumption of the average life-time of a bituminous coal mine. From my own experience, and that of other mining engineers whom I have consulted, the assumption has been made that the average life-time is 20 years. If this is true, then one-twentieth of the mines are worked out and abandoned each year.

The Geological Survey compiled the number of mines, and the outputs for mines of different sizes from 1909 to 1914 inclusive ("Mineral Resources"). This compilation shows that the output of mines producing over 10,000 tons annually was over 98 per cent. of the total production of the United States. The number of such mines and their output is as follows:

Year	Number of Mines with Outputs Over 10,000 Tons Annually	Total Output, Million Tons	Average Output per Mine
1909	3,721	371.6	100,000
1910	3,909	419.7	107,000
1911	3,810	397.9	104,000
1912	3,977	443.0	111,000
1913	4,027	471.3	117,000
1914	3,916	415.3	106,000

In 1913 the number of these large mines reached a maximum. If 5 per cent of the mines were worked out every year then we are justified in assuming that 201 mines, producing 23 million tons cease production annually.

Extending the line (curve 3) representing the average annual output to 1917, figure for the total output during that year is obtained, namely 520 million tons, 5 per cent. of which is 25 million tons. This amount must be made up by the opening and development of new mines. In addition to this enough new developments must be made to provide for the natural increase in consumption, which as has been shown has steadily increased for 20 years at an average rate (see curve 3) of 18 million tons per annum. In other words, to maintain the margin of capacity over consumption enough new mines to produce 43 million tons per year must be opened in 1918 and the number of new mines opened per year must increase during the years that follow. From the foregoing it is clear that at present 400 new mines are needed per year to take care of increased consumption of coal and the exhaustion of mines now in operation.

Assuming that the maximum capacity of all the mines on a 300-day basis was the same in 1917 as in 1916 (the capacity for 1914 to 1916 inclusive apparently being stationary), and assuming that no new mines were opened after Dec. 31, 1917, then the line 6, which indicates a drop in capacity of 25 million tons per annum, would intersect the extended average consumption line 3 in 3 years, or at the end of 1920. As a matter of fact, it is probable that the estimated maximum capacity indicated on the chart could never be quite reached, on account of transportation difficulties. Hence, if no new mines were opened after Dec. 31, 1917, it is probable that inside of 2 years, or by the end of 1919, the consumption would have to be curtailed by reason of the decrease in the capacity of the mines now shipping.

Fortunately, however, the situation was appreciated, and I understood that no legal restrictions have been placed on the opening of new mines.

Alabama Coal and Coke Production in 1917

In the following tabulation is shown the Alabama coal and coke production by counties for the year 1917 as compared with 1916. The data were furnished by C. H. Nesbit, chief mine inspector of the State of Alabama.

COAL PRODUCTION IN ALABAMA DURING 1917 AS COMPARED WITH 1916

County	1917	1916	Decrease	Increase
Jefferson	10,927,707	9,973,202		954,505
Bibb	1,507,669	1,507,141		528
Blount	381,777	329,693		52,084
Etowah	49,929	53,407	3,478	
Jackson	3,266	778		2,488
Marion	108,795	77,658		31,137
Shelby	791,405	609,369		182,036
St. Clair	842,750	771,992		70,758
Tuscaloosa	919,316	959,431	40,115	
Walker	4,839,289	3,926,752		912,537
Winston	40,938	25,202		15,736
Grand totals	20,412,841	18,234,625	43,593	2,221,809
Increase in 1917 over 1916				2,178,216

COKE PRODUCTION IN ALABAMA DURING 1917 AS COMPARED WITH 1916

County	1917	1916	Decrease	Increase
Jefferson	4,240,981	3,872,738		368,243
Etowah	127,542			127,542
Tuscaloosa	396,843	389,372		7,471
Walker	103,232	123,383	20,151	
Grand totals	4,868,598	4,385,493	20,151	503,256
Increase in 1917 over 1916				483,105

Zone Plan Working Well

The zone system is functioning better than had been anticipated. The comparatively few mines which have been affected adversely have been relieved promptly. There is abundant proof that the system is elastic and that modifications developed in practice can be made quickly. The plan is being well received by operators. The Fuel Administration and the railroad management are acting in entire harmony. The railroad administration, which really had an important part in the development of the plan, seems to be more than willing that it should be regarded as purely a Fuel Administration project, with the latter organization getting all the credit and incidentally all the blame for its proper operation.

One of the difficulties which have to be overcome is that many retailers and consumers, who have been cut off from their previous sources of supply, do not know how to proceed in establishing new connections. In order that such arrangements may be made in the most advantageous way, the district representatives have been instructed to pay particular attention to lending assistance of this character. All the license cases have been acted on and work began Apr. 16 with a clean slate.

Under an order modifying the zone system of bituminous coal originating on the Pennsylvania R. R., Monongahela R. R. and Huntington & Broad Top Mountain R. R., and their short line connections, in the States of Pennsylvania, West Virginia and Maryland, when routed via the Pennsylvania R. R. is embargoed from Baltimore and Washington markets.

To meet this situation, the United States Fuel Administration will arrange for the essential supply to the points designated from mines on the Baltimore & Ohio R. R., the Western Maryland R. R. and their connections, which lines afford a much more direct route to these points. As a consequence, a vast amount of time and mileage will be saved to the Pennsylvania lines, thus assuring an increased movement of coal to points in eastern Pennsylvania, New Jersey and New England.

Consumers of the classifications named in Preference List No. 1, of the Priority Board, will receive coal in preference to any other individual or class of consumers.

Under the modified order, which will become effective on Apr. 20, producers in the sections named will be prohibited from selling, shipping or distributing coal to dealers and consumers at Washington and Baltimore and at all stations on the Baltimore & Sparrow Point R. R., when routed via the Pennsylvania Railroad.

The order forbids the shipment of bituminous coal over the railroads named for railroad delivery or transshipments to vessels in Baltimore, at President St., Highlandtown, Jackson's Wharf, Calvert, Bolton, Frederick Road and Gwynns Run Station, and points of delivery between any two of such stations; all stations and points of delivery on the Baltimore division of the Pennsylvania R. R. from Loudon Park, Md., to Catonsville, Md., inclusive, and Arbutus, Md., to Washington, D. C., and Rosslyn, Va., including Popes Creek branch running from Bowie, Md., to Pope's Creek, Md., inclusive.

Consumers located on the Pennsylvania R. R. and Baltimore & Sparrow's Point R. R. will continue to receive their coal at their regular points of delivery, the coal moving via the Baltimore & Ohio and Western Maryland being delivered to the Pennsylvania R. R. at junctions near destinations.

Railroad Fuel Situation

While a deadlock exists in the railroad fuel controversy, the Fuel Administration gained a great advantage last week when the President, himself, ruled out assigned cars. From the developments of the week, it is apparent that the Fuel Administration is determined to stand by its contention that coal must be sold to all consumers at the same price. The price-fixing policy has been conducted on that basis. The purchasing agents of the railroads, however, are not willing to relinquish the advantage that they hold in being large consumers and are insisting that they get coal at the lowest price they can squeeze from the operator.

Finding that the Fuel Administration is an obstacle of consequence to the carrying out of this plan, the railroads have stated their willingness to purchase coal at cost plus 10c. a ton. There was a rumor current in Washington last week that this proposal came from the President after the matter had been laid before him. The rumor proved to be unfounded, however. It is generally understood that it was the President himself who insisted that the prices fixed on various commodities are to be the same to the Government and to the public.

One effect of the activities of the Fuel Administration in this matter has been to bring to its support many of the operators who have been antagonistic to it. In fact, the confidence of operators generally in the Fuel Administration has increased.

The action of the railroads in withholding purchases is having an untoward effect on the general fuel situation. Every effort has been strained to remove doubt

and uncertainty during the new coal year. It now has come to be generally known that the price regulations are not going to be revised downward and, as a result, one of the confusing uncertainties of the last coal year has been removed. It is a cause of deep regret at the Fuel Administration that the action of the railroads should have injected a new uncertainty into the fuel situation.

Weekly Production Statistics

A drop of 14 per cent. in the bituminous coal production took place during the week ended Apr. 6. Telegraphic advices indicate that most of the loss was recovered during the week ended Apr. 13, but the production still will be under that of the week ended Mar. 30. The observance of Apr. 1, the anniversary of the enactment of the eight-hour law, is responsible for a portion of the poor showing.

Anthracite forwardings, during the week ended Apr. 6, totaled 32,232 cars, or 11,410 cars less than were forwarded during the week ended Mar. 30.

Beehive coke production declined 4 per cent. during the week ended Apr. 6, as compared with that of the week preceding. The total production for the week was 624,000 tons. Byproduct coke production totaled 466,324 tons.

Some Industries To Receive Preference in Coal and Coke Supplies

By instituting a priority policy in the supply and distribution of coal and coke, the War Industries Board has taken a step which will be far-reaching in its results. The priorities division of the War Industries Board has issued preference list No. 1. Speaking of this list, the Board says:

While the list speaks for itself, it is proper to say that the Board has not undertaken to classify any industry as nonessential or at this time to limit the quantity of fuel which any particular industry or plant shall receive. The Board has, however, listed certain industries whose operation is of exceptional importance measured by the extent of their direct or indirect contribution either toward winning the war or toward promoting the national welfare, and these industries will be accorded preferential treatment by the Fuel Administration in the distribution of coal and coke and also in the transportation of such coal and coke by the railroads.

This same plan will be followed in according preferential treatment to war industries and plants in the transportation of raw materials and supplies required by them in their manufacturing operations, so that they may not be delayed or hampered in complying with priority orders issued against them governing their products.

The following industries and plants are to be given preference in the matter of coal and coke supplies:

Plants engaged exclusively in manufacturing aircraft or supplies and equipment therefor; plants engaged in the manufacture of ammunition for the United States Government and the Allies; Army and Navy cantonments and camps; plants engaged in manufacturing small arms for the United States Government and for the Allies; plants engaged exclusively in manufacturing chemicals; coke plants; domestic consumers; plants manufacturing electrical equipment; plants producing electrodes; plants manufacturing explosives; manufacturers exclusively of agricultural implements and farm operating equipment; plants producing feed; plants producing ferro-alloys; manufacturers of fertilizers; plants producing firebrick exclusively; plants manufacturing, milling, preparing, refining, preserving and wholesaling food for human consumption; manufacturers of tin and glass containers and manufacturers exclusively of other food containers; gas-producing plants; plants manufacturing exclusively gas-producing machinery; plants manufacturing large guns; plants manufacturing exclusively hemp, jute and cotton bags; manufacturers exclusively of insecticides and fungicides; blast furnaces and foundries; laundries; plants manufacturing machine tools; mines; plants engaged exclusively in manufacturing mining tools and equipment; plants printing and publishing exclusively newspapers and periodicals; refineries of both mineral and vegetable oils; plants manufacturing exclusively oil well equipment; public institutions and buildings; public utilities; railways; plants manufacturing locomotives, freight cars and rails, and other plants engaged exclusively in manufacture of railway supplies; refrigeration for food and exclusive ice producing plants; producers or wholesalers of seeds (except flower seeds); ships (bunker coal), not including pleasure craft; plants engaged exclusively in building ships (not including pleasure craft) or in manufacturing exclusively supplies and equipment therefor; manufacturers of soap; steel plants and rolling mills; tanning plants save for patent leather; plants manufacturing tanning extracts; manufacturers of tin plate; plants producing exclusively binder twine and rope and manufacturers of wire rope and rope wire.

Regulations Covering Bunker Coal

To insure greater speed and a greater steaming radius, bunker coal is to be limited to the smokeless variety. Regulations governing bunker coal are as follows:

At Atlantic ports, north of Cape Hatteras, at which all tidewater coal is pooled and delivered through the Tidewater Coal Exchange, permissible bunker coal is specified as follows:

At Hampton Roads—Coal originating in the Pocahontas and New River fields which have been or may be classified by the Tidewater Coal Exchange for consignment to Pool No. 1 or Pool No. 2 at Lambert's Point, Sewall's Point or Newport News.

At Philadelphia, New York and Baltimore—(a) Coal originating in mines on the acceptable list of the United States Navy, which has been or may be classified by the Tidewater Coal Exchange for consignment to Pool No. 1.

b. Coal originating at mines on the New York Central R.R., on the Pennsylvania R.R. or any of their connecting lines, which has been or may be classified by the Tidewater Coal Exchange for consignment to Pools Nos. 9 and 10.

c. Coal originating at mines on the Buffalo, Rochester & Pittsburg R.R. which has been or may be classified by the Tidewater Coal Exchange for consignment to Pool No. 14.

d. Coal originating at mines on the Baltimore & Ohio R.R., Western Maryland R.R. or any of their connecting lines, which has been or may be classified for consignment to Pool No. 22.

At ports north of New York which receive their supply of coal from New York, Baltimore, Philadelphia or Hampton Roads, coal for steamship use is to be supplied from the permissible list as herein specified.

F. J. Herman has severed his connection with the estate of W. J. Rainey in order that he may give his full time to his work as chief assistant to W. S. Blauvelt, coke director of the Fuel Administration.

A deficiency in the supply of blacksmith coal has been reported to the Fuel Administration. Since producers are not allowed to make an extra charge for coal of this character, it apparently is not being loaded in sufficient volume to meet the demands.

It's our war and we must win it. Do your bit by buying LIBERTY BONDS.

THE LABOR SITUATION

General Labor Review

This week the main event to record is the telegraphic protest of the United Mine Workers on Apr. 13 against any further reconsideration of prices by the United States Fuel Administration on the ground that when prices are raised the mine workers become restless and when they are lowered many mine workers working at plants of inferior efficiency are laid off. Assuming that the first prices established by the Fuel Administration, in the hurry of the first days of its inception, were perfectly just, there is no logic in the establishment of new prices.

But the Fuel Administration admits that it did not have until now any costs of production from which it could adequately arrange a price schedule. Guesswork is now giving place to knowledge. The old prices were recognized as unscientific, but that mattered little when no coal was obtainable at the prices set. So long as all coal was sold on earlier contracts the prices of the government were a future menace or a pleasing prospect, as the case might be, but nothing more.

Union Complains of the Many Idle Days

This telegram of the United Mine Workers declared that mines in Iowa, Oklahoma, Missouri, Kansas, Colorado, Wyoming, Montana and West Virginia are working less than half time. It did not, however, explain just why this fact is more distressing in those states than in some others where the working time is as short, but it may be assumed that the union singles out these regions because it believes that the reason for this slow run is, in part, due to the prices which have been established for them. The telegram added that many large mines are actually shut down. It then goes on to say that the men are leaving the mines and "if this exodus of miners to other lines of employment is permitted to continue, even though full-car supply and the most satisfactory distributing facilities are provided later these provisions will fail to relieve the situation."

The communication then asserts that the miners are ready to dig all the coal the nation can possibly use and declares that they are "able and eager to break all records in coal production and distribution (sic?) if given the necessary facilities and coöperation." It goes on to say:

Declares Union Has Bought $2,000,000 of Bonds

"The best evidence of this fact is the record of production of 1917 under the most trying circumstances. The international, district and local organizations have subscribed for approximately $2,000,000 of the three Liberty Bond issues. We want to help with all our force in the present crisis—not hinder. But the outlook for an adequate coal supply is of such grave concern that we must, for the protection of the mine workers and as a public duty, call your attention to what we are constrained to believe is a menace to the hope of providing sufficient coal.

"Almost every day coal prices are changed in the whole or part of some state. Distributing agencies are annulled as they exist, or restricted, or so completely changed as to upset every stable calculation. Whenever the prices are lowered in any state the operators affected immediately ask for a hearing. This invariably results in decreased production until the operators' appeals are definitely determined. When prices are raised the coal miner naturally feels that he should receive a proportionate amount of such increase. This condition has created an unrest that nothing short of a stable, permanent price arrangement can satisfy.

"The coal miners feel that they have not had that degree of consideration in adjusting the affairs of the industry and the promulgation of policies that rightfully is theirs. Therefore we feel it our duty to ask of the Fuel Administration that a greater degree of consultation be given the half million of our members through the organization's representatives in order to promote the most efficient and effective coöperation."

In the anthracite region, especially around the Panther Creek Valley the miners are using coercion to induce every mine worker to buy Liberty Bonds. On Apr. 11 the mine workers at No. 10 mine of the Lehigh Coal and Navigation Co. refused to go to work till a German miner of their number had been induced to sign for the purchase of a bond. At No. 8 colliery a Hungarian, with a decidedly pro-German bias, who refused to buy a bond was compelled to do so and also forced to kiss the flag. The mine workers do not want any "Liberty Loan slackers," and are determined that at every colliery every employee shall buy a bond. At some collieries this aim has been fulfilled.

On Apr. 9 a small strike occurred at Young's Landing, near Pottsville, Penn., because the loaders at the Taylor culm-pile were required to do increased work without additional pay. The firm is loading culm for the New York City markets for admixture with bituminous coal. The men were receiving $2.40 a day for loading six 2-horse wagons with culm, the culm being hauled a short distance to the nearby freight station.

Malcontents Not Numerous in Hard-Coal Region

On Apr. 12 the Tridistrict Board of the United Mine Workers of America in the anthracite region met and issued an appeal to the mine workers to buy Liberty Bonds. The board took no action on the dissatisfaction in the Shenandoah field in relation to the increase in dues decreed by the international convention. The promise of an independent union does not seem likely to materialize. In the future the legal department of the United Mine Workers of America, of which Rogers Devers, of Wilkes-Barre, is head, will have the assistance of qualified physicians and surgeons in presenting testimony to the compensation board and referees.

There has recently been quite a general unionization of the Georges Creek field where William Diamond, former international statistician of the union is president. The men went on strike Monday, Apr. 16, for higher wages and recognition of the union. William Diamond was called to Washington, D. C., by H. L. Kerwin, the head of the bureau of conciliation and mediation of the Department of Labor.

Georges Creek Strike Ends in a Few Hours

The Government promised to adjust the differences and the Fuel Administration issued a notice that it would not treat with the mine workers while they remained on strike. As a result 2000 men returned to work early on Wednesday, Apr. 17, and 4000 more men during the course of the day. The strike involved not only the Georges Creek, but the Upper Potomac, region also. Among the more important firms affected were the Consolidation Coal Co., the Black-Sheridan-Wilson Coal Co. and the Davis Coal and Coke Co.

West Virginia has been quiet except for a strike at the Minden mine of the New River & Pocahontas Consolidated Coal Co., a Berwind-White affiliation in the New River region. The men at the mine struck because they objected to the assistant mine foreman, but the trouble has been finally settled through the State Department of Mines.

The Illinois mine workers are still endeavoring to Americanize those whom they suspect of pro-Germanism. Probably nothing so severe as lynching is purposed, but violence, like other vicious practices, feeds on its own fires. Prager's death, let us hope, and the action of the grand jury at Edwardsville, in presenting a true bill against five of Prager's alleged murders, leading among whom is Joseph Riegel, will subdue a spirit which should never have been allowed to arise. It is expected that the grand jury will indict some 40 others. It is generally felt that Prager was a better man than his tormentors.

The Marvel mines, of the Roden Coal Co., in Alabama recently had a partial suspension of work, but fortunately a temporary settlement has been reached and the mines are now operating with full force. H. G. Selheimer will act as umpire to consider and determine as to what should be done relative to the demands of the miners.

To turn to eastern Canada, a labor convention recently met in Sydney with delegations from all the various labor unions in the province of Nova Scotia. It instructed the executives of those unions to draft a bill to be presented to the House of Assembly for enactment. This bill will force corporations to recognize the labor unions of the men's choice.

In Alberta a strike occurred Apr. 9 among the men employed at the Federal Coal Mines near Lethbridge. The men struck to prevent the discharge of an Austrian agitator. The company refused to reinstate this man. The mine workers declare, and the manager denies, that the contract is violated by the discharge of this employee.

In Nanaimo, Vancouver Island, British Columbia, the Western Fuel Co. recently announced an advance of 50c. a day which took effect Apr. 16. The increase applied to all the 1500 employees underground and to the surface workers. The payroll is thereby increased some $20,000 monthly.

Salute the Flag or Quit the Work

No miner can enter the St. Louis & O'Fallon Coal Co.'s No. 1 mine in St. Clair County, Ill., without saluting the United States flag. Recently Thomas Simpson, a mine examiner, found a bottle in the mine which contained what seemed to be a dangerous explosive. When the miners heard of it they called a special meeting and adopted resolutions declaring that their loyalty was brought into question, and that it was their duty to demonstrate that they were loyal. To this end a committee was appointed to place a flag at the pit entrance and post a guard there to see that every man entering the mine saluted it. The resolution also called upon all employees of the mine, including in this unnaturalized men, to buy at least one Liberty Bond.

Belleville miners, in the same county, have voted that they will go no further with plans for the erection of a Labor Temple, on the ground that patriotism requires them to put into Liberty Bonds the money which would be needed for the erection of the temple. Employees of the Superior Coal Co., near Belleville, subscribed for almost $10,000 worth of bonds. One miner bought $1200 worth and several others took $500 worth each.

Even the Spirit Is Unwilling

The "jumpy" condition of the Illinois miners, due to a number of recent mine explosions, believed to have been caused by disloyalists, was shown when 450 men employed in three mines near O'Fallon, Ill., refused to work on Saturday, Apr. 13, on account of a "spirit message" received by one of the men, Elmer Birch, who is employed at the Taylor mine. This message came in the form of a telegram Saturday morning: "This is warning. Don't go to work Saturday thirteenth. There is an accident for you if you go. Don't think this is fun. Grandpa said there would be an explosion, and listen to this. Letter will follow. Mamma." It was sent from Kansas City, where Birch's mother lives. She is a spiritualist and the "grandpa" referred to is her deceased husband. When the 200 miners employed at the Taylor mine heard of the message they refused to work. Two hundred employed at the Yoch mine and 50 at the Angell mine heard about it and also refused to go down. Federal officials were asked to make an investigation.

An explosion in the Shoal Creek mine at Panama, Ill., which is situated in the Springfield district, occurred on Friday, Apr. 12, and caused such damage that the mine was temporarily closed. It happened before the men had entered the mine, and is believed to have been of I. W. W. origin. As already stated about two weeks ago a number of sticks of dynamite were found in the shaft, with a burned-out fuse attached. Since that time some of the miners have refused to return to work.

Battles Between Loyal and Disloyal

The recent lynching of Prager came as the culmination of a period of disorder and violence in Illinois. Most of this disorder was not of an extremely harmful character, but the authorities were always afraid that it might result in an outbreak, of which the state would be heartily ashamed.

It is probable that some of the "direct action" of the Industrial Workers of the World was caused as much by a desire for retaliation as from undiluted pro-Germanism.

IN BUYING A LIBERTY LOAN YOU ARE STARTING A BANK ACCOUNT. AND IN STARTING A BANK ACCOUNT YOU ARE STARTING TO GET SOMEWHERE. CLIMB ABOARD.

The men who were compelled to kiss the flag one day in abject simulation of Americanism may well have been the men who a few days following were seeking by violence "to break even" with those who tried to make them simulate a virtue that they did not possess.

A review of the events leading up to the lynching of Prager, which has brought apprehension both to loyal and disloyal, is for these reasons quite timely.

The trouble started at Staunton, Ill. The disloyalists were not satisfied with performing disloyal acts, but they tried to get the loyal men to pay for their disloyalty, and it was just there that all their plans went awry and turned a lot of quiet, law-abiding citizens into a mob with which they could not hope to cope.

Severine Oberdan violated the law and was put in jail and let out on bond. His friends took advantage of the fact that union meetings were not any too generally attended, and they voted away $100 of the local's money to defend Oberdan.

The loyal men, when they heard of the misuse made of the local's money, seized and tarred and feathered Oberdan and Metzen, his attorney. They then invaded the homes of the disloyal and made them kiss the flag and take an oath of allegiance.

Starting in this way, the disorder spread to Mt. Olive, Hillsboro, Nokomis and Gillespie. At Hillsboro a fatality occurred as a result of the general disorder, a band of "loyalists," early on the morning of Feb. 18, storming the home of Clifford Donaldson at that town, in search of a Socialist editor. Shots were fired and Donaldson, a naval recruit, received a wound from which he died the next day. Ernest Fath, a prominent young man, and Chief of Police Emory were wounded. The editor was not found. His effects were taken from his room in another building and burned. At Nokomis and Gillespie, suspected disloyalists were compelled to kiss the flag.

Loyalists Took Charge of Union Finances

As the Industrial Workers of the World were completely cowed, no attempt was made by them at the later meetings of the Staunton local to have the $100 paid which had been subscribed for the defense of Oberdan. The meeting was turned into a patriotic demonstration. All members of the union now in the service who had been dropped for nonpayment of dues were reinstated and the local agreed to keep up the necessary payments. The union appropriated $1000 for Thrift Stamps and assessed the members 50c. a month for the Red Cross.

On Feb. 18, 500 employees of the Citizens' Mining Co., at Springfield, seized Henry Martini, their superintendent, and his two sons, and escorted them from the mine to the courthouse and made them kiss the flag, because it was said Martini refused work to a man who had been discharged from the navy for physical disability, and told him: "If you wan't a job, you'll have to go to the navy for it." Martini strongly denied that he was disloyal and explained that the man was not employed because there was no vacancy in the blacksmith shop, where he had been employed before. He said he offered the man other work in the mine. The men did not work Feb. 25 and about one-third remained away from the mine Feb. 26, laying themselves subject to the automatic penalty.

Later the mine workers at Bingham and Mayville took up the cudgels against those they regarded as disloyal. At Bingham there was a free-for-all fight and six men were forced to kneel and kiss the flag. At Maryville, after a contingent of drafted miners had departed for the training camp, a crowd marched through the streets carrying a large flag and several persons whose loyalty was considered doubtful were compelled to kiss it.

But Miners Must Be Discreet as Well as Loyal

Both Governor Lowden and President Walker of the State Federation of Labor issued statements condemning the outbreaks. The Governor's statement was issued after he had been appealed to by Charles Enos, a Hillsboro miner, who said that he was loyal but had been driven away from Hillsboro. The Governor declared that mob rule would not be tolerated in any part of the state, even though it was in the name of loyalty. "If any man in any community is guilty of treason or sedition or any other crime," he said, "there are proper tribunals open for his punishment. They who take the law into their own hands at such a time are helping not our own cause but that of the enemy. Mob rule is mob rule, whatever disguise it wears."

President Walker, in admonishing union men to do nothing unlawful, said: "I again want to point out the danger of the precedents that are being established by mobs taking the law into their own hands, no matter what the motives may be, and to urge upon you in every community in the state to use your influence to keep these things from being done, for just as sure as day follows night, if these things are done by any of our members or any friends of the labor movement, the enemies of the humble toiler will use them now and in the future wherever possible to destroy our movement under the same pretext."

A survey made by P. M. Greenlaw, Secretary of the Fifth and Ninth Districts Coal Bureau, reveals that 23.9 per cent. of the miners in the districts are subject to the draft, on the basis of returns from 34 mines. Some weeks ago Greenlaw sent questionnaires to the mining companies. The 34 replies received show that in that number of mines 7804 men are employed and 1867 are subject. Of this number, 996, or 12.7 per cent., are in Class 1.

Successful Coöperation with Labor

District No. 25, the Missouri district, the home in the past of continual labor trouble, where both operators and laborers looked at one another with suspicion and dislike, has been recently the seat of a remarkable experiment in coöperation which has proved most successful. The credit is due largely to Wallace Crossley, the state fuel administrator, who felt convinced that it was his duty to speed both mine operators and mine workers in their work of producing coal.

On Dec. 14, he brought the representatives of the United Mine Workers of America and those of the Southwestern Interstate Coal Operators Association together. The aim of the mine workers in meeting with the operators was not to get more wages or more satisfactory working conditions, but to coöperate with the operators in the production of more coal and to seek a way of settling troubles with a minimum of disturbance to industry. They met with a will to peace and progress rather than with a will to disorder and disagreement.

War efficiency committees were provided at each mine. The Coal War Board makes general suggestions as to the manner in which the mine shall be conducted in the interest of safety and of efficiency of operation. It hears complaints and receives suggestions from the miners and operators. The war efficiency committees at each mine are composed of the mine superintendent and foreman and a committee of mine workers, and until recently they met weekly or more often to consider safety and production needs. The present slackness of operation, however, has made these meetings unnecessary.

As long as the mines were working, the mine workers who took part in such war efficiency committee meetings were paid for their time, the expenses being shared between the mine workers and the operators.

There have been many instances where the war efficiency committees successfully solved difficulties that might have resulted in serious conflicts, and it is certain that strikes have been prevented. As a result Missouri has been freer from strikes than at any prior period, the mine workers have been patriotic and loyal, and production has been maintained at a high level.

Much of the credit must be given to D. A. Frampton, the president of the district, who has worked zealously in promoting the aims of the Coal War Board, and it must not be assumed that activity on his part was unnecessary. There has been possibly as much scrapping as ever, but there have been few strikes.

Coming Meetings

Canadian Retail Coal Association will hold its 14th annual meeting Apr. 25 and 26, at the King Edward Hotel, Tronoto, Ontario, Canada. Secretary, B. A. Caspell, Brantford, Canada.

American Association of Engineers will hold its fourth annual convention May 14 in Chicago, Ill. Secretary, A. H. Krom, 29 South La Salle St., Chicago, Ill.

National Coal Association will hold a meeting May 8 at the Bellevue-Stratford, Philadelphia, Penn. Secretary, J. D. A. Morrow, 707 Southern Building, Washington, D. C.

Illinois Mining Institute will hold its next meeting May 23, 24 and 25, at Peoria, Ill. Secretary, Martin Bolt, Springfield, Ill.

What Doth It Profit a Man?

Germany is working, by every scheme that ingenuity can devise and money can put into operation, to make American workingmen traitors to their country in its hour of need.

What Doth It Profit a Man

if he sends his sons and brothers to the battlefields, and after he gets them there he betrays them to the enemy by stopping the industrial home work without which they can neither win nor escape?

The courses of nations—the lives of millions—are changed by very small events. Had the Monitor not been ready for the Merrimac exactly when she was, the Union fleet would have been rendered useless and the Civil War might have had a different ending. Had someone then succeeded in making serious trouble in a mine, a foundry, or a shop—had someone then succeeded in delaying transportation while the Monitor was under construction, what would have become of the whole Union fleet of wooden ships which was blockading the Southern ports?

Germany wants us to be unready or confused when a similar crisis comes.

Our whole nation is preparing for the turning point in this war which is to determine whether every man shall have a chance to work out his destiny, or whether he and his country are to become subject to the dictation of a Prussian group.

If we are not fully ready when the test comes it will be easier for German armies and German ships, German submarines and German aircraft, to kill the men that go out from your community to protect you and your rights.

Whoever from any motive delays work bearing directly or indirectly on the war will be an accessory to the murder of his fellow Americans.

Every strike in the United States, while this war is in progress, is a blow in favor of Germany.

What Doth It Profit a Man

—to increase his wages or decrease his working hours if by so doing he contributes to the victory of a nation that makes slaves of white men and scourges them as they work? The condition of the blacks in America before the Civil War was far better than the condition of the whites of Belgium who today are carried off like cattle, are overworked, underfed, beaten and, sick or well, must labor incessantly, often under the fire of their own guns.

What Doth It Profit a Man

—to aid a monarch who in this manner has shamelessly re-established the slavery of white men? The workingman in America who obstructs the cutting of wood, the mining of fuel, the weaving of cloth, the turning of wheels in factories or on rails while this war is in progress—he is helping the slave masters, the destroyers of civilization, the murderers of women and children.

What Doth It Profit a Man

—who has lived in a land of incomparable liberties, of advantages unparalleled in all the history of the world, to contribute by any act, however small, to the success of an autocracy to whom a common man is but a clod of earth? The workingman who stands faithfully by his duties day by day, allowing no person and no thought to get between him and an honest performance of his work, is rendering the highest kind of patriotic service to his nation and to his family.

What Doth It Profit a Man

—to sell his manhood, his self-respect, perhaps his soul, for a little selfish gain in such an hour? When life's services are measured up at the end, those who have faithfully labored through the war shall be entitled to their credit as well as those who have led the charges in battle.

What Doth It Profit a Man

—who wants to improve the condition of laboring men if he gains a little but in so doing prolongs the slavery of Belgian workingmen, who now cannot gain their freedom but by death, or through the victory of the Allies?

Stand by your work for your own honor and safety, for the safety and success of your fellow countrymen who go forth to fight, as well as for the sake of workingmen who are now in actual slavery beneath German slave drivers

What Is Needed from the Wage Earner

THE Third Liberty Loan has one powerful competitor, the Collector of Internal Revenue. Probably the loan would have been much bigger if William G. McAdoo had not realized that those who are paying phenomenal taxes, roughly four and a half billions of dollars, cannot buy Liberty Bonds at the same time, for the loan and the taxes together will reach the phenomenal sum of seven and a half billion dollars.

The bulk of the Third Liberty Loan must be carried by the untaxed and lightly taxed people of the country. Those who pay only a few per cent. on their yearly incomes may be classed with the untaxed so lightly will their burdens rest upon them. To all such the appeal is particularly pressing. Such people must not be content to buy bonds equal to 7½ per cent. of their yearly income, which would be their share if there were no taxation, and this for three reasons: First, because the larger incomes will be considerably hampered by large taxes; second, because more than three billion dollars is desired, and third, because in any voluntary collection of dues, loans or contributions, some supererogation is necessary to make up for the under subscriptions of the less liberally minded. It is for this reason that every wage earner who does not have special obligations at the present moment should feel it incumbent on him to buy bonds equivalent to 10 or 15 per cent. of his yearly income. This he should pay before the next loan is floated so that he will be able to do his duty again when the opportunity is afforded.

General Leonard Wood recently said that twelve million men were battling on the front in France. If the numbers are equally divided between Germans and Allies each will have six million men. The killing of a million Germans, which would be a tremendous victory for the Allies, almost more than they could hope for, and the arrival of a million or two Americans on the field will not turn the tide of battle.

If, as stated some time ago, and as seems probable from recent developments in the field, the Allies are much less numerous than the enemy, then the recent slaughter and the arrival of American troops will do little more than restore the balance. Looking at it from this point of view the case would be desperate were not the defense so much stronger than the offense. But this fact puts the final victory further off. We must look for a long war and for sacrifices far greater than we have yet faced.

In the past year we have spent on *our own* conduct of the war about four billions of dollars, about one-third of what we expected to spend. In the second year of the war now just commenced we shall be organized so that more can be spent. Perhaps we shall eventually reach such a state of efficiency that twenty billions will represent our capacity for warfare. When we do, the war will end but it is hardly possible that it will end before that time.

What's Wrong With the Mines?

AN INCREASE of 21 per cent. of fatalities in 1917 as compared with those in 1916 is a severe blow to our self-esteem, and not an easy one to explain. Certainly the increase in tonnage of 10 per cent. does not explain it.

The foreigner, on whose broad shoulders most of us delight to lay the blame for accidents, is surely able to prove an alibi. For is it not true that for some few years foreigners have not been coming across the water and entering our mines? A few Mexicans perhaps have joined our laboring forces, but surely few others made acquaintance with our mines for the first time during the past year. Probably at no time within a half century have our mines been operated by a larger percentage of Americans than today, and yet we are confronted with more accidents than ever!

Is it more general labor turnover that is the cause of the increase of accident frequency or is it the spirit of unrest, absent-mindedness or discontent? No one seems to know. A few facts about the relation of labor turnover to accidents are, however, timely and may shed some light on the subject. J. S. Herbert, of the Cambria Steel Co., speaking at the National Safety Council's Congress in 1917, said that he found that in the latter part of 1914 the accident record, which had been falling, began suddenly to mount, and the safety engineers were disposed to dodge the general manager till they could find out just why.

Investigation of the records showed that the new men, those who had been employed for less than 30 days, were 12 times as liable to injury in an iron and steel plant as the men who had been employed for a longer period of time. The breaking-in time broke the workmen. Till he had memorized the hazards and sensed the dangers of the plant he was 12 times as liable to accident as he was afterward.

This, then, is the naturalization which is mainly needed for safety—an introduction to the dangers of the plant. While the men who had 30 days of training in the specific dangers of the Cambria plant and in the perils of iron and steel plants in general had an average loss of time of 0.13 day per month, the men who had been at the plant less than 30 days lost on an average 2.41 days in the same period. The relative loss of time is 19 to 1. The accidents suffered by the new men, as just defined, were more serious than those from which the old hands suffered, for only 14 per cent. of the older employees who were injured went to the hospital, whereas 41 per cent. of the new men so injured had to receive hospital treatment.

Mr. Herbert was able to report that by helping the new man to accommodate himself to his environment the Cambria Steel Co. had cut the relation of the hazard of new men to old from 12 down to 6. Some plants, perhaps the Cambria Steel Co. also, have a man known as the "plant preacher." He takes the new man to his

work by the nearest route, shows him all the dangers on the way and the perils of the work, and tells him that the company has an interest in his safety and welfare.

In contradistinction to this kindly method of treatment compare the method at some mines where the miner is told off to some other miner or a driver, to be shown the way to room 25 on the 16th left. All he is shown is his place. He has absolutely no introduction into the dangers of the mine.

Perhaps, as stated, labor turnover is not the source of increased fatality rate, but no one seems to know as yet what is the real cause. But in any case it would at least pay us to take a little more care with the new man and not leave his training to the spare moments of a foreman who is probably not a good teacher. Most of them are not skilled in the work and do not have the time.

The "plant preacher" is chosen, not for his power of getting work out of men or for directing operations, but for his power of visualizing the other man's needs and gaining his coöperation in safety and in other like matters. He is the employee's friend, not his boss. The difference is not in mere words, and his mediatorial work may well stave off many a difficulty as well as many an accident.

Expansion is the life of the royalty trade. The house of Hohenzollern has done some pushing in Europe. A LIBERTY BOND *bought now may act as a stone wall to their designs on America later on.*

Germany Never Was a Paradise

THE greatest propagandists of all times have been the Germans. No one could state a half truth or an untruth with more appearance of passionate conviction. In fact, like most deceivers they were probably themselves the most deceived. The most skillful of all Germany's press agents were those who had been long domiciled among us. Strange to say with some men, the more remote their connection with their fatherland or motherland—German or other—the more worshipful their regard becomes.

Those who never lived or worked abroad, and those who left many years ago have no touchstone of experience. They can believe all they please without restraint. They can magnify single instances into the broadest generalizations, and again, they can minimize a general condition into an unimportant instance, as the fancy pleases. The foreign country is like an earlier age, not an object of sense but of the mind; not something actually experienced, but something merely imagined.

It was these men, with a sort of nostalgic dementia, who thus idealized Germany, who misrepresented it to America, who made us confuse "kultur" with culture. The less they actually knew, the less their imaginations were hampered. It must be admitted that Germany really had the symbols of some extremely pleasing institutions, both political and sociological, as for instance, the symbols of a parliament, of a freedom of thought and utterance, of a farm-loan provision, of an old-age pension system, of unemployment insurance, of accident compensation and accident prevention, of model housing and so forth.

That they had the symbol and not the institution itself made it quite easy for the Germans in America, and especially for the children of Germans in this country, to think over well of their fatherland. It is not the intention here to take up political matters, but a few sociological facts presented by the League for National Unity are interesting.

Coal miners averaged $334 a year in 1907; lignite miners, $297; salt miners and salt workers, $309; copper miners, $271 and iron miners, $266. Yet in Germany the mine workers usually worked every day and for long hours.

The average invalidity pension was $46.51 a year—less than $1 a week. The average sickness pension was but little more, $48.45 a year. It was still as much less than $1 a week as eleven months is less than a year. The average old-age pension was $39.75 a year, about 76c. a week. Just imagine staying out of the poorhouse to starve to death on 15c. a day or 5c. a meal, not to mention, of course, rent and clothing.

But the pensioners had nothing to complain of. Compared with pensioned widows and widowers they were grossly overcompensated. For the aforesaid widows' and widowers' pension was $18.49 a year, or about 35c. a week or 6c. a day—just 2c. a meal without charges for rent or clothing. The average widows' sickness pension was $18.59 a year, and the average orphans' pension $19.07 a year. This in a country where the poorest paid adult needed at least $140 to $155 a year for the cost of the barest subsistence.

The German government certainly showed its efficiency in ducking its obligations to its more unfortunate citizens, who in America would have been far more adequately supported by the local authorities.

Until the beginning of the war the highly skilled workers of Germany worked 57 to 60 hours a week. In other trades 12 to 14 hours were the rule. Hours of labor in Germany, at least in 1908, were 10 to 12 per cent. higher than in England and 10 to 34 per cent. higher than in the United States.

As a result of the low wages women and children were more generally employed than is customary in the Anglo-Saxon countries. In 1914, before the war made the labor of women common, 7265 women and 51,290 children worked in the salt mines. In Berlin, according to Ambassador Gerard, 55 per cent. of the families live in one room. Workingmen quite usually live in a two-room flat, and in these flats are crowded four to six persons of the family and lodgers besides.

Germany is a land for the imagination to idealize and for the workman no place to live in. It never was a paradise for the workingman. When you see the citizens from a foreign land work hard, save money, live in narrow quarters, easily satisfied with conditions, enduring, persevering, you may be sure they come from a place where these qualities have become ingrained from long necessity. Without the severe culture of penury the virtues described would never flourish.

Don't TALK about winning the war. Help to win it. If you cannot fight, help the boys to do it. Feed them, cloth them, give them guns and shells. You can do this by buying LIBERTY BONDS.

DISCUSSION BY READERS

Loading and Shipping Clean Coal

Letter No. 2—Reference has been made, in *Coal Age*, to the shipping of an inferior quality of coal and the Daily Press reports plants as being compelled to shut down because they have been unable to raise steam with the coal sent them. In these anxious days when the conservation of transportation facilities means so much to the country, the shipping of slate and rock for coal is nothing more nor less than an act of treason.

While it would be unfair to charge this condition to dishonest shippers, there can be little doubt but that it arises from carelessness and a lack of mine discipline. A false sense of fairness to their miners, or a false sense of patriotic duty to speed up the production of coal, may have caused some operators to neglect the means necessary for the proper preparation of their coal for market.

It can be stated without hesitation that there are comparatively few mines in the country working under conditions that make it next to impossible to avoid the shipment of dirty coal. When due attention is given to the proper separation of coal from its impurities, by the miners at the working face, and the suitable preparation of the output of the mine for shipment, there is seldom any excuse for sending an inferior quality of coal to market. The trouble can generally be traced to the miner. It does not take many miners, in an average size mine, to render the output of an otherwise good grade of coal almost unfit for market. A half-dozen men loading dirty coal throughout the day will destroy the quality of the entire output.

No Excuse for Shipping Impure Coal

In normal times, especially if the market is dull and competition keen, more attention is given to cleaning the coal and preparing it for market. This fact is proof sufficient that it is possible to give the same attention to the loading of clean coal, at the present time, when this is demanded for the welfare of the country instead of the reputation of the mines.

There are always some miners who cannot be reached except by the most drastic remedies. If not watched closely and made to suffer for the violation of rules, they will load dirty coal whenever opportunity offers. They are paid a high price today for every pound of coal sent to the surface, and there is good reason why they should perform their work well as a patriotic duty. On the other hand, the operator is responsible for permitting the loading of dirt and refuse with the coal. It is his duty to weed out these undesirable loaders, even though it may be found necessary to discharge half a dozen of them, which would show the company's determination to stop the practice in the mine. The loss of a few men in a mine will do less harm in the country's present crisis than to permit the shipment of an inferior quality of coal, which would tie up plants and factories and delay the sailing of ships from our ports.

Every mining official should be proud of the service he is in a position to render to his country in this regard. If a miner fails to consider his own interests or that of his family and persists in a practice that he knows is unpatriotic and wrong, any mine official can well afford to do without him. Let us then be true to the colors and serve the country the best way possible during the period of the war.

Thomas, W. Va. W. H. NOONE.

Safety in Shotfiring in Mines

Letter No. 1—The recent letters appearing in *Coal Age*, relating to shotfiring in mines, have set me to thinking in regard to some of the dangers attached to the work; but, first, I want to say a few words in regard to the enemy-alien miner and what he might accomplish when insufficient restrictions are in force in the mine where he may be employed.

In many of our mines, the miners are permitted to use dynamite in blasting. In such places, it would be a comparatively easy thing for a German sympathizer to allow small pieces of dynamite to get into his coal that he loads out of the mine. It is easy to imagine what damage these small pieces of dynamite would do when the coal is burned in the furnaces of a power plant or factory. The presence of the explosive would rarely be discovered when the coal is dumped into the chute and loaded for shipment.

There are other ways, however, that dynamite can get into the coal. For example, when a miner fires a shot that is heavy at the point, he frequently employs the practice of placing a small piece of dynamite at the bottom of the hole, before inserting the charge of black powder. He uses for this purpose a low-grade dynamite and depends on the explosion of the black powder to set off the dynamite. This frequently fails, however, especially if the hole is not well tamped or the dynamite is slightly frozen. In either case, the unexploded dynamite is quite liable to be loaded out with the coal unnoticed.

Explosive Loaded With Coal Shipment

I recall an extraordinary incident that happened some time ago when 12½ lb. of permissible explosive was loaded out in a miner's coal and escaped notice until it was observed in the railroad flat standing under the chute where it was being loaded. The explosive was scattered through the coal, and it was a difficult matter to recover all of it with certainty. Such accidental happenings would bring an enemy-alien miner under suspicion of committing acts of which he was not guilty.

The system of employing competent shotfirers to charge and fire all holes drilled by the miners appeals to me as the safest method to adopt, and is

particularly needful at the present time. Not only would this greatly reduce the number of accidents in blasting, but more and better coal would be produced for the same weight of powder burned. Most accidents in blasting occur from overcharging or improperly tamping the holes, and these are the results that come from allowing unskilled and reckless miners to shoot their own coal.

Undoubtedly, many questions would arise in the consideration of the employment of shotfirers. These men might require to be certified by examiners appointed by the Government. Competent shotfirers would have to be paid good wages, and it would be necessary for two to work together. The charging and firing of a large number of shots by shotfirers would require considerable time. Two men could probably charge and fire, say six holes an hour, or 48 holes in an 8-hour shift. One advantage that would result in this slow rate of firing would be that the mine atmosphere would never get so hot as to invite an explosion.

Assuming that two men could charge and fire 48 shots in an 8-hour shift, and that each shot would blow down 5 tons of coal, making a total of $5 \times 48 = 240$ tons; and, say the shotfirers were each paid $6 a shift, the cost of firing the shots would then be $1200 \div 240 = 5$c. per ton of coal broken down.

It would be interesting to hear from others who are in charge of work where the shots are all fired by shotfirers, after the men have left the mine, and to learn the details of how the work is performed and how the shotfirers are paid. Does this system increase the cost of production, or is the expense of firing the shots charged to each miner, according to the number of holes fired in his place?

Shelburn, Ind. R. J. PICKETT.

What Caused the Explosion?

Letter No. 1—I have read the inquiry of "Fireboss," *Coal Age*, Apr. 6, p. 645, asking for suggestions as to the possible cause of the explosion that he has described as having occurred in a mine that was not known to be producing gas, and which had been idle for a period of two months previous to the event of the explosion.

It is stated that no one was in the mine at the time, and the cause of the explosion is therefore a mystery. The mine is said to be a drift opening, having a shaft 32 ft. deep, located a short distance back from the entrance. It is further stated that the ventilation was wholly natural, there being no fan or furnace.

I agree with the suggestion in the editorial note that follows this inquiry; namely, that there was sufficient gas generated in the mine to have caused quite an accumulation in the workings, during the two months of idleness, inasmuch as the mine was not ventilated except by natural means. The amount of gas might be very small and escape detection by the lamp; and, yet, when the mine was not working this gas could easily accumulate so as to form a dangerous body of firedamp.

In addition to the suggestion made that this gas was ignited by a fall of roof, I would like to say that another possibility is the existence of a gob fire somewhere in the workings. It seems to me that this is a more natural cause of the ignition of the gas.

Let me say, in this connection, that no mine should depend on natural ventilation as the only means of circulating an air current and keeping the mine free from gas. Had this mine been ventilated by a fan, I venture the remark that there would have been no explosion. I shall hope to hear the expression of opinion from others. OSCAR JONES.

Worley, Ky.

Surveying and Mapping

Letter No. 6—From the letters that have been written on this subject, it would appear, as F. C. Sanner has already suggested in his letter, *Coal Age*, Mar. 16, p. 517, every engineer will prefer that method with which he has long been familiar and which he considers best adapted to his use. All will agree, however, that an accurate and complete map of the inside workings of a mine, showing, besides, the surface improvements and physical characteristics of the tract, is one of the primary necessities of every well-managed colliery.

Speaking of an accurate and complete map, I do not refer to such apologies for maps as are in use at some mines, and which show nothing more than an approximate outline of the main workings, together with the various haulage roads and airways on which is marked the direction of the air current.

MINE MAPS SHOULD BE COMPLETE AND ACCURATE

Many coal operators do not see the advantage of going to the expense of making a complete map, which in time cannot fail to prove a great source of satisfaction and avoid many mistakes that would otherwise be made in the planning of the workings. A mine map may be accurate and yet incomplete. I do not wish to be understood as decrying an accurate map of this kind, since it is far better than no map at all.

The point I wish to urge is that a mine map to be of the most value must be a complete history of the mine and show the progress of the work done year by year, giving the date of each survey of the working face and showing the thickness of the coal and the elevation at different points of the seam. This will enable the manager, superintendent, or other official to observe at a glance the work that has been done from time to time.

HOW A MINE SURVEY SHOULD BE MADE

Allow me, then, to outline briefly the manner of making a good mine survey, which should be commenced by traversing the entire property so as to accurately locate all boundary lines and such physical features and surface improvements as will be of interest in the future development of the property. This survey should include the accurate location of all prospect boreholes or shafts, and show the position of any streams or other bodies of water on the property.

The surface survey should be carefully connected with the nearest section corners or other monuments, in order to enable the notes to be correctly plotted in relation to the land lines and other properties. The same survey should then be carried into the mine so that the survey underground will correspond or conform to the same meridian as that on the surface survey.

An important feature in making any survey is the careful establishment of a true meridian line, which must form the basis of this and future surveys. The instrument must be carefully adjusted before starting the survey. No reliance should be placed on the readings of the magnetic needle, which are merely used as an approximate check on the bearings of lines as determined by their azimuth or deflection angles.

The survey underground should be made by running the transit lines from station to station throughout the several entries and airways. The ribs of all entries should be carefully located by offset measurements taken at different points of the transit lines. The survey notes should show what pillars are being drawn back and what rooms are worked out and abandoned, so that when plotting the map from the notes it will be possible to show the exact condition of the workings in every part of the mine. It is often possible to tie the underground survey to that on the surface through the finding of a borehole that has penetrated the workings or an air shaft. Such an opportunity to check the accuracy of the surveys should never be missed.

Let me say, in closing, that inaccuracy in the surveying and plotting of underground workings is not excusable. Not only may an inaccurate map be the direct cause of a serious mine accident, but much valuable coal will often be lost. Millions of tons of coal have been lost beyond recovery, in the anthracite field, through the inaccuracy of mine maps that should have guided the operations of the mine. At times, I have observed mine pillars many times the thickness required for the support of the roof, while in other places they would be so small as to be crushed by the roof pressure and start a squeeze that would make it impossible to mine large areas of the coal. On the other hand, an accurate mine map means not only greater safety in the operation of the mine, but larger profits and a more complete extraction of the coal.

Kingston, Penn. MINE SURVEYOR.

Echoes from the Mine and Camp

Letter No. 1—How frequent are the complaints and grumblings that are heard from mine workers, owing to misunderstandings and lack of sympathy between them and their employers who operate the mines. It has occurred to me that this condition is largely due to the total ignorance of mine workers of the costs attendant on the mining, loading and shipping of coal.

To the average miner, the difference between the amount paid for the mining of coal and the price at which the coal is sold on the market is the clear profit, which he thinks goes into the pockets of the operator. He has no knowledge of the overhead charges in the operation of a coal mine.

Overhead Expenses in Operating a Mine

Miners seldom stop to consider the amount the company must pay for deadwork, in the mining of the coal; the wages paid to daymen, drivers, timbermen and trackmen; the salaries paid to the monthly men, both in the mine and in the office; the freight charges for transporting the coal to market; claims for shrinkage and loss in transportation; the expense of upkeep of buildings and equipment; and numerous other items involved in marketing the product of the mines.

It is safe to say that if the average miner were shown the monthly cost-sheet of the mine where he is working he would receive the greatest surprise of his life. At a certain small operation, for example, the cost of keeping the horses alone averaged from $500 to $600 a month; the expenditure for lubricating oil, grease, etc., was another $100, besides $1200 was paid a year for taxes and an almost incredible amount for mine timber, iron rails, bolts, splices and other mine supplies and electrical equipment.

Consider for a moment what the cost of mine timber may be with crossties 23 c. apiece, props 22 c., crossbars 46 c., with an additional cost of 29 c. for the labor of handling and putting in place. A little reflection, on the part of the miner, in regard to these manifold expenses, which I have hardly begun to name, would soon cause him to cease from complaining that he is not getting his share of the profits of the mine.

Rentals Barely Cover Expense of Upkeep

From the camp the complaint is often heard that the rent demanded by the company for the houses in which the miners live is exorbitant. The idea often prevails that these rents collected from the miner net the company a very nice income, whereas they barely suffice to cover the cost of improvements and repairs and yield a fair interest on the investment.

The welfare work conducted by many of the larger companies for the education, entertainment and betterment of its men is no small item of expense. The amount expanded for this purpose brings excellent returns but they are not such as can be classed as financial profits.

One frequently hears a miner's wife remark about improvements such as playgrounds, bath-houses, etc., "Oh yes, they are nice and we enjoy them, but the company can well afford to give them to us when you think of the money they are making." However, I am frank to say that this sentiment comes more frequently from the men, as the women who have the care of their children are more appreciative of any efforts put forth in their behalf.

Class Distinction Harmful to Success

Is it not true that too many coal operators treat their employees as belonging to what they term the "mining class," because their occupation in life is the mining of coal? In the same way, the occupation of the farmer determines the "farming class" and that of the common laborer the "laboring class." But, after all, these men are all more or less alike in their sensibilities and necessities. Because their occupation is different, does not make them worthy of less consideration. It is true that their education and habits of life may differ widely, but this places a larger responsibility on those possessed of greater advantages.

It is needless and unwise for operators to claim that the miner does not need more money, for the reason that he would not appreciate the changes made for him. Or, that he does not require better living conditions than those to which he has been accustomed, claiming that he would not appreciatethe changes made for his benefit. The better class of miners do like to own

their own homes and educate their children. They enjoy the same recreations and pleasures of life as their employers if these are placed within their reach.

In closing, let me say that greater progress would be made if we did not classify men and people according to their trades and occupations, in the sense that their desires, needs and sensibilities are different and call for different treatment. Let us strive to educate them to a higher plane of living, and not withhold from them the opportunities for improvement. The wage question would then not be so great a bone of contention as it is at the present time. M. P. H.

Mine Cars

Letter No. 6—I have been following with great interest the discussion regarding the change of mine equipment from plain to roller bearings for mine cars, which started with the letter of L. B. Paul, *Coal Age*, Feb. 16, p. 346, and would like to add a word or two expressing my own view.

The consensus of opinion among the correspondents who have referred to the letter of Mr. Paul seems to be that there is no objection whatsoever to installing roller-bearing cars, in either anthracite or bituminous mines, while there are a good number of plain-bearing cars yet in service. I presume that these writers all have referred in their letters to mines where the plain-bearing cars had been in use for some three or four years.

The saving effected, in respect to lubrication, etc., brought out in the several letters, is certainly quite remarkable and very interesting to me. The discussion has opened my eyes with regard to some points about which I was a little hazy before. I must say that looking at it from as practical a viewpoint as is possible, the mine that is operating with plain-bearing cars is simply wasting a great deal of energy that could and should be conserved. Either that or it is failing to produce the tonnage which it would otherwise be possible to produce.

In conclusion, allow me to say that these various letters have opened up a good field for discussion, and I hope that many other members of the mining fraternity will give us the benefit of their experiences.

Brooklyn, N. Y. J. R. STURGES.

Frozen Mine-Car Journals

Letter No. 1.—The short article that appeared in *Coal Age*, Mar. 30, p. 573, by Henry M. Payne, describing the method of overcoming the difficulty due to the freezing of the journals of freight cars in extremely cold weather, reminds me of my experience last winter when visiting the mines in western Pennsylvania.

At that time, my interests called me several times to the mines in that section, and I was greatly impressed by the serious delay in the operation of the mines, caused by the freezing of the journals of mine cars. At one operation, I counted at least 35 cars overturned at the side of the track, being thrown out of commission because they could not be moved on the track until they could be thawed out.

This trouble would not be so serious if the mines had a surplus of cars, which is not usually the case, however. At most mines the entire rolling stock is kept constantly in use, except such as are undergoing repairs, and where a few cars are thrown out of service, in the manner I have mentioned, the output of the mine is much reduced, which means a considerable loss of profits. This feature alone would seem to serve as a strong argument for the use of roller bearings on mine cars. If I am correctly informed, it is possible to lubricate a roller bearing with a lighter oil, as Mr. Payne says is the common practice in automobiling in winter when the heavy oil used is discarded for one that will flow more freely.

The advantage derived, in this respect, by the use of roller-bearings on mine cars was first brought to my attention by coal operators whose mines were equipped with such cars. They stated that, in the coldest weather, they had never experienced any difficulty from the freezing of journals and the operation of the mine had not been delayed by this cause for several winters past since the adoption of roller-bearing cars. To my mind that is an important consideration, since there must be no interruption in the movement of coal, from the working face in a mine to the tipple, if coal properties are to return dividends to their owners.

Washington, D. C. MAVERETTE ASHLEY.

Mutual Capitalizing

Letter No. 2—The largest joint meeting of employers and employees, in the history of the safety movement in Kansas City, was held Jan. 19, 1918, when 420 owners, managers and workmen in 75 industrial plants sat down together to listen to and discuss matters pertaining to their common interests. I could not help but feel that this was a practical illustration of the idea of the mutualizing of industries referred to and particularly urged with respect to coal companies in this country, in the excellent Foreword, in *Coal Age*, Jan. 5, 1918.

About 18 months previous to this meeting, 20 resident members of the National Safety Council organized a Local Safety Council. The movement received the hearty coöperation of the Kansas City Chamber of Commerce. Monthly meetings were held at noon in the various plants, when methods were discussed for promoting safety work and the prevention of accidents and fires.

THE FOREMEN'S "ROUND TABLE"

Probably the most important feature in this movement was the establishment of a "Foremen's Round Table," to which the superintendents, foreman and members of plant safety committees were invited. At first, the Local Council provided the program, by supplying a speaker and directing the discussion. A little later, however, the foremen assumed control, and the program of each meeting was based on the discussion of matters that seemed of the most importance to them. The interest greatly increased with each meeting, and all the foremen learned much from each other in regard to the practices in the various plants by which greater safety was insured.

While there are 70 plants in this city, an average of 20 of these was represented at each meeting, and, during the year, practically all the plants had been represented at different meetings. It frequently hap-

pened that the managers of some of the plants would come to the meeting, because they could not get away at the noon hour to attend the regular monthly meetings of the Council. This seemed to cause no embarrassment, however, on the part of the men who spoke freely on the subjects under discussion.

The fear of some employers that the Round Table might become a source of unreasonable demands for safety devices and hygienic improvements has proved to be ungrounded. There has never been a complaint heard at these meetings regarding the failure of an employer to provide the necessary safety appliances, although frequent reference has been made to the conditions existing in different plants.

To illustrate: At a discussion relating to toilet facilities, one foreman remarked, "Well, we've been up against this question, but some day we are going to have an entirely new equipment; and, until that time, we are going to keep the old equipment painted white. The men who have the right idea often speak to the other fellows who are careless and urge them in a friendly way to help in keeping things in good condition; so that we're doing fairly well." The men show their desire to coöperate with their employers by the use of the pronoun "we" in their discussions, which tends to give them a feeling of pride that they are part of the plant.

Joint Meeting of Managers and Foremen

This narration would not be complete without referring to a big joint meeting of the managers and foremen, which was held after the Round Table had been running about a year. This consisted of a banquet at which it was first thought about two hundred would be present. The interest was so great, however, that more than four hundred tickets were sold, members of the National Safety Council taking anywhere from 10 to 50 tickets to give to their foremen and Safety Committee chairmen.

The Committee on Arrangements had so distributed the men that representatives from different plants were seated at the same table, and the suggestion was made by the president, who presided at the dinner, that "everyone get acquainted with the men at his table," which all proceeded to do at once, shaking each other's hands across the board.

One of the speakers epitomized the situation by saying that "it is up to the foremen to see that plant operations are conducted safely and men kept at work without loss of time to themselves and the plant, through accidents to men or equipment." I have described this movement briefly in the hope that it would lead to similar movements equally successful in other places.

Kansas City, Mo.

Coal Production and Booze

Letter No. 8—No one can doubt, after reading the many letters that have appeared in *Coal Age* relating to the effect of booze on the production of coal, but that the drink habit among miners gives valuable assistance to the Kaiser and handicaps our Government in its efforts to win the war. Men working in and around the mines see the effect of booze every day.

Some time ago, one of the leading newspapers in the Wyoming Valley (Penn.) advocated the proposition that the court should regulate the hours when saloons could be kept open. The scheme was to compel the saloons to close from 10 p.m. until 8 a.m. every week day. It was hoped, by this means, to keep those miners who are controlled by the drink habit, in a fit state for work in the mine. The plan was favored generally throughout the valley, by mining men, who declared that the efficiency of mine workers would be greatly increased if this action should be taken.

Courts Petitioned by Societies and Churches

The courts were further petitioned by patriotic and fraternal societies and church organizations. In the little mining camp of Shickshinny, the Odd Fellows Lodge and the Patriotic Order of Sons of America unanimously adopted resolutions, asking the court of the county to refuse licenses for saloons in that camp, during the continuance of the war.

They urged this for patriotic purposes, stating that the little borough was practically a mining settlement and that, following payday at the mines and after holidays, it is practically impossible to operate the mines at anything like their full capacity, owing to the miners failing to report for work, because of their drunken state. It was stated that the two orders just mentioned represented about 85 per cent. of the men in the camp.

In response to these petitions, the honorable judge stated that he could not withhold licenses from the saloons when no complaints had been made by the operators of the mines. This fact would make it appear that what is needed is that mine operators should link hands with the better class of their men and, with them, petition the courts to close the saloons or regulate them in a manner that will not interfere with the steady and complete operation of the mines.

Coal Operators Strongly Urged to Do Their Part to Exterminate the Saloon

It goes without saying that coal production, everywhere, suffers from the presence of the saloon in the vicinity of the mine. No mine worker can do efficient work unless he is in fit condition, and this is not possible where his time and money are spent in the saloon, during idle hours.

Allow me to suggest, further, that coal operators would do well to follow up and advocate strongly the suggestion of Fuel Administrator Garfield, who gave warning of the possible revocation of the license of any saloonkeeper or bartender who sold drink to miners previous to their going to work in the morning.

Much can be done, also, in this direction, if mine foremen would impress on their men the fact that the saloon is a poor place for a miner to visit in his idle hours if he expects to hold the good will of his employer. In every mine, there should be the strict prohibition of drinking before and during working hours.

Let me repeat, here, that the Kaiser and booze go hand in hand. If the coal miner is, as the President has said, an important factor in the winning of the war, he must let drink alone and do his bit in support of the fighting men at the front.

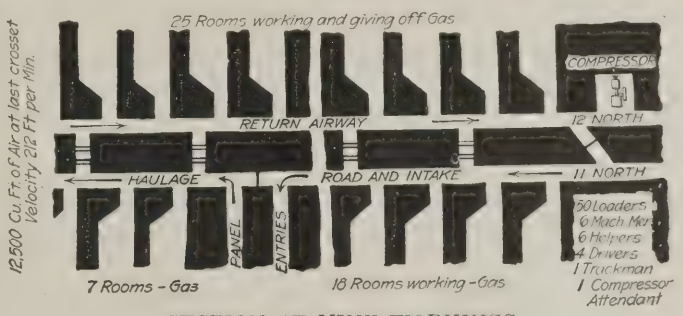
Kingston, Penn. Fred B. Hicks.

INQUIRIES OF GENERAL INTEREST

Air Compressor in a Gassy Mine

In our mine we have recently come face to face with a problem that has caused us some concern, and I want to ask the opinions and advice of *Coal Age* and its readers, in regard to a method that I have had under consideration for some time. I have hesitated putting the plan into operation for fear that the condition of the mine in respect to gas might invite disaster. The situation is becoming urgent, however, and it will soon be necessary to adopt a temporary expedient in order to maintain the output of the mine.

Ours is an old mine that was formerly operated by compressed air exclusively. The growing development of the workings decided us, some time since, in favor of installing electrical equipment, and the result is that we have at present ample electrical power. Not long ago, owing to the inadequacy of our compressed air installation to operate the coal-cutting machines in use at the face, the attempt was made to replace the air machines with electric coal cutters. It was then found that we could only get one machine in three or four months; and, as we require six machines to cut our coal, it became necessary to adopt some expedient that would tide over the difficulty.



The situation is about as follows: The air compressor located on the surface is of sufficient capacity to supply plenty of air to run the six Harrison coal cutters now in operation, if it were not for the extensive piping system that conducts the air from the compressor to the machines. Starting from the plant, there is 1500 ft. of 12-in. pipe followed by the same length of 6-in. pipe. From this point there are three branches, making from 1000 to 2500 ft. of 4-in. pipe leading to different sections of the mine, and 1¼-in. pipe is then used a short distance from the working face.

We have taken good care of this piping system, everything possible having been done to stop the leakage of air. After a close examination of the entire pipe line, I have concluded that in order to operate the machines with anything like efficiency, it would be necessary to replace much of the line and to purchase about 3000 ft. of 12-in. pipe. This, however, is plainly out of the question, as we shall soon abandon the air system.

Casting about for some way out of the difficulty, I have found that it is possible to exchange some of our pipe and other equipment for some small air compressors that have been in use in another operation and which can be run by electricity. The idea of making this exchange has interested me greatly, but there are one or two questions that must be settled regarding which I wish advice.

The accompanying figure shows the general arrangement of the workings, there being some fifty rooms working on the 11- and 12-N. The ventilation is sufficient for all present needs; but the fan is now working to the limit of its capacity, and it will not be possible to further increase the circulation of air. In the figure, I have marked the rooms as generating gas, although this is not the condition at present, but I wish to provide against trouble that may arise later. Today, there is not sufficient gas generated in the rooms to show a cap on a safety lamp, except when the face has advanced 40 or 50 ft. ahead of the air.

In connection with the electrically-driven air compressors mentioned, my plan is to locate these at a convenient point near the working face, which will save the great length of pipe line now required to conduct the air to the machines. By rights, the compressors should be located on the intake airway to avoid the possible ignition of gas in the return air. In the sketch, however, I have shown them on the return airway where

SECTION OF MINE WORKINGS

less difficulty would be experienced by reason of having to carry the pipe under the track on the haulage road.

There are close to seventy men working in this territory. The ventilation is sufficient at all times to keep the return air current below the explosive point when working under the present conditions. I would like to ask: (1) With the compressors located on the return airway, and compressing that air charged with some gas, would there be any danger of explosion? (2) With the compressor located on the intake airway, would this interfere with the necessary ventilation of the working faces by reason of using the intake current for the compressors and what effect would this have on the fan?

————, Ky. INQUIRER.

We cannot recommend the location of an electrically-driven air compressor on the return airway in this mine. While the return air may appear to be below the explosive point in the airway, when this air has been compressed to five or six atmospheres, especially if some dust is present, there is a grave possibility of explosion taking place in the compressor cylinders.

On the other hand, it can be stated that the location of the compressor on the intake airway would not interfere with the ventilation of the working faces, because the air compressed would again be released at the working face, after operating the drills. The effect, if any, on the fan would be to assist the circulation of air. This is a good question for discussion.

EXAMINATION QUESTIONS

Bituminous (Penn.) Mine Foremen's Examination, April 9-12, 1918

(Selected Questions)

Ques.—What observations should a mine foreman make during his visits through the mine and what should his written report of the same include?

Ans.—The mine foreman is responsible for the safety of the men employed underground. He must, therefore, be particularly observant of the condition of the roof and sides and the timbering in all working places and on the haulage roads and airways to detect any danger that may be present because of loose top, broken timbers or other causes. He must observe the manner in which the men are performing their work in mining coal, loading cars, or when otherwise employed.

The foreman must see that there is a plentiful supply of timber of the proper length and kind, in every working place. Where safety lamps are used, he must observe the condition of the lamps and the manner in which they are used. Where miners blast their own coal, the foreman must examine carefully the placing of the shots and note what explosives are on hand and the amount of powder charged in the holes.

The foreman must observe the ventilation of each working place and see that the air current is conducted forward so as to reach the face of the coal in sufficient quantity and with the velocity required to sweep away any gases that might otherwise accumulate. He must also see that all void or abandoned places are properly ventilated or sealed off. He must examine, from time to time, all stoppings, doors and air bridges to see that they are not leaking air and observe the breakthroughs and crosscuts made in rooms and entries to see that they are of sufficient size and made at proper distances apart. Finally, he must see that the mine is being operated, in every respect, in compliance with the mining law and note any violations of the mine rules and regulations.

Ques.—What are the economic and other dangers of creeps and squeezes, and what methods would you adopt to prevent them?

Ans.—From a point of economy, the occurrence of a creep or squeeze in a mine presents the danger of the loss of much coal or the use of a large amount of timber and an increased expense for labor in setting the same, or both. It often happens that there is a large amount of tracking, tools and timber lost when the workings take a sudden squeeze. There may also result considerable surface damage for which the company may be liable. There are, besides, the dangers to life caused by heavy roof falls and the possible emission of large quantities of gas located in the roof strata.

The best method of preventing a squeeze or creep is to leave ample pillars for the support of the roof, and avoid maintaining too large a standing area in the workings. Except in particular cases, all pillars should be drawn back as quickly as the rooms are finished. It is necessary, also, to adopt a method of working that will be adapted to the conditions existing in the seam, having due regard to the depth and character of the overlying strata and the kind of material underlying the coal, the hardness and thickness of the seam and its inclination.

Ques.—Suppose a workman was found in contact with a live electric wire and was rendered unconscious. State what steps you would take to revive him. Also, state your procedure in reviving a person found unconscious from noxious gases.

Ans.—Shut off the current or break the circuit at once, if this is possible. Throw an iron bar or other instrument of iron across the live wire, on the side of the victim toward the power plant, which will help to short-circuit a portion of the current. Without delay, if the ground is dry and likewise the patient's clothing, seize the latter and attempt to drag the person off from the wire. Do not touch the person's skin, and, in no case, stand on wet ground or handle wet clothing. Give one steady pull and avoid rocking the person to and fro, which will increase the shock and burn. It is safe to cut the wire on the side of the victim toward the generator, using a sharp dry ax and standing in dry ground.

After removing the victim from the wire, artificial respiration should be performed at once to restore the person to consciousness. Spirits of ammonia on a handkerchief or sponge passed back and forth near the person's nose will assist to revive him. He should be kept warm and every effort should be made to assist the circulation of blood in the body by rubbing the limbs toward the heart. This should not be done, however, until breathing is commenced.

To revive a person found unconscious from inhaling gas, he should be removed promptly to fresh air and artificial respiration applied. If the patient is conscious and able to swallow, give a half-teaspoonful of aromatic spirits of ammonia in a half-glass of water. In giving artificial respiration, the patient should be laid on his back with a coat rolled to form a light pillow placed under his shoulders. When he shows signs of breathing, the circulation of blood should be assisted by rubbing the limbs toward the heart. In all cases, send for a doctor at once while continuing to administer first aid.

Ques.—The cause of the greatest number of accidents being falls of roof, slate, coal, and sides, what methods would you enforce to reduce the accidents from these causes?

Ans.—Insist on the regular and frequent inspection of the working places and a systematic method of timbering. Enforce strict discipline in regard to the setting of timbers and see that the necessary supplies are on hand in every place. Insist on the spragging of the coal while mining the breast.

COAL AND COKE NEWS

Harrisburg, Penn.

The basic point in the proposition submitted by the coal operators of the anthracite region to the sub-committee of the civic bureau of the Board of Trade of the City of Scranton, for the amicable settlement of the mine cave question, is the appointment of a commission of three to administer a fund for the repair of cave damage, this commission to have absolute control of the fund.

The membership of the commission is to be composed of a man named by the coal companies, another by the trade board and the third to be selected by the first two. They are to be paid a salary large enough so that their entire time will be taken up with the work of administering the fund.

The fund is to be created, it is understood, by a voluntary tax on every ton of coal mined in Scranton and the surrounding towns. Every case of damage done surface property will be referred to the commission and its action in the case will be final as far as the administering of the fund is concerned.

The operators included in their proposition that they will repair all damages to properties of the city that have an assessed valuation of $5000 or less; the creation of the fund to be approximately $100,000 to repair damages to properties in areas where abandoned mine workings are located, this fund to be perpetual; the non-repair of damage to property of public service corporations; the repair of all city streets, sewers and conduits.

Birmingham, Ala.

In the mining sections of the Birmingham district the activity is regulated only by the labor available. There is need of men at all mines, and though there is no indication of a labor shortage the lack of ample help is noticeable. Second to the labor problem is the car shortage situation. While production in Alabama shows an increase, producers are raising a general complaint against the transportation facilities which are being offered them. Early relief is deemed essential by the producers to offset a serious shortage of fuel, and an urgent appeal has been addressed to the Federal Fuel Administration in an effort to bring about a change in conditions.

While some complaint has been raised in Alabama on the zone system of shipping, every ruling is being obeyed the local representatives of the Fuel Administration state. The complaint of producers centered upon the closing of a good market west of Memphis for the mines in the western part of Alabama, Carbon Hill, Corona and other places. It has been demonstrated to the Alabama producer, however, that a ready market awaits every ton of coal that can be produced in this state, and he is rapidly adjusting himself to the new state of affairs.

The coke ovens of the Birmingham Trussville Iron Co., of Trussville, have started manufacturing coke on an extensive scale, the coal being furnished from the Labuco mines in the western part of the county. The Central Foundry Co., which has extensive properties in Alabama at Anniston, Bessemer and Holt, including the Central Iron and Coal Co., at Holt, in its financial statement for 1917 shows after interest and taxes had been paid, the company earned $1,228,441, the business being the best of any year for the company. Its net working capital as of Dec. 31, 1917, was $1,888,687, or more than twice the present market value of outstanding bonds. In 1917 the company wiped out its floating debt of more than $500,000. The first mortgage sinking fund 6s, 1931, of the company are selling around 83½ to yield about 8¼ per cent.

Charleston, W. Va.

The increasing shortages in cars furnished the Fairmont field is causing the operators and even the Fuel Administration at Washington serious concern. Recently, of 150 mines reporting to the Central Coal Operators Association, 62 of the number were shut down, causing 5629 men to be idle and causing a loss in production of 39,910 tons. On some of the days during the recent week the supply has declined to 437 cars, or about one third of the number of cars needed, it being estimated that it takes about 1500 cars to supply the Fairmont District. Not only has there been a loss of production, but the loss of employment has caused serious hardship among the miners, causing intense dissatisfaction and having a tendency to disorganize the industry in the field affected. The union miners in Taylor County recently protested to the Director General of Railroads against the failure of the Baltimore & Ohio to furnish the region's proportional supply, calling attention to the fact that the region was 6000 cars behind the amount to which it was entitled.

The war program of the Government calls for so many more cars from the Fairmont region than has been supplied that a hurried conference was called and held at Baltimore between Vice President A. W. Thompson, of the Baltimore & Ohio; President J. H. Wheelwright, of the Consolidation Coal Co., and George T. Watson, general manager of the same company, at which plans were perfected to improve the present conditions prevailing in the Fairmont region. As a result of the conference the restriction of the Fairmont district to 700 cars East per day will be increased to 800. The plans worked out have the approval of the National Fuel Administration.

Coal mines in many sections have been forced to close down because of the inability to secure cars. Mines supplying fuel to railroads have been able to secure a far better supply of cars than mines having coal for purely commercial shipment. This discrimination has had the effect of making it possible for companies supplying railroad fuel to maintain their efficiency by keeping their organization intact while mines supplying commercial coal have found it difficult to keep their employees because they have not been able to keep them working regularly.

Dallas, Tex.

Regulations put into effect by the Federal Fuel Administration, at the request of Wiley Blair, of Dallas, Tex., Federal Fuel Administrator of Texas, are designed to increase the use of Texas lignite for fuel and thus release a large amount of coal for other and more imperative uses. The regulations include fixed maximum prices to be charged by the lignite operators. The fixed prices are as follows: Run-of-mine, $1.40, per ton; screenings, over ¾ in. screened with 15 per cent. of screenings deducted, $1.50 per ton; lignite screenings, 85c. per ton.

Before recommending fixed prices and regulations for handling lignite as a fuel, Mr. Blair employed Alex Cobden, of Fort Worth, an experienced coal and lignite man, to make a careful survey of the Texas lignite fields and mines in operation. This survey disclosed that the use of lignite for domestic and industrial purposes in Texas is rather limited, and Mr. Cobden assigned the following reasons:

1. Because of lack of knowledge of the most efficient method of combustion of lignite.
2. Difficulty of transporting and storing.
3. Ability of consumers to purchase fuel oil or bituminous coal in Oklahoma and Arkansas at about the relative cost of lignite and the rejection of the latter for the fuel with the higher heating efficiency.

The report of Mr. Cobden shows that the supply of lignite in Texas is enormous. In the United States it is estimated that there are 127,000 square miles of lignite territory, distributed in ten states, and of this total, Texas has 60,000 square miles, or 47 per cent. of the aggregate. Conservative estimates show workable beds in the state containing at least 17,000,000,000 tons.

The Texas Fuel Administrator declared that if lignite is given an even break with other fuels and its sale prosecuted vigorously and intelligently, there is no reason why the annual production should not reach 5,000,000 tons instead of approximately 1,000,000 tons, and the revenue kept within the state amount to $7,000,000 or more annually instead of about $1,000,000, the probable revenue from the output of lignite in Texas in 1917.

Comparative figures on cost of lignite and various kinds and grades of coal at various points in the state, which cost includes expense of unloading, firing and removal of ashes, show that Oklahoma and Arkansas screenings are 14 per cent. higher than lignite and fuel oil is 8 per cent. higher than lignite. These comparative costs, the Fuel Administrator says, demonstrate the economy in the use of lignite instead of coal, especially in view of the uncertain deliveries.

For domestic use lignite is not an ideal fuel, yet it is freely used in central and southwest Texas. Lignite can be used, however, in almost any type of furnace, although in some cases it may be necessary to change furnace grates to get better combustion and greater efficiency.

The heat efficiency of Texas lignite with the other steam fuels with which it competes are as follows: Texas lignite, 7500 B.t.u. per pound. Oklahoma and Arkansas screenings, 11,500 B.t.u. per pound. Fuel oil, 19,500 B.t.u. per pound. North Texas natural gas, 700 B.t.u. per cubic foot.

Texas lignite contains 25 to 35 per cent. moisture, which must be evaporated before the lignite will burn readily, and this consumes about 5 per cent. of its heat value.

Lignite operators in Texas now have 15,942 acres of developed lignite lands, and the average thickness of the lignite vein on this developed land is 7 ft. 4 in. It is conservatively estimated that the present operators possess approximately 148,000,000 tons of lignite, or about 8.7 per cent. of the total lignite in the state.

There are now thirty producing lignite mines in Texas, distributed by counties as follows: Bastrop County, 7 mines; Henderson County, 3 mines; Hopkins County, 5 mines; Houston County, 1 mine; Leon County, 2 mines; Medina County, 1 mine; Milam County, 6 mines; Robertson County, 1 mine; Titus County, 2 mines; Wood County, 2 mines.

The estimated total consumption of fuel in Texas during 1917 is as follows: Lignite produced in Texas, 891,116 tons. Bituminous coal produced in Texas, practically all consumed by Texas railroads, 1,197,972 tons. Fuel oil consumed by railroads, 9,100,000 bbl. Fuel oil consumed by industrial plants, 8,000,000 bbl. Natural gas produced in Texas, 13,323,747,000 cubic feet.

The lignite industry opens up a great investment field for Texas money, and companies are now being organized to develop some of the idle lignite lands.

PENNSYLVANIA

Anthracite

Wilkes-Barre—Marcin Urbin, a miner in the Bliss colliery of the Lehigh & Wilkes-Barre Coal Co., has been presented with a medal by officials of the company for having established a new record in individual mining. During the month of March, Urbin, who is 25, mined 350 cars of coal and 58 tons of rock. He worked every day, Good Friday included.

Mount Carmel—Two of the largest verdicts ever awarded by juries in Northumberland County have been sustained by Judge F. B. Moser in opinions filed on Apr. 13. Joseph Ford was awarded $11,636 against the Reading Coal and Iron Co. for the loss of his leg at the knee. Peter Sebastin, a miner, was awarded $6425 against the same company for permanent injuries to his spine and hips.

Bituminous

Uniontown—J. G. Carroll, referee in bankruptcy of the J. V. Thompson estate, recently confirmed the $6,000,000 purchase of the J. V. Thompson coal lands by the H. C. Frick interests. He dismissed all exceptions to the sale and directed that all mortgage creditors involved in the 12,000 acre deal be paid in full with interest. He directed that none of the costs should be borne by the mortgagees. Mr. Carroll directed that $3,200,000 of the purchase

price should be paid to the Thompson estate. The decision will be forwarded to the District Court of Western Pennsylvania for final confirmation.

Uniontown—Remonstrances have been filed in the Fayette County courts asking that all the liquor licenses be suspended during the war. It was pointed out that the coke operators in the county discovered this year that on account of the intemperance of the miners at Easter their output was diminished from 14 to 21 per cent. Police records of Uniontown, which has a population of 20,000, show that there were 5000 arrests for drunkenness made during the last year. There are now 54 retail licenses, 18 distillers and 9 brewers in the county. Two of the distilleries are not asking for renewals of their licenses, but there are three new applications for retail licenses at hotels.

Johnstown—A precedent is believed to have been established by Jacob Snyder, compensation referee in a decision rendered in the case of Mrs. Robert McTavish, of this city, in which he refuses to order the discontinuance of compensation granted for the death of her son, although she has remarried. Mrs. MacTavish lost a son as the result of an accident in a mine of the Pennsylvania Coal and Coke Corporation. Compensation was granted for 300 weeks at the rate of $2.71 a week. Mrs. MacTavish remarried a short time ago. The fact that the beneficiary remarried does not affect the compensation, Referee Snyder ruled.

WEST VIRGINIA

Edgwood—At a recent meeting the Council unanimously decided to prohibit the Fairmont & West Virginia Coal Co. from putting in a proposed sidetrack at its new operations here. It is not known what steps the company will take. It is claimed that if the mines are established in this district it would greatly decrease the value of surrounding property.

Clarksburg—A tract of Pittsburgh coal on the West Fork River, near here, has been bought by W. F. Bickman from Lauda Custer and others at the price of $1000 an acre. Several tracts of Pittsburgh coal have lately brought this price in this county.

Weston—A railroad siding will be laid and a tipple built at the farm formerly owned by W. J. Nichols, which has been bought by the Beckley Coal Co.

The Lynch Coal Co., of Berkeley, has recently acquired 700 acres of coal lands on the Baltimore & Ohio R. R. between Weston and Gaston, and is planning for the installation of the necessary machinery, including the construction of a grader tipple, for immediate development work.

Elm Grove—Work is to begin at once on the new tipple at the No. 1 mine of the Elm Grove Mining Co. The lumber has been on the ground for some time, and the contractor, P. T. Finnegan, will put a force of men to work on the structure at once.

The Century Coal Co. has already driven an entry into its coal field here and is taking out coal sufficient for its present needs. The large force of workmen required to carry on the work will necessitate the erection of a large number of houses during the coming summer.

Williamson—The Gray Eagle Coal Co. is preparing to tap the No. 2 Gas seam with a slope which it will soon sink.

A new tipple will be built and 3600 ft. of siding laid by the Wigarb Coal Co. as a preliminary step toward operating a mine at Goodman.

A new tipple of the Bailey Coal Co. at its mines on Pond Creek has almost been completed.

Beckley—Fifty-five new houses will be built and three-quarters of a mile of siding laid by the Ingram Branch Coal Co. of which C. H. Mead is general manager.

Clothier—The Boone County Coal Corporation, controlled by Philadelphia capitalists, has acquired the mines of the Coal River Coal and Coke Co., at Dobra, on Coal River.

KENTUCKY

Hazard—Frank Raney, of Raney & Denham, civil engineers, has been named superintendent of the Hazard-Jellico Coal Co., which was formerly operated at the Harvey Coal Co., with mines on First Creek. E. E. Denham has become engineer for the First Creek Coal Co. These coal properties have been taken over by Jouett, Biglow & Brooks, of Detroit, Mich., and have named E. L. Douglas, former manager of the Harvey Coal Co., as general manager of the combined interests.

ILLINOIS

Gillespie—Workmen have installed the tipple scales in the tipple at the Superior Coal Co.'s mine No. 4, a new mine. As soon as the main shaft is completed coal will be hoisted that way. From 300 to 400 tons are being handled now and a much larger production will be made when the tipple is ready for use.

The Coyne Drill Co. has begun testing operations half a mile north of here. If the results are satisfactory a mine will be sunk by a company which is being organized by G. W. Schmidt, S. M. Westwood, W. E. Schmidt and others. A new building addition will be laid out adjacent to the development.

Pana—An explosion in the Shoal Creek mine Apr. 12 wrecked the air shaft and the fan. It is believed to be the work of I. W. W. workers. About ten days ago ten sticks of dynamite were found in the mine, but the fuses had burned out without any damage being done. Since that time many of the miners have refused to work in the mine.

Toluca—The Toluca Coal Co., operated by the Jackson-Walker Coal and Mining Co., is installing improvements to cost $175,000, including steel tipples and modern power plants and mining machines. This will increase the tonnage from 1000 to 1800 tons a day. The same company is installing a new power plant at Marceline, introducing mining machines and crushers to crush all production for railroad purposes. The tonnage in southwestern Kansas, Frontenac, has been increased by reason of new mines from 2000 to 4000 tons and a further increase will be attained by fall, from openings of mines and development of present ones.

Farmersville—The ownership of the Farmersville coal mine is being investigated by the Government. When it was sold at receiver's sale several years ago it was bought by boadholders in Germany and is supposed to still belong to them. If this is found to be the fact the mine will be seized by the Government and disposed of. The mine has a 14-ft. vein on excellent quality, but there is no rock above it to act as a roof, which makes mining expensive. It is probable that if a sale takes place an effort will be made to reopen it.

Springfield—County Clerk Byers has been authorized by the Government to issue licenses to miners to buy fuse. Some time ago Government inspectors ordered that no fuses be sold to the miners except at the mines where they were employed. Protest was made against the restriction, on the ground that fuse by itself is not an explosive, and the miners asked to be permitted to buy from merchants, who sometimes sell at a lower price than the employers. Hereafter miners who hold licenses may purchase the fuses wherever they please.

OHIO

St. Clairsville—The Pursglove-Maher Coal Co. is making plans to open a new mine to tap the coal owned by it between Glencoe and the Chambers schoolhouse south of here.

Cannelville—The Brush Creek Coal Co., of Columbus, recently chartered with a capital of $25,000, has acquired a coal property near here, on the Toledo & Ohio Central R. R. The operation has been in idleness for several years and steps have been taken to resume operations. E. I. Washburn is president and general manager.

Athens—The Cincinnati Mining Co., chartered some time ago with a capital of $300,000, has taken over the property of the Luhrig Coal Co., consisting of approximately 2500 acres on the Baltimore & Ohio. The operation of the property will be pushed by another corporation, known as the Luhrig Collieries Co. Officials of the New York Coal Co. are interested in the two companies.

Foreign News

North Sydney, N. S.—Coal areas at Sydney mines have been taken over by the Indian Cove Coal Co., of Boston. T. H. Hartigan of the Nova Scotia Steel & Coal Co., has been selected president and general manager. The areas which adjoin those of the Scotia Co. and are at tidewater, are extensive. The colliery, which is already a going concern, is expected to produce about 300 tons a day.

Fernie, B. C.—The annual report of the Crow's Nest Pass Coal Co., Ltd., showed net profits for 1917 of $57,635, as against $340,501 in 1916. The balance at credit of profit and loss was $381,013. The coal mined during the year was 504,768 tons, as against 910,839 tons in 1916, and the coke produced 146,533 tons, as compared with 268,989 tons. The decrease in tonnage was due to a five months' strike and labor shortage. During the year the company spent $125,102 on improvements and developments.

Toronto, Can.—The manufacture of briquets from the lignite coal of Saskatchewan is to be undertaken on a large scale by the Canadian government acting in conjunction with the provincial governments of Saskatchewan and Manitoba. A recommendation to that effect was made by the Advisory Council for Scientific and Industrial Research in pursuance of which a briqueting plant capable of producing 30,000 tons of briquet fuel per year will be erected in Saskatchewan, where there are extensive lignite deposits in the vicinity of a good market for the ouput. The estimated cost of the plant, including the outlay for operation and administration during a sufficient period to establish a commercial process is $400,000, of which $200,000 will be borne by the Canadian government, Saskatchewan and Manitoba contributing $100,000 each. The plant will be managed by a commission which will shortly be appointed.

Personals

W. E. E. Koepler, of Philadelphia, Penn., has been elected secretary of the Pocahontas Operators' Association, headquarters to be at Bluefield, W. Va.

N. M. Garland, of New York, district manager for the Ohio Brass Co., of Mansfield, Ohio, has been elected a member of the board of directors of that company.

O. P. Chatfield, formerly of the Big Sandy, Ky., field, has been appointed general superintendent for the Kanawha Central Coal Co., which recently acquired the holdings of the Black Band and Brier Creek companies at Olcott.

William H. Patton has resigned as Exide depot manager for the Electric Storage Battery Co., of Philadelphia, Penn., to accept a position as salesman for the Ironton Engine Co., making his headquarters at Pineville, Ky.

J. R. Smith, of Jasper, Ala., has been appointed associate mine inspector, vice Thomas Roscoe resigned, effective May 1. Mr. Smith will have jurisdiction over the sixth district and will serve during the administration of Governor Henderson.

C. W. Chappelle has resigned his position as district engineer of the Cleveland office of the Electric Storage Battery Co., of Philadelphia, Penn., to take the management of the St. Louis office of the Ironton Engine Co., with headquarters at 314 North Fourth St., St. Louis, Mo.

Robert S. Blake, one of the founders of the Blake Electric Manufacturing Co., of Boston, Mass., and more recently connected with the Condit Electric Manufacturing Co. as Pittsburgh district manager, is now with the Duquesne Electric and Manufacturing Co. in the capacity of Chicago district manager.

E. L. Sparks, lately Industrial Editor of "Engineering News-Record," has been appointed New England representative of the Ball Engine Co., manufacturer of Erie revolving shovels. Mr. Sparks has had considerable experience in construction work having done a great deal of pioneer work for the Southern Pacific in New Mexico.

M. E. Haworth, of Pittsburgh, Penn., has resigned his position as chief draftsman in the engineering department of the United Coal Corporation to accept the position of chief engineer in charge of construction with the Cambria Collieries Co., with headquarters at Bellaire, Ohio. Mr. Haworth will take up his new duties early in May.

Morgan W. Price of Hazleton, Penn., attached to headquarters of the first aid department of the Lehigh Valley Coal Co., has resigned to accept a position with the C. M. Dodson Coal Co., which operates in the coal fields of Pennsylvania, Virginia and Maryland. Mr. Price has been connected with the Lehigh Valley company for more than 10 years and was considered one of the most efficient men in first aid work in the hard coal region. He will be engaged in a similar capacity with the Dodson interests.

Industrial News

New York, N. Y.—The Homestead Valve Manufacturing Co., of Homestead, Penn., has opened a branch office at 1 Franklin St., New York City.

Louisville, Ky.—The firm of Volkman & Kerlin, one of the older retailing concerns of Louisville, has been dissolved, M. D. Volkman having withdrawn from the concern, which in the future will be conducted by C. M. Kerlin, who has been the junior partner.

New York, N. Y.—The Hyatt Roller Bearing Co. announces that it has opened completely equipped engineering and sales offices in the Metropolitan Tower. All information on Hyatt bearings can be obtained quickly and correctly from these offices, and the concern advises that all communications be sent to the new address.

Columbus, Ohio—The announcement came out of Washington last week of the resignation of Homer H. Johnson, of Cleveland, who has been Ohio Fuel Administrator for about six months. No reason was given for the resignation and no successor was announced. No information could be secured from the Ohio Fuel Administration office.

Madisonville, Ky.—The O. & R. Coal Co., which recently took over the "No Clinker" mine at Grapevine, has incorporated with a capital of $20,000 and a debt limit of $100,000, to handle coal, oil and gas development projects. The company plans installation of a tramway at its mine. James D. Overall, J. B. Ramsey, and others are named as incorporators.

Pittsburgh, Penn.—The Hyatt Roller Bearing Co., has established an office here at 1272 Frick Annex. W. J. Kearns and S. G. Little are the engineers in charge, and it is expected that the location of the office in this city will enable the Hyatt Company to give better service to the mine operators in western Pennsylvania, northern West Virginia, Maryland and Ohio.

Columbus, Ohio—The Colonial Coal and Coke Co., which is a large operator and retailer in the Buckeye capital, will soon open a new retail yard to be located on Cleveland Ave., near the Norfolk & Western tracks. A site has been purchased and the work of building the plant will start at once. It is expected to have the yard ready for operation by May 1.

Louisville, Ky.—Charles Powell, of Louisville, who recently organized the Powell Coal Co., of Whitesburg, Ky., plans development of several thousand acres of coal land now under lease. An electrically equipped plant and mining town will be installed at a cost of about $500,000. Plans are being laid for starting the work at an early date. Mr. Powell will be general manager.

Cincinnati, Ohio—President R. A. Colter, of the Coal Exchange of the Chamber of Commerce, has named a coal quotation committee which will have charge of securing and recording prices of coal for the official records of the chamber, with the following members: Thomas H. Richardson, chairman; W. T. Ulland, M. E. Lynn, William E. Minor, A. A. Liggett, F. B. Raines, James A. Reilly and R. S. Magee.

Charleston, W. Va.—A call has been issued by J. C. McKinley, president of the Richland Coal Co., and other coal operators in the state, to West Virginia mining men to meet in Washington on Apr. 23 for the formation of the West Virginia Mining Association, which is to be known as the West Virginia branch of the American Mining Congress of Washington, D. C. The meeting is set for 11 a. m. at the Munsey Building, Washington.

Lexington, Ky.—The Marion Coal Co., recently organized to develop the Branson coal lands at Indian Bottom, consisting of about 1000 acres of coal property, has purchased most of the machinery for an electrically operated plant of 1000 tons daily capacity. The officers of the company are John P. Gorman, president; George P. Morrison, vice president and treasurer; Robert Curry, secretary, and Harry R. Smith, manager. Offices are in the City Nat'l Bank Building, Lexington.

Centertown, Ky.—The Centertown Coal Co., incorporated last October with a capital of $160,000, plans development of 1,700 acres of land, and intends to have a daily capacity of 3000 tons of coal. Machinery contracts have been let. The promotors are P. O. McKinney, who is president and manager; W. Pratt Dale, vice-president; and Brent Altsheler, secretary-treasurer. The latter two men are of Louisville. The same interests are also interested in a new lumber mill at the same point.

Hazard, Ky.—The engineering firm of Raney & Denham has practically gone out of existence. Frank Raney has become superintendent of the Hazard-Jellico Coal Co., while E. E. Denham becomes engineer for the First Creek Coal Co. These properties were recently taken over by Jouett, Bigelow & Brooks, of Detroit, Mich. E. L. Douglas, formerly manager of the Harvey Coal Co., now the Hazard-Jellico Coal Co., has been named general manager of the Detroit company's interests in this section.

Springfield, Ill.—Notice of an embargo on "gas coal," to go into effect Apr. 15, has been received by A. D. Mackie, general manager of the Springfield Gas and Electric Co. The embargo is under the zoning order restricting that coal, which is mined in Pennsylvania, to use in that section. Illinois coal can be used for the manufacture of gas, but it is inferior to the Pennsylvania coal. The company has a supply on hand sufficient for 30 days. After that Illinois coal will probably have to be used.

Springfield, Ill.—The Illinois Central Railroad Co. is conducting a school of instruction at various shops and terminals on fuel conservation. Two cars are sent out to various division and terminal points, and lectures and demonstrations are given in coal saving. The cars are fitted with seats and the talks are given in the cars. It is the plan of the railroad company to acquaint its employees as fully as possible with the fuel problems of the purchasing department and of the best methods of coal conservation.

St. Louis, Mo.—The St. Louis Coal Club, at its annual meeting Monday night, Apr. 8, at the American Annex, elected H. B. Wessel, sales manager of the Kolb Coal Co., president for the ensuing year. The other officers elected were L. P. Coan, first vice president; C. M. Snow, second vice president; E. L. May, secretary; H. C. Richner, treasurer, and E. G. Ridgway, W. H. Riester and H. F. McDonald, directors. Wallace Crossley, Missouri Fuel Administrator, was guest of honor at the dinner and entertainment which preceded the election.

Boyerstown, Ohio—The Mining Safety Device Co., manufacturer of automatic safety mine car cagers, is introducing this equipment into many mines. Among those operations which have recently installed this company's cagers are the following: Rachel mine at Downs, W. Va.; New River Collieries Co. at Gun, W. Va.; Colorado Fuel and Iron Co. at Walsenburg, Colo.; Fernwood Mining Co. at Mine No. 2, Montana, Ark.; Southern Anthracite Coal Mining Co. at Russellville, Ark.; Pantha Creek mine at Auburn, Ill.; Byproduct Coke Corporation at its Nos. 18 and 19 mines in Franklin County, Illinois.

Columbus, Ohio—Chieftain Coal Co., of Columbus, incorporated for $30,000, has been organized by electing W. E. Wheeler, president; John W. Mason, vice president; F. F. Wilkinson, secretary, and Charles C. Green, manager. The company has purchased two operating mines, one located in Vinton County and the other in Noble County. The Vinton mine consists of 221 acres in No. 6 seam near Hope Station. The other property was purchased from the Central Ohio Coal Co., and consists of 77 acres located on the Ohio River & Western R.R. The product will be sold through the Wheeler & Mason Coal Co., Columbus.

Columbus, Ohio—A story is current of how the state of Ohio lost a half-million dollars which it might have realized on a coal deal. Last fall when the State Board of Administration was considering the policy of mining coal for the various institutions under its charge, it was given an option on a tract of Hocking Valley coal lands near Athens, at a price of $175,000. The option was allowed to expire. Some time ago, when it was decided by the board to again take up the project, attempt was made to get another option on the same property, when it was discovered that the holding had been sold to a New York syndicate for the sum of $775,000 cash.

Columbus, Ohio—Ohio wagon mines have been struck a hard blow by a recent ruling of the Federal Fuel Administration in ordering that no open-top cars be apportioned to such mines, where they are unable to secure box cars. Owners of wagon mines claim that they are unable to get sufficient box cars to take care of their output and that the ruling, if permitted to stand, will put hundreds of them out of business. The owners point out that it was the wagon mines of the state last winter that saved the situation and that they will be in the same position to help next winter, if there is an acute fuel shortage, if allowed to operate and ship their product. The ruling is an annulment of a former ruling permitting the use of open top cars by wagon mine owners.

Columbus, Ohio—One-fourth of the coal consumed by rural Ohio can be substituted by wood next winter, states Edmund Secrest, forestry expert at the Ohio experimental station. He estimates that the population on farms and in villages less than 2500 is 2,101,978, and that it consumes 1,890,000 tons of coal annually. By the use of available wood 12,000 carloads of coal would be diverted to war industries and that number of cars released on the already overburdened railways. This substitution would require 700,000 cords of wood, which it is claimed is now going to waste. Its value in stumpage and labor is estimated at $5,970,000. A campaign will be started urging wood as fuel for rural homes, churches and assembly halls.

Belleville, Ill.—The St. Clair Central Railway Co. has been incorporated by J. T. Taylor, W. C. Wolf and P. K. Johnson, of Belleville, and Louis E. Fischer and John Henderson, of St. Louis, to lease the properties of the Southern Illinois Traction Co. and extend the line, which has been constructed from East St. Louis to Belleville, through St. Clair, Washington, Perry and Franklin Counties to Benton, to be used principally for the transportation of coal. The Southern Traction Co. is now in the hands of a receiver and its affairs are being wound up in the United States District Court. The new company expects to operate the road in a short time as far as Belleville for the transportation of coal from three mines adjacent to it, and extend it to Benton as soon as possible.

St. Louis, Mo.—The St. Louis Fuel Committee, with the approval of Wallace Crossley, Missouri Fuel Administrator, announced Apr. 13 the summer scale of prices for St. Louis. On orders placed in April for April and May delivery the price is to be the same as at present. On orders placed in May for May delivery the price will be advanced 15c. a ton. On orders for delivery in June or thereafter the price will be 30c. higher than at present. The total advance of 30c. a ton is 21c. a ton less than was asked by the Coal Service Bureau, which introduced evidence to show that distribution cost had advanced 51c. a ton since last year. Administrator Crossley has issued a statement warning nonessential industries that if they fail to lay in early their next winter's supply of coal they will get scant attention when the supply is below the requirements of essential industries and domestic consumers.

St. Louis, Mo.—The Terminal Railroad Association filed with the Interstate Commerce Commission at Washington, Thursday, Apr. 11, its answer to the petition of the Chamber of Commerce for the removal of the bridge arbitrary of 20c. a ton on coal. The answer denies that St. Louis and East St. Louis are one industrial zone and that the charge is a discrimination against St. Louis. The charge of 20c. a ton, it is claimed, is not only for hauling coal across the bridges but for all terminal services. It is declared that there is a difference between St. Louis and Chicago, Minneapolis, St. Paul and other cities mentioned in the Chamber of Commerce petition, in the circumstances under which coal is delivered. It is claimed that transportation conditions since the present rate was granted by the Commission would justify increasing the rates instead of lowering them. A hearing on the petition will be held at the Jefferson Hotel on May 2.

Philadelphia, Penn.—At a meeting of the Philadelphia Wholesale Coal Trade Association, held on Tuesday, Mar. 26, 1918, at the Manufacturers' Club, it was decided to appoint a committee to express appreciation of the services rendered the association by its president, Noah H. Swayne 2d, while acting as commissioner at Washington of the National Coal Jobbers Association. The following resolutions were engrossed, suitably framed, and sent to Mr. Swayne at Washington: RESOLVED: That the members of this association owe a lasting debt of gratitude to Mr. Swayne for his untiring efforts in behalf of the coal trade during the past several months and for the very valuable assistance to the United States Government by his suggestions and recommendations to the United States Fuel Administrator. Be it further resolved that we express the unanimous assent of the entire membership when we say that Noah H. Swayne 2d has nobly and loyally done his whole duty and that we fully appreciate him and wish him every success.

MARKET DEPARTMENT

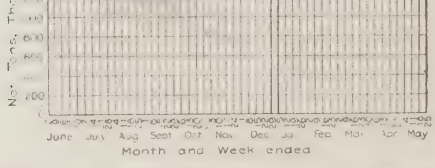
Weekly Review

Many Orders from Consumers—Dealers Unable To Get Coal To Satisfy Demand—Bituminous Coal Situation Getting Worse—Stimulus Needed for Greater Production

COAL-DISTRIBUTION plans go on apace; modifications are being made to the zoning system to facilitate the shipping of coal; the Fuel Administration is rapidly winding up most of its immediate problems—but the coal itself is lacking.

Repeated urgings that consumers lay in their next winter's supply of coal during the coming summer months have resulted in a flood of orders from domestic users, but the trade is at a loss to know how the demands are to be satisfied.

Supplies of the domestic sizes of anthracite coal are short, and the efforts made by a number of dealers to stock up proved unavailing. And this in spite of the fact that March was heralded as the banner month in the history of the anthracite industry. The situation is serious. Great improvement must be shown in the near future if the plans to have a large tonnage stocked this summer are to be carried out. Steam coal business continues to be active. Buying on the part of steam plants is good, and a marked disposition is shown by many factories to accumulate a surplus. Every available ton of steam coal is quickly taken up.



The bituminous coal situation is getting worse. So far as production is concerned the past month has proved to be as barren of favorable results as any month in 1917. The basic cause for the meager output is the poor car supply furnished by the railroads. Another obstacle is the unsettled question of the price to be paid for railroad coal. Despite the pressure being brought to bear upon the director general of railroads to renounce the fuel policy promulgated by John Skelton Williams, no tangible results are yet in evidence.

Owing to the lack of cars many of the large producing mines can work only half time. This is having a demoralizing effect on mine labor. In West Virginia the mine workers are deserting the mines for the large steel mills and munitions plants, as these industries hold out the promise of high wages and regular employment.

The settling of the railroad fuel matter and the introduction of an equitable plan for the distribution of empty cars to the mines will go far toward providing the much-needed stimulus for greater coal production.

COAL PRODUCTION

A decrease of 1,500,000 tons, or 14 per cent. as compared with the preceding week, marked the total output of bituminous coal during the week ended Apr. 6. The total production of bituminous coal (including lignite and coal made into coke) is estimated at 9,395,000 net tons. It is difficult to determine the rate of production per working day because of the unequal observance of Mitchell Day, Apr. 1 (anniversary of enactment of eight-hour law), as a holiday. Next week when the reports from individual operators will be available it will be possible to make allowance for the effect of the holiday in reducing working time. Comparison of the production of Monday, Apr. 1 of 16 roads reporting 10 per cent. of loading, with the average of the two Mondays previous thereto and Monday, the 8th instant, indicate that Mitchell

Day was equivalent to 0.4 of a regular working day.

The total production of beehive coke is estimated at 624,000 net tons, about 4 per cent decrease. The average per working day is estimated at 104,000 compared with 108,000 for the week previous.

Decline in production is reported by the western Pennsylvania fields 73.7 per cent. for the week of Mar. 23, to 61.6 per cent. for Mar. 30; Somerset County, Pennsylvania, from 49.6 to 36.9 per cent.; high volatile fields of south West Virginia from 59.5 to 49 per cent. and northeastern Kentucky from 63.1 to 47.9 per cent. Losses in production by these districts are mainly attributed to lack of coal cars. Losses on account of no market in the Kansas and Missouri fields rose from 19.2 per cent. for the week ended Mar. 30 to 26.8 per cent., although production in these districts decreased but slightly due to improvement in the car situation. In Iowa the decrease of 3 per cent. in production was due to losses on account of no market which rose from 20.5 per cent the week previous to 24.9 per cent. Oklahoma and Arkansas, however, report no market losses at 18.6 per cent.; 6.3 per cent. lower than last week.

Beehive Coke—Sixty-six operators in the Connellsville, Greensburg and Latrobe districts of Pennsylvania report improvement in operating conditions during the week ended Apr. 6. These operators produced 306,320 net tons, or 67.2 per cent. of their full-time capacity as against 63.7 per cent. for the week previous. Losses due to car shortage declined from 24.3 per cent. for the week of Mar. 30 to 12.8 per cent., but labor shortage increased nearly 8 per cent. The week's performance, however, was the best since the early part of December. The same operators shipped 156,109 net tons of coal.

Byproduct Coke—The output of byproduct coke during the week of Apr. 6 was slightly below the production of the previous week, and the decrease is attributed mainly to labor shortage in Pennsylvania. The ratio of tonnage produced to actual capacity declined from 88.6 per cent. the week of Mar. 30 to 87.5 per cent. No material changes were reported by any of the states with the exception of Pennsylvania, where production amounted to 79.9 per cent. of full-time capacity compared with 83.8 per cent. for last week. The loss in this district is attributed to labor shortage, reported at 5.3 per cent. of full-time capacity, while no loss due to labor trouble was reported during the previous week. The lowest ratio of production to capacity was reported by Indiana at 78.1 per cent of full-time capacity.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS

	Week Ended: Mar. 16	Mar. 23	Mar. 30	Apr. 6
Bituminous shipments, 123 roads	190,298	191,127	189,546*	161,500†
Anthracite shipments, 9 roads.	42,265	42,487	43,642*	32,232†
Beehive coke shipments, 4 roads.....	13,218	13,643	13,320*	12,801†

* Revised from last report. † Subject to revision.

Anthracite shipments decreased from 43,642 cars for the week of Mar. 30 to 32,232 cars.

BUSINESS OPINIONS

Bradstreet's—War needs naturally grow at a great rate, and industrial operations in lines essential to them continue to expand. Cereal crop news is exceptionally favorable, whatever may be conjectured as to storm effects on northern fruits and southern truck. Wholesale trade in staple commodities is probably as active as could be expected, seeing that supplies are short, that quotations are inordinately high, and that the Government gives some indication of eventually extending a firm grasp over the price situation in many lines of manufacture.

American Wool and Cotton Reporter—The woolen goods situation has been much upset by what amounts to the commandeering of available machinery for fabrics required by the Government. Little change is expected in the woolen goods market for some time to come. Production will be largely upon special fabrics and there will be little available production for ordinary distribution. During the week under review the only change in the cotton goods market has been the comparatively small trading. Altogether the cotton goods market may be characterized as a runaway market. Prices appear to be at or very near the top. The demand for goods is much smaller than it actually appears to be and existing conditions create high prices.

Marshall Field & Co.—Current wholesale distribution of dry goods is ahead of the heavy shipments for the same period a year ago. The total volume of road sales for both immediate and future deliveries shows a good increase over the large volume of the corresponding week of 1917. Merchants have been in the market in fewer numbers. The market on domestic cotton goods is strong. Collections continue good.

The Iron Age—This week most plate mills are running 100 per cent. on Government and Ally work, save such part of their product as in ordinary practice cannot meet ship requirements. Great Britain is getting 5000 tons of plates a week to apply on the 300,000 tons her yards are to have in return for British advances of munitions and other steel to the American army in France. The War Industries Board is urging the Railroad Administration to take Bessemer steel rails instead of open hearth as far as possible for this year's renewals, so that all the open-hearth steel needed may be available for shells and other war requirements.

Somewhat lighter rail sections are also suggested so as to conserve steel.

Dry Goods Economist—The sudden stoppage of trading in wool in the Boston, Philadelphia and New York markets and the prospect that the production of wool fabrics of all grades for commercial purposes will be halted until August, or later, have formed the principal topics of discussion in dry goods circles this week. To what extent cotton dress goods can take the place of woolen and worsted fabrics is likely to be demonstrated next winter if the supply of raw cotton proves equal to the demand. Prices of cotton goods will probably be stiffened as a consequence of the increased call now looked for. Spot cotton was quoted on Wednesday at 35c. per lb., a decline of 1c. from the high price reached last week.

Atlantic Seaboard

BOSTON

Some progress on "contracts," and shippers show more confidence in receipts by water. Still a large number of plants not "covered." Unsettled question of railroad fuel one of the obstacles. New England all-rail factors decide to oppose assigned cars for engine supply. Order that bunker coal be confined to high-grade low volatiles another cause of realignment, together with Government 65 per cent. ruling. Meanwhile production lags. Hampton Roads piers short of coal. New England Fuel Administration gives attention to zoning of consuming territory. All-rail embargoes lifted on Apr. 11. Anthracite deliveries still disappointing.

Bituminous—The rehandling factors at Boston and Providence having opened the way by "covering" the consumers who regularly look to them for supply, several of the all-rail shipppers have arranged "purchasing contracts" which are assumed to guarantee to the buyer their best efforts to secure coal. The all-rail shippers, however, have lately stated their inability to get assurances from operators beyond 50 to 60 per cent. of the tonnage they were able to engage last year, and it is obvious that a large number of New England plants are leaving no stone unturned in their attempt to get their supply lined up. A large volume of anthracite steam sizes down to silt and culm has been placed, and everyone knows this would not have been done if good steam coal was thought in prospect in sufficient quantity. In spite of spasmodic outcry against using car service on stuff that runs 30 per cent. ash, the outlook is for a big increase in its tonnage this year.

Distributors of water coal inland who were guarded in making commitments six weeks ago have now closed with their 1917 customers for 100 per cent., some rehandlers making a price subject to increases in Government prices, freights, etc., and others making no price but on a cost-plus basis. In this way a large tonnage has been covered. There seems to be a new optimism among the Hampton Roads shippers over the New England prospect, due apparently to the assurance that a large number of boats, including steamers from off the lakes, will be placed in the coastwise service. Some dependence also is being put upon the extra volume of Pocahontas and New River that is expected to flow east under the zoning plan. Certainly ideas of price have been modified the past week on spot coal f.o.b. Boston and Providence. Pressure brought to bear by the New England fuel administration has tended to bring prices down to a cost-plus basis, and from now out there is likely to be less complaint along this line.

Production is sagging off while important questions remain unsettled. A mine operator who tries to do the fair thing by the Government and by his accustomed trade sees his men leave and he is rapidly being deprived of an organization it has taken years to build up. It will require most skillful handling on the part of the fuel authorities to avoid a far worse situation this fall than obtained at any time the past winter. The reservation that operators shall not contract for more than 65 per cent. of output is another serious influence on production.

The shortage of coal at Hampton Roads is another sign of the times. We are constantly being assured that more boats will be forthcoming, but shippers are not likely to take on boats unless there is reasonable assurance that the coal will be brought to tidewater. It has been officially affirmed that New England needs this year 20,000,000 tons by water. This means nearly 1,700,000 tons monthly, against which the average for January, February and March was 667,000! Certainly there will have to be some speeding up before long.

The New England fuel administration is beginning seriously to take up the question of zoning New England territory as between shipments all-rail and those by water. It is felt that a considerable gain can be made by restricting points within a short distance of Tidewater to water shipment, and should rail movement be relieved to that extent the congestion that was usual last winter will be obviated. It follows that any such action must be arbitrary, for the inequality in price is such that it will be impossible to make a regulation without drawing a hard-and-fast line. Wherever the line is drawn there is bound to be a lot of adverse criticism, but the feeling is so strong that next winter it is going to be a question of getting coal and not so much a question of price that the trade as a whole will back any reasonable arrangement. There is a feeling, for instance, that Maine should be entirely excluded from all-rail deliveries, and with this question up the conference which Mr. Storrow has called for the 22d will be an interesting occasion. All embargoes against coal into New England were lifted by the 11th instant.

Anthracite—All-rail deliveries show improvement over last week. Apr. 15 was the biggest day on anthracite through the New England gateways since Mar. 14, 803 cars being passed through. This, of course, includes junior sizes and culm, but is nevertheless a satisfactory showing, considering the congestion that has been the rule and the number of embargoes that were in effect ten days ago. The Boston & Albany and Boston & Maine show a movement about normal, and although the New Haven is still in poor shape as to deliveries via Maybrook and Harlem River there is really a considerable improvement even at those points. Not so much can be said for receipts by water. On barge shipments from New York and Philadelphia the tonnage is uniformly disappointing.

NEW YORK

Lack of coal a serious matter for New York. Record-breaking shipments apparently of little benefit to this market. Complaints are numerous and everybody demanding coal. Prospects for next winter not promising. Commercial bituminous scarce. Operators complain of car supply and deflection of employees. Railroads continue efforts to buy coal at low prices.

Anthracite—The last half of April finds the situation extremely serious. Supplies are short and efforts of the dealers to stock up result in nothing. The trade was interested in the statement of the Anthracite Bureau of Information that March was the banner month in the history of the anthracite industry, only to inquire where the coal shipped to market was sent.

Market conditions show no change for the better, but on the contrary are apparently growing worse. Taking the advice of the Fuel Administration the public have placed their orders for winter supplies but are unable to get the coal. Retail dealers are likewise unable to buy coal, and the wholesale offices are crowded at all times with dealers willing to take any of the domestic sizes obtainable.

There is not much hope held out for any improvement in the situation this month. Reports show that shipments for the first week of April were about 11,000 cars less than they were the last week of March and about 7000 cars less than the first week of the same month.

Dealers are apprehensive of the plan of distributing coal on the 1916-17 basis. Demand has steadily increased and dealers are fearful that if the plan is strictly adhered to there will not be coal enough to go around. Meanwhile the wholesale dealers are making every effort possible to induce heavier shipments to this market.

Stocks of the domestic sizes are low with no immediate betterment in sight. The steam sizes are in better shape and now, on account of the higher temperatures and the consequent let-up in consumption, stocks are larger and in some instances quotations are lower.

Current quotations, per gross ton, f.o.b., Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.15	$6.90
Egg	6.05	6.80
Stove	6.30	7.05
Chestnut	6.40	7.15
Pea	4.90	5.65
Buck	4.45@5.15	4.80@5.50
Rice	3.90@4.10	4.80@4.50
Barley	3.40@3.65	3.00@4.00
Boiler	3.65@3.90	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—There has been no change in the attitude of the trade toward the railroads in their efforts to secure fuel below the fixed Government price. Car supply is unsatisfactory and numerous complaints are heard from the miners because of the lack of work. Stocks of commercial coal are low at the docks but bunker fuel is in better condition. Generally speaking, the past month has been about as bad for the trade as any within the past year so far as supplies are concerned, but the demand has not been so urgent because of the higher temperatures.

Operators are not taking kindly to the efforts made to secure railroad fuel at lower prices than those fixed by the President, although they realize that failure to do so will probably mean that their mines will go without anything like a normal car supply, while those mines whose owners give in to the railroad companies will be provided with sufficient cars to permit them working nearly full time. Efforts are being made to have the Fuel Administration supported in its efforts to make the railroads pay the full Government price and also to provide an equal distribution of cars. The extraordinary efforts of the railroads to secure fuel has resulted, according to report, in at least one company having so much coal on hand that it was found necessary for it to dispose of some of the coal to individuals.

Some contracts have been closed with individuals at the full Government price, the dealer acting as purchasing agent.

Labor conditions at the mines are reported as serious. Many of the mines are working less than half time because of the poor car supply which, along the Pennsylvania, is less than 25 per cent., with no better reports coming from along the Baltimore & Ohio. Along the Western Maryland complaints are numerous and operators in addition are threatened with labor troubles.

Many complaints are heard regarding shipments. Some cars already on the road a full month have not been heard from at their destination. Some relief may be expected from an order expected to be issued the latter part of this week modifying the zone system of coal distribution as it affects Baltimore and Washington, and which change it is expected will insure increased shipments to this market and New England. There are reports to the effect that some shippers are shading the Government price on bunker and coal for export.

BITUMINOUS PRICES

	F. o. b. New York Gross	Mine Price Net	Gross
Central Pennsylvania	$5.06	$3.05	$3.41
Maryland:			
Mine-run	4.84	2.85	3.19
Prepared	5.06	3.05	3.41
Screenings	4.50	2.55	2.85

PHILADELPHIA

Anthracite trade stirred by return of winter storms. Receipts light. Heavy retail orders. Retail labor shortage. Big task ahead of fuel officials. Complaints of distribution plan. Bituminous shortage serious. Lack of cars still the cause. Miners suffer. Railroads try to contract. New bunker regulations. Priority list revised.

Anthracite—Unusual weather conditions, including severe rain, hail and snow storms, caused the dealers to forget all about filling cellars for next fall and winter and devote their attention to small orders of a ton or two for immediate use. The call for chestnut and pea was heavy and the short supply of many dealers was soon exhausted. If it had not been for the liberal shipments here during the latter part of March many yards would have been entirely out of supplies. April shipments to date have been light and the excuse has been that the distribution orders of the Fuel Administration were not clearly understood. No shipments were made by one large company until Apr. 10. However, there are hopes now that this market will be regularly taken care of, and this week some heavy consignments have been made to Port Richmond piers. Altogether the market has been in an unfavorable condition. Little progress has been made in retail deliveries and orders are piling up in the retail offices.

With the opening of spring the dealers are alarmed at the labor outlook, as help is growing scarcer and more independent each week. During the recent stormy weather every yard was shorthanded. Owing to the inferior preparation of much of the coal that came to market last win-

ter there are undoubtedly many dissatisfied customers who are now seeking new affiliations, yet are receiving little consideration from the more conservative dealers. There are others, however, who are taking every order that offers, inasmuch as they are covered as to price at time of delivery, and if orders cannot be delivered they lose nothing.

The fact that the operators are not allowed to make contracts with manufacturers for pea coal is giving the retailers considerable satisfaction, and they are expecting to receive greatly increased shipments of this size during the present coal year. They might, though, feel discouraged if they could learn of the almost unbelievable tonnages of buckwheat and the smaller steam sizes for which the operators are being called upon to reserve for steel and other preferential plants.

The present ruling of the local fuel administration forbidding more than two-thirds of an order calling for more than six tons, to be delivered until all the dealers' customers have received that proportion, is working a hardship on the retail men. They claim that many customers will withhold payment of their bills until their orders are completed and will use this as an excuse to hurry them.

While the independent's charge of 75c. above the companies' price is being accepted as a matter of fact, we find some in the trade who consider the arrangement only temporary and who look for an entire rearrangement of rates, both company and individual. This view is supported by the report from Washington this week in which the National Fuel Administration was reported to have said that a new coal price list and order of distribution had been prepared, but would not for the present be made public.

The steam coal market continues to display much activity, with all production quickly taken up. If there is any lagging at all it is with culm, but even this size has shown some added strength recently owing to the continued stringency in the soft coal market.

The prices per gross ton f.o.b. cars for line shipment and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$4.90	$6.05	Buckwheat	$3.15	$3.75
Egg	4.50	5.70	Rice	2.65	3.65
Stove	4.75	6.05	Boiler	2.45	3.55
Nut	4.85	6.10	Barley	2.15	2.40
Pea	3.45	4.35			

Bituminous—Meager supplies have been received recently and all industrial plants are running on close margins. Only one cause continues to be assigned for the shortage—no cars. Despite all the efforts that have been put forth by the mining interests they so far have been unable to get any tangible results from the railroads.

Ordinarily at this time of the year the industrial and utility plants hereabouts endeavor to accumulate coal, but now are really fortunate when they have more than a week's supply ahead of them.

The only thing of interest in the contract situation is the fact that the railroads have been endeavoring recently to place their year's business under the usual plan. However, with a fixed Government price they have been unable to do so and now face a heavy increase in fuel costs. It is rumored that the Railroad Administration is working on a plan to allow the companies to buy fuel from the usual sources at cost plus 10 per cent.

Shippers interested in bunker coal this week receive special instructions specifying the grades of coal which must be used in this business. The coals are classified as to their smokeless qualities, which are fixed at four grades for this part, being turned into pools of the local exchange numbered 1, 9, 10, 14 and 22.

BALTIMORE

Order cutting off Pennsylvania R.R. shipments to Baltimore district disturbs trade. Coal supplies low. Hard coal men plan for future.

Bituminous—The entire coal trade, and many consuming interests here, have been plunged into a further state of uncertainty by an order of the Fuel Administration which embargoes coal to this city and vicinity from originating points on the Pennsylvania, Monongahela and Huntington and Broad Top Mountain railroad connections, and all short line rail connections in Maryland, West Virginia and Pennsylvania. Under the zone system it is planned for the Baltimore & Ohio and Western Maryland railroads to make up the deficiency thus caused. As there is no intimation of the last two railroads being embargoed elsewhere, and both are now failing to meet even their existing obligations here, much uneasiness is caused in trade circles generally over the possibilities of the order. Consumers on the Pennsylvania lines in this section must rely on coal originating on the other roads and transshipped. Among those uneasy over the order are some coal men here who had relied on Pennsylvania R. R. mine connections to fill their business requirements. Jobbers who failed to protect themselves on the other roads must now hustle for new mine supplies and with little prospect of success. Even the jobbers who have Baltimore & Ohio and Western Maryland supply connections, many existing over years, are unable to promise customers what they will deliver, as the mines in most cases are refusing to promise supplies.

The bituminous supply situation here is most unsatisfactory. The only class of coal reaching here in anything like adequate amount is bunker fuel. This has a price difference of $1.35 for the operators and the difference is undoubtedly a big spur. Many industries here are already short of coal, and one of the important plants the past week was shut off for a time from power because the supply concern could not get coal. Conditions are far from promising, and the local fuel administrator can give no assurance of relief. The long line of red tape needed now to get preferential shipments for emergency needs has further crippled deliveries here apparently.

Anthracite—The hard coal men here are facing the fact that deliveries of anthracite here continue approximately light, and are largely planning for the future. A heavy business is going on the books. Some of the firms are making customers send checks for orders with their Federal applications, and then designating delivery periods, subject of course to the supply received by the dealer. The trade believes that consumers here will be lucky to have two-thirds of their needs in their bins when the next winter rolls in.

Lake Markets

PITTSBURGH

Late opening of navigation. Zoning system getting into operation. Practically sufficient byproduct coal. Market quiet.

A late opening of the lake shipping season is presaged by the general plan adopted for handling the lake coal and ore movement. The governing influence throughout will be the rail situation, the object being to avoid congestion at all points and to obtain maximum efficiency from the cars in service. The vessels will be operated subject to the requirements produced by the rail situation. Thus it is announced that the lake vessels will not buck the ice this season in order to secure an early opening of lake navigation, but will let Nature take her course, this suggesting free channels by Apr. 25 or later. The railroads are busy taking ore from Lake Erie docks and are expected to improve in condition from week to week, so that the later the better for moving the limited tonnages of ore and coal that are absolutely required. Coal shipments in force will not begin until the vessel movement is fully established.

There is little being done in the coal market. Nearly all the regular contract business was done before Apr. 1, subject to any new prices the Fuel Administration might possibly establish, though it was the common expectation that there would be no change in prices. Since the reaffirmation of prices was made some points have been added to a few contracts, but in general the business was done some time ago. There is little free coal being offered in the market, while there is not a great deal of demand. Shipments were not altogether satisfactory last week, but on the whole the situation is improving, and the zoning system is gradually working out into a more orderly distribution of coal. The byproduct coal movement, which is largely exempt from the zone restriction, has been practically satisfactory, the byproduct ovens with few exceptions receiving full supplies. The market remains quotable at $2.20 for slack, $2.45 for mine-run and $2.70 for screened coal, per net ton at mine, Pittsburgh district, with 15c. extra permitted to be charged by any broker regularly constituted as buying agent for a consumer or retail dealer.

TORONTO

Heavy demand from consumers anxious to stock up ahead. Dealers busy. No summer price reduction. Manufacturers oppose controller's restriction. Attempt to introduce Alberta coal.

The demand for coal continues unusually heavy, as consumers are anxious to lay in stocks in anticipation of a shortage next fall. Dealers are busy and supplies are coming forward well. The usual summer reduction in price is not likely to be made, as any reduction in price at the mines will be fully offset by the increase in freight rates. The order of the Fuel Controller limiting the supply to 70 per cent. of the year's normal requirements is strongly opposed by the manufacturers, who will appoint a committee to urge that it should be rescinded. Hydro-electric power is to be substituted for industrial purposes as far as possible. Fuel Controller Magrath has issued an order that in cases where such power can be economically installed the use of coal for power purposes may be prohibited. Some Alberta coal companies are endeavoring to introduce coal from the Western mines into the Toronto market, but none from that source has as yet been received. Dealers do not regard the movement as practical, considering that the freight rates will be prohibitive.

Quotations per short ton for best grades are as follows: Retail anthracite egg, stove, nut and grate, $10; pea, $9; bituminous steam, $9; slack, $8. to $8.50; domestic lump, $10; cannel, $11. Wholesale f.o.b. cars at destination as per present contracts, three-quarter lump $7 to $7.50; slack, $6.50 to $7. New prices as fixed by Government should be, for three-quarter lump, $6.11; slack, $5.18.

BUFFALO

Car shortage cuts down bituminous supply. Jobbers get their licenses. Little Pittsburgh coal to be had here.

Bituminous—The situation does not change much, though the car supply is so light that it is hard to get shipments through. Shippers complain that the railroad operating force is lax; for if it would do the work of listing and searching for cars that shippers are so often obliged to do, there would be much less delay. Often cars get to destination after all record of them has been lost.

The difference of price between thick and thin-vein coal is making it hard to get as much Pittsburgh coal here as is needed. Nobody wants to pay extra for the Allegheny Valley coal if Pittsburgh can be obtained, and so the demand for the latter has cut out the surplus entirely. Besides, the shipments to the lakes have begun and it looks as if the shortage will increase, especially if the car supply does not improve. The Pennsylvania, on which the shippers must depend for most of the Pittsburgh coal, is short of cars, while the Buffalo, Rochester & Pittsburgh and the Shawmut lines are not so short as they were.

Quotations, based on Government prices, f.o.b., Buffalo, are $4.45 per net ton for Allegheny Valley and Bessemer thin vein, all sizes, and $4.25 for lump, $4 for mine-run and $3.75 for slack, Pittsburgh or Bessemer thick-vein.

Anthracite—The local trade complains of lack of coal in all of the sizes except chestnut, and it appears to be getting none too much of that. Shippers are not much disturbed, as they say it is always the case at this time of the year. Large consumers with furnaces lay in the big sizes now. The shippers claim that they have sold more coal in Buffalo so far this season than usual.

DETROIT

Bituminous coal arrives in satisfactory volume. Anthracite shipments are disappointing. Lake rate is named for season.

Bituminous—Shipments of bituminous coal are apparently moving freely into Detroit, though jobbers say there has not been a volume of receipts so great as to create any free coal on tracks. The larger proportion of the shipments seem to be of coarse coal, with domestic lump predominating. Slack is not plentiful, though the supply is described as improving and jobbers predict the amount received will be increased when the loading of coal for lake shipment gets fairly under way.

With Detroit industrial plants operating at nearly capacity, turning out products essential for war, there is a well sustained demand for steam coal. Some progress is said to have been made by certain of the

manufacturing establishments toward building up a reserve, though the volume of requirements for daily consumption leaves no great amount of stock available for storage. Jobbers and wholesalers are warning their customers to make the most of the present opportunity, however, on the theory that receipts are likely to be curtailed when the navigation season opens, within a week or 10 days. Except for by-product and railroad coal practically all incoming shipments of bituminous coal are being handled through the Detroit terminal pool, the expense of the pool's operation amounting, it is said, to about 1c. on each ton.

Anthracite—While fuel administrators, federal and state, are urging household consumers to put in at once a sufficient supply of coal to meet next winter's needs, the quantity of anthracite coming into Detroit continues far short of expectations. The larger number of household consumers have heating equipment designed for use of anthracite, and being unable to obtain that kind of coal are unwilling to stock up with soft coal. Little or no coke is to be had and there seems no prospect of improvement in supply. The absence of Pocahontas and New River coal increases the demand for anthracite.

Lake Trade—Ice still closes St. Mary's River and St. Clair River. It is disappearing rapidly and lake navigation may be reopened the week of Apr. 21. The carrying rate on coal to ports at the head of Lake Superior has been fixed at 48c. for the season, which will apply also to a number of long time contracts.

COLUMBUS

Stocking of domestic sizes is still going forward actively. Weakness continues in the mine-run business, and prices in certain districts are being cut.

The coal trade in Ohio continues quiet, especially in mine-run sizes. There is a good demand for domestic sizes and consequently a good movement of that grade. Outside of cutting in certain districts prices are strong at the Government figures. The tone of the trade is generally satisfactory and production is fair. Car shortage on some roads is cutting down the output appreciably. Activity is expected just as soon as the lake trade is formally opened.

Domestic business is still one of the best features of the trade. Retailers are buying rather actively as stocking on the part of householders is quite active. Some sections are still waiting for the fancy grades such as Pocahontas and West Virginia splints, but on the whole the consumer is trying to get under cover for the next winter's supply of fuel. Stocking on the part of retailers has just about reached the limit of storage space. Pocahontas is quite scarce, but there is considerable other West Virginia grades arriving. The main portion of domestic business is in Hocking and Pomeroy varieties. Jackson No. 2 lump is also being stocked, but there is considerable weakness shown in No. 4 Jackson. Retail prices are firm at the levels which have maintained for several months.

The steam business is active to the extreme. Buying on the part of steam plants is good and there is a marked disposition to accumulate a surplus to guard against an emergency. This is especially true of public utilities, which were caught short handed last winter. Railroads are also stocking to a large degree. On the whole the steam business rules firm and all available tonnage, with the exception of mine-run, finds a ready market.

Production in Ohio districts has not been up to the records of previous weeks. This is due largely to shortage of equipment, more especially open top cars on certain railroads. This is explained by the order of the railroad director to have all ore moved from the lower lake docks before the opening of the lake season. As a result of the car shortage the Hocking Valley output was curtailed to about 80 per cent. and Pomeroy Bend about 70 per cent. Eastern Ohio is still suffering from shortage of cars and its production is estimated at 55 per cent.

CINCINNATI

Efforts to secure early ordering are proving successful, but the trade is finding difficulty in securing deliveries. Car situation is not improving as expected.

Realization of the necessity of storing coal for next winter's consumption during this spring and summer has been forced upon the public by the joint efforts of the Fuel Administration and the coal trade, and it is now fairly certain that there will be a continuous heavy demand for coal from all quarters during the entire period of warm weather. Whether the trade will be able to take care of that demand is becoming a serious question, however, as the situation at the mines in this section as to the supply of cars is giving cause for anxiety. The snows which fell during the past week, causing a decided stimulus in orders for immediate delivery on the part of domestic consumers, hampered the movement of freight somewhat, and emphasized the shortage of cars at the mines.

LOUISVILLE

Domestic demand excellent. Steam demand fair, with steam consumers holding out for better grades. Supplies low due to car shortage and shortage of labor, with few carlots being delivered to domestic consumers.

Sleet, snow and cold weather on Apr. 10, and a full week of cold weather, resulted in a regular December demand for domestic coal throughout Kentucky. Domestic consumers had let their stocks run out, and had figured on getting through the season. Retailers had trouble in taking care of the heavy demand which resulted, and which kept delivery departments working overtime.

Regulations under which western Kentucky coal could not go into New Albany and Jeffersonville, Ind., which were left out of the west Kentucky zone, have been modified at Washington to permit such coal to go into the two cities across the river from Louisville.

In eastern Kentucky as well as western Kentucky much labor is deserting the mines to go into agricultural pursuits, and production has dropped off considerably due to lack of labor as well as cars. Manufacturers and large consumers are getting particular about grades, and are demanding the best of coal of any stated grade, refusing to accept dirty coal. One large coal company reported the demand as so heavy that it was accepting about one order out of ten offered, and that it had found the demand for domestic coal to be heavier than for steam grades.

BIRMINGHAM

Trade active in both domestic and steam grades. Domestic stocking slow, dealers not being able to place their requirements. Output badly off due to irregular work and sickness among the mine workers. Car shortage not being keenly felt.

Inquiry among representative domestic dealers brings out the fact that stocking is proving extremely difficult this season, the output of the mines being prorated to such an extent that retailers are only able to place from one-quarter to one-third of their usual bookings. A dealer who had approximately 7000 tons on his yard this time last year reports that he has not over 1500 tons at this time. Consumers as a whole are showing an unusual degree of indifference about laying in their coal and the orders on the books of the yards are probably not over 50 per cent. normal for the time of year.

The Jefferson County Fuel Board has fixed a gross margin of $2.50 per net ton over mine prices for dealers, which will make the retail price of prepared sizes of Montevallo coal $6.50; Cahaba, Black Creek, Blue Creek, $5.60; Big Seam, $4.95; Corona, $5.25. This price must absorb the broker's commission when acting as purchasing agent for the dealer.

The steam market continues strong, the available supply being inadequate to fill requirements. It is reported in coal circles that the railroads will endeavor to place contracts under the mine prices now in effect. Any effort in this direction will be stoutly fought by operators, who for years prior to 1917 have been furnishing the railroads fuel at little or no profit—in some cases under cost. Contracts involving from one-half to three-quarter million tons taken in this field will expire June 30, if not cancelled by the Fuel Administration before that time.

Coke

CONNELLSVILLE

Car supplies improved somewhat, but reports misleading. Market quiet. Contracts absorb shipments.

It develops that the 100 per cent. car supply furnished Monday of last week was so far beyond the preparations of the operators, accustomed for many months to greatly restricted supplies, that the cars held over and not loaded made technically a 100 per cent. car supply not only on Tuesday but also on Wednesday, and thus there was the phenomenon of a 100 per cent. car supply, in railroad parlance, for three successive days, when the actual fact was that the total cars available for the three days fell far short of representing three times the full loading capacity of the region for a day, when ovens are all in operation. Finally the ovens got the cars loaded and then the rate of influx of cars into the region was shown by there being only 30 per cent. for Tuesday, 50 per cent. for Friday and 40 per cent. for Saturday. The actual supplies for the whole week were about 55 per cent of ratings, on an average, though the average of the technical supply, taken day by day, would come out at 70 per cent., altogether a misleading figure.

On the whole there is a better car supply, due partly to the railroads getting into better shape in general and partly to the work done by the authorities at Washington who are interested in seeing heavier production of pig iron and steel. This week's car supplies promise to average as good as those of last week, and the two weeks may show an average of shipments, per week, of about 375,000 tons, including coke shipped by water. This is probably the full requirement of the furnaces dependent on the region. The "Courier" report shows for the week ended Apr. 6 a production of 333,065 tons, a decrease of 19,370 tons, and shipments of 322,398 tons, a decrease of 60,310 tons.

The coke market continues quiet, as nearly all the shipments are absorbed by regular contracts. It appears that with few exceptions the furnaces are covered by contracts for the year. The majority of these are contracts made at flat prices, averaging about $8.25, while a few are on a ratio basis, depending on the price of pig iron, and a few are based on the current market for coke, being therefore adjusted weekly or monthly to the Government price of $6. Scarcely any contract business will expire June 30. As consumers would be willing to take extra shipments of coke, beyond their daily requirements, to accumulate a stock, increased coke shipments expected may not at once result in coke being offered in the open market. Offerings even of foundry coke are quite limited. The market remains quotable at the Government prices, $6 for furnace, $7 for 72-hour selected foundry and $7.30 for crushed, over 1-in., per net ton at ovens.

Buffalo—Jobbers report that they are practically unable to get any coke except the small amount of byproduct that is on the market, most of which is not suitable for regular furnace firing. The iron furnaces are losing their contracts by expiration and are looking eagerly for new connections. At the same time the coal supply at the coke ovens is poor, so that the output is light. With poor car supply both in and out the ovens are having a hard time to keep up with the demand. Furnace companies that did not set up as coke manufacturers when labor and material were more plenty are sorry. Buffalo has two large furnace companies that make their own coke and two that do not.

Middle Western

GENERAL REVIEW

Demand for prepared domestic sizes good, while screenings and slack market drag.

The failure of the railroads to start their storing campaign has caused operators to divert their attention to the preparation of domestic sizes, and they are having little or no difficulty in keeping their mines well supplied with orders for lump, egg and nut. During the past week railroad fuel agents have called meetings with their line operators, and this would indicate that purchasing agents are becoming alarmed at the solid front presented by the operators, who are in almost every instance contending they should not be asked to accept a figure less than that made by the Government. One of the inducements offered by the railroad is to take the output of mines with a full car supply, which argument is met with the statement by the operators that such a contract is within their belief contrary to the instructions of the Federal Fuel Administrator. At this writing special extraordinary prepared sizes are freely moving at the 20c. per ton premium price. Although some companies report difficulty in moving slack and screenings,

The maximum tonnage production in any mining district during the past week has not exceeded 85 per cent. In some localities 50 per cent. working time has been noted. However, there is an occasional railroad mine that has worked full time.

CHICAGO

One of the heaviest buying campaigns of the year by dealers was the feature of the past week.

Acting on the advice of the state fuel administrator, the dealers of Chicago have been active in not only putting all the coal possible into the consumers' basements, but in storing all the high-grade southern Illinois and Indiana coal that they could get. During the week quite a few dealers contracted for their year's supply, and in almost every instance such contracts call for equal weekly or monthly tonnage, with an understanding that should the operator at any time have any surplus they are willing to take care of it. This movement on the part of the dealers has been a lifesaver for some of the large producers in Illinois and Indiana, who had formerly provided considerable tonnage to the railroads.

Anthracite movement in this section is limited to those who have in past years had an established trade relationship, and those that have not been so favored are anxious to connect with some concern that will promise to furnish them with some hard coal.

Quotations in the Chicago market are as follows, per net ton f.o.b. cars at mines:

	Williamson and Franklin	Saline and Harrisburg	Fulton and Peoria	Springfield	Carterville	Grundy, La Salle, Bureau and Will
Steam lump	$2.65@2.80	$2.65@2.80	$3.05@3.20	$2.65@2.80	$2.65@2.80	$3.35@3.50

MILWAUKEE

Coal docks are about bare, but a heavy run of cargoes is expected on the opening of navigation in a few days. Troubles of the coal administration are many.

With Uncle Sam performing the duties of jobber and solicitor free of charge, and almost ordering people to buy their coal supplies at once, it would seem that the coal man had reached Elysium, but he is having his troubles, nevertheless. Consumers still complain that some dealers are refusing to book orders, claiming they have no coal on hand. Fuel Administrator Fitzgerald's advice in all such cases is to go to the next dealer.

Urgent appeals are being sent out by county Councils of Defense for prompt reports on future coal needs, so that something definite as to the amount which may be called for at once by lake will be known by May 1. The docks are bare of coal at present, but the opening of navigation is only a matter of a few days, when Milwaukee will be in line to receive all the coal needed to meet the accumulation of advance orders.

Because of limited lake tonnage, it is aimed to increase the consumption of bituminous coal in the Northwest. The haul for this quality of coal is comparatively short, and it is believed the supply can be kept up all summer without detriment to rail tonnage.

State Fuel Administrator Fitzgerald has received the report of the Federal Trades Commission on the coal price situation in Oshkosh. The report shows that the average gross margin on all sizes of anthracite in April and May is $2.94 and $2.29, respectively, and that since $2 per ton is ordinarily an ample gross margin, it is clear the retailers of Oshkosh, on the whole, obtained unreasonable margins.

ST. LOUIS

Market extremely quiet, except on Carterville. Prices way below maximum and coal extremely hard to move. New retail prices will stimulate market some. Movement extremely slow and cars scarce. Anthracite shipments small. General condition shows improvement.

The conditions show signs of improvement here in view of the fact that new prices have been made by the St. Louis Fuel Committee on domestic coal. The lull in the market has been because of no prices for the public to buy on excepting last year's prices, and there seemed to be a feeling that this would be cut. When the new prices showing an increase were announced, on the 13th, there was an instant response in the retail demand.

For the month of April prices remain as they are, and on the first of May prices advance 15c. a ton on everything, and on the first of June another 15c. per ton. They remain at that for the balance of the season. The present prices on Illinois prepared sizes are: Standard, $5 per ton; Mt. Olive, $5.25; Duquoin, $5.50; Carterville district, $5.75; Big Muddy, $6.25; Anthracite, grate and egg, $10.75 per ton; stove and chestnut, $11 per ton.

On account of the variance in the mine price on Arkansas coal there is a $2.50 gross margin on Arkansas-Oklahoma coal allowed the dealer on the semi-anthracite and also on Bernice anthracite. The gross on Spadra anthracite is $2.75.

The maximum gross margin of profit on steam coal delivered shall not exceed $1.50 per ton to the dealer. There is a reduction of $1 a ton to a wagon dealer and 75c. deduction to a domestic consumer f.o.b. dealer's yard. There is a sliding scale of prices for less than two-ton lots, allowing the dealer greater margin for delivery.

The dealers asked for an increase of 51c., basing that contention on figures submitted by Gregg & Co., who have for the past three months made a retail survey of the coal trade conditions. The figures submitted by the survey were accepted by the committee, but there was a difference on what constituted the proper net margin.

Conditions in the Carterville field are extremely good. Mines are working full, with exception of those unable to get cars.

In the Duquoin field conditions are satisfactory. There are plenty of orders and the only thing that prevents full working time is shortage of equipment. This also prevails in the Carterville field on the Iron Mountain and Illinois Central, and transportation conditions on both these roads are miserable. The Mt. Olive field shows almost steady work. The car supply is good and only at one or two of the small mines is there any trouble in handling the output.

In the Standard field, however, conditions are much different. The market has gone to pieces on this coal and there are rumors that some coal from this field has gone to Chicago in large quantities that sold for as low as $1.75 the mine. Locally it is offered as low as $2.25 for 2-in. lump and $1.65 for screenings. The 6-in. lump sells at $2.35 and $2.40.

Owing to the 20c. increase on prepared sizes, which is effective mostly in the Carterville field, the maximum market here is about as follows, beginning with the operator's price up to the jobber's commissions, and including the special prices:

	Williamson and Franklin County	Mt. Olive and Staunton	Standard
6-in. lump	$2.65@3.00	$2.65@2.80	$2.65@2.80
3x6-in. egg	2.65@3.00	2.65@2.80	2.65@2.80
2x3-in. nut	2.65@3.00	2.65@2.80	2.65@2.80
No. 2 nut	2.65@3.00	2.65@2.80	2.65@2.80
No. 3 nut	2.65@3.00	2.65@2.80	2.65@2.80
No. 4 nut	2.65@3.00	2.65@2.80	2.65@2.80
No. 5 nut	2.15@2.40	2.15@2.40	2.15@2.40
2-in. scrgs	2.15@2.40	2.15@2.40	2.15@2.40
2-in. lump	.....	.....	2.25@2.50
3-in. lump	.....	2.50@2.65	.....
Steam egg	.....	2.35@2.50	2.25@2.40
Mine run	2.45@2.60	2.45@2.60	2.45@2.60
Washed:			
No. 1	2.65@3.00	2.65@3.00	2.65@3.00
No. 2	2.65@3.00	2.65@3.00	2.65@3.00
No. 3	2.65@3.00	2.65@3.00	2.65@3.00
No. 4	2.65@3.00	2.65@3.00	2.65@3.00
No. 5	2.15@2.30	2.15@2.30	2.15@2.30

Williamson & Franklin Co. rate is 87½c.; other fields, 72½c.

SEATTLE

Coal prices are readjusted on a sweeping scale and retail dealers' profits fixed in drastic measure.

A complete and comprehensive reclassification of the coal produced in the state of Washington, with maximum prices fixed on every grade put on the market, has just been put into effect. Readjustment of retail prices in accordance with the new mine prices has also been made and is the result of over four months' close study of dealers' costs by the local fuel administration, as recommended to the National Administrator.

The fuel administration announces classification of bituminous coal mines and maximum coal prices at the mines for the state of Washington, on the lines heretofore laid down by the President in fixing the prices of coal. If, upon completion of the investigation now being made of operators' costs in the fields affected, it is found that these prices are not justified, further modifications will be made at once.

No run-of-mine coal is to be sold from King, Pierce, Skagit or Lewis County bituminous fields except in cases of emergency, prices to be fixed by the fuel administrator. The maximum retail prices of coal which may be received by Seattle dealers shall be determined as follows. Bunker Sales—On sales of coal from dealers' bins or bunkers the dealer may add to the prime cost of one ton of 2000 lb. of the kind of coal specified the following margins:

Class 1, lump nut, egg, lump nut or lump egg mixture, $1.10. Class 2, mine-run, mixed steam or special steam, $1. Class 3, pea, buckwheat and finer sizes, 75c.

General Statistics

ANTHRACITE SHIPMENTS IN MARCH

March was the banner month in the history of the anthracite industry as is indicated in the record of shipments as reported to the Anthracite Bureau of Information at Philadelphia. The shipments by carrier companies in March, 1917 and 1918, and for the coal year, were as follows:

	March, 1918	March, 1917	Coal Year, 1917–1918	Coal Year, 1916–1917
P. & R. Ry	1,339,051	1,374,051	14,798,496	12,915,229
L. V. R.R.	1,355,933	1,234,871	14,221,783	12,169,141
C. R.R. of N. J.	777,642	785,209	8,376,398	7,270,945
D., L. & W. R.R	1,155,587	1,162,230	12,528,523	10,938,844
D. & H. Co.	861,253	728,857	8,754,113	7,247,090
Penn. R.R.	519,806	517,704	5,643,501	5,519,220
Erie R.R.	864,968	792,453	8,840,579	7,722,506
N. Y. O. & W. Ry.	199,680	185,496	2,065,236	1,925,038

	7,430,808	7,104,028	79,256,078	68,566,349
* Deduction	*154,031	*114,953	*1,503,763	*789,760
	7,276,777	6,989,075	77,752,315	67,776,589

*Deduction: Tonnage reported by both C. R.R. of N. J. and L. & N. E. R.R.

COAL AGE

Volume 13 NEW YORK, APRIL 27, 1918 Number 17

Putting the Roof on First

By FLOYD W. PARSONS

IT IS necessary to complete a foundation before we can build high and safe. It is slow traveling when we place the cart before the horse. It cannot be denied that some of this Nation's present plans and policies bluntly ignore fundamentals.

The Government has entered on a shipbuilding program destined to practically bridge the ocean. We all applaud, for we see the necessity. But let us inquire, how are we going to fill the ships if we haven't sufficient locomotives and cars to haul the supplies to tidewater? The slogan "Build Ships" is fine, but we had better add another—"Build Locomotives and Cars," especially the former.

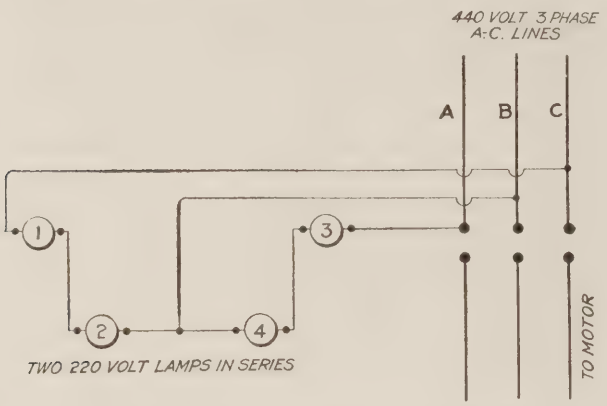
It appears incredible, but it is a fact that the American railroads today are not only attempting to handle the present enormous freight tonnage with practically the same number of cars and locomotives that were employed by these same roads three years ago, but they are using engines and cars that are badly in need of repair. The transportation shortage today is about 150,000 cars. With our present plants, we can manufacture not more than 80,000 cars this year, while 150,000 are necessary to carry out our minimum war plans.

In the face of a railroad construction program that will hardly replace engines and cars going to the scrap heap, it is difficult to avoid questioning the wisdom of other Government officials who plan to build an endless variety and number of war plants throughout the country when present mills, factories and mines are working only part time. Is it not better to bring present plants up to capacity before we clog our already inadequate transportation lines with materials for building additional works?

The productive capacity of all our great industrial regions is limited by the railroad gateways serving these districts. Let us take for instance the busy Lehigh Valley region in Pennsylvania, where great steel and munition plants are located. It is a fact that if the war works located here were to operate at 85 per cent. capacity it would be impossible for the railroads serving the region to handle a pound of unessential freight. There are other districts that present a similar case, so that it is plainly evident what is going to happen very soon to lines of business not necessary to the conduct of the war.

A further case of building from the top down is shown by the drafting of miners. In one of the most important anthracite districts 2½ per cent. of the entire population has enlisted for war service, whereas the average for the country is only about 1 per cent. The reason for this is that miners constitute a class of men who are disinclined to await being drafted. Hundreds of these men enlisted from each coal district, and later, in arranging the draft, no recognition was given to the fact that these same regions had already furnished their quota. As a consequence, the labor situation in the anthracite field is critical; but, notwithstanding all this, draft boards are still refusing to place these men on a preferential list.

Coal is vital if we intend to play an important part in the war. We must have men to mine our coal, and we must have adequate transportation facilities to get this fuel to our war plants. Even ships, as necessary as they are, should come second.



When will the agents of Uncle Sam in Washington see the necessity of building a solid foundation on which to erect our war machine? If the light does not dawn soon, such things as last winter's closing down order of all business will be as a summer zephyr to a tropical typhoon. The outlook was never so bad.

IDEAS AND SUGGESTIONS

A Phase Test Set

BY FRANK HUSKINSON
Lafayette, Colo.

One of the worst troubles experienced with a three-phase alternating-current system is called "single-phasing"; that is, one of the lines may be broken at some point, generally at a set of fuses, or a break may occur in the line. Many small three-phase induction motors

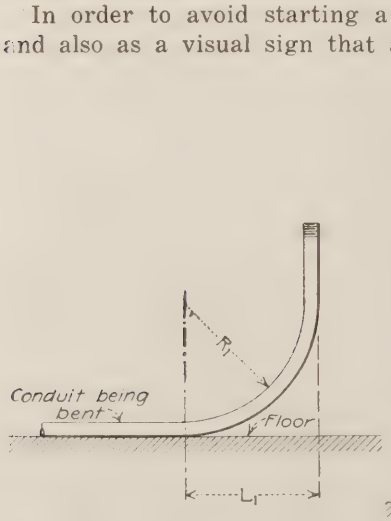
SET OF LAMPS AT EACH THREE-PHASE INSTALLATION

will start equally well on two phases or three phases, and larger sizes will keep on running if one phase goes out.

The result of a three-phase induction motor running on two phases is that the windings will become hot and overheat to such an extent that the insulation becomes charred, and the wires will short-circuit together. Sometimes, also, the insulation breaks down between the windings and the motor frame. In a short time it then becomes necessary to rewind the motor.

In order to avoid starting a motor on two phases, and also as a visual sign that all three phases of the circuit or lines are right, I am using a set of lamps arranged as shown in the accompanying illustration at each three-phase motor installation, also at each main or branch line switch or fuse set.

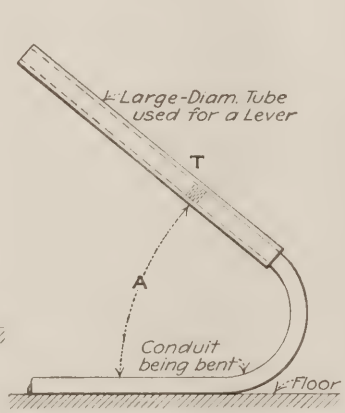
A glance at the lamps will indicate the condition of the current. If phase *A* is open lamps 3 and 4 will not burn. If phase *B* is open lamps 1, 2, 3 and 4 will burn at one-half candle-power. If phase *C* is open lamps 1 and 2 will not burn. If all three phases are O.K. all four lamps will burn at full candle-power. A leak in a line is indicated by the lamps on that phase not burning up to full candle-power.



A phase test set should be installed at all alternating-current motor installations, and also at all switches and fuse sets. Such a set will save its cost many times over if it gives a warning once.

A single evidence of carelessness, even though slight, may destroy confidence which has been years in building.

To Shorten a Bend in Conduit



BY LESLIE C. DALTON

To shorten a bend in conduit (Fig. 1) which has already been formed, a tube *T* of such diameter that it will slip over the conduit is used as a lever (Fig. 2) and the end of the conduit, the operator standing on the other end to hold it to the floor, is bent back so that the angle *A* is somewhat less than 90 deg. Then the lever tube (*T*, Fig. 3) is slipped down further on the conduit and the conduit then bent back to a vertical position. Thus the radius of the bend may be decreased from that of R_1 of Fig. 1 to R_2 of Fig. 4. That is, the offset has been decreased from $L_1 = 19$ in. to $L_2 = 11$ inches. The entire operation is simple.

Rotary Car Dump for Boiler Room Coal

By Ralph W. Mayer
Connellsville, Penn.

Dumping coal at the boiler room or at a mine just being developed, which is sometimes a more or less difficult operation, may easily be accomplished by the aid of a rotary dump. Such a contrivance may be readily and inexpensively constructed.

For such a dump as that shown in the accompanying illustration a piece of 6-in. pipe serves as a shaft. Bars of strap iron about ⅜ x 2 in. are so bent as to half encircle the shaft and extend outward at right angles to it. These are firmly clamped in pairs upon the shaft and a hole drilled straight through each pair of straps and the shaft. A bolt is then placed in this hole, which effectually prevents the arms from turning upon the shaft.

DEVICE ASSISTS THE DUMPING OF COAL

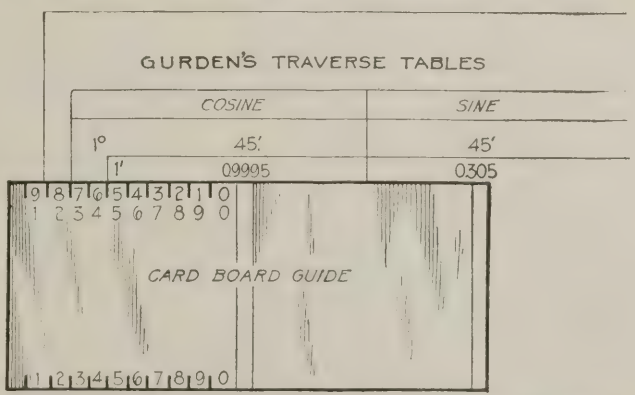
At the proper distance from the end each strap is bent at right angles. The bent portion of each strap lies in the same plane as that of its mate, but the two extend in opposite directions. A bar of iron of the same size as that forming the arms is then bolted securely to the bent ends of the arms. About five sets of arms are thus built up upon the shaft, and track rails are securely attached upon each side of the arms.

A piece of angle iron with about 4-in. legs is next bolted across the ends of the bars attached to the ends of the arms. These angle irons, four in all, are parallel to and directly above the track rails and at such a distance therefrom as to permit the tread of the mine car wheels passing between the rails and the angle iron. The edge of the angle will of course then be in such a position as to prevent any considerable sidewise movement of the car by catching against the wheel flange. The angles thus form the track supporting the car when it is upside down beneath the dump. Slight depressions in these angles at the points where the car wheels rest will be sufficient to prevent longitudinal movement of the car.

Two pieces of bar or strap iron are now bent to the proper radius and bolted to the ends of each pair of angle irons at the end of the dump where the loaded cars arrive. These segments are securely braced to the crossbars holding the angle irons.

At the middle of each segment two wedge-shaped lugs are fastened by means of countersunk bolts with a space of about 3 in. between them. A notch is thus formed upon each segment into which a pawl may drop, thus stopping movement of the dump, while on the opposite side a suitable projection upon a hand lever holds the dump stationary. The pawl is pressed against the segment by a suitable spring while a stop prevents its going too far. The lever pivoted at its lower end is also prevented from moving too far by a suitable stop. The hand lever is pressed against its work by a weighted bell crank the upper extremity of which is bent at right angles to this arm and bears against the lever.

In operation the dump revolves toward the lever. In order to insure this movement the track rail upon this side of the approach is depressed about 4 in. below its mate upon the other side. The rails on the dump meet those of the approach and the car, upon reaching its proper place upon the dump, is slightly tilted toward the lever side. Its center of gravity is thus not directly above the dump-shaft center.



The dump should be made about a foot longer than the car it is to handle. The bearing upon either end of the shaft should be so set as to bring the track rails to the proper elevation. The shaft should extend about a foot beyond the bearing at one end of the dump. Here a wheel or pulley about 12 in. in diameter should be fastened and encircled by a band brake. This brake is used to prevent too rapid a rotation of the dump. It may be operated by means of a foot lever placed near the hand lever so that one operator can handle both.

Another Table Indicator

By Harry Goodnow
Duquoin, Ill.

Mr. Gurden has had so many "guides" devised to facilitate the reading of his tables that one more won't hurt him. I accordingly evolved the one shown in the accompanying illustration, which has been found handier than any we have tried heretofore.

A flat piece of cardboard is fitted over any page in the table and marked so that the "minute" indicator on the finder will come directly under the "foot" column of the tables when the parallel column indicators are under their respective decimals. For reading the tables up a secondary row of figures on the top or a row on the bottom can be used.

GUIDE FOR THE READING OF TRAVERSE TABLES

The advantage of this guide is mainly in that it puts the minutes and feet together on the paper just as they are usually carried together in the head when glancing from the traverse sheets to the tables.

Byproduct Coke and Coking Operations*

BY
C. J. RAMSBURG †
AND
F. W. SPERR, Jr. ‡

THERE has been so much written and published bearing on the surprisingly large development in the building of byproduct coke ovens that it seems unnecessary further to emphasize this point in detail. Suffice it to say that in the three-year period—Jan. 1, 1915, to Jan. 1, 1918—byproduct coke production has practically doubled, and there has been as much gain in capacity as in the previous twenty years. The cause of this rapid increase has not been a desire to take advantage of the inflated prices for byproducts due to war conditions, but a financial condition favoring large investments brought about by the war, and making it possible to carry forward plans made previously for such development when opportunity presented. That many of the plants have been completed and put into operation at a time when they might take advantage of the high prices for tar, ammonia and benzols is a fortunate coincident and not a contributory cause.

While one is much impressed by the amount of money saved from the recovery of these byproducts and by the stimulus given to the chemical and manufacturing industries by the supply of such an abundance of raw materials, the most impressive fact is the conservation of our coal supply brought about by the introduction of modern methods. It may be of interest to put aside, for the moment, the question of profits obtainable from the sale of ammonium sulphate and other byproducts as materials of chemical industry and to make a few calculations simply from the standpoint of fuel values. To put the matter on the most conservative basis possible, let us figure such values in terms of coal.

Table I shows the fundamentals of the matter from this standpoint. This table shows a total fuel saving of 825 lb. of coal per ton of furnace coke. Please note in this that the fuel value of the gas is put not at its value compared with the coal necessary to replace it with producer gas, which is necessarily made at a low efficiency, but as against raw coal, B.t.u. for B.t.u. There is a further saving in the blast furnace. Reports from a large number of blast furnace plants indicate that a saving of 200 lb. of coke per ton of beehive coke formerly used is a conservative average figure. Figured back on a coal basis, these 200 lb. of coke represent 282½ lb. of coal at the beehive oven, so that the total saving amounts to approximately 1100 lb. of coal—0.55 ton—for each ton of byproduct coke made in the modern plant.

Since the ovens gained in operation from Jan. 1, 1915, to 1918, will produce practically 16,200,000 tons of coke per annum, it follows that these ovens will save annually to this country the fuel equivalent of 9,000,000

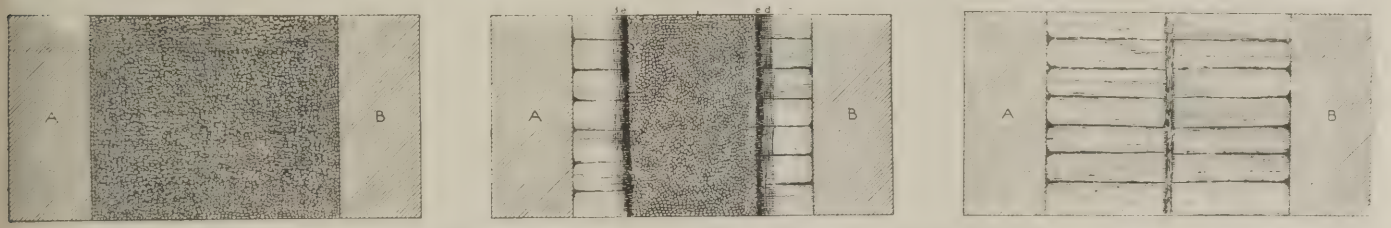
TABLE I. BYPRODUCT FIELDS FROM COAL SUCH AS NOW USED TO MAKE FIRST-CLASS BYPRODUCT COKE IN THE MIDDLE STATES DISTRICT. 85 PER CENT. HIGH VOLATILE, 15 PER CENT. LOW VOLATILE

		Fuel Value Equivalent Pounds of Coal
To make 1 ton furnace coke 1.4—1.5 tons coal required By beehive coking, the byproducts wasted have a heat value equivalent to 625 lb. of coal. At least 200 additional pounds of coal are wasted in the process of beehive coking by combustion.	Surplus Gas: 9,000 cu.ft., 550 B.t.u. Used as fuel.	350
	Tar. 12 gal. Used to make creosote oil, pitch, lampblack, various oils and dye materials.	133
	Ammonium Sulphate: 33 lb. (or, in form of 25 per cent. ammonia liquor, 33 lb.). Used for fertilizer, for refrigeration and for nitric acid and other chemical manufactures.	(No fuel equivalent)
	Benzols (as light oil): 4.5 gal. Used for motor fuel, dye material base, phenol and other chemical manufacture, solvent and cleanser	42
	Coke Breeze: 120 lb. Used as fuel.	100
	Total	625
	Add coal equivalent wasted in beehive oven	200
	Total economy of byproduct oven per ton of coke	825

tons of coal. While it is true that the total coal resources of America have up to this time hardly been scratched, nevertheless it is important to emphasize that this saving is taking place in low ash, low sulphur, high-grade coking coal—coal which, from its mining locations, naturally carries the most favorable freight and labor conditions, and as such is of vast importance—to us and to posterity.

*Presented by Mr. Ramsburg at a joint meeting of the Mechanical and Engineering Section and the American Society of Mechanical Engineers.

†Second vice president, the H. Koppers Co., Pittsburgh, Penn.



‡Chief chemist, the H. Koppers Co., Pittsburgh, Penn.

Looking backward over the years consumed in bringing the coke oven to its present stage of development in America, there are a number of events and conditions which stand out preëminently and may be considered as the high spots in progress. The first of these dates back to 1906. In that year the United States Steel Corporation was brought face to face with the necessity of formulating a definite policy as to its coke supply and, in preparation, appointed a committee of its leading engineers and works managers, whose object was to study beehive coking and byproduct coking and to make a recommendation to the company as to the course to pursue after a comprehensive study of the whole matter. This committee did not restrict its investigations to America, but spent a long period in England, Germany and Austria, studying with great care and attention to detail the most minute phases of the various processes submitted for consideration. It has been said that the report of this committee, which was headed by G. G. Crawford, now president of the Tennessee Coal, Iron and Railroad Co., was one of the finest and most complete reports ever presented on an engineering and general technical subject.

The advice of this committee was quickly acted upon by the corporation in the decision to build a byproduct oven plant at Joliet, Ill., in connection with the blast furnace and steel plant of the Illinois Steel Co., and to build that type of oven which they found to be giving the most efficient results in the European countries.

The success of this Joliet plant was so immediate, not only from a standpoint of economy of coke manufacture, but in the increased blast furnace capacity and efficiency, that the corporation without delay proceeded with the construction of additional plants of the same type, including the largest byproduct coke plant in the world at Gary, Ind., consisting of 560 Koppers ovens, and a plant of approximately the same size as the Joliet plant (280 ovens) at Ensley, Ala., for the Tennessee Coal, Iron and Railroad Company.

The second high spot was the selection of silica material for one of the oven batteries at Joliet. While some silica had been used on other types of ovens previous to this time, the use of it in the ovens of the Koppers type, with their inherent qualities of uniform heating due to their basic heating principles, intensified the value of this type of oven enormously, and put a new aspect on the entire coke situation. The value of the silica in this connection is due to four characteristics:

FIGS. 1, 2 AND 3. DIAGRAMS OF INITIAL, MIDDLE AND COMPLETED COKING STAGE IN BYPRODUCT OVEN

FIG. 4. CHARACTERISTIC BLOCKS OF BYPRODUCT COKE

FIG. 5. STANDARD BYPRODUCT COKE ON WHARF AT OVENS

(1) The conductivity at high temperatures is superior to that of clay brick. (2) The fusing or softening temperature is much higher than that of fireclay. (3) The action under heat may be calculated with scientific exactness, due to its practically constant composition. (4) The expansion and contraction of silica material between 2000 and 2600 deg. F. is practically negligible, so that when the material has once been heated to within this temperature range (under which condition the coking operations are conducted) no further appreciable movement takes place.

The Koppers oven is designed to utilize all of these characteristics to great advantage. From the time that the silica battery (one of four) was first built at Joliet, Ill., no Koppers oven has been built in America of any other material.

The third high spot might be better represented by some other simile, since it was more gradual in its development. It consisted in a realization that with uniform heat distribution in the ovens and with the use of silica material much higher heats and consequent higher coking velocities could be employed and, further, that with the lower coking periods higher volatile coals could be used, with increased yields of byproducts and equally satisfactory coke.

The result can be demonstrated by the fact that the Joliet plant of the United States Steel Corporation, put into operation in 1908, was originally planned to use from 70 to 80 per cent. of low volatile coal, and the coking time was figured at 24 hours. The Koppers company is now building at Clairton, Penn., near Pittsburgh, a coke plant for the Steel Corporation of 640 ovens, and the plant is so designed that it may be operated on 15 hours' coking time and is expected to use 100 per cent. high volatile coal. Even if the 100 per cent. high volatile coal proves not to make quite as high grade furnace coke as the coke at Joliet, its use will work out on broad lines to better purpose and time will tell where the comparison lies, after opportunity has been given the furnace operators to adjust themselves to the new type of coke.

The effect on the products can best be shown by reference to Table II.

A comparison in value of byproducts on a basis of normal values shows a credit per ton of furnace coke of approximately $1.25 in favor of the high volatile coal.

The fourth high spot in development was the awakening to the fact that, while an increase in the cubical content of an oven tends to a reduction in plant cost

TABLE II. YIELDS OF BYPRODUCTS PER TON COKE

	Coal Mixture A. 80 per cent. low volatile, 20 per cent. high volatile.	*Coal Mixture B.* 100 per cent high volatile
Tar	6.5 gal	13.5 gal.
Ammonium Sulphate	23.3 lb.	38.0 lb.
Surplus Gas (debenzolized)	7500 cu.ft.	10,000 cu.ft.
B.t.u. per cu.ft. gas	500	560
Total B.t.u.'s in surplus gas	3,750,000	5,600,000
Light oil (benzols)	2.6 gal.	5.4 gal.

and in operating labor due to handling larger units, a decrease in oven width would more than offset this unit size advantage because of absolutely different conditions.

The reason for this becomes apparent with an understanding of the factors involved. Increased length of oven gives increased cubical content, and the ultimate economic length depends on the mechanical and structural limits. Of increased height the same may be said, except that this involves questions of time of contact of volatile products and speed of their flow which modify the advantage and which are yet to be finally worked out.

Increased oven width involves an entirely different consideration. Practically all the heat supplied for the coking of the coal mass flows from the two walls toward the center. This flow of heat depends, to a large extent, on the resistance and temperature, and in the coke oven the average rate of coking depends, of course, on the rate of heat penetration.

For example, it becomes apparent at once, in a comparison between a 16-in. oven and a 20-in. oven, that the following is true: (a) With the same temperature of wall the average velocity of coking in the 20-in. oven will be less than in the 16-in. oven, and the time required to coke the 20-in. oven will be more than proportionally greater than the 16-in. oven. (b) To coke the 20-in. oven in the same time as the 16-in. oven, the wall temperature must be increased very markedly. (c) To coke the coal in the two ovens at the same average rate, the wall of the wider oven must be considerably hotter than the narrower one. (d) With the same wall temperatures, more coke can be

made per day in the narrower oven than in the wide one. (e) To make the same amount of coke per day, the wall temperature in the 16-in. oven would be lower.

Four points are of great value in this connection: (1) Overcoked material is of less value in a furnace than a greener coke. (2) The wider the oven the more overcoked the outside layers will be and the larger the proportion of overcoked material for a given output. (3) The production of byproducts is enhanced by reducing the wall temperatures. (4) The life of oven brickwork is increased by being operated at lower temperatures.

The result of this reasoning was the decision, in 1914, to reduce the width of oven from 19¾ in., average then being built, to 18½ in. Plants of the reduced width are now in operation as follows:

	Ovens
Toledo Furnace Co.	94
Youngstown Sheet and Tube Co.	204
United Furnace Co.	47
River Furnace Co.	204

There is no doubt among those who have been acquainted with the wider ovens that the narrower oven has the following distinct advantages: (1) Less sponge in the coke. (2) Better coke from the same coal. (3) As good coke from higher volatile mixtures. (4) Higher yields of tar, ammonia, and benzols. (5) Low temperatures for the same coking velocity.

We shall now consider the fifth high spot in coke oven development—namely, the universal recovery of benzols. This may be laid almost entirely to the war, but partly to the increasing demand for motor fuel. It was the war which furnished the primary inducement to developing this phase of the industry; but the fact that the material might be disposed of advantageously for motor fuel after the demand for explosives would cease had an important bearing in stabilizing the investments demanded.

Previous to the war comparatively few plants were equipped for benzol recovery; in fact, outside the plants of the Semet-Solvay Co., operated for their own account, there was comparatively little benzol extracted, and this was used, for the most part, in enriching illuminating gas. Today practically every coke oven plant in America has installed this recovery.

While the removal of benzol reduces the heat units in the gas, the loss in this manner is a very small factor, and the return to be secured from the sale of this product is likely to be greater than that secured from the recovery of tar. One feature of the benzol credit as related to motor fuel is the smallness of the quantity compared with gasoline production, and, since benzol and gasoline are miscible, the utility of benzol will be enhanced by increasing the quantities available.

Experiments recently conducted by a large oil company on its trucks and passenger automobiles proved that not only is benzol more valuable than gasoline as a motor fuel when used straight, but its effective value is increased by being mixed with gasoline. While these experiments are not complete, nevertheless they indicate that a mixture of equal parts of gasoline and benzol gives a value over 16 per cent. greater than that of straight gasoline, which shows 32 per cent. increased value for the benzol half. In 1917 there was produced in this country over 1,000,000,000 gal. of

FIG. 6. TYPICAL BYPRODUCT COKE AT OVENS

gasoline, so, while the value of benzol is stabilized, for this reason it cannot be a very great factor in the motor fuel situation. Every means should be taken not only to secure additional quantities from a standpoint of preparedness, but from a standpoint of motor-fuel supply.

In connection with the value of benzol as a motor fuel there is an interesting fact which may in the future have a very marked influence. Alcohol is in many quarters looked upon as the ultimate fuel, but it cannot be employed except with less efficiency and with greater difficulties, due to its high hydrogen content. Commercial alcohol and gasoline are not miscible. Alcohol and benzol are miscible and make a most efficient fuel, and, further, after the addition of benzol to alcohol the mixture will carry quite a high proportion of gasoline. The future may see benzol as the tie between gasoline and alcohol, permitting a piecing out of the gasoline supply and an introduction of alcohol as a commercial motor fuel.

So much for the introduction of benzol recovery into all coke plants, and for the salient points in coke oven development in America. We shall now take up a somewhat more detailed study of byproduct coke and its use in blast furnaces.

The phenomenal growth of the byproduct industry has stimulated a renewed interest in the main product. This interest is due, first, to the recent revolutionizing

of ideas regarding the relative values of byproduct and beehive coke. The tardy recognition of the fact that byproduct coke of a fairly wide range of origin, when properly used in the blast furnace, gives results not merely as good as, but much superior to, those obtained from beehive coke, was accompanied by a realization that the limit of efficiency had by no means been reached; that Grüner's "ideal performance"—long the *ne plus ultra* of blast furnace men—was actually

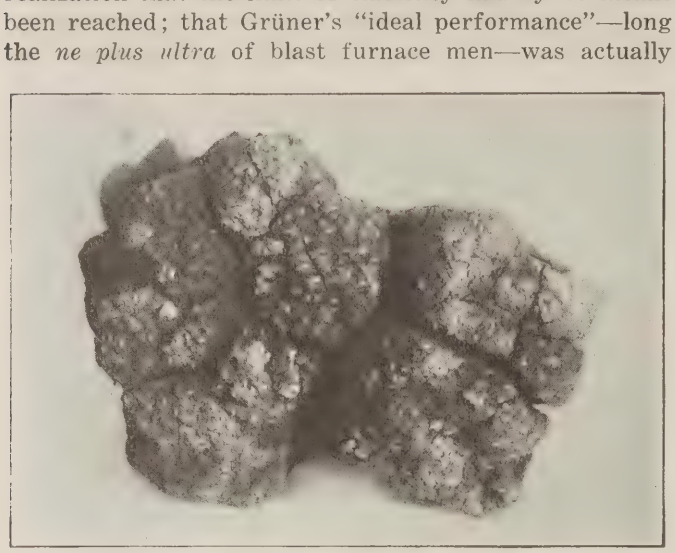


FIG. 7. COKE ADJACENT TO WALL OF OVEN

being surpassed by many blast furnaces, and that much regarding the question of coke economy still remained to be learned. In the renewed study of the subject that this realization is just beginning to stimulate, we have the inestimable advantage that the byproduct coke plants are being located in proximity to, and usually under the same management as, the blast furnaces that they are intended to supply, instead of being placed at the coal mines, long distances away, as was the case with the beehive ovens. Thus the blast-furnace operator knows better the sources of the material that he has to use and the conditions under which it was produced, while the coke plant operator can more intelligently regulate the performance of his ovens and the quality of his product, according to the requirements of the furnace. Above all, the combination and coöperation of the two plants result in a regularity of performance that is perhaps more to be desired than any specific quality of material. It is to be hoped that this coöperation may soon be extended to the foundry and other industries using coke as fuel.

It will assist in following the few descriptive studies of coke that we have to present, to give a brief account of the generally accepted theory of the coking process. The development has received such abundant confirmation from every practical standpoint that there can be no question of its soundness.

Let Fig. 1 represent a section across a byproduct coke oven immediately after the charge of coal is introduced. The layer of coal next to each wall *A* and *B* is rapidly heated. A complicated process of destructive distillation begins, and at a temperature of about 375 to 400 deg. C. the layer becomes soft and pasty. The pasty mass is for a while in a state of violent ebullition, due to the rapid expulsion of its volatile matter, and then rapidly solidifies, the indurated residue retaining the vesicular form and structure of the pasty, foaming stage.

The adjacent layer toward the interior has in the meantime reached the pasty stage, the fusion being assisted by the penetration of some of the soft material forced over from the outer layer. The gases and vapors follow always the line of least resistance and pass through the porous outer layer and up along the wall of the oven instead of forcing their way through the viscous inner portion of the fused layer, and then through the mass of coal. In passing through the highly heated porous layer, the hydrocarbons undergo a partial secondary decomposition, depositing part of their carbon on the cellular surfaces, just formed, thus building up and strengthening the coke. The coking process is thus to be conceived as involving the formation of a fused zone, and the gradual advance of this zone toward the center of the oven, the evolved gases and vapors depositing part of their carbon in the vesicular mass left as the zone progresses. The condition of the material in the oven when the coking has fairly well advanced may be represented by Fig. 2—*c* is the portion already coked; *d* is the fused zone merging into an adjacent zone *e*, which, being in a state of incipient fusion, is more viscous; *f* is the uncoked coal.

The actual thickness of the fused zone is probably not over $\frac{1}{2}$ in. The drop of temperature across this narrow zone is very great, and the interior of the oven remains comparatively cool, even at an advanced stage in the coking process. Simmersbach's experiments on a Koppers oven of 500 mm. (19$\frac{7}{8}$ in.) mean width, operating on 29 hours' coking time with a final maximum temperature of 1120 deg. C., showed that the temperature in the middle of the oven, 1 meter above the floor, remained about 10 deg. C. for 2.5 hours after charging; then rose to 100 deg. C., and remained

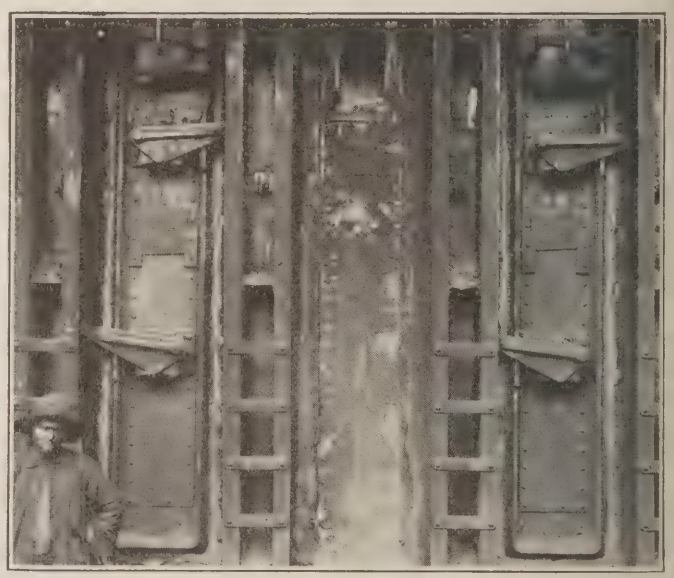

FIG. 8. COKE IN OVEN AFTER REMOVING DOOR

at this temperature until 13 hours after charging. At 20 hours the temperature was only 410 degrees.

The rate of advance of the two zones toward the center of the oven depends principally upon the temperature of the walls (*A*) and (*B*). In present practice, with ovens 18 in. wide and wall temperatures about 1000 deg. C., the average rate is about $\frac{3}{4}$ in. per hour. The initial rate is, however, much more rapid than this, and decreases as the center of the oven is approached.

As the coking progresses, cracks or joints develop perpendicular to the walls of the oven, thus determining the blocks of coke as they are eventually formed when the oven is discharged. These cracks form avenues of escape for a larger percentage of the gases, hence the amount of deposited carbon is greater in proportion on the surfaces of the blocks than in the interior. Eventually the two zones merge at the center of the oven (Fig. 3) and, with the practically complete expulsion of the last of the volatile matter, the coking process is finished. There is always a distinct parting in the center of the oven, so that the length of the blocks is equivalent to about half the width of the oven. Fig. 8 shows a view of the coke as it appears when the door of the oven is removed. Most of the coke immediately adjacent to the walls of the oven is covered with a skin of carbonized pitch. The true form of the blocks may be seen in a few places.

Fig. 5 shows a lot of standard byproduct coke used on one of the lake furnaces as the material appears on the wharf, just after being run out from the quenching car. Fig. 4 shows a closer view of another typical coke. In this figure the individual blocks may be seen more distinctly. A few characteristic blocks are shown in Fig. 4. The three smaller pieces in this figure are cross-sections. The end of the block (Fig. 7) that was originally adjacent to the wall of the oven may always be distinguished by its cauliflower-like appearance and dense layers of deposited carbon. We shall designate it as the wall end and shall call the other extremity the center end, for want of a better term. The structure of the coke towards the center end is always more open, and occasionally is somewhat spongy.

The shape of the coke is quite characteristic, depending upon the coal from which it was produced, and also, to a considerable extent, upon the method of heat treatment. The coke-oven man classes his product as either "blocky" or "fingery," coke of the former character being preferred. Some typically fingery coke is shown in the headpiece. As a rule, the coke from coals of over 30 per cent. volatile matter is apt to have a fingery tendency—and this becomes highly pronounced if the coal has a high oxygen content. By coking such coals very slowly at temperatures somewhat lower than used in ordinary practice, the fingery tendency may be disguised or in many cases entirely eliminated. By disguising it, we mean that the product will actually appear to form large, massive blocks, but these blocks, if closely examined, will be found actually to be bundles of slender pieces more or less firmly cemented together. However, if the heat treatment be very carefully regulated during the coking process—especially in ovens designed and adapted to this particular type of coals—genuine, firm, blocky coke may be made from many coals regarded as producing only the fingery variety.

The size of the blocks is affected to a certain extent by almost all the conditions pertaining to the manufacture of coke. The length is, of course, dependent upon the width of the oven, the average being, on account of shrinkage, a little less than half the width of the oven. The blocks from the top of the oven are usually (especially with high volatile coals) shorter than those from the bottom. Overcoking and high temperatures tend to produce small-sized cok

(*To be continued*)

Iowa Coal Production in 1917

The production of coal in the state of Iowa during the calendar year 1917, by counties and districts, is shown in the following table:

COAL PRODUCTION OF IOWA FOR THE YEAR 1917

Statistics Given by Counties and Districts

First District Counties	Total Production in Tons for the Year 1917	Number of Miners and Loaders Employed, 1917	Number of Other Inside Employees, 1917	Number of Surface Employees, 1917	Total Employees in the Mines, 1917

Production in the State of Washington During 1917

The final figures for the 1917 production of Washington's coal mines as prepared by State Mine Inspector James Bagley show that the mines of the state produced 34 per cent. more coal in 1917 than the year before. The total output for 1917 was 4,002,759 tons, an increase over 1916 of 983,159 tons. Last year's production was the state's largest output, though Mr. Bagley estimates that the 1918 production may reach 5,402,000 tons if the present demand continues throughout.

In 1917 all the coal-producing counties except Whatcom showed increases. King and Kittitas Counties show the largest increases, about 850,000 tons. The coke output was also the largest the state has ever had —96,427 tons—all manufactured in Pierce County.

Five thousand three hundred and forty-three men were employed in and around the mines in the past year. This number worked an average of 271 days for the year, a higher average than the state has heretofore shown. Thirty persons lost their lives in or around the coal mines during 1917.

Every man in the world is a salesman—some good, some bad and some indifferent; some sell ideas, some goods, some service and others pretenses. What do you sell?

Coal Company Organization

Coördination of Departments, Elimination of Red Tape and Efficient Systems Secure Action and Results

By W. W. BEDDOW
Lundale, W. Va.

WITH the expansion of business, concentration has characterized modern times even to the restriction of trade as our lawmakers viewed it. Later the same legislative body gave the stamp of approval to this method by uniting a whole country's industry under the direction of a high Government official. We have lately had impressed upon us the futility of division of authority and responsibility—the necessity for coördination of departments, elimination of friction—all looking to directness and quick action. The unwieldiness of the cumbersome machinery of large governing boards has also been corrected. In some cases coal companies reflect these ideas, and their methods and successes point to the wisdom of their judgment. Get-together meetings of the officers of a company for an exchange of ideas prove highly beneficial. In some instances office men are sent out into the field and field men are taken into the office, to give each the point of view of the other man. The benefits a large corporation secures through its specialist officials can be largely duplicated by smaller companies combining positions and consulting experts. The adoption of a real efficiency system constitutes one of the important steps in the successful conduct of business today.

WITH the exception of a few of the very large coal-producing companies, there are not many coal corporations whose directors and officers have a definite idea of just what their organization is. The officers of most coal companies would probably be puzzled if they were asked to diagram their organizations; to outline, definitely, the interrelations of the officers, superintendents and foremen of their companies. Their organizations were built up in a manner somewhat similar to the ways our ancestors used to build houses. When starting housekeeping, they would build a four-room cottage, which would then amply suffice for their needs. As their family grew larger, they would add a room here, with a step or two down into it and a room there, with a step or two up to it. In a like manner our coal-producing organizations grew.

Modern developments made advisable the use of electricity in the mines, the use of scientific methods in the employment of men and in the designing of houses, the laying out of towns, the projection of mines, the cleaning and handling of coal and the conservation of by-products. The growth of the companies made it impossible for the chief executive to go into details and give matters his personal supervision as formerly; he was compelled to add a department to inspect operating conditions, raw materials and the product—coal—both at the mines and at the market; it made the purchases of the companies so large that a separate department was added to take care of this function alone; it made necessary the addition of an auditing department to check up the records of the companies and the systems of obtaining these records.

This expansion required the employment of electrical engineers, employment experts, expert architects, landscape engineers, mining engineers, mechanical engineers, chemists, purchasing agents, inspectors and auditors. And the science of efficiency has come into sight, bringing with it a department for the scientific introduction of efficiency methods. This requires the determination of time standards, material standards and equipment standards to cover all operations necessary for the production, shipping and selling of coal.

Accordingly, the chief executive of every company should have his organization diagrammed as it is and then have it charted as it should be, or as he wants it to be. The next step should be to gradually effect what changes are necessary to accomplish the proposed organization.

The chart of the proposed organization of a producing and selling company is here shown. It is what would probably be called by organization experts a "line and staff organization." Line functions are shown by rectangles; staff functions, by circles. The full lines show line authority, the path of the chain of command; the dotted lines show advisory relations only.

In this diagram, the directing head—the chief line officer—of the organization is the president or general manager. Next in authority to him, in the order named, are the manager of operations, the treasurer, the sales manager and the chief of staff. To these and no others the chief line officer communicates his commands. Thus he maintains the chain of command, which is so necessary to an industry fraught with as many emergencies as coal mining.

Treasurer in Charge of Finances

The treasurer is a line officer in charge of finances. He has line authority over the chief accountant, the chief paymaster and their respective clerks. His relations to the sales manager, the chief of staff and the manager of operations are advisory only. Here note that the treasurer has not line authority over the auditor; their relations are but advisory. It is incongruous to give the man responsible for the finances and records line authority over the man who audits these accounts.

The sales manager is also a line officer. He has directly under him the district sales managers, the traffic manager, the chief billing clerk and the advertising manager. These line officers are advised by the chief of staff and his associates.

The staff and their chief occupy the same position to the president or general manager as the general staff of an army occupy to their commanding general. Their purpose is to maintain the efficiency of the organization at a high point. Their relations to everybody else in the organization, except their own subordinate staff officers, are purely advisory. They have no authority over the line. They should not have this authority for three reasons. First, it would seriously interfere with the chain of command. It would mean a division of authority and therefore a division of responsibility. Second, if the staff were given authority, naturally

they would soon be taking up so much of their time issuing orders and directing workers that they would neglect the thinking, investigating and inspecting parts for which their office was created. Third, a good organization is but a proper system of checks and balances. When the staff is advisory, the line checks the plans drawn up by the staff. When the line acts on its own initiative, the staff checks up. If the staff had authority, it would both advise and execute. The organization would thus lose its system of checks and balances.

The director of employment advises in regard to the personnel of the organization. He recommends to the management the employment of the officers of the company, and he advises the colliery superintendents and

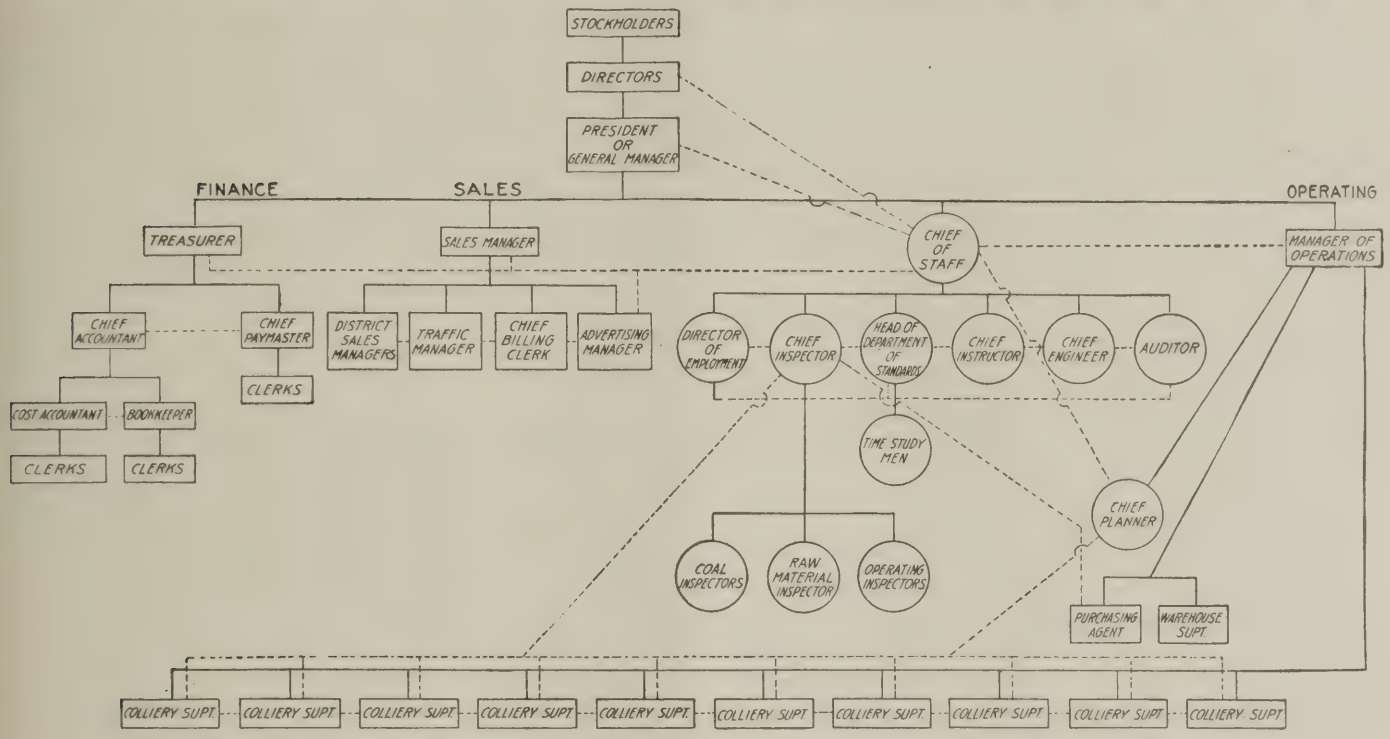

CHART SHOWS THE PROPOSED ORGANIZATION OF A PRODUCING AND SELLING COMPANY.

investigates and determines the most efficient ways of working mines, of planning towns, buildings, water systems, drainage systems, tracks, tipples and the thousand and one engineering details necessary for the production of coal.

The auditor inspects the records of the company. He reviews the methods of obtaining and keeping these records and advises the proper officers of his findings. Not shown on the chart are the lawyers, which the chief of staff retains for advice and instruction on legal matters.

It should be noticed in the diagram that the staff advise each other whenever an occasion arises to do so. For instance, a coal inspector finds that they are loading coal at a colliery not up to the standard set for their employment supervisors. He selects a scientific method of employment, and as his investigations warrant improves it from time to time.

The chief inspector, through his aides, advises the sales manager and the operating department of the quality, cleanliness and loading of the coal; the purchasing agent and other officers concerned of the quality and condition of supplies and equipment purchased or on hand; the operating officers of the efficiency or condition of their respective departments. This department usually takes the yearly inventory and plant appraisal.

The head of the bureau of standards, through his time-study men, advises the line officers of the standards of efficiency which should be set up for each job. He also determines the standard of efficiency of each department, of each colliery, and finally of the whole organization.

The chief instructor advises all department heads and instructors in the instruction of their men and themselves so as to reach the desired standards of efficiency. He prepares the written standard practice instructions to cover each and every job in the organization.

The chief engineer heads the technical experts. He cleanliness. He first advises the colliery superintendent of this fact. If the colliery superintendent states he cannot remedy the trouble on account of the inadequacy of his tipple equipment, conditions in his mine or other factors beyond his control, then the inspector sends a report covering it to his superior staff officer, the chief inspector, and leaves a copy of this report with the colliery superintendent. The chief inspector reviews the report, and if his judgment dictates he advises immediately the sales manager and the manager of operations. He also advises the head of the department of standards, the chief instructor and the chief engineer. The sales manager has the coal shipped where it can be used; the manager of operations reviews the matter with his superintendent; the head of the department of standards has his standard checked up for this case; the chief instructor sees if anything can be done in the way of improving the method of instruction so as to increase the efficiency of the slate pickers; the chief engineer studies the tipple equipment to see if a remedy can be found in a convenient improvement. The colliery superintendent thus has focused on his problem the expert attention of special-

ists. He very likely makes suggestions, but he need not concentrate his attention on the problem and therefore does not neglect his many other line duties.

The manager of operations is the chief line officer in charge of operations. His superior officer is the president or general manager, from whom only he takes his orders. He issues orders to the next lower officers in the chain of command—the chief planner, the purchasing agent, the warehouse superintendent and the colliery superintendents. He is advised by the chief of staff and his subordinate staff officers.

Duties of Colliery Superintendent

The colliery superintendents are the line officers in charge at each operation. They rank as assistant managers of operations, and the manager of operations, by a circular, designates the order in which they succeed him in authority. The lines of authority run from the colliery superintendents to the manager of operations and thence back to the purchasing agent and the warehouse superintendent. However, an ordinary requisition would cut across corners, thereby eliminating red tape, by going direct from the colliery superintendents to the chief planner, whose staff would study it with regard to its efficiency; if satisfactory, would forward it to the warehouse superintendent for filling. If the records of the chief of staff showed the requisition to be inefficient, he would advise the colliery superintendent accordingly. However, the colliery superintendent, possessing the authority of assistant manager, could insist upon the filling out of this requisition. In fact, in an emergency the colliery superintendent would telephone the warehouse superintendent and order out a requisition immediately. In any case the superintendent would have to send the chief planner a copy of the requisition for his records. If the chief planner thought that the colliery superintendent insisted, against his advice, on the instant issue of material on requisition, through pure arbitrariness, he would advise the superintendent's superior officer, the manager of operations.

It is evident that the superintendent or any other line officer, if he is the proper one for his position, would accept all the good advice he can get from the staff. By doing so he would certainly increase the efficiency of his colliery or department, and therefore would augment his own efficiency reward. However, it frequently happens that the staff, having a highly specialized and thus naturally narrow view of a situation, advises something which, while very good in itself, is incompatible with the operation as a whole. The line officer, having a broader view of the situation, rejects the advice and tenders his reason for doing so. The staff officer, if he still sincerely believes that if his advice were followed out it would increase the efficiency of the operation as a whole, should take the matter up with the superiors of the line officer, up to the stockholders if necessary. In the meantime the colliery superintendent would conduct the operation as he judged best. The line officer has the authority and must therefore bear the responsibility. If the line officer is arbitrary and resists progress unreasonably, the efficiency of his department and consequently his own efficiency reward is affected. But probably before that time his attitude has attracted the attention of his superior officers and he has been reprimanded, demoted or discharged.

In all organizations the difficult thing to accomplish has been the successful coördination of staff and line. Great strifes have occurred and millions of dollars have been lost by staff officers taking upon themselves line authority and by line officers neglecting their own functions in the performance of staff work. All corporations have likely had their greatest troubles in achieving this coördination.

A high degree of coördination could be obtained by the amalgamation of staff and line. For instance, we might appoint a colliery superintendent as chief engineer for a certain period and make the chief engineer a colliery superintendent; we might let the purchasing agent and the head of the department of standards trade jobs. The experiment should bring forth many gratifying results. A chief engineer often changes his tune when he takes hold of the management of a company. The staff officer would find that it is easier to advise than to do; the line officer would find that it required an immense amount of what would very likely be to him constant, boresome study in order to properly advise. The test would probably result in the true staff officer (doubtless a high, long-headed type) qualifying for a permanent place in the staff; the true line officer (a broad, motive, vital type) qualifying for a permanent place in the line, each one considerably improved by the experience he has been through.

Functions Vary in Different Organizations

In the chart the squares and circles represent functions only. In a large company it would likely be necessary for one man or even a man and an assistant to handle each function; in a small company one man could handle several functions. For instance, the chief of staff might also be the chief engineer and the head of the department of standards. The qualifications of the personnel should determine such arrangements. In another method the staff might be committees formed by appointments from the line. There might be a committee on standards, a committee on instruction, a committee on employment, a committee on each of the different technical problems. Such committees would be appointed by the general manager or his chief of staff. It would be unwise to give these committees line authority, as they should act in an advisory capacity only.

Still another way for small companies to obtain the benefits of a good staff organization would be to employ consulting experts for short periods of time. When this is done, however, great pains must be taken to secure the coördination of this casual staff with the line officers—the old or tried and trusted men—of the company. Otherwise, more harm than good will come of their employment. This coördination can be best accomplished by means of get-together meetings where all points of controversy can be thrashed out, where the staff will fully explain the efficiency of their proposed methods and where the line officers will declare their intention to follow or execute these methods.

As mentioned before, every company should carefully plan its organization, first as it is and then as they want it to be. Different conditions will demand different methods. But in every case there should be brought to bear upon the problems offering themselves higher common sense—practical, common-sense experience, combined with theoretical knowledge.

Minecdotes

In Which Bill Miner's Wife Takes a Hand.

Bill Miner's wife was worried, and she was having quite a lot to worry about. Moving from one place to another over quite a stretch of railway, with two or three changes in between, isn't exactly a picnic for a woman with three children to look after; not to mention the bother and upset of tearing up house in one place, getting straightened out in another and the financial outlay involved.

Now things were shaping round for another move before she had well got over the last, according to the tone of Bill's conversation lately: "The pit was rotten, the boss didn't know his business, he gave all the best places to his pets, the company was cheating on the weights, they were overcharged at the store, a fellow would be a fool to spend his time where he couldn't get a square deal if he worked there from now till the crack of doom, and he was going to pull out as soon as he could make it."

"Well, you haven't given them much of a show, have you?" answered she. "We've not been here long enough to get thoroughly acquainted yet, and you've not done bad so far."

"Oh, that's just how they work it," came the reply. "Give a fellow a good place for a week or two to jolly him on, and then as soon as he gets a bit settled put him in a rotten one where he can't make expenses. Why, Tom Jackson says—" what Tom Jackson said made Mrs. Miner wonder how ever any member of the company contrived to keep on the sunny side of the pen—"and he's worked here four winters running," said Bill, as he ended up.

"That so? Put in his summers on the homestead, I suppose?" queried his wife.

"Yes, that's where his folks are," came the reply.

"Well, why don't you ask him up some time, if he's such a friend?" asked Mrs. Miner. "It must be tiresome at the bunkhouse all the time."

"All right, if you say so. It'll be a change. Bye, bye" —and he went, slamming the door quite happily. He hadn't met with any reproaches this time, and it was quite a relief to think of going away without them.

"I thought as much," said Mrs. Miner to herself after her husband had gone. "Another doggone anti as usual, and I'll bet he's got the whole bunch 'on the go.' Gee, some of those boys make me tired. If somebody'd saw their blocks off and roof the rest of 'em in with shingles they'd never know the difference," she told herself disgustedly. "Well, I'll just get busy and do a bit of 'anti-ing' myself for once. Here's one case of anti-itis that'll get stopped before it gets out of hand, or I miss my guess."

A week or two passed, and still the question of moving kept cropping up.

One day Jackson arrived, with another man. The talk was all shop, and since Bill's wife wasn't exactly a fool she could follow most of the discussion with ease, passing a remark now and then, but not allowing anything to get past her. She listened to everything that was said. "How long have you been mining, Mr. Jackson?" inquired she, when a pause came at last.

"I've worked at that job ever since I knew what work was," came the reply. "There isn't a pit in the country where I couldn't work if I wanted to."

"My!" exclaimed Mrs. Miner admiringly, with a glitter in the corner of her eye which didn't quite match her manner. "You must have an awful lot of patience to put up with such things. A smart man like you that knows his job from the bottom up and can get work anywhere, with your people settled and all, and only yourself to move, I can't understand why you stay with it. Not only that, but even when you are out you don't stay out. If it was such a whale of a rotten place to work one would think you'd be tickled to death to get out and keep out, and yet they tell me this is your fourth season here and you come back of your own free will. Nobody asked you to. You see," she went on, "it's only likely that men with families and household effects are going to think twice before they'll let themselves in for the expense and inconvenience of a move, when somebody like you can stand it that's got nobody but yourself to shift, and can pack all you need to move in a suitcase."

Evidently this was a new one, and Jackson didn't make much of an effort to answer. Soon after the visitors rose and took their leave.

"Lord! Bessie," grinned Bill when they had gone, "wasn't I a fool not to think of that myself. I guess it's up to a fellow to figure things up for himself a bit, after all. I'll try it out a while longer, anyway."

Determining the Presence of Manganese in Iron and Steel Pipe

In establishing the identity of iron and steel pipe, as used in buildings, the following test for determining the presence of manganese in the sample has been used, according to the A. M. Byers Co., of Pittsburgh, Penn., manufacturers of wrought-iron pipe:

Place in a porcelain dish, preferably a small porcelain crucible, a clean, bright drilling or some filings of the metal to be tested, about the size of a pinhead; add six drops of pure nitric acid, heat, add two drops of silver-nitrate solution, then one crystal of ammonium persulphate not greater than $\frac{1}{8}$ in. in diameter. Warm the solution but do not let it boil. If the metal is steel, a pink color will begin to develop and at this point it should be removed from the source of heat, when a decided red coloration will result. If no coloration develops, but a small amount of dark residue remains in the dish, the metal is wrought iron. Care should be taken at all times to test only clean drillings and to keep dirt or foreign matter out of the dish. If a small thimble-size crucible is used, a match will supply sufficient heat for the purpose.

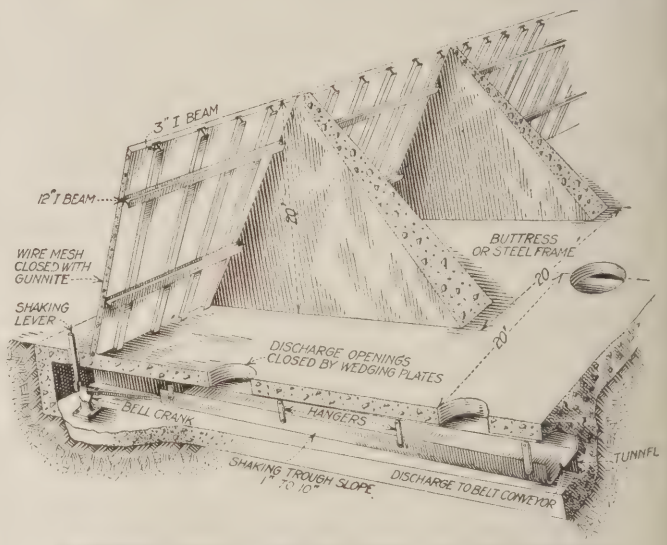
Manganese, in the process of steel manufacture, has to be added to the molten metal in order to make it possible to roll and weld it into pipe, while wrought iron requires no such manganese addition and therefore usually contains only a trace of this metal. Wherever it is possible to obtain samples, the manganese test can be supplemented by the crushing test, revealing the bright crystalline fracture of steel or the dull gray, fibrous fracture of wrought iron.

Smother the Fire Before It Appears*

By G. J. YOUNG
Assistant Editor-in-Chief, "Engineering and Mining Journal"

SYNOPSIS — *Why not keep coal when in storage under a perpetual dampening atmosphere of carbon dioxide and so prevent the possibility of spontaneous ignition.*

IN a paper presented at the February meeting of the American Institute of Mining Engineers, C. M. Young gave the results of certain experiments and tions upon the proper storage of bituminous coal. He pointed out the limitations caused by the heating of the coal when stored and contributed the valuable suggestion observations upon the proper storage of bituminous coal. He pointed out the limitations caused by the heating of the coal when stored and contributed the valuable suggestion that by the admixture of lump with fine coal heating can be controlled. Mr. Young showed that if air can be excluded from the coal or reduced in amount there will be less heating. The storage of coal under water was touched upon, but the possibility of other methods for excluding air received no mention.



Pursuing the thought that the exclusion of the oxygen of the air is the vital element in the storage of coal, it occurs to me that a gas could be substituted for water and that by this means the difficulties of storage under water might be eliminated. Two gases suggest themselves, carbon dioxide and sulphurous acid gas. Both of these gases are heavy enough to displace air. Of the two, carbon dioxide is the one which promises most, both because it can be cheaply generated and because it is less objectionable than the sulphurous acid gas.

Dioxide Will Prevent Fire Starting

The quantity of carbon dioxide required to fill the interstitial space in coal is comparatively small. If we assume an interstitial space of 20 cu. ft. per ton of coal, it will require 3 lb. of carbon dioxide to fill this volume, which weight of carbon dioxide could be generated from 7 lb. of limestone and 4 lb. of hydrochloric acid, and the cost would be nominal.

It is evident that it would be impracticable to use carbon dioxide in the case of open heaps. To construct bins or bunkers of the ordinary type that would be sufficiently gas-tight to prevent a reasonable loss of gas would be prohibitive in cost. Such being the case, a type of bin departing from usual practice is suggested. A bin to meet the requirements of the case should be exceedingly simple in structural elements and low in cost. These conditions could be met by the use of light side walls inclined at a slope approximating the angle of repose of piled coal. These side walls would be constructed of steel mesh embedded in from 1½ to 2 in. of cement applied by a cement gun, the thin walls to be supported by light structural steel and this in turn supported by reinforced concrete buttresses (or steel frames) which would divide the bin into bays 20 ft. wide. The bin would be placed upon the ground and a concrete floor laid to cover the entire bottom.

To provide for the reclaiming of the coal, a tunnel would be constructed under each bay. Openings through the floor of the bin, provided with cast-iron doors of gas-tight construction, would communicate with the tunnel. In each tunnel a suspended trough would be placed below the line of openings. The trough would be sloped and provided with a reciprocating mechanism to facilitate the delivery of the coal to a collecting belt conveyor, which would be placed in the center of and transverse to the length of the bay. The belt conveyor would deliver to an elevator, which would

STORAGE BIN IN WHICH COAL IS SMOTHERED
Coal is surrounded, not supported, by the reinforced-concrete side walls

discharge into loading bins placed at such a height as to secure convenient discharge into motor trucks or other vehicles. The filling of the bin could be accomplished from a bridge constructed along the center line of a series of bays or by means of conveying appliances.

For the operation of the shaking troughs beneath each bay, a car carrying an ordinary machine drill, operated by compressed air, could be used. This car would be shifted from bay to bay as required, and attachment would be made to each shaking bar. A compressed-air main would be required on each side of the bin. Significant features of the bin are shown in the sketch. Other methods for reclamation are also available.

To provide for the introduction of the gas a gas main would be placed close to the center line of each bay and a number of outlets at symmetrical points provided. Connecting with the main would be a delivery pipe which would extend from a central generating plant.

Assuming a width of bay of 20 ft. and a ground length of 120 ft., the approximate storage capacity for a height of 20 ft. would be 1000 tons. The ground area required would be 3 sq.ft. per ton of storage capacity. The cost of construction, roughly approximated and including all features except the central bridge and the gas system, would be $3400, or $3.40 per ton of storage. For a pile 40 ft. high, 2 sq.ft. ground area per ton of storage capacity, and a cost of $3.15 per ton of storage capacity, are obtained.

If an annual depreciation of 10 per cent. and an interest charge of 10 per cent. be assumed, the cost of

*From "Engineering and Mining Journal."

storage per year is estimated as follows for the 20 ft. pile:

Depreciation and interest	$0.68
Interest 10 per cent. on coal at $5 per year	0.50
Unloading and loading	0.30
Depreciation and interest on bridge	0.20
Land rental 10c. per sq. ft.	0.30
Total	$1.98

For a 40 ft. pile, the estimate is $1.58, including all of the items given in the estimate of the 20 ft. pile.

In gassing the pile, the bin would first be partly filled before the introduction of the gas. As the bin was filled, the gas could be gradually introduced. After completely filling, a top layer of fine coal would be spread evenly over the whole surface so as to prevent diffusion of the gas as much as possible. Over the top a waterproof tarpaulin or roofing felt could be securely placed. At intervals more gas could be forced into the pile, so as to compensate for losses.

In the estimate I have not included the cost of the top covering nor of the gas. The type of bin suggested would prevent leakage, and diffusion at the top would be greatly retarded. The top area of the bin for a 20 ft. pile would be 1.6 sq.ft. per ton of storage capacity and for a 40. ft. pile, 0.5 sq.ft. The superior advantages of the 40 ft. pile are obvious. The costs given are tentative only. I know of no example of the use of carbon dioxide in the way described and believe the plan to be feasible. There is an additional fact that makes the use of carbon dioxide as a submergence agent especially advantageous. Both oxygen and carbon dioxide are adsorbed by carbon, but the latter is more readily adsorbed and in greater relative quantity at a given temperature than the former. It can therefore be inferred that the carbon dioxide adsorbed by carbon would displace any adsorbed oxygen. Without much doubt adsorbed oxygen plays an important part in spontaneous combustion. Whether coal would be as energetic in adsorbing carbon dioxide as pure carbon must be experimentally determined.

Washing Furnace and Domestic Ash for Fuel Recovery

By Mark Meredith
Liverpool, England

In operating boiler and other coal furnaces there is a considerable loss of fuel through the grates as a general thing, while in the domestic ashes sent to the destructor there is possibly quite 25 per cent. of fuel that could be recovered. In some places both furnace and domestic waste is sorted by hand, and some fuel thus recovered, but of late years the chief object aimed at appears to have been to destroy everything but the ash and clinker, these being variously disposed of in the quickest way available. Possibly from many points of view this is advantageous, but none the less it is wasteful; and probably, when the present times of lavish expenditure have passed, some other method of dealing with waste will be adopted.

In dealing with ordinary furnace waste all hard clinker should be kept separate for road or concrete making and other purposes for which hard material is needed, while all fine dust passing a mesh of from $\frac{1}{8}$ to $\frac{1}{4}$ in. should be screened out, the coarser refuse being then treated to recover the actual fuel.

The solid waste from domestic collections should be similarly dealt with, although this would need more apparatus in the shape of screens to remove the light stuff, much of which has a commercial value, locality having much to do with this, however. In any case the fuel recovered would pay for all work undertaken in a business-like way, and for this reason it is practically certain that private enterprise would give better results than are usually obtained with municipal enterprises.

The principles of separation would be those used in jig washing. The crude material would be first sized and then passed through jigging machines. The fuel passing the machine could be elevated into hoppers for draining and delivery into wagons, the ash and dirt being deposited where desired.

The waste from the hutches, which would vary in size from a $\frac{3}{16}$ to 1 in., would be available for making tar-paving after it had been dried. It could be conveyed automatically to a convenient dumping place for use as required while, roughly, the only part of the solids which would pass to actual waste would be the fine ash and dirt, of which probably there would be a larger amount than could be put to practical use.

It is not a profitable proposition to handle small bulks in a plant costing from $7500 to $10,000, but anywhere up to, say, 100 cu.yd. per day of purely furnace refuse could be dealt with, and in domestic collections probably larger bulks could be readily secured in most places of any size. With domestic waste, however, all garden and other nonmineral refuse would have to be excluded.

To those who are interested in the utilization of domestic waste the municipal ash yards offer a good opening. Even after all of the larger pieces of metal and the few other things usually collected are taken out there is a large amount of valuable material left untouched, which either goes into the destructor or is hauled or barged away in the ash and waste. The money value thus lost is considerable. There should be no necessity to have fleets of barges to carry valuable waste products out to sea, and lose them by dumping, when they might be utilized if a little care was taken.

All combustible substances burn slowly in an atmosphere of highly diluted oxygen, but in the case of soot this slowness is much more pronounced. The reason for the very slow combustion of soot in highly diluted oxygen probably lies in its complex molecular structure. It is commonly supposed that a molecule of soot consists of a considerable number of atoms, and that a similarly large number of molecules of oxygen is required to come in contact with the molecule of soot before the latter can combine with the oxygen. The chances of the molecule of soot finding this large number of molecules of oxygen in the furnace gases are small, and hence the slow combustion. Thus assuming the molecule of soot to consist of 12 atoms and represented by the symbol C_{12}, there will be required 12 molecules of oxygen to burn the one of soot. The reaction for the combustion of the soot may be expressed by the formula $C_{12} + 12O_2 = 12\ CO_2$. For comparison the reaction for the combustion of CO is given in the following equation, $2\ CO + O_2 = 2\ CO_2$.—*Bureau of Mines Bulletin No. 135.*

Mine Trackage for Motor Haulage

By DEVER C. ASHMEAD
Tarrytown, N. Y.

SYNOPSIS — *The condition of the haulage tracks exerts a great influence on the operation of any coal mine. Frequently the proper or improper construction and maintenance of the tracks mean all the difference between profitable and unprofitable operation. Here, as elsewhere, certain maximum and minimum limits obtain. Crossing the maximum limit means unnecessary expense; crossing the minimum limit means trouble.*

THE successful operation of any kind of locomotive haulage—whether trolley, storage-battery, gasoline, steam or air—depends largely on the condition of the track. This is particularly true in a mine. No matter how perfect the locomotives may be, delays, wrecks and breakdowns will occur if the track conditions are poor.

Although the main features to be discussed in this article have been described again and again, they cannot be emphasized too often, as in more cases than one the failure of a mine can be traced directly to poor track. Labor troubles have also arisen from this same cause, when the men have not been able to get a proper turn owing to the inability of the locomotives to get the mine cars to the faces in sufficient number.

The first thing to be considered in mine haulage is the width of the headings in which the locomotives are to operate. These passages cannot, in an ordinary sense, be too wide. There must be sufficient space on each side of the locomotive to allow plenty of clearance, which should be enough to permit the moving locomotive to pass a man safely. There should be room enough in case of a wreck so that the men will not be crowded while working. For a 36-in. gage track the heading should be 10 ft. wide; for standard railroad gage the heading should be between 14 and 16 ft. in width.

Sometimes Profitable To Widen Headings

In many old mines the headings were driven only 7 ft. wide, and in one case of which I have knowledge only 6 ft. If motor haulage is to be employed in such a mine it may be necessary to widen the headings by slabbing. Whether or not this would pay depends largely on conditions, such as the cost of slabbing, the cost of changing timbers, the amount of coal recovered, and on what sum of money would the saving resulting from the installation of locomotives pay interest.

The second point to be considered is the material used in the construction of mine track. Here the kind of rail is of the utmost importance. If the rail is too light and the ties are spaced too far apart surface bends are likely to occur, making the track rough and "bouncy." A few rail size limits may be given for locomotives of different weights. For a 4-ton machine the rail should weigh between 16 and 20 lb. per yard, for a 6- or 8-ton motor from 20 to 30 lb., for a 10-ton motor between 25 and 40 lb., and for a 15-ton motor not less than 30 lb.

Of course, the heavier the rail employed the better will be the track, and some mines even use rail weighing as much as 80 lb. to the yard. This statement concerning rail weight is true with one exception, and that is on hauls where storage-battery locomotives are used. Here the rail should never exceed 45 lb. to the yard, for when sand is applied to such large rails the locomotive cannot slip its wheels readily and there is danger of the motor burning out. In order for the locomotive to slip its wheels a larger motor would be necessary, therefore a larger battery, which in turn would only increase the size of the locomotive and make it larger than would ordinarily be necessary to do the required work[1].

Next in order of importance come the ties. Outside of the average mine a visitor can usually see a pile of wood from 4½ to 7 ft. long, and he often wonders what use can be made of it. The sticks are too light to serve for props, and when he asks what it is for he is surprised to learn that it is a pile of ties. Ties should have two parallel sides and be reasonably straight, but the usual mine tie is triangular and crooked.

Some Hints On Spacing of Ties

A good tie should be from 4 to 6 in. thick and have a face from 6 to 8 in. wide. The two bearing sides should be parallel whether sawed or hewn, and the tie should be straight. It should be long enough to extend 1 ft. beyond the rail on each side of the track.

The correct spacing of ties is of great importance and will vary according to the size of the tie, the weight of the rail, the weight of the load to be hauled and the concentration of load on the driving wheels of the locomotive. Whatever spacing is adopted should be followed out. Ties should not be placed far apart in one place and close together in another.

Two methods for spacing the ties can be employed at joints. If the rail is light, it might be well to have one broad tie under the joint; but if the rail is heavy, two ordinary ties should be used so that they can be placed properly at the end of the fishplate. The placing of ties at joints in this manner lessens the liability of low joints and the wrecks that can be traced to them.

The subject of spikes is worthy of some consideration, as the selection of the wrong size of spike often leads to wrecks and wastage of material. There is no specific rule governing the selection of spikes, and this has to be left to the judgment of the user. Too small a spike will not have sufficient hold, and the rails are liable to spring loose and a spreading track result. Too large a spike is liable to split the tie and allow it to rot more rapidly and cause the same spreading of rail. In order to select a spike intelligently the following facts should be considered: The weight of rail, the size of tie, the kind of wood in the tie and the amount of traffic that will pass over the road.

[1]As considerable difference of opinion appears to exist on this subject among engineers, most men preferring as heavy a rail as possible, "Coal Age" would be glad to receive comments and discussion of the statements made in this paragraph.—Editor.

Many mine managers neglect to see that all fishplates are in place and bolted tight. Quite often when the tracklayer is building track he runs out of fishplates, and he does not bother to obtain more. Kinks are apt to appear wherever fishplates are omitted, and this means that there is a chance for the wheels to climb the rail or that the rail be shoved out of place. In either case a wreck may result.

More wrecks are likely to occur at the switches in a mine than at any other point, and in a large percentage of mines anything that a locomotive and cars can pass over serves as a switch or a frog. Many mines endeavor to make their own switch points, frogs and stands, but unless a fully equipped machine shop with a large-size planer is available this should never be attempted. No matter how skillful a blacksmith may be he cannot make these articles as well as they can be turned out in a machine shop or factory where the manufacture of this class of apparatus is a specialty.

Kind of Frogs and Switch Points to Use

A frog for mine work should preferably be of the riveted plate type, as this possesses the advantages of simplicity and strength. A frog with an angle greater than a No. 4 should not be used except in rare cases. Switch points ought not be less than 5 ft. long and should have two bridle bars. Switch stands should be used on all main-line switches, but they are not absolutely necessary at room switches. A switch stand sufficiently high and properly arranged so that it can be thrown by the motorman would be of great assistance at a room switch. It is advisable to place spring connecting-rods between the switch points and the switch stand. If these rods are used they will often prevent switches from breaking, as the motor can run through the switch when it is thrown the wrong way.

The time lost through a single wreck on a switch, not to mention the possible damage, will usually cost more than the purchase and installation of two or three switches. This can be well exemplified in the case of two plants in Illinois. These two mines were opened in the same bed of coal, at the same time, on adjoining properties. The shafts were the same depth. The coal was the same thickness. The equipment throughout was practically the same. The same mining system was used. One mine had an output of 5000 tons a day and the other but 2000 tons. The management in both cases was the best that could be procured, but the results obtained were hardly comparable. The management of the mine with the smaller output requested the other company to send its manager to examine the mine in order to determine if he could locate the cause of the small tonnage.

This man spent one week at the plant, and when he was through he made a report in which he stated that as far as he could see both mines were identical in every way except one, and that was that the mine with the smaller output had an abnormal amount of wrecks. These wrecks kept the output down and the cost up. The cause he attributed to the frogs and switches, which were homemade. The only recommendation he made was to replace these frogs and switches with manufactured ones. The company followed his recommendation and in a year's time its output had increased to 4000 tons a day.

Next to be considered are the curves. The curves from the main entry to the cross-entry and from the cross-entry to the butt-entry should be of as large a radius as possible. This should be 30 ft. or more, and in no case should it be less than 25 ft. Curves of these radii apply to all points where the locomotive travels at any considerable speed or around which it pulls or pushes a trip of cars. The greater the radius when pushing the better, particularly where double-bumper cars are used, as there is then less danger of the bumpers locking and causing wrecks.

The radii of room curves do not need to be as great as those mentioned above, but they should not be less than 20 ft. for a locomotive with a wheel base of 36 in. A larger radius should be employed for a larger wheel base. In every mine the entry and heading curves should be laid out by the engineer with a transit, the center line of the curve from which the trackman can take his points being marked on the roof.

The fourth consideration in the construction and maintenance of mine track is the alignment. The more straight and even a track is kept the less is the chance for wrecks. Some companies have their sights for driving the headings placed in the center. The engineers connect these points with a string and paint a white line on the roof above this string. This gives the trackman the center of his track. The careful following of this line, together with a close adherence to curves, will result in a properly located track.

The fifth consideration is the ballasting and drainage of the track. A track that is poorly ballasted will not keep good alignment; and one that will not keep alignment is one on which wrecks occur, since it gives points at which the flanges of the wheels can climb the rail.

Proper Ballasting Saves Mine Ties

The ballasting should be thick enough so that the ties will not rest on the bottom. The ties will thus be kept away from excessive moisture. If the mine is wet a good ditch should be provided and kept clean. This ditch should be deep enough to prevent the water in it from soaking the ballasting and should be on the trolley side of the track so that the men will walk on the opposite side away from the wire and its dangers.

The space between the ties and the rib on the opposite side from the ditch should be kept clean and free from loose coal and rock so that it can form a free and unobstructed man road. If the heading is the proper width this space between the ties and the rib will be from 3 to 4 ft. wide.

The sixth consideration regarding mine track—the elevation of the outer rail on the curves—has probably received the least attention. Most wrecks in mines occur at one of two points—the switches and the curves. The wrecks on curves can be eliminated almost entirely if their alignment is correct and if the outer rail is elevated to the proper height. This height depends on the speed at which the locomotive takes the curve. A number of tables given in various books on mine haulage tell what these elevations should be for the degree of curvature and the speed of travel. It will therefore be unnecessary to repeat such data here.

If a mine track meets the conditions stated above the danger from wrecks will largely disappear, haulage costs will be low and the output large.

It would probably surprise many operators to learn what a powerful influence the condition of mine track has on the labor situation, particularly as regards the miners who are paid by the ton. Remarks like the following are often heard as the miners leave the mine in the afternoon: "I could have loaded more coal if I had the cars"; "That motorman is as slow as molasses"; "I did not make enough to pay for the powder I use"; and so on *ad infinitum*.

Did you ever consider the cause of these remarks? If you did, how many times have you found that a wreck or two had stopped production from a heading for a couple of hours, preventing the men from receiving their proper turn? Did you ever investigate the cause of that wreck? If so, did you ever try to remedy the trouble?

Did you ever analyze the reason why the miners demand an increased wage? If you did, you would find that their demands do not always arise from the fact that they are not receiving enough for each ton mined, but because they are not able to mine enough tons. If the miners were supplied with steady work each day of the week and were given a sufficiently large turn each day they would have been able at their old wages to load a sufficient number of tons to give them a satisfactory week's pay. As they do not get this they are compelled to ask for sufficient wages per ton of coal so that the amount of coal mined will produce enough money to take care of their wants.

There are two ways in which operators can remedy this condition, but in this article we are interested only in one. If the operator can furnish his men with a good turn he will have partially remedied the situation, for the miner will realize that the operator is doing his part. The operator, in order to provide the better turn, should see to three things: (1) That the mine track is in proper condition, (2) that sufficient motive power is available and (3) that he has plenty of mine cars. Unless the track is good it does not make much difference about the other two items, for locomotives and cars cannot travel rapidly unless the track they traverse is maintained in proper condition.

Big Foreign Coal Trade After War Is Over*

By J. H. WHEELWRIGHT
President Consolidation Coal Co., Continental Building, Baltimore, Maryland

SYNOPSIS — *Importance of finding just what coal the purchaser's conditions demand and of being ready to enter the market when the war comes to an end so as to anticipate readjustments in European countries whereby American coal may be rendered unnecessary. The need for American shipping, for better maritime laws, for a readjustment of international credits, and for better banking facilities is given as reasons for our past restricted coal sales in Europe.*

WHEN the war is successfully concluded, there will be opened up to America a wonderful opportunity to further expand her exportations of coal. The splendid progress made in the early stages of the war in introducing American coal in foreign markets and the further extension and strengthening of its position in markets that had already been more or less established—now at a lull for reasons with which we are familiar—will give us an opportunity of pushing our coal. Our fuel is now beginning to be known in the markets of the world, and foreign buyers will not look upon it in the future as an experiment and often a costly experiment, but as a commodity having proved qualities particularly adapted to their requirements.

Many of the unfavorable conditions with which the American coal exporter had to contend will be removed or greatly remedied. A few of these may be enumerated: (1) Lack of knowledge of the quality and character of our coals by foreign buyers. (2) Lack of vessels under the American flag to transport our product. (3) Unfavorable maritime laws, making it impossible to construct or operate vessels in competition with vessels under foreign flags. (4) Adverse credit balances, and the absence of proper exchange facilities in the countries to which the coal is to be transported.

Great strides have been made in solving the first difficulty in the course of selling the large amount of coal exported early in the war, at a time when conditions made only American coal available to foreign consumers. Its quality, character and preparation fully and satisfactorily met the requirements of foreign countries whenever it was intelligently supplied. This latter feature should be jealously watched, and pains should be taken to ascertain from the buyer for just what purpose the coal is to be used, as the use of the wrong kind of coal is such a costly mistake as to make a customer reluctant again to give it a trial. This feature alone in many communities has given American coal a bad name such as it does not deserve.

The second unfavorable condition is being rapidly removed by the construction and acquisition of a large fleet of vessels by both our Government and individual capital.

The third incumbrance will doubtless be lifted when the crying necessity for an adequate merchant marine has been forcibly demonstrated and when, at the cessation of hostilities, we find a large investment of Government and private capital in vessel tonnage. Then surely a revision of the present laws will be made which will place our vessels where they can fairly compete with those under other flags.

The fourth difficulty has already been solved by the readjustment of international credits. This has gradually taken place during the progress of the war. Furthermore, banking facilities abroad have been established by our large fiscal institutions, and branch offices have been opened in the important centers of all foreign countries. This would appear to have placed us on an

*Paper read before the National Foreign Trade Council in Cincinnati at its meeting held on Apr. 18, 19 and 20.

equality with our competitors in the important item of credit and exchange.

With some of the obstacles removed, and with the entering wedge already made, we must be prompt to take advantage and make the most of the pioneer work already done the moment the opportunity presents itself. Immediately after the termination of the war I believe there will be a tremendous world-wide demand for coal, as most countries, including our own, have practically no stocks available. Unquestionably foreign trade will only be limited by the ability of the mines to produce coal, the ability of transportation facilities to deliver it and the ability of labor to mine it.

It looks as if we would have a ready export market during the period of reconstruction for all the coal we can ship, as the producing countries of Europe will feel the effects of depleted man power. In many sections, furthermore, it will take a long time to restore to anything approaching normal production the properties that have been devastated by the war.

By the time the war is successfully concluded this country should be in a position she has never been in before. She will have American vessels to carry coal and other exports to foreign countries and to bring back such of their products as we import. This will place us on a more favorable basis insofar as marine rates are concerned and, in addition, the experience we have had since the war began in the shipment of huge tonnages abroad will have taught us how they may best be handled, while adequate international banking facilities will enable us to handle them.

Indeed, the question in my mind is whether we will have at that time the production of coal sufficient to enable us to supply the demands made upon us by foreign countries. If we have not it would be a great misfortune; for, as I have said before, it is of the utmost importance that we should be prepared and prompt to supply any demand arising. Unless American coals are supplied immediately, and foreign nations are thus prevented from returning to their old sources of supply, it will be difficult to displace them.

The mines of America have the capacity to meet such an emergency, and it seems that the vessel tonnage will be available. Therefore, the question seems to resolve itself into our getting the coal loaded on cars and transported to tide—a matter of transportation and labor. The inadequacy of the railroads to handle the tonnage of coal which can be produced in this country has been strikingly demonstrated during the past year, and not only the Government but the people at large now realize a situation which has been known and proclaimed by the coal industry for years.

We have faith in our Government, however, that when a condition has been so fully demonstrated an effort will be made to remedy it. Already we find concerted effort to improve the railroad facilities of the country by a unification of systems and terminals, as well as by many new methods for the handling of such commodities as coal, the purpose being to improve the unfortunate situation that has so long existed. In all probability, at the end of the war, there will be a let-up in the home demand and many men who have left the coal-mining industry for work in munition and kindred employment will sooner or later be seeking their old vocation of coal mining.

Pittsburgh Coal Co. Report for 1917

The Pittsburgh Coal Co.—the premier miners and shippers of coal—reports in its last annual statement to its stockholders that "the year 1917 was disorganized throughout in demand, costs, prices and distribution. The light stocks carried over, general business activity, severe winter weather during the first quarter, followed by the entry of this country into the European war, together created an insistent demand from the beginning, largely added to cost of production, and raised general selling values to an unprecedented level. All these governing factors were aggravated by railway inability to render usual service caused by abnormal general traffic, preference movements and other adverse conditions, thereby reducing the output of the mines and work of its employees much below requirements of expectation and necessity after a large increase of plant facilities and unremitted effort on the part of the whole organization of the company."

The experience of the Pittsburgh Coal Co. as regards disturbance to the operation of its mines due to abnormal causes has been shared by most if not all coal companies, the most acute situation being reached when the railroad administration made contracts giving 100 per cent. car supply to certain mines in return for cheap coal, a practice resulting in unequal distribution of available cars, reduced production and labor unrest at mines where, through car shortage, working time was seriously diminished. In the face of great uncertainty, many of the big coal producers have adopted a policy of extension and are preparing for increase of tonnage over record production of 1917. Thus far coal shipments during 1918 have been less than for a similar period last year, owing to the failure of transportation.

This report of the Pittsburgh company was not published until about the first of March, and its comments on the situation of the first two months of this year are extremely interesting at this time. The report states: "So far this year (1918) company production has fallen off 20 per cent. below the same period of 1917, adding so much more to the existing general coal shortage to be made up with nothing more to depend upon but trust that conditions will turn more favorable in aid of strenuous efforts to effect it. The coal must come out and be moved nearer to the supply of the needs of the country for the remainder of the year or the distress and trade disturbance of 1917 will be increased under the record so far made."

Continuing, the Pittsburgh company says: "Increased coal prices, higher wages paid in other industries and increase in living expenses disturbed labor and made necessary two large advances to all employees within the year, and costs of material and supplies also sharply advanced. While 97⅝ per cent. of full productive capacity was kept in steady commission, actual output represented the use of but 50½ per cent. And while the working force was reduced about one-third in number on the average through the year, there was practically no labor shortage. Facilities were increased by the opening of two other mines. The plants and equipment everywhere have been maintained in an efficient condition and no serious accident has occurred."

The total tonnage produced and handled for 1917 was 18,388,739 net tons, a decrease under 1916 of 317,705 tons or 1.7 per cent. A greater unmined coal content remained at Dec. 31, 1917, than was owned on Jan. 1, 1916. A material addition to the coal reserves was made during the year by the purchase of 8042 acres of coal rights in excess of sales. This makes the total owned and leased acreage of unmined coal of the Pittsburgh Coal Co. amount to 237,800 acres. The report further states:

"There has been a large increase in personal injury payments since Jan. 1, 1916, when the Pennsylvania law became effective, as every accident becomes a claim for adjustment. To carry this risk and provide against extraordinary ones, a fund has been set aside out of earnings as of Jan. 1, 1916, based on the rate for such risks fixed by the Employees' Liability Insurance Department of the State of Pennsylvania."

"The [employees'] pension fund amounts to $197,706.13, of which $187,405.98 is invested in the preferred stock of the [Pittsburgh] company and United States bonds, and there are 100 men drawing pensions. Payments into and out of the fund were increased during the year [1917] and it is also on a satisfactory basis for the present." The report relative to the Pittsburgh company's Employees' Association is also interesting and at the same time a further illustration of the spirit of coöperation between employer and employee. "Since this association was formed there have been subscribed for, paid and delivered 4791 shares of preferred and 2236 shares of common stock; and there are now under subscription 7420 shares of preferred and 4724 shares of common, or a total of 19,171 shares of both classes from its inception."

"A revision of the contract with the United States Steel Corporation entered into Apr. 1, 1905, for a term of 25 years, and which had become during 1916 a source of loss to the company, was made effective Feb. 15, 1917, for the balance of the original contract period at prices and on conditions insuring more favorable results for the future . . . , and with the further result of influencing the revision of other term contracts." This establishes a precedent which may have an important bearing on many other cases needing adjustment, among which is the irreducible minimum royalty clause in some leases, if transportation is to continue as capricious during the remainder of the year. During times when coal is in such heavy demand it would not seem that a minimum royalty would come up for consideration. But mines cannot long work from one to two days a week without feeling it seriously, not to mention the feeling of unrest among the miners.

The Fireman's Dream

Written expressly for "Coal Age"

By BERTON BRALEY

"These are the firemen," said the devil

THE fireman slept and he dreamed a dream
Of going down where the hell-fires gleam
And the Devil said, when he met him there,
"Aha, my friend, you may now prepare
For a job to last through eternity
So just step lively and follow me."

HE SEIZED the fireman and rushed pell-mell
Down to the nethermost depths of hell,
Till he and his quaking captive came
To a pit that was full of smoke and flame;
And there, on a bed of glowing coals
Was a hopping, skipping band of souls,
Whose forms would bend and whose backs would crouch
As they picked the coals and bellowed "ouch,"
Blew on their fingers a bit and then
Went back to picking coals again.

He thinks of that bed of coals

"THESE," said the devil, "are firemen who
Were wasting fuel their whole lives through,
But here in Hades we kept account
Of every ounce of the whole amount
That went unutilized up the stack
Or mixed with ashes; and now that pack
Of careless spirits must snatch each bit
Of coal they wasted from out the pit.
Each lump or morsel or tiny grain
Whose heat was lost or was used in vain,
Must be extracted by wasteful souls
From the very heart of this bed of coals.

"SO NOW get busy," the devil said.
The fireman blinked at the fire so red,
But the first live coal that he reached to take
Stung him suddenly wide awake;
And he gave a yell as he left the spot
Where his hand had fondled a steam-pipe hot.
But whenever he looks in the boiler's glare
He thinks of that bed of coals down there
And his boss notes a fuel-saving clear
Of a couple of hundred bucks per year!

Economy in Power for the Mine

By C. M. GARLAND
Chicago, Ill.

UNTIL within the last few years the question of economy in power for the coal mine was, comparatively speaking, a question which had scarcely been considered. The attitude of the coal operator was to a certain extent justified in this respect, for with coal having a value of $1 a ton or under at the mine an investment in costly but efficient power equipment would hardly be warranted.

The result was that the operator, as a rule, bought the cheapest equipment obtainable. He could better have afforded to install equipment that would require 50 per cent. more coal to operate than highly efficient equipment, but he could not afford to install any equipment and operate it in such a manner that from two to five times as much coal was used as was actually required. This poor efficiency has resulted disastrously in more cases than one. There were in the past, undoubtedly, numerous mines that would have shown dividends instead of deficits if the power end of their operation had been properly handled.

Now that coal has reached a value of $2 a ton and upward at the mine, and shows every prospect of remaining at or near this figure, there can be no further justification for poor economy in power generation. In discussing this matter with the operators, the usual justification for poor economy is given as poor labor conditions. While the labor has something to do with the matter, it might be well to refer to Frederick W. Taylor's pioneer work on efficiency in industrial operation, in which he has pointed out that for an industrial organization of any kind to be efficient it is necessary that the management should know more about the work than the workers themselves.

Cause for Inefficient Power Generation

Herein to a large extent lies the cause for the inefficient power generation at the mine. The trouble is not so much in the labor as it is in the management. As a rule, firemen or engineers around the coal mines are on a par with the firemen or engineers around the average industrial plant. The real problem is to convince the management that a half dozen or more small hand-fired boilers connected up to a half mile or more of bare steam pipe is not an economical installation, or that a system of maintenance which permits repairs only when equipment has broken down and nothing more can be obtained from it is ruinous. "A stitch in time saves nine" is literally true in power-plant operation.

At the present time the use of central station power is becoming quite common, and properly so. The question as to whether it is more economical to purchase or to generate power is, however, a particularly complicated one for the mine plant. There are five elements entering into the problem which must receive consideration. The nature and magnitude of the load, cost and reliability of the purchased power, the status of the power equipment installed at the mine, the value of the coal and the amount of heating to be done in winter.

If the plant is a new one from the ground up, and the load is small or medium, it is probable that it will be more economical to purchase power and install the equipment accordingly. If, on the other hand, the plant is new and the load is sufficiently large, it may be more economical to generate power.

If an existing plant is being considered and the load is medium or large and the power-generating equipment installed is in fair condition, it is probable that by making suitable alterations it will be more economical to generate power. It is not possible, however, to make rules covering plants in general. Each plant is a problem in itself and must receive individual consideration.

In addition to the five principal points enumerated above, there are numerous minor details which may be combined to throw the decision either way. The following is a typical example: The plant consisted of an engine and boiler room adjoining. The boiler room contained twelve 72 in. by 18 ft. return-tubular hand-fired boilers and three, direct-acting steam pumps. Boiler settings were all in poor condition, the piping was without covering and numerous leaks around the flanges were discharging steam into the room. The water was bad and the boilers and pipe lines were filled with mud and scale. The engine room contained one 100-kw., one 200-kw. and one 300-kw., 250-volt, direct-current, high-speed engine generator, noncondensing.

In addition to the foregoing units there was a 24 x 36-in. hoisting engine. Outside of the engine room and located at a distance of from 50 to 500 ft. from the boiler room the following small engines were located: Three car puller engines, one sand dryer engine, three engines for conveyors, one fan engine, four small steam pumps, two engines for the repair shops and one shaker screen engine.

These engines were all connected up with piping ranging in size from 1 to 4 in. and having a total length of approximately 2000 ft. No covering was used and the lines were drained by bleeding into the atmosphere. The steam generated in the plant during a working period of 7½ hours was distributed approximately as follows:

	Lb. per Hour
Hoisting engine	18,000
Condensation in pipe lines	1,200
Leakage	1,200
Small engines and pumps	14,000
Engine generators	20,000
Total	54,400
Total for 7½ hours	408,000

During the nonworking period of 16½ hours, the following steam was used:

	Lb.
Condensation in lines	1,200
Leakage	2,000
Engine generator	5,400
Hoisting engine	6,000
Fan	1,500
Pumps	1,500
Total steam per hour	17,600
Total steam for 24 hours	698,000

Evaporation of steam per pound of coal was approximately 5 lb. About sixty-nine and eight-tenths tons of

coal were used per day and the annual coal bill was $44,400, of which no record was kept. Coal has a value of approximately $2 per ton under present conditions. The annual cost of power was as follows:

Coal	$44,400
Labor	21,600
Repairs	4,500
Oil and supplies	2,500
Total	$73,000

The following changes were recommended: Replacement of small engines with motors; the installation of a 750-kw. mixed-flow turbine with regenerator and condenser to operate on the exhaust from the hoisting engine; the replacement of the small boilers with three 400-hp. units equipped with mechanical stokers. If these changes were made the old engine-generator units would serve as emergency equipment while the steam turbine would normally carry the load. The electrical load, which formerly averaged 400 kw. per hour during the working period, would now average 550 kw. per hour. All of the small engines would be discarded.

Changes Brought About Large Saving

After the changes are made the following is the estimated steam consumption:

	Lb. per Hour
Hoisting engine	18,000
High pressure steam for turbine	7,370
High pressure steam for auxiliaries	4,500
Total	29,870
Radiation and leakage	787
Grand total	30,657

The steam required for the nonworking period of 16½ hours is as follows:

	Lb.
Hoisting engine	3,000
Auxiliaries	3,600
Generator	5,000
Total	11,600

The coal consumption for the 24-hour period is 32½ tons and the annual coal bill is $21,640. Under these conditions the annual cost of power would be as follows:

Coal	$21,640
Labor	10,600
Repairs	2,500
Supplies	1,500
Total	$36,240

The total investment required for the foregoing changes, including the overhauling of hoisting engine and engines and generators, would be $101,000. The fixed charges on this investment at 12½ per cent. would be $12,620. The annual cost of power is therefore $48,860 and the annual saving over the cost of power before the making of the changes $24,140.

The question next to arise is that of purchased power. In the event that power is purchased the hoisting engines will be discarded and an electric hoist installed. The total investment necessary is $52,000, and the fixed charges at 12½ per cent. are $6500 per annum.

With purchased power the average load for the working period is 775 kw. and for the nonworking period 120 kw. The power companies' rate for this load was 1.7c. per kw.-hr. The total estimated kilowatt-hour consumption per annum was 2,329,000, making the bill for current $39,500 yearly. The annual cost of power is estimated as follows:

Current	$39,500
Labor	6,000
Coal (for heating)	1,400
Repairs	1,500
Supplies	1,000
Total operating cost	$49,400
Fixed charges	6,500
Annual cost of power	$55,900

The saving in generated power over purchased power is $7,040.

A plant of this size would be classed as medium. Owing to the comparatively high figure of 1.7c. for the cost of current, it would be more economical to generate power with the improved equipment. In addition to this saving the item of spare equipment which makes shutdowns due to failure of the power equipment almost impossible, there is an additional item of saving which cannot well be estimated.

If the cost of current had been 1.5c. per kw., which would have been a more reasonable figure for the amount of current required, and if there had been no heating requirements, the cost of generated power and purchased power would have been approximately the same. The selection then should have been made on the basis of the reliability of the service.

If in the example above the amount of power required per annum had been from 25 to 50 per cent. greater, this additional power would be generated at approximately the cost of coal. There would then be little chance for purchased power even at the lower rate of 1.5c. per kw.-hr. Conversely, if the amount of power required had been from 25 to 50 per cent. under the actual demand, there would have been no economy in generating as the fixed charges and labor item would remain essentially the same.

Referring again to the original coal bill of $44,400, which was based on coal at $2 per ton, it will be noted that if the price of coal had been $1 per ton that the cost of power under these wasteful conditions would have been $50,800 per annum. This compares favorably with $48,860 as the cost of power generated with improved equipment and with purchased power at $55,900.

It will be noted also that the large saving effected by the improved equipment is not alone due to the decreased fuel consumption. The labor item about which there is so much complaint, which to a large extent is justified, is excessive and would never be tolerated in the average industrial installation. Small hand-fired boilers together with the large number of small engines makes an excessively large labor item, which can be reduced readily by anything like modern generating equipment.

Correction

In the explanation of the use of the diagram (Fig. 3) for finding the change in declination of the sun, in the article on "The Ross Meridiograph," in the last issue of *Coal Age*, a misstatement is made in the third paragraph on page 734. The last lines in this paragraph should read as follows: *Then, project this last point vertically onto the scale at the top or bottom of the diagram, as the case may be.*

Likewise, in the seventh line from the bottom of the same column, the words "whose intersection with" should read *and that point again projected vertically onto.* Also, the words, *corrected for refraction and declination* should be inserted after the words "sun at noon," in the last line, second paragraph, second column, page 732.

Fuel Mixing Plant at Hazleton, Penn.

An article appeared in the Mar. 9, issue of *Coal Age* on the "Utilization of Anthracite Culm," by M. S. Hachita, who describes a number of interesting experiments conducted by the Lehigh Valley Coal Co. on various mixtures of anthracite culm and bituminous coal. This matter has attracted so much attention that further information about the plant itself might be timely. Also the latest developments in the situation.

The utilization of hitherto practically waste fuel products, conveniently stored for use, serves various purposes: It is quickly available in considerable quantity, it releases other fuel which is in great demand, and valuable space around some breakers is not stored with what was previously an ever-increasing pile of culm.

Lehigh Valley Coal Co. in the Clearfield region of Pennsylvania, is dumped into the boot of the elevator *A*, from which it is elevated to the top of the structure. At the upper end of this conveyor line the coal passes over bars —the fine coal falling through goes direct to the bin *G* and the lumps are carried on to the rolls, which crush to about 1 in. The rolls have little work to perform, as the coal coming from the Snow Shoe mines is screened through 1¼-in. bars. The bin *G* has a capacity of about 85 tons. The culm bin *F* holds about 50 tons.

Coal feeds by gravity from the bins to the revolving tables *C* and *D;* the former has a peripheral speed of about 2½ ft. per min. and the table *D* of about 5 ft. per min. (See diagram below for details of these tables.) This arrangement tends to feed one volume of silt to two of bituminous coal to the mixing table *E*. A strip of sheet iron (12 in. wide) around the outer edge of the revolving table, but not attached to the table, keeps the

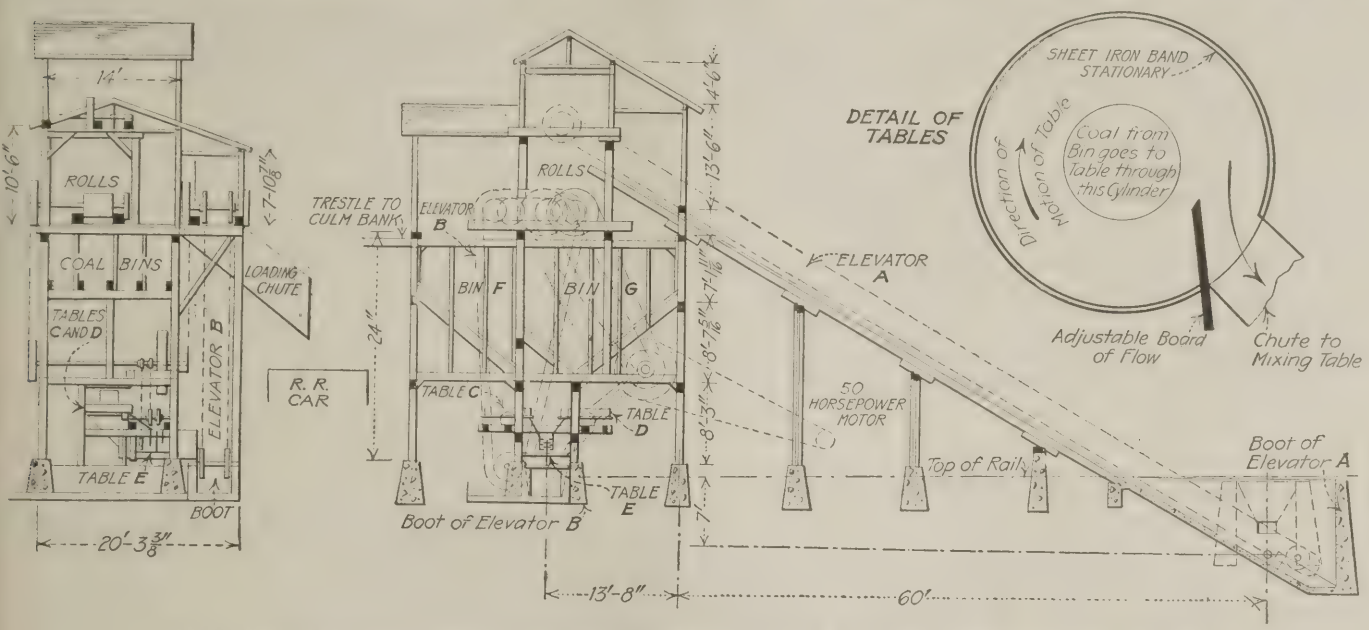


FIG. 1. LONGITUDINAL AND CROSS-SECTIONAL VIEWS OF MIXING PLANT AT HAZLETON

For many years the water used in preparing coal in the breakers in some sections of the anthracite field was conducted from the breaker by chutes to a settling pond, or allowed to spread out over territory adjacent to the breakers. This wash water generally, if not always, carried much fine coal. From the settling ponds the coal has been recovered and often stored in banks now generally available for use. In some other cases large areas carry culm beds several feet thick, where the silt was deposited when the transporting wash water spread out and drained slowly away to a stream in the vicinity. The wastes of yesterday are frequently the valuable byproducts of today.

The experimental mixing plant was located at Hazleton partly on account of the proximity of a large bank of culm to a site on the Lehigh Valley R.R. convenient for mixing and shipping the fuel. The external view of this plant is shown in an illustration accompanying the article referred to above—longitudinal and cross-sectional views of the structure are given in Fig. 1 herewith. The structure and its coal-handling apparatus are so simple as to need little explanation.

Bituminous coal from the Snow Shoe mines of the

coal on the table except at one point where it is scraped off into a chute by a board or plow. The coal feeding to the revolving tables through a central cylinder tends to spread out on the table due to the weight of the coal above and to centrifugal action. The tables are 5 ft. in diameter and are made of cast iron 1 in. in thickness.

The mixing table *E* mainly differs from the other two in one particular. Attached to the center of the table is a vertical shaft provided with several series of projecting arms. Other similar arms project from and are attached to the sides of the central stationary cylinder. The arms on the shaft revolve with the table and between the stationary arms. Coal passing through the cylinder is stirred up by the arms and mixed. From the table *E* the fuel goes to the boot of the elevator *B*, from which it is elevated to the top of the building and into a chute to railroad cars. It is expected shortly to about double the capacity of this Hazleton plant by arranging to dump more cars at one time into the boot of the elevator *A*. It is also planned to load the culm into the hopper cars, which transport it to the mixing plant, by a steam shovel instead of by hand as at present.

The Lehigh Valley R.R. at present uses about 7000

tons of coal a day on its engines—no small item. The present Hazleton mixing plant coals the locomotives on the Mahanoy & Hazleton division and also to Coxton. When the plant is enlarged to twice its capacity, the excess fuel will coal engines running to Lehighton and also to Wilkes-Barre. On the mountain divisions a mixture of one part culm to two parts bituminous coal is required, but for yard service a 50-50 mixture answers and saves money.

The Hazleton plant has proved to be such a success that another and larger mixing plant is well under way at Coxton. Part of the material for this new plant is on the ground and construction should proceed rapidly with good building weather. With the addition of the Coxton plant, the coaling service should extend to Manchester. It is expected that the new plant will use annually 250,000 tons of culm, which will come from the following collieries: Dorrance, Franklin, Mineral Spring, Exeter, Seneca and Heidleburg. These mines are operated by the Lehigh Valley Coal Co. and produce about 250,000 tons of culm a year, which will be used as made. If this supply from the Wilkes-Barre mines does not fill the requirements, then collieries of the Lehigh Valley company in other regions of the anthracite field will make up the deficiency. When new culm is used it will be necessary to filter it in centrifugal machines to remove the excess water.

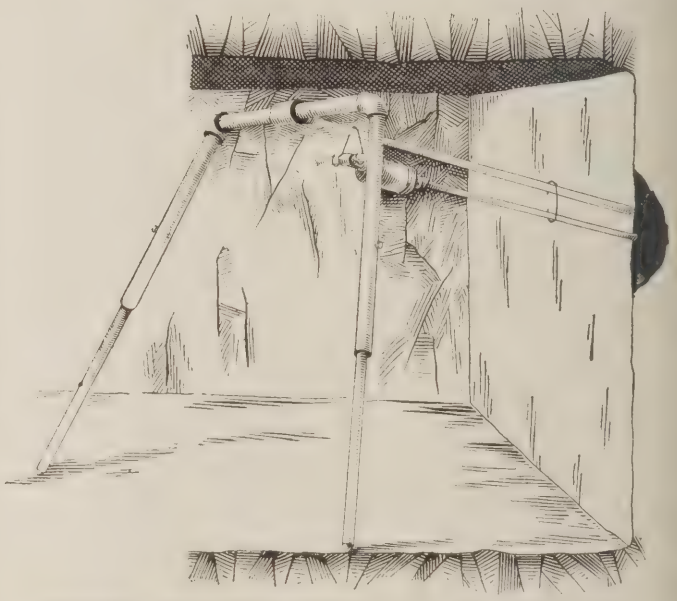
It is safe to predict that collieries which have used this culm for filling old mine workings to support the top will likely store it for future use. At some of the collieries of the Lehigh Valley Coal Co. the slate or breaker refuse has been reduced to ¼ to ½ in. in size and flushed into their mines.

Drill Mounting for Drilling Coal

By B. B. Brewster

The use of the Sullivan rotator or other types of hand-feed, automatically rotated hammer drills has made much headway in the past year or two, for drilling shot holes in the coal face, when blasting is required after undercutting.

As a substitute for hand drilling, the rotator, driven by compressed air and weighing only 38 lb., is many times faster and is perfectly convenient to handle.



While the rotator, in coal drilling, is readily operated by one man, even on deep holes, a drilling gang frequently comprises two men. This is simply to provide for greater speed in handling the drill, steel, hose, etc., and in carrying them from room to room. In coal of ordinary height (6 ft. or less), and for holes of ordinary depth, the operator, either alone or with a helper, has no trouble in supporting the drill by hand. For deep holes or high coal, some form of simple mounting has been found desirable.

The accompanying illustration shows such a mounting, devised by the writer for this purpose, and used with success in at least two Utah coal mines. This consists of two rear legs or feet, joined at the top by a cross bar, having a tee in the center, in which is secured a horizontal bar or leg. The rear legs have a telescoping joint formed by drilling holes at regular intervals in the pipes, of two diameters, composing the leg and a pin inserted to hold the leg at the height desired.

This mounting is made of ordinary pipe, 1 in. or 1¼ in. in diameter, and fittings. It is set at the height desired, and the drill is hung under the horizontal bar or leg on two hooks, one on the drill handle, the other at the bit end of the steel. This makes it unnecessary to hold the steel while collaring the hole. The operator merely steadies the machine and thrusts it forward to its work.

In the setting shown, holes were put in about 6½ ft. above the floor, in 8-ft. coal, and the drilling was done rapidly and easily. In this mine, where the coal was fairly hard, miners with hand augers drilled about 10 holes per man per shift, the holes being 5 to 5½ ft. deep. It required two, four or even sometimes six hours to drill the holes for a single room.

In trying out the new mounting, several rooms were drilled. One of these will serve as an example of the

SIMPLE DRILL MOUNTING FOR DRILLING COAL

results secured. Five holes were drilled, or a total of 27.1 ft., in 13 min. 10 sec. drilling time, an average of 2.1 ft. per min. The drill and mounting were then pulled down, moved to a near-by crosscut, reset, and three holes drilled, or a total of 16.3 ft., in a total time of 17 min. The actual drilling time on these three holes was 8 min. 2 sec. The drill used was ⅞-in. hollow hexagon steel and "Z" bit. On the first hole two lengths of steel were used; on all others, one 6-ft. length only. The great time and labor economy of such a coal-drilling rig will at once be evident.—*Mine and Quarry.*

New Coal Mining Paper

A new coal mining paper, to be known as the *American Coal Miner*, has been started by K. C. Adams, formerly in charge of publicity for the United Mine Workers of America. The new publication will be a weekly digest of coal mining news, summarizing and briefing the best articles appearing in other coal mining papers. Mr. Adams is editor of the new paper, and he states that it will be a high grade publication throughout. It will doubtless be received with a great deal of interest by the industry.

Which?

Will you lend your money to fight the foe "Over There," or will you wait till they come "Over Here" before you are sufficiently aroused?

New Coal Prices

New coal prices in the States of West Virginia, Kentucky, Missouri and Kansas, effective Apr. 20, were announced by the Fuel Administration last week as follows:

State or Field	Run-of-Mine	Prepared Sizes	Slack or Screenings
West Virginia:			
No. 10 district, Coal & Coke and Gauley districts; Taylor, Barbour, Lewis, Buckhannon, Randolph, Gilmer, Braxton, Webster and Greenbrier Counties; operations in Nicholas County east of the mouth of the Meadow branch of the Gauley River and Coal & Coke district in Kanawha and Clay Counties, north of Charleston	$2.30	$2.55	$2.05
Fairmont district; Monongalia, Marion and Harrison Counties	2.15	2.40	1.90
Thacker district, operations in McDowell County west of Panther on the Norfolk & Western and in Mingo County west along the Tug Fork of the Big Sandy River to Williamson on the Norfolk & Western	2.30	2.55	2.05
New River district; Fayette County south of Hawk's Nest on the Chesapeake & Ohio, Fayette and Raleigh Counties south of Paintsville on the Virginian R.R., Wyoming County north of Herndon on the Virginian Railroad	2.35	2.60	2.10
Logan district; Logan County and operations in Boone County south of Danville on the Chesapeake & Ohio, Lincoln County south of Gill on the Chesapeake & Ohio	2.15	2.40	1.90
Putnam County	2.50	2.75	2.25
Kenova district; operations on the watershed of the Tug Fork of the Big Sandy River west of Williamson on the Norfolk & Western and Wayne County	2.30	2.55	2.05
Kanawha district; Nicholas County west of the mouth of Meadow creek, Fayette County, west of Hawk's Nest and north of Paintsville and operations in Raleigh and Boone Counties on the watershed of the Clear Fork branch of Coal River, Boone County, north of Danville, Kanawha County south of Charleston and Lincoln County north of Gill	2.25	2.50	2.00
Kentucky:			
Thacker district; operations in Pike County on the watershed of the Tug Fork of the Big Sandy River east of Williamson	2.30	2.55	2.05
Kenova district; operations in Pike County and in Martin County on the watershed of the Tug Fork of the Big Sandy River west of Williamson	2.30	2.55	2.05
Missouri:			
District No. 1; Audrain Bates, Calloway, Henry, Johnson, Monroe, Randolph, Ralls, St. Clair, Schuyler, Vernon, Montgomery and Adair Counties, except operations of the Star Coal Co. and operation in Macon County east of New Cambria and mining operations not covered by other rulings	2.70	2.95	2.45
District No. 2; Boone, Clay, Cooper, Chariton, Carroll, Dade, Harrison, Linn, Lafayette, Putnam, Ray and Sullivan Counties and Macon County west of New Cambria and the long wall thin-seam mines in Randolph County	3.15	3.40	2.45
Grundy County; operations of the Star Coal Co. in Adair County; shaft workings on the upper thin vein in Barton, Bates and Vernon Counties	3.65	3.95	2.45
Platt County	3.40	3.65	2.45
Kansas:			
Cherokee and Crawford Counties, except shaft mines on the upper thin vein and any mining operations in the State not covered by other rulings	2.70	2.95	2.45
Shaft workings on the upper thin vein in Cherokee and Crawford Counties	3.65	3.95	2.45
Osage, Franklin and Linn Counties	3.50	4.50	2.80
Leavenworth County	3.40	3.65	2.90

The foregoing prices do not include the allowance of 45c. a ton to those operators who have complied with the Washington wage agreement.

Weekly Production Statistics

Bituminous coal production during the week ended Apr. 13 was 10,947,000 tons, an increase of nearly 18 per cent. over the preceding week. Anthracite forwardings were 37,760 cars during the week ended Apr. 13, an increase of nearly 6000 cars over the week ended Apr. 6. Beehive coke production for the week ended Apr. 13 aggregated 672,000 tons, an increase of 50,000 tons over the week preceding. Byproduct coke production for the week ended Apr. 13 was 469,561 tons, a very slight increase over the week preceding. The figures are estimates made by C. E. Lesher, the geologist in charge of coal statistics for the Geological Survey. Telegraphic advices to the Fuel Administration covering bituminous coal production during the week ended Apr. 20 indicate that a still further increase in production has been made.

An increase of 744,000 tons of bituminous coal over the production of the first three months of 1917 was attained in January, February and March of this year, Mr. Lesher estimates. This is equivalent to an increase of one-half of 1 per cent. over the corresponding period of 1917, but is slightly less than the coal mined during the first three months of 1916. March production, however, was greater in 1918 than in either 1917 or 1918.

Railroad Fuel Situation Not Yet Settled

While the railroad fuel situation, at this writing, is by no means settled, the advantage in the controversy has turned sharply to Dr. Garfield, the Fuel Administrator. In the hope of devising some means whereby the deadlock may be broken, Dr. Garfield has laid the entire matter before the Board of Directors of the National Coal Association. The advisability of making any concessions in an effort to do away with the present uncertainty is being discussed. If the amount of the concession from the price schedule could be turned directly into the treasury of the United States, it would come nearer meeting the approval of the Fuel Administration, it is understood.

The stumbling block in the whole negotiations has been John Skelton Williams, the director of purchases for the Railroad Administration. It is known that the President has the utmost confidence in Dr. Garfield's judgment. In the discussion of the railroad fuel situation with the President, it is said to have developed that the President has been embarrassed on a previous occasion when the advice of Mr. Williams was followed and, as a result, it is considered logical that he will

scrutinize any of Mr. Williams' recommendations with unusual care before allowing them to be carried into effect. The controversy already has interfered with production and distribution of coal to such an extent that it is believed a settlement of some sort must be reached promptly.

Retail Prices To Be Equalized

Retail prices of coal are to be made as near uniform as possible. To accomplish this end, the following message has been sent by the Fuel Administration to all its county chairmen: "No doubt the most perplexing problem confronting you and your committees has been the great variation between the costs of the different retailers in a given community. Some committees have not realized that the high cost of the inefficient retailers were abnormal costs; and they have so fixed the gross margins that even the dealer with the highest costs realized a substantial net profit. By regulation of retail prices and practices the Fuel Administration can encourage efficiency in handling and delivering coal."

Comparatively Few Licenses Requested

Fuel Administration officials apparently overestimated the number of licenses which would be asked in connection with the zoning plan. Instead of the flood of applications expected, comparatively few have been received. Information reaching the Fuel Administration shows that thousands of industries, which previously have been using coal from other zones, are placing orders and receiving their coal in the zone in which they are located.

In some cases, however, the Fuel Administration has learned that consumers are withholding their orders in the expectation that the zone of distribution may be altered in a way that will broaden their sources of supply. Such a policy is likely to prove unwise as the greater portion of modifications are certain to be in the direction of further restriction rather than enlarging sources of supply.

Domestic Consumers Must Fill Forms

Retail coal dealers in New Jersey are demanding from each applicant for coal for domestic use a signed statement as to the amount of coal in his possession and such other information as is required by the form reproduced herewith.

Name of dealer .....

City ..... State .....

In accordance with the order of the State Fuel Administrator in New Jersey, purchasers are required to make true declaration in answer to the following questions:

1. Amount and size of coal desired .....
2. To heat ..... rooms (not including bathrooms, pantries, etc.).
3. Size used last year .....
4. Approximate amount used last year .....
5. Coal on hand at present .....tons ..... size .....
6. Will last approximately ..... days.
7. Have you any unfilled orders with other dealers .....

I hereby certify that the above report is true to the best of my knowledge and belief.

Name .....

Address .....

Coal Brasses To Be Utilized in Making Sulphuric Acid

Coal brasses are being relied upon in estimates now being made to furnish a portion of the iron pyrites needed in the making of sulphuric acid. No less than 500,000 tons of coal brasses are available for this purpose, according to the Committee on Mineral Imports and Exports. While few coal companies are in a position to recover pyrites from this material, plans are now being worked out for the establishment of a number of central plants which will turn out the treated product. Efforts in this direction in the past have been looked into and found not to have been scientific, or to have been followed determinedly.

New Maximum Coke Prices

Smelting or furnace coke in Colorado may be sold at $8.50, according to a ruling by the Fuel Administration. Seventy-two-hour selected foundry may sell for $9.50.

Prices in Monongalia County, West Virginia, are $6.25 for blast-furnace grade and $7.25 for 72-hour selected foundry.

The price for 72-hour selected foundry made by the Empire Coal Co., at Empire, Ala., is $8.75.

No revision of prices for any district or field will be considered for at least ninety days after the date upon which a revision of prices for the field in question had been announced, a Fuel Administration order sets forth.

MAKE YOUR MONEY FIGHT. BUY LIBERTY BONDS.

THE LABOR SITUATION

EDITED BY R. DAWSON HALL

General Labor Review

There are several items of more than ordinary interest —a settlement in Alabama, the promise of the Tennessee Coal, Iron and Railway Co. that it would enter into contractual relations with its men as have other Alabama operators, the decision of the central Pennsylvania mine workers to be content with their wages, the announcement by President Hayes that it was low-price railroad coal that worried him and not the alleged price tinkering of the Fuel Administration and the decision of the United Mine Workers to issue their journal semi-monthly and distribute it gratis to all members.

The anthracite mines are working well despite threats of strikes against Liberty-bond slackers. There have been, however, a few actual button strikes and a few mines closed down by flooding. Just recently there has been a gain in the mine forces, but the draft may well upset this favorable circumstance. Besides the gain is not in the coal getters. Miners in the anthracite region increased from Sept. 17 of last year to Feb. 13 of this year by 618, but miners' laborers in the same time decreased by 949. The main increases are in company men who handle the coal after it is mined, at mines and at culm piles, whereas the only really hopeful increase would be in men at the face. A table we publish elsewhere shows that this number has decreased by 331. The anthracite region needs 22,000 more men to be as well staffed as it was before the war started.

ANTIUNION DRIVE HAS SPENT ALL ITS STRENGTH

The drive against the union has reached its limit. Everybody now knows what it amounts to, and the panic is at an end. There are 40 local unions in the secession and, apparently, they are all in District No. 9. The leaders of the secession movement have called a meeting for the day on which this issue of *Coal Age* appears. They are not very sure of themselves and so have not signed their communication to the officers and members of the district, individually, but as a "committee." The notices are carboned in red—a fact somewhat symbolic of the affiliation of their issuers with those who use red as an emblem of their bloodthirsty purpose. President Hayes feels sure that the situation is well in hand.

In central Pennsylvania the delegates from District No. 2 met at their regular rendezvous, Du Bois, on Apr. 22. The policy committee reported to the delegates that the price set upon coal by the United States Fuel Administration did not contemplate or admit of an increase in wages. They recommended that there be no strike but urged that the Fuel Administration investigate wages in the district. In all of this the delegates somewhat ruefully concurred.

EVEN THEIR PATRIOTISM DID NOT SPARE THEM

The Pittsburgh district has its enemy-alien trouble like most other districts. Three Austrian mine workers were drafted before the United States went to war with Austria Hungary. With all loyalty and good will they went to camp. When war was declared with the Dual Monarchy they were compelled to return home. Two other Austrian miners who had volunteered before the draft, returned at the same time.

The mine workers at No. 2 mine of the Pittsburgh Coal Co., at Bishop, Penn., refused to work with these men. Vice-president Robert R. Gibbons of the Pittsburgh district, brought the mine workers' local committee down to see United States District Attorney E. Lowry Humes and he explained that the men were simply obeying military regulations and that the strike would serve no worthy cause. A meeting of the strikers followed. Gibbons warned that a riot would follow if he condemned the strike, but he took the hazard, and the strike ended after it had lasted a day.

The Maryland strike of which mention was made last week appears to have included all the mines in the Georges Creek and Upper Potomac field with but one exception, the Reilly-Peabody concern which operates the old Jackson workings. This is a New York City company and several weeks ago it had signed an agreement with its men.

About 900 mine workers employed on the Western Maryland R.R. between Shaw and Schell, W. Va., in the Elk Garden field stayed out longer than the other mine workers

AINT IT A GRAND AND GLORIOUS FEELING?

because, according to their own declaration, they were not notified to resume. They returned to work, however, Apr. 18, a day after their fellows in the adjacent fields.

This is the first serious strike the Georges Creek and Upper Potomac field has had for 18 years when, in 1900, William Warner, an organizer for the United Mine Workers, closed the mines for two months.

The Washington agreement not only established a penalty clause, but it put in operation a new schedule of wages. Those who comply with the agreement are allowed to charge 45c. a ton more than before. The union makes the assertion that in many nonunion regions the operators are dutifully adding 45c. to their price and forgetting to add the full increase to the wage paid their employees. The charge is no light one, and if the union can establish the facts by

the organizers they have sent into the nonunion fields they will do the industry no small service. Dr. Garfield has informed President Hayes, of the United Mine Workers of America, that by special investigators he will make careful inquiry of all the abuses of which Mr. Hayes has given him notice. These men will visit the mines and will enforce the provisions of the agreement.

War Reactions in Anthracite Region

The recent actions against enemy aliens in the anthracite region have been more reasonable than those in the past. For a while the mine workers, especially in the Panther Valley region, seemed determined to keep Germans and Austrians from working in the mines. The feeling was only sporadic, and did not seem, even where it appeared, to evidence an all-inclusive exception to all enemy aliens. Still it was menacing for it might have spread to all the mines of the anthracite region and have involved all those whose naturalization was still incomplete.

But no matter how strange and illogical it may seem the feeling existed nevertheless. The public had barely seen the matter settled satisfactorily by the exertions of the labor-union leaders, when it read in the papers that German prisoners in France were being compelled to work by American soldiers. It is the old story. Nobody seems to know what to do about the alien. He is damned if he does and he is damned if he doesn't. Today he must be compelled to work, tomorrow he must be forbidden; now he must be naturalized—this if he is not an enemy alien—then again he mustn't be allowed to accept naturalization.

More Excuse for Central Pennsylvanians

It must be admitted that there is some possible shadow of justification for the mine workers in central Pennsylvania when they proclaim that they will not let friendly "enemy aliens" share in a car service that is wholly inadequate even to keep native and naturalized citizens busy. The action of these mine workers is perhaps none too kindly when we consider that it denies a living to men who show their goodwill by their readiness to work, and often by their buying of Liberty Bonds and by their attempts to become soldiers in the United States army. In fact, unreasoning bitterness to them will not engender in them that spirit of Americanism which we want newly arrived Americans to share with us.

But the objections formerly raised to friendly "enemy aliens" in the anthracite region was more inexcusable, because men are scarce in that region and every man, native or foreign, has work every day. Some men are even complaining that the companies are insatiable in their demands on the workers for more coal and more shifts of labor.

However, as said, the refusal to let men work when they will not buy Liberty Bonds rests on a far better basis. All men whom America is aiding should do their part in return by subscribing to the Liberty Loan.

Must Buy Liberty Bonds or Leave the Job

At the Sandy Run mine, near Freeland, the mine workers have served notice that they will refuse to work with three pro-Germans who have refused to buy Liberty Bonds. A Hungarian and an Italian were discharged Apr. 18 from the Harleigh strippings of the Central Pennsylvania Stripping, Quarrying and Construction Co. because they made a similar refusal. Their fellow workers threatened to strike if these slackers were permitted to work, and for a while it appeared that a lynching was in prospect.

At the Lytle colliery five Austrians who refused to purchase Liberty Bonds were taken by the heels by the workmen and dipped into a steel tank where oil is heated for the colliery engines. The men are covered with an amber stain that will not easily be washed out. When they threatened suit against the ringleaders they were told that any such action would result in their being strung up. As a result on Apr. 18 all five men purchased Liberty Bonds, and decided to make no trouble for those who had been guilty of hazing them.

At Last, Alabama Wage Is Settled

On Saturday, Apr. 21, the wage scale of the Alabama region was settled after a long delay. It will be recalled that on Dec. 14, 1917, the Fuel Administration made certain recommendations to the mine workers and operators relative to an adjustment of working conditions in the Alabama coal field. In this document under section 7 it was provided that the readjustment of mining rates and wages be postponed until July 1, 1918.

However, the representatives of the Alabama coal operators and those of the mine workers in Alabama expressed a desire for an earlier adjustment and conferred with the Fuel Administration to that end, and in consequence it was decided that the following rates and wages should become effective May 15, 1918, and continue in effect and binding during the continuance of the war, but not longer than for two years from Apr. 1, 1918, should the war be protracted for a longer period of time.

New Day-Wage and Tonnage Scale Provided

Under the scale day labor will be paid as follows: Drivers, $3.44 per day; unclassified inside day labor, $3.20; unclassified outside day labor, $2.75; tipple men, $3.00; miners employed by the day, $3.84; trappers and other boys, 50c. per day advance.

All other classes of day labor employed in and around the mines to be advanced 75c. per day over present prices. But in no instance shall the rate paid exceed that paid for the same class of labor in the Tennessee and Kentucky scale which was approved by the Fuel Administrator Nov. 7, 1917. It is understood, however, that where day labor is now paid more than the Tennessee and Kentucky scale no reduction shall take place.

The pick-mining rate for run-of-mine coal is advanced 5c. per ton. The machine-coal loaders are to receive 4c. more per ton. Machine runners and helpers where employed by the day, ton or foot are to be advanced 10 per cent. Compensation for all yardage, room turning and dead work is to be increased 6¼ per cent. Miners when taken from the face to do company work shall receive the rate paid for that classification, but, in no instance, shall the rate be less than the rate paid for miners when employed by the day.

House-Coal Price Is Increased to Miners

Each operator affected by this agreement shall file with the umpire within two weeks after its formation (sic?) the scale of wages paid at each mine during March, 1918, for mining, yardage and dead work and day labor, also the scale of wages paid for the same work under this agreement. House coal shall be advanced 45c. per ton.

If any mine worker or group of mine workers in any way interrupt the operation of the mine or causes a strike, the operator shall deduct from the earnings of each employee, except those who continue at work, the sum of $1 per day for each day or fraction thereof that such mine worker fails to report for work.

If any mine is closed or the men locked out by an operator, without just cause, the umpire of the Alabama district will impose upon and collect from such operator the fine at the rate of $1 per day for each mine worker affected. All questions arising under the foregoing provisions are subject to review by the umpire of the Alabama district. All fines collected shall be paid to the American Red Cross. It is not the intention of this penalty clause that it shall apply to individuals who may temporarily absent themselves from work, but it is intended to insure maximum coal production and to compel operators and miners to submit their complaints to the proper tribunal for adjustment without strike or lockout. Any operator failing to collect the penalty as provided herein shall be penalized one dollar per day per man affected.

This agreement is signed by Rembrandt Peale and John P. White on behalf of the Fuel Administration and by G. B. McCormack and J. H. Bankhead on behalf of those operators who agreed to the recommendations dated Dec. 14, 1917, and by J. R. Kennamer, William Harrison and Adam Wilkinson on behalf of the Alabama Mine Workers.

EDITORIALS

To Have and To Hold

THERE is a little advantage in talking thrift to anyone. Probably no one ever saved because he was urged to save, at least not for long. Thrift is one of the negative virtues. There are no thrifty people. There *are* people, however, who like to spend. Even the miser does not really enjoy saving, but he puts away his pennies to *buy* gold so that he can gloat over it.

Most people are not satisfied with gold; for they need something less like money; but a bond or a war-saving stamp will satisfy their buying propensity. They will buy a bond, but they will not save the money which would purchase it. Any man with this objective can be turned into what looks like a thrifty man. He is not so much a self-denying fellow, however, as an acquisitive one. It is no good to tell him to save; tell him to buy a bond. He is approachable on a buying line, and on that only.

A spendthrift is a man who squanders his money on perishable things; a thrifty man is one who expends his money on less perishable things. Both are spenders; both are actuated by the desire to spend. All of them will buy a Liberty Bond, for all have the desire to purchase something, and there is no investment that is better than this one; for it brings a profit both to the buyer and to the nation.

Why This Is the Worker's Paradise

IT WAS generally conceded not so many years ago that nowhere in the world did the workingman have more comforts and privileges than in the United States. Of recent years, as a result of an assiduous campaign, a doubt has come into some minds. Germany, where the workman has been face to face with the most grinding poverty, has woven a spider web across the chasm of disaster to catch the workman when he fell. As shown editorially last week, the webs are too thin to do anything but mock the faller with their substanceless unreality. Yet Germany, we have been told, has a better civic life than we have.

It has been quite generally the opinion of our workingmen that wages were better than welfare provisions; that it was better to put money in a man's pocket and let him use his freeborn judgment on it than to dole it out to him and spend it for him. Perhaps that is not the correct view. But, at least, nations that give pensions and protection of various kinds must take that gift from wages, and it is quite clear that wages, pensions and other protection are alike inadequate in Germany, as we Americans rate adequacy.

The workingmen of America are fortunate in living in a country where the raw materials are in abundance and readily accessible, where the coal outcrops at the surface, where iron can be dug by steam shovel, where large cliffs of limestone are found, where the hills have been clothed with magnificent forests, where the oil springs from the ground as water alone rises in many countries, where the soil has, at least till recently, been unexhausted, and where there has always been room for expansion because the country is not nearly so close to its limit of population density as are other countries. Nevertheless, in comparing the United States and Germany, it must always be remembered that next to the United States there is no country so well favored as Germany in its natural resources.

Almost as important, however, as natural resources is the spirit of the workingman. There is no workman like the American. No one can avoid the impression that it is his genius and readiness for production that have made possible that large output which has been so liberally divided among American workingmen. His capacity for production is unexcelled. In no country has he obtained a larger percentage of the product of his labor; in none has the product been greater. No wonder his lot has been enviable.

In only a few instances have American workingmen felt that there was a limit to the annual consumption of mankind, and that therefore it was to their interest, to do as little as possible so as to provide the maximum hours of employment for the workingman. They have almost always been willing to do their level best, knowing that cheap goods make a brisk market and so promise as large an annual wage as dear goods and a sluggish market.

They have argued, when they cared to argue, that as their desire for the good things of life was unsatiated and insatiable, so was the desire of other people; and they felt assured therefore that in the long run the public would buy all that the public could and would produce. Work has never been to the eager American workingman a drudgery to be avoided, but a pleasure to be sought. Of course, there are exceptions—some, alas, in the coal industry—but they are not as numerous as in Europe.

A restless race of people, who left Europe because they wanted to progress and dared to try a new country in pursuit of that progress, the American people have always had a surplus of energy; and what they produced with their hands they used to build their homes and to clothe their bodies. What wonder then that the workingman lived in a home like a bourgeois, his good lady dressed like a burgomaster's wife and his children were educated like the sons of merchants. It had to be. They made the wealth, with their two hands and swaying bodies. They won it as by an incantation, and when it was won they could not fail to have it and to use it.

They have preached to us another workingman who would not work so happily—a workingman who gloried in low production. Let us never doubt that such a workman living in a land of low production will have but stinted product for his stinted labor. He will

try to rob his fellowman by half-hearted labor, and his fellowman will try to rob him by pouring water into the milk of his hourly endeavor, and all will starve.

"Product" should be our watchword—not to best the foreigner, but to better ourselves; not to prevent John Bull, Jean Crapaud or Johann Schmidt from serving us with goods that they can more cheaply and more easily produce and which, perhaps, in some instances they alone can produce, but so that we may have the material to buy and the product on which to live lustily and well.

Big Foreign Coal Trade After War is Over

UNDER this title appear some remarks by J. H. Wheelwright on the prospects of extending our coal trade after the war. It is cheering to find that such an undoubted expert looks so favorably on possibilities. It will be noted that the reasons he gives for our past failure to obtain entry into the European markets are those which have been quite generally advanced before. As they are largely superable by good salesmanship, reasonable legislation, favorable treaties and suitable banking facilities, it is heartening to note that Mr. Wheelwright recognizes no other difficulties. Surely, if these be all the hurdles, they can be taken in a run. As the French say, "We have arrived."

Mr. Wheelwright says that the larger death rate of those in European countries will make for greater trade. It is a mournful reason for an extension of commerce, but a mournful syllogism is about as apt to be true as a cheerful one. However, the killing of men never makes for trade. The less people in Europe, the less possibilities of trade there are. Moreover, as the producers of coal have been less generally drafted than the consumers of coal, it may possibly be that they have the higher death rate. That being so, the coal industry in Europe may find itself overstocked with men when the war is over. The importance as an essential product will have proved its buckler.

Credit balances, furthermore, are apt to be unfavorable after the war. The Allies have borrowed five billions of dollars. For their sakes we regret that they are likely to have to borrow much more. Suppose it is ten billions in all that they borrow. Roughly, they will be required to pay back in interest alone half a billion dollars a year, about the amount our Federal Government expended before the war. Anybody can see that debtors such as these will be sellers rather than buyers. They can only become extensive buyers by entering still further into our debt. This they may do for a few months or years after the war ends. But thereafter they will be less ready to purchase.

The future for the foreign coal trade is in South America. The most profitable and extensive trade is with those whose products are different from ours, and South America, being more tropical, furnishes that condition. There is some coal there, perhaps more than we think. Coal is so universal that its alleged absence from any large area argues rather imperfect investigation than anything else. Gradually we are getting to know of resources of coal in South America, but even if they are developed we shall ship coal to that region nevertheless.

Suppose the Argentine has a fine deposit easily available to the sea coast, with a good harbor, sufficient labor and favorable mining conditions, and it desires to ship to the Amazon region. Will it ship there? Hardly, for there being few people in the section with the coal mines there will be no return cargo, whereas the United States is a ready market for the products of the Amazon region—rubber and coffee and what not. The same is true of the United States of Colombia.

In the countries where the coal cannot be got to the coast readily, or where the coal so far discovered is of little value, we shall find a splendid market. The countries of South America have products which supplement our deficiencies, and ours will supplement theirs. Trade with South America is trade with the unlike and should always be brisk as far as the size of the populations of South America and the energies and resources of those populations will permit.

Capitalizing One's Inefficiency

WITH what effrontery the Government railroads have capitalized their inefficiency! One would think the railroads would be around apologizing to the operator and mine worker for their inability to supply cars. A proper spirit of public responsibility should lead them to go the length and breadth of the coal field, promising that what little service they could give would be rendered without discrimination. They would explain just why the service is slow, but assure the coal industry that the distribution, if inadequate, will always be just.

But this is not the attitude of the new railroad trust. The companies deliberately said to the operator: "We have fallen down on the job, we expect to continue to fall down on it, and we propose to profit by that fact. We will give any operator the cars which belong to his neighbor if he will give us coal at a low price. We have made up our minds that the railroads are not constructed to serve the public but to serve the railroads. We will give our cars only to those who will sell us coal for less than cost."

It is not necessary that we point out to our readers how the railroads could secure all the coal they need just as surely by distributing their orders pro rata among all or a large proportion of the coal mines as by confining their purchases to a few. There has been no need to secure that priority by giving all the cars to certain mines, letting the others go almost entirely unsupplied. By this action all the evils of discrimination in car supply have been renewed, this time under Government auspices.

Worse yet, it is reported even by the friends of the Railroad Administration that the railroads have been turning some of the coal over to munition plants; in what quantity is not known. Thus the inequality has been intensified. The ability of the railroads to ruin business has often been asserted, but its baleful influence was never so arrogantly used as it has been since the control fell into the hands of the Federal Government. However, we take no little pleasure in acknowledging that the railroads have been compelled by the strong hand of our national steersmen to promise a more equitable service to the industry in the future. A fair price is a desideratum, but a fair service is even more important. Surely we may look for this from the Railroad Administration.

DISCUSSION BY READERS

Safety in Shotfiring in Mines

Letter No. 2.—The danger that might arise, in the present war crisis, from the promiscuous handling of high explosives by unauthorized persons, was emphasized strongly by the order issued some time since by Fuel Administrator Garfield, requiring that this class of explosives should only be handled by persons who were licensed.

It is reasonable to suppose that there are working in our mines certain enemy aliens whose animosity would lead them to dangerous acts in retaliation for the attitude of our Government toward their country. It is not difficult to imagine the terrible results that would be caused by persons so disposed, loading out dynamite with their coal. The subject calls for more than passing thought and consideration.

Dynamite Found in Coal Shipments

Since the order requiring the licensing of persons handling high explosives was issued, there have been found quantities of dynamite cartridges in shipments of coal. It is only natural to believe that the explosive was placed in the coal willfully in hopes that it would effect its deadly purpose. We can readily picture to our minds the appalling sight of one of our transports bearing thousands of troops being blown up and brave lives sacrificed without a chance of escape.

It is possible, in the daily performance of work in mines where blasting is performed, that others than those duly authorized would have access to the cartridges of those who have been intrusted to use them. For example, an experienced miner who is a citizen of foreign birth may find it necessary to call for the assistance of his buddy who is an enemy alien. This man is only too glad to avail himself of the opportunity thus offered to get in possession of some of the high explosives used. To avoid such a chance the strictest regulations should be enforced in every mine, limiting the amount of explosives taken into the mine and taking account, at the beginning and close of each shift, of the number of shots fired by each miner.

Drastic Measures May Be Necessary

So serious is the aspect as to even warrant the prohibition of the use of high explosives in coal mining, except where specially authorized shotfirers are employed to load and fire all shots after the miners have left the mine, and who are held accountable for the cartridges, caps and fuse given in their charge. Where this is not done, it may be necessary to compel the breaking down of the coal by the use of hydraulic power, wedges and other means formerly employed, so as to eliminate from indiscriminate use anything in the nature of high explosives.

Where high explosives are used at mines, a system of accounting should be employed that would show every particle of explosive issued from the magazine and enable this amount to be checked with the number of shots fired in the mine. This would require a properly constructed form of blank that would be filled out and signed by the mine foreman each day.

In mines where the work of blasting is performed by shotfirers, the amount of explosives required each shift, in each section of the mine, should be determined by the mine foreman. The shotfirer should then be charged with this amount of explosives, which would be delivered to him. In case the shotfirer finds, in his judgment, that a less amount of explosive is required in any hole, than the amount allowed for by the foreman, he should return the unused balance and receive credit for the same.

One of the difficulties confronting the situation, however, is to get conscientious, law-abiding citizens who are capable of performing the duties of shotfirers, and others to be placed in charge of the magazines, so as to insure a true and accurate account of all explosives used in the mine. The duty of making this selection will naturally devolve upon the operator or mine superintendent, who should feel the responsibility resting on him in this regard and give the matter the attention its importance demands.

West Leisenring, Penn. R. W. LIGHTBURN.

Gathering Motors

Letter No. 1—Since the discussion on "Gathering Motors," which I remember took place in *Coal Age* about two years ago, great advance has been made in the improvement of different types of locomotives used in mines for the purpose of gathering cars at the face. At present, this subject is very interesting, on account of the increasing number of new mines that are being opened, and because of the fact that many of the old mines are improving their systems of gathering cars and installing different types of motors on the gathering hauls.

In the last eight or ten years, I have gathered coal with almost every type of motor used, and have observed motors working under widely different conditions. I am convinced that there is no one motor that will suit all of these conditions, which vary in different mines and, frequently, in different sections of the same mine, so as to require motors of different types adapted to meet the different conditions.

One instance that I recall just now and which proved a failure was the employment of the old "crab" type of motor. The conditions under which this machine was working, I described in *Coal Age*, Vol. 10, p. 227. As there stated, the rooms were driven 100 yd. deep, and it required much effort for a man to drag the crab cable back to the face of a room, where he would hook it to a loaded car, which was then pulled out of the room by the crab on the locomotive.

Most mining men know that this type of gathering

motor is only adapted to exceptional conditions where the rooms are driven to the dip and the loaded cars must be hauled from the face of the room to the entry by some mechanical means. Where the rooms are driven level to a great depth, or to the rise of the entry, the crab is liable to prove a failure, as it did in the case just mentioned.

Neither is it possible to use the trolley system in such cases, as this would require the wiring of each room to the face, which would make a costly proposition. Under these conditions, it is better to use what is known as the "cable-and-reel" motor. This is a type of gathering motor equipped with a reel on which is wound a light cable provided with a hook that enables the end of the cable to be attached to the trolley wire on the entry when it is necessary for the motor to be run to the face of a room.

Operation of the Cable-and-Reel Motor

The cable unwinds from the reel as the motor advances toward the face, and is again wound on the reel as it returns to the entry. Some motors of this type are provided with a friction clutch whereby the reel is thrown in or out of gear, while others are equipped with a separate motor that operates the reel when required. Where the tracks in the rooms are fishplated, it is seldom necessary to bond the rails.

The cable-and-reel motor is built very low so that it is able to haul coal from rooms that the smallest mule could not enter. This locomotive has the disadvantage that the cable is very apt to be injured when the reel is improperly handled, or by the cable catching in a track tie or other obstacle in its path and being broken or so badly injured that it must be repaired or replaced with a new one. These cable troubles often prove very expensive, in the cost of repairs and the time lost in making them.

I have seen a type of locomotive equipped with both the crab and the cable and reel. By the use of this machine it is possible to gather cars from the faces of rooms driven to the rise or the dip, and to avoid the necessity of the motor entering a room that is driven but a short distance, since it is easier to use the crab at such times. Also, cars can be lowered to the faces of rooms driven on the dip much more quickly by the use of the crab than when the motor is required to enter the room with the car.

A Successful Type of Gathering Motor

By far the most successful type of gathering motor is that known as the "storage-battery locomotive." This type of gathering motor is gaining in favor every day, as mining men learn more of its good features. The power, in this machine, is self-contained, which enables the locomotive to go anywhere where track is laid, without the necessity of stringing wires or bonding rails. The only objection to this type of motor has been the cost of the batteries, but this is not excessive when compared with the expense of wiring and bonding rails required in the use of another type.

I have found that the most successful storage-battery motor is that equipped with a pole for use on main haulage roads where a trolley system is installed. A little reflection will show the benefit to be derived by thus equipping a storage-battery locomotive with a pole. If operated at all on the main line, the power can be derived from the trolley wire, at which time the storage batteries are "boosting." Also, when standing on the siding, waiting for cars, the storage batteries can be boosted, which will be found a great advantage in the daily operation of this type of motor.

My experience is that when the charge of a storage-battery motor is about half exhausted, the drop is much more rapid in the latter half than the previous half of the shift. By the use of the pole, I have worked a storage-battery motor hard for a full shift, and have been able to maintain almost a full charge on the batteries to the end of the shift, by boosting them from time to time as opportunity offered. In this connection, it should be stated that when a storage-battery motor is equipped with a pole, it is possible to use a short-time battery, which means a great saving in the first cost of the battery. This alone is a feature well worthy of consideration.

In closing, let me say that the success or failure of any system of gathering haulage will depend much on the management of the means employed. Objection has been offered by the miners and their union, because they thought it was an effort, on the part of the company, to reduce the working force by cutting out the drivers employed in gathering coal. However this may be considered, the fact remains and it is my belief that the next five years will see this work performed by motors in all large mines.

MOTORMAN.

Herrin, Ill.

Opening New Mines

Letter No. 2—Reading the letter of J. L. Donahue, *Coal Age*, Mar. 16, p. 516, calls to mind the statement of Francis S. Peabody, which he made on this subject, in January, when called before the Senate Investigating Committee.

As everyone knows, Mr. Peabody is a thoroughly practical and experienced coal man and, to my mind, his remarks at that time corroborate substantially the argument of Mr. Donahue in urging the opening of new coal mines. Following is the question asked by Senator Reed and Mr. Peabody's reply:

Senator Reed—Is it not a fact that if there are good prices assured, that there would be new mines opened up and new companies organized, and is it absolutely essential that this should be done?

Mr. Peabody—It is absolutely essential that we should do so. There were 179 mines that went out of business or were exhausted in 1915. These mines produced approximately 18,000,000 tons of coal. During 1916, which was the best year the industry has ever had, there were 106 mines went out. None of these 106 mines that went out would have done so if they had not been exhausted or unable to continue profitably. Now, something must be done and other mines must take the place of these that went out.

If what Mr. Peabody says is true, that the opening and operating of new mines is an immediate necessity, there should certainly be more coöperation on the part of the railroads. One frequently observes that the time which elapses between the application to a railroad, asking them to lay a switch for a new operation, and the performance of the work by the railroad, appears to be unnecessarily long. The amount of red tape that must be gone through before this can be done is almost unbelievable. In many cases, the

mine will be in readiness to ship coal before a switch is placed. It is not uncommon for a period of six months to go before anything is done, and, in one instance, I knew a whole year to elapse before the switch was finally laid.

It is unquestionably true that a certain amount of form is necessary and agreements must be signed by both parties, but it does seem that this necessary procedure should be expedited and any unnecessary delay avoided, for the sake of expediency if for no other reason. In the present speeding up of the coal production, it is more than ever important that all work preliminary to the opening up of a new mine should be pushed forward as rapidly as possible.

Necessary Backing Often Difficult to Secure

Another hindrance to the development of new coal properties that are owned by men whose means are limited is the inability to secure a sufficient loan for the purpose. It is easier for larger operations to get the backing that they need; but banks hesitate to make a loan of sufficient size for the successful launching of a small property. It may be that the owner is a man of experience in coal mining and has operated properties for other companies successfully and is anxious, now, to run a mine of his own. His desire may come from patriotic or financial reasons.

The sum asked to enable an owner to open and equip a mine will generally seem exorbitant to a banker who is unfamiliar with mining requirements; and he makes the excuse that the unsettled condition of the coal business and the instability of market prices will hardly warrant advancing the money. In one instance that has come to my knowledge, a bank offered to advance the amount asked, provided they received a donation of one-fifth of the stock from the coal companies, which is clearly a high rate of interest to be paid for a loan.

In closing, allow me to ask why it would not be possible, during the period of the war, to establish a loan bank for the purpose of financing new operations, and conduct it on a plan similar to that of the "Farmers' Loan Bank," which has played such an important part in fostering agricultural growth in this country. Under such a provision, there would be no chance for profiteering, as the mine would be owned by the Government until the loan was satisfied. If the plan has worked well for the farmer, why has not the miner a right to an equal privilege? M. P. H.

——, W. Va.

Loading and Shipping Clean Coal

Letter No. 3—I have read with interest two editorials and several letters relating to the fuel situation and the need of securing good clean coal in the market, which has recently been flooded with impure coal. It seems to me that both the miner and the operator are equally to blame in this matter. They forget, apparently, that the shipping of a poor quality of coal will give the mine a bad reputation and injure both of them.

In every contract entered into between operators and the United Mine Workers of America, and in every district under the jurisdiction of that organization, provision is made penalizing the loading of dirty coal or any impurities that could, in reason, be kept out by the miners. The failure of the operators to impose those penalties when a miner loads dirty coal is a grave error.

To overcome this difficulty, a law should be adopted that would enforce punishment on both the miner and the operator for the shipment of coal without its first being properly cleaned at the mine. For the protection of the miner against persecution on the part of petty bosses, for personal reasons, or because of alleged activity in the union, there is a clause inserted in the contract, safeguarding the miner against unfair discrimination.

Honest and competent miners have absolutely no sympathy with a laborer that will load dirty coal; but the miner is often from 300 to 400 ft. away from where the laborer is loading cars. This is particularly true in pitching seams and, on this account, the miner cannot always be held responsible for the loading of impure coal. A good miner knows well that the desirability of the coal shipped to market depends largely on the care taken in its preparation. He recognizes that the shipment of a poor quality of coal is a menace to the mine, which cannot run regularly when the demand for coal slackens, unless the place has a reputation for putting out good coal.

The high wages paid for mining has attracted many men who know nothing of the requirements of coal mining. Such men care little what they load and are often unable to distinguish between bone and coal. Their chief aim is to draw big pay. They, as well as some old miners, think that, at this time, any kind of coal will have no difficulty in finding a market.

One Source of Impurities in Coal Shipments

Referring to the letter of W. R. Jones, *Coal Age*, Mar. 16, p. 513, it appears to me that he has overlooked some important reasons when he stated that "there are two responsible sources for the shipment of impure coal to market . . . (1) dishonest miners who will fully load slate and rock with their coal in order to increase their daily tonnage . . . (2) small mines that have no means of properly cleaning the coal, or that are compelled to work in seams of inferior quality."

Before the war most of the larger mines had erected washeries. The coal shipped from these mines was sold in two grades or classes; namely, "fresh-mined coal" and "washery coal," the latter being classified as "No. 2," in quality. Since the Government fixed the price of coal, the entire output of the mines is sold at the same figure, no distinction being made in the quality of the shipments.

Again, as is well known, there are different kinds of mechanical slate-pickers or separators, some depending on the difference of the specific gravity of rock, slate, bone and coal, and others depending on the difference of the form in which coal and slate breaks, and the difference in velocity with which coal, slate and bone slide down an incline chute. In the present hurried preparation of coal for market, these differences are not as effective in securing the separation of coal from its impurities.

Some time ago Inspector Ryan was called to Plymouth (Penn.) to inspect a shipment of washery coal billed as "fresh-mined coal," and found it to contain 60 per cent. of slate, there being more slate than coal.

The suggestion of Mr. Jones that the smaller mines, not having the same facilities for cleaning the coal as the larger mines, should be shut down, appeals to me as an unfair discrimination, since the smaller mines can still clean their coal by hand-picking, which has always been their method. I agree with him that those seams containing too high a percentage of ash and sulphur should not be worked. The same may be true also of seams having only a clay roof. However, as I have previously stated, if operators and miners alike will do their part there will be no difficulty in obtaining clean coal, now as before. FRED B. HICKS.

Kingston, Penn.

Letter No. 4—From every side, this subject calls for serious consideration. The difficulty experienced in many localities of securing the necessary labor has no doubt restricted the operation of mines and has had its effect in creating an unprecedented and urgent demand, and this condition has been offered as a possible excuse for the shipment of an inferior quality of coal. However, in my opinion, the situation is aggravated by the inadequate equipment of many mines that has made it practically impossible for them to meet the present demand made upon them. This and the inability of the railroads to furnish the necessary cars for shipment has made it impossible to operate the mines continuously.

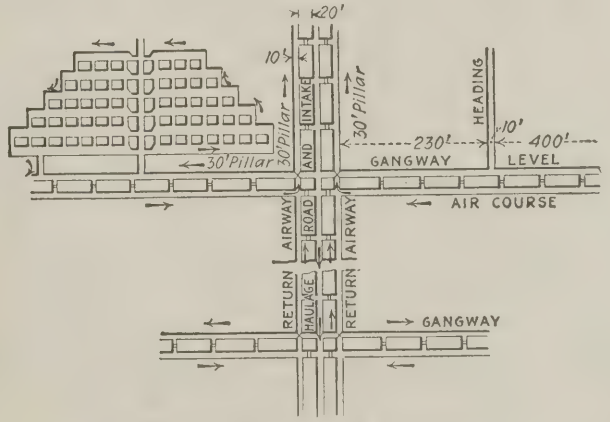
Now, if these facts are true, there is no room for excuse for the shipment of impure coal because of the failure to properly clean the coal by separating the slate and other impurities when loading the cars at the working face. This is chiefly the result of laxity of supervision by mine officials.

MINERS HAD AMPLE TIME TO CLEAN THEIR COAL OWING TO SLACK CONDITIONS

The advent and continuance of a severe winter greatly hampered transportation. Rivers and lakes were frozen, and railroads were greatly impeded. Under these conditions, I repeat, that had mine officials, whose duty it was to see that the coal was properly cleaned, given this matter suitable attention, there would be no reason for complaint in regard to the quality of coal sent to market. My point is that the want of time to properly clean the coal cannot be urged as an excuse for this lack on the part of mine officials; there was plenty of time and only clean coal should have been loaded.

The present, it will be agreed, is no time for criticism of the past; but our efforts must now be exerted to rectify mistakes in the quickest manner possible and with the utmost forebearance. Reflecting on the recent demand of the President, that the head of each special department should use his utmost endeavor to straighten out business in his charge, one cannot help but feel that the same spirit should animate all mine officials, and that they should give unremitting attention to the loading of clean coal at their mines.

The loading of dirty coal is an old sore that for 20 or 30 years has troubled mine operators who have striven to gain a good reputation for the quality of coal sent to market from their mines. The study of the question shows that the trouble lies largely at the coal face, and that greedy miners, with little or no conscience, do not hesitate to load dirty coal if they can escape detection and avoid being docked. No miner, organized or unorganized, will deny the fact that the loading of a mixture of coal and slate is an injury to the mine.



To realize the effect of this dishonest practice on the part of some miners, it is necessary to look at the situation broadly. For example, a train crew hauls a shipment of, say 30 cars of 50 tons capacity from a mine. When this coal has been bunkered, it matters not how or where, whether in the factory, on shipboard, or in domestic use, we will say that 30 tons of slate have to be thrown out from this shipment. In other words, 2 per cent. of the coal purchased cannot be burned, and the consumer is burdened with the expense of its disposal as refuse. What the dishonest miner has gained is paid for by the consumer. Let every miner strive to do his part and bear his share of the present burdens laid upon him by reason of the war.

West Leisenring, Penn. R. W. LIGHTBURN.

Working 10-Ft. Inclined Seam

Letter No. 1—In response to the request, *Coal Age*, Mar. 23, p. 561, asking for the best method to be employed in the working of an inclined coal seam, 10 ft. in thickness and overlaid with a soft sandy shale that makes a weak roof, permit me to offer the following method, which my experience recommends as particularly adapted to the working of this seam.

It is stated in the inquiry that the inclination of the seam is from 15 to 20 deg. and that it contains many irregularities faults and "pinchouts." The floor of

PROPOSED PLAN OF WORKING

the seam is said to be a sandy shale. In order to obtain the greatest possible extraction of coal at a minimum cost, under these conditions, I would drive three main slopes on the full dip of the seam. These slopes should be each 10 ft. wide and from 6½ to 7 ft. in height. They should be driven on the floor of the seam, leaving from 3 to 3½ ft. of roof coal above them and separated by 20-ft. pillars. Let me say, here, that the height of all slopes, cross-entries and headings should be varied so as to conform to any natural parting that may be present in the seam.

DESCRIPTION OF THE GENERAL PLAN OF WORKING

The accompanying figure shows the general plan of the workings. Cross-entries are driven in pairs to the right and left and at right angles to the main slopes at distances of 1000 ft. apart. These cross-entries are driven slightly above the level course so as to provide good drainage, which will also give a grade in favor

of the loaded cars. The cross-entries are separated by the same width of pillar as the main slopes.

In order to secure the best results and reduce the cost of timbering and the upkeep of roadways and secure a maximum of safety in the workings, about 6 ft. of coal should be taken out in the first working in the rooms, the remaining 4 ft. of coal being left for roof and taken down when drawing back the pillars.

Development of the Workings

When the main slopes and the first pair of cross-headings have been driven far enough, a heading is driven 10 ft. wide on the full pitch of the seam. As shown in the sketch, the first heading is started at a distance of 230 ft. from the main slope airway. This will provide for a solid pillar of coal 30 ft. wide flanking the main slopes and allow for the driving of rooms 200 ft. in length off the heading. Later in the development, a second heading is driven of the same width, at a distance of 400 ft. from the first, which will provide for rooms 200 ft. in length, to be driven on the strike of the seam to the right and left of each heading.

The rooms off the headings are driven 15 ft. wide, the first rooms being started at a distance of 30 ft. from the gangway, which leaves a 30-ft. pillar for the protection of the cross-entries, the same as on the main slopes. The rooms are driven on 30-ft. centers, which makes the room pillars 15 ft. in width. Breakthroughs or crosscuts are driven in the pillars every 15 ft. apart, as shown in the figure.

Drawing Back the Pillars or "Stumps"

This method provides a series of small stumps or pillars 15 ft. square, which can be taken out conveniently in retreating when the 4 ft. of roof coal is also taken down. The rooms being only 200 ft. deep minimizes the work of handling the coal from the face of the rooms to the heading, where self-acting jigs are employed to lower the cars to the gangway.

A system of endless rope haulage can be used on the main slope, the center slope being made the haulage road and intake airway. I should not recommend a double track slope, but would use one of the side slopes for returning the empties into the mine. The two side slopes serve as return airways for their respective sides of the mine.

The rooms should be timbered by a double row of posts staggered, while the track is laid along one rib.

South Burgettstown, Penn. Andrew Orr Bain.

First Aid to the Uninjured

Letter No. 4—The question of lending "First-Aid to the Uninjured" is so broad and involves so many features that one is led to ask, where shall we begin the discussion, and when it is finished will it have accomplished anything worth while? In other words, will mine officials feel any more deeply their responsibility for the safety and health of the men in their charge and be induced to give closer attention to making the mine safe and comfortable for work?

The records show that the greatest number of fatal and nonfatal accidents in mines are due to falls of rock, slate and coal. It is also well known that any able bodied man who is a member of the Miners' Union can get work at a coal mine, for the asking. If the man cannot drive a mule, run a motor, lay track, or set timbers, he is given a place to dig and load coal. No questions are asked regarding his ability to safeguard his life and the few instructions that he may receive are a poor sample of what can be classed as first aid to the uninjured. At the present time particularly, very much the same state of affairs exists at a nonunion mine.

While I am willing to admit that many inexperienced men must be employed to work in the mine, I am unwilling to be held responsible, as safety inspector for the lives of such men when they are permitted to work by themselves. Safety demands that an inexperienced man shall work with an experienced miner for a period of six months, or until he has learned how to protect himself from danger. If the two men earn, say $10 a day, the experienced miner should receive $5.50 and the inexperienced man, $4.50. By this means, there will be fewer accidents recorded from the fall of rock and coal.

Death Rate in Colorado Mines Reduced

An examination of the records of accidents in Colorado mines during 1915 and 1916 shows a reduction in the death rate in this state, in these two years, from 5.1 to 3.35, per thousand men employed. This is a creditable showing for the earnest activities of the deputy inspectors, in the enforcement of the timber agreement of 1916. The work of the deputies can rightly be called "First Aid to the Uninjured."

Let me say, here, that there is not sufficient thought and attention given to the employment of inexperienced men in the mines, and if we continue in this course it will be useless to write suggestions of first aid to the uninjured. However, let me suggest one means of giving this kind of first aid and reducing the number of accidents from falls of roof, slate and coal. It is as follows:

Enforce Strictly the Timber Agreement

Let the mine examiner (fireboss) examine each working place, in the morning, to see that the timbers are set in accordance with the timber agreement that I have mentioned. If he finds the timbers are not set as the agreement requires, let him notify the miner working in that place that he will lose his turn and no cars will be set in for him for 24 hours. The miner should then be instructed to reset the timbers to conform to the agreement and in the presence of a mine official. When this is done, the miner should be sent home unless there is good reason for his being excused for his neglect. For a second offense of the same kind, the miner should be discharged and his name reported to the state mine inspector for future reference.

By doing this, I believe that it may be possible for us to get somewhere in our efforts to give first aid to the uninjured. I am not in favor of blacklisting a man for his neglect or disobedience of orders. The record for the year 1917 shows clearly that eternal vigilance is the price that must be paid if we are to reduce still further our mine-accident rate.

Farr, Colo. Robert A. Marshall.

INQUIRIES OF GENERAL INTEREST

Cubic Contents per Ton of Coal

To settle a dispute that has arisen, kindly show how to calculate the weight of coal, in tons, and the amount, in bushels, that a wagon bed will hold whose dimensions are 10 ft. long, 3 ft. wide and 22 in. deep.

Grafton, W. Va. S. F. & V. N.

The cubic contents of this wagon bed is $3 \times 10 \times \frac{22}{12} = 55$ cu. ft. In estimating capacity, it is customary to allow 40 cu.ft. per short ton of bituminous run-of-mine coal. Hence, assuming that the wagon bed was loaded level full, the coal being 22 in. deep over the bed, the weight of coal in the wagon would be $55 \div 40 = 1\frac{3}{8}$ short tons.

The laws of West Virginia make the weight of a bushel of coal 80 lb., which gives 25 bu. in a short ton, and makes the amount of coal in the wagon when level full $1\frac{3}{8} \times 25 = 34\frac{3}{8}$ bu.

More briefly stated, the amount of bituminous coal in a bin or wagon, in bushels, is equal to $\frac{5}{8}$ of its volume in cubic feet, and the weight, in tons, is $\frac{1}{25}$ of the number of bushels. All of these rules are based on an average specific gravity of 1.3 for run-of-mine bituminous coal.

Gasoline Motors in Mines

We are installing a home-made gasoline haulage locomotive in our mines. The driver, or motorman, claims that when operating the locomotive on the last of the air, the fumes become very offensive. I am writing to ask if you, or any of the practical readers of *Coal Age*, can suggest some way of overcoming this objection.

H. N. ROGERS, Secy.

Coal City, Iowa. Southern Iowa C. & M. Co.

The use of gasoline locomotives in mines has frequently been referred to, in *Coal Age*, as being attended with danger. It has been stated that its use should be confined wholly to the intake airways, where there is a good current of air continually passing.

The deadly effect of the exhaust gases of a gasoline motor when used in the limited confines of a mine, or any other close place, has been fully discussed and was treated editorially in *Coal Age*, Vol. 10, p. 549, under the title "Petromortis." Particular attention was then drawn to the fact that the danger arising from the exhaust gases of this type of motor is greatly increased when its use is permitted where the air is stagnant, as in a pumproom or other closed place that is not thoroughly ventilated by a current of fresh air. The same is true when a gasoline locomotive is operated in a mine, on the last of the air, as in a return airway.

It was further stated, in the editorial just mentioned, that particular danger arises when such a locomotive is running with the air. Especially is this true when the machine is hauling a loaded trip upgrade and the engine is not in perfect order, since in that case the character of the exhaust gases is very apt to be more deadly than when the engine is working properly.

Again, when a locomotive is advancing with the air, the motorman is liable to be overcome with the gas, which then travels with about the same speed as the locomotive. This might result in a serious accident due to the motorman becoming unconscious and failing to control the movement of the trip. On page 552 of the volume of *Coal Age* just mentioned, an instance is given of the fatal results of operating the gasoline motor of an automobile, in a garage, causing the instant death of a man and his wife by breathing the deadly gases. On page 688, in the same volume, a correspondent has suggested that the exhaust gases of a gasoline motor may contain 1 per cent. of carbon monoxide, while 0.1 per cent. of this gas is fatal when breathed but a short time.

It is the deadly effect of the exhaust gases of a gasoline motor that renders its use in mine workings extremely hazardous. To our knowledge, there is no way of overcoming or preventing this effect and rendering the exhaust gases harmless, except by providing for their rapid diffusion in an ample air current; and, even then, danger may arise from unavoidable causes.

Notwithstanding this fact, however, there are numbers of gasoline locomotives in use in mines, in different localities. The advantage claimed for this type of locomotive is that its power is self-contained, which enables the locomotive to go anywhere where track is laid, without depending on a trolley system.

However, the more recent development of the storage-battery locomotive has given to the mining industry a machine that presents peculiar advantages and makes unnecessary the use of gasoline in the mine. There is no doubt that the gasoline locomotive reduces the cost of haulage wherever the conditions are favorable to its use.

The gasoline locomotive is particularly useful on long outside haulages, where the tipple is located at some distance from the mine entrance, which is the case in many mines where this type of locomotive is employed. There are, no doubt, particular instances where the machine can be employed without danger on the main haulage road of a mine when this is the main intake airway, and the volume of the current is such as to render practically harmless the almost inappreciable volume of the exhaust gases of the motor.

At times, it may be possible to arrange the ventilation so that the underground haulage, from the main parting to the tipple, is ventilated by a separate current of air, which is not permitted to pass into the mine but is conducted at once into the main return airway. In this case, the main intake airway supplying the circulation in the mine is not affected by the operation of a gasoline motor.

EXAMINATION QUESTIONS

Bituminous (Penn.) Mine Foremen's Examination, April 9-12, 1918

(Selected Questions)

Ques.—The rubbing surface of a square airway 4000 ft. long is 128,000 sq.ft. (a) What is the area and perimeter of the airway? (b) What is the velocity of an air current if its volume is 19,200 cu.ft. per min.?

Ans.—(a) The perimeter of an airway is found by dividing the rubbing surface by its length, which gives, in this case, 128,000 ÷ 4000 = 32 ft. Since this airway is square, the length of each side is 32 ÷ 4 = 8 ft. and the sectional area is, therefore, 8 × 8 = 64 sq.ft.

(b) The velocity is found by dividing the quantity of air in circulation by the sectional area of the airway, which gives, in this case, 19,200 ÷ 64 = 300 cu.ft. per min.

Ques.—Is an accurate mine map important? Why?

Ans.—In mining, it is of the utmost importance to make and maintain an accurate mine map, showing all the airways, haulage roads, travelingways, rooms and other openings, exactly as they exist in the mine. The map should also show the thickness and character of the coal, the inclination and direction of the dip of the seam and the elevation at different points in the workings, besides the position of the boundary lines and other surface features and improvements. The direction of the air currents in the mine should be clearly indicated and the position of all boreholes shown.

The purpose of an accurate mine map is to show the correct position of the workings with respect to the boundary lines and other surface features, and the relation of the several openings in the mine to each other, so as to avoid accidents from breaking into other workings or tapping dangerous accumulations of water or gas in adjoining mines, An accurate map also avoids the loss of much coal because insufficient pillars are left and rooms are permitted to break into each other, or a squeeze is started that crushes the pillar coal and prevents its removal. When a mine is abandoned, it is necessary to place on file an accurate map of the workings, as a safeguard of future operations.

Ques.—When do you consider a mine properly ventilated?

Ans.—A mine is properly ventilated when there is a sufficient quantity of air in circulation to comply with the requirements of the mining law, provided this air is properly distributed so as to ventilate each section of the mine separately and furnish each section with its proper proportion of air. The air current must also be conducted into each working place and made to sweep the face of the coal in sufficient volume and with sufficient velocity to prevent any accumulation of gas in those places.

It is also necessary that all abandoned and void places in the mine shall be properly ventilated and that mine stables be ventilated by a separate air split that passes directly into the return airway by which it is carried out of the mine. In any case, the volume and velocity of the air current in all portions of the mine must be sufficient to render the workings safe and keep them in a healthy condition.

Ques.—Do you consider the driving of places on sights important? If so, state why.

Ans.—It is important that each working place be driven on sights so that it will keep its proper direction and there will be no danger of leaving too thin pillars that will be hard to remove. Where the work ng places are not driven on sights properly established, it is difficult to maintain a uniform thickness of pillar between the adjoining rooms, and this will often cause heavy roof falls or induce a squeeze that will destroy the pillars and make it impossible to recover all the coal.

Ques.—An entry is driven 400 yd.; the cost per yard is $2; the drain alongside cost 15c. per ft. Ties spaced 2 ft. between centers cost 17c. each. The T iron for the road weighs 35 lb. per yd., is in 30 ft. lengths and costs $50 per gross ton. The spikes are worth 2c. each. Splice-bars cost 60c. per pair. What is the total cost of the headings?

Ans.—Following are the items of cost: Yardage, 400 × 2 = $800; drain, 400 × 3 × 0.15 = $180. There is 3 × 400 = 1200 ft. of track, which will require 1200 ÷ 2 = 600 ties, costing 600 × 0.17 = $102. The 400 yd. of track will require 800 yd. of rail. The weight of this rail is 800 × 25 ÷ 2000 = 10 tons, making the cost 10 × 50 = $500. Allowing four spikes to each tie will require 4 × 600 = 2400 spikes, at a cost of 2400 × 0.02 = $48. The length of each rail being 30 ft. or 10 yd., the number of rails required to lay this track is 800 ÷ 10 = 80, which will require 80 — 2 = 78 pairs of splice-bars, costing 78 × 0.60 = $46.80. The total cost of the heading with track all laid, exclusive of labor, is, therefore, the sum of these items, which is $1676.80.

Ques.—Given the dimensions of an arched airway as follows: 9 in. high to top of arch, the radius of the circle being 4 ft. 6 in. If the current of air is 450 ft. per minute and a half what is the total quantity of air passing per minute?

Ans.—The question probably intends to give the height to top of the arch is 9 ft. instead of 9 in. Taking this to be the case, the size of the rectangular portion of the cross-section, below the arch, is 9 ft. wide by 4½ ft. high, and its area is 9 × 4½ = 40.5 sq.ft. The area of the semicircular portion forming the arch is ½ (0.7854 × 9²) = 31.8 sq.ft. The total sectional area of the airway is, therefore, 40.5 + 31.8 = 72.3 sq.ft. If the average velocity of the air current is 450 ft. per min. the quantity of air passing in this airway is 450 × 72.3 = 32,535 cu.ft. per minute.

COAL AND COKE NEWS

Harrisburg, Penn.

Rumors are afloat that some of the bituminous operators were disobeying the regulations calling for clean coal by shipping poor fuel on the assumption that the Government would reject it and turn it over to the second-class bunker coal pool for ships at a price higher than that allowed for domestic purposes. "We are going to put a stop to this scheme," the state fuel administrator is quoted as saying. "We now have a general inspector who is active at destination. The demand that this practice be stopped is imperative."

Last year the Philadelphia & Reading Coal and Iron Co. expended $1,505,507 in improvements and developments of its collieries as compared with $867,665 for 1916. The production of anthracite from its coal properties was increased 1,577,482 tons to 12,818,706 tons.

That every effort is being made to increase the output of anthracite, even though there are 22,000 fewer mine-workers than in 1915, is shown by the fact that the Lehigh Coal and Navigation Co. has undertaken at an estimated cost of $1,500,000 additional mine developments including two modern steel breakers, one at Caska William, where an old colliery will be reopened; the other being at Rahn. Both should be in operation by next winter and will add from 2500 to 3000 tons of anthracite to the company's output, which now averages 18,000 tons a day. For 1917 this company increased its production by 34 per cent.

All mines in the anthracite region are working to maintain the record-breaking March output. Conservation of energy with additional results through electrical means is being worked out in all parts of the anthracite fields. The Mill Creek Coal Co. has just awarded a big $200,000 contract to the Scranton Construction Co. to install electrical appliances at its Morea colliery. The Eastern Pennsylvania Electric Light, Heat and Power Co., besides supplying the power, will also illuminate the interior of the mines and the outside plants. Steam hoists and boiler houses will be practically eliminated by the new power.

Seeking to conserve anthracite and also to hold down its locomotive fuel bill, the Lehigh Valley R.R. plans to install a big mixer plant at Ashmore, where the smallest size of anthracite byproduct—what is commonly termed silt or slush in the region—can be artificially mixed with bituminous. In that way both bituminous and anthracite can be saved.

Recognizing the great necessity for the largest possible output of coal while the nation is at war, F. M. Chase, vice president and general manager of the Lehigh Valley Coal Co., has issued a strong appeal to its employees to exert themselves to the utmost. His appeal follows:

"It must be a matter of gratification to all of us to know that the Lehigh Valley R.R., over which our output is shipped, stands No. 1 in point of anthracite tonnage transported, both for the month of March, 1918, and for the three months ending Mar. 31, 1918, showing a gratifying increase over the same period of last year.

"The country will undoubtedly need more coal during the war than can be mined even under the most favorable conditions. The industry has been, and will continue to be, affected by the loss of men who are 'called to the colors,' and there is no more practical way for those who stay behind to show their patriotism than to make the greatest possible effort to meet the demand for fuel, to keep our people warmed and fed and our industries in operation at full blast.

"Our boys 'over there' will be required to work every day; to put in long hours; to endure great hardships. It should be our personal effort to see that no time is wasted here; that our mines work full-handed every day. Show by example that there is no place in our ranks for the industrial 'slacker.' The individual who, in this critical time and crisis, fails to do his bit toward speeding up our vital industries is disloyal.

"Let us be able to look into the faces of the boys who return and honestly say: 'It was necessary for me to stay at home, but I did my best to maintain conditions which enabled the soldiers and sailors to be kept well armed, well clothed and well fed."

Fairmont, W. Va.

The car supply in the Fairmont region last Monday was the best since the war started. There were 1919 cars in the district on that day, although some of them did not get placed in time to be available for loading the same day. The number of empties sent to the Fairmont district Monday will reduce the regional car shortage something like 500 cars. Every mine in the region has its full rating.

If other regions were short in car supply Monday this abundance of cars is not gratifying, for the number was even greater than could be loaded. Until the coal operators of the Fairmont district can get their organization together it is impossible to load 2000 cars in a day, and it is argued that it is unfortunate if cars are sent here when other regions are short. The car supply for week of Apr. 15-20 averaged 1052 cars a day. Coal operators are saying this week that it is always a feast or a famine.

Morgantown, W. Va.

For several years the Mining Department of West Virginia University has offered a summer course in coal mining to the men engaged in the mining of coal. The course was originally started at the direct request of the mine operators of the state and has always received their hearty support as well as that of the miners themselves. The tuition is free to any resident of West Virginia, and there are no restrictions as to admission. Any one, old or young, no matter how much or how little schooling he may have had, will be welcomed and given every opportunity.

The Short Course will be held this year from June 17 to July 27, a period of six weeks. The work has been arranged so that those who cannot come for the full course can come for any period that is convenient to them. The following subjects will be given at the times indicated: June 17-29—Explosives, Timbering, Methods of Working, Prevention of Accidents, Mine Gases, First Aid and Mine Rescue Training. July 1-13—Mine Ventilation, Mine Explosions, Electricity in Mines, Hoisting and Haulage, Analysis of Mine Air and Safety Lamps; July 15-27—Mine Surveying, Mine Drainage, Mine Management, Geology and the Preparation and Uses of Coal.

The course is comprehensive and one well-calculated to improve a man's knowledge of the coal-mining industry and to put him in line for promotion. The men who have taken the work in past years have been enthusiastic in their reports of the benefits they have secured and the advancement which has resulted.

Prof. C. R. Jones, Dean of the College of Engineering, or Prof. A. C. Callen, head of the Mining Department, Morgantown, W. Va., will be glad to furnish any further information which may be desired.

Charleston, W. Va

A telegram has been received by an officer of the Central West Virginia Coal Operators' Association from Carl R. Gray, former president of the Western Maryland, now assistant to Director General McAdoo, stating that a special representative of the railroad administration would be sent to the Fairmont region to investigate the car situation there, which has become extremely serious, as will be evident when it is stated that so many of the miners have given up hope that there will ever be any improvement in the situation that they are leaving to secure employment elsewhere. A canvass of 82 out of 200 mines disclosed the fact that more than 700 miners have left.

The claim is made by operators in this section that though under Government control coal cars are supposed to be pooled for distribution to the various coal fields, and that though cars are ordered sent to West Virginia through the Federal pooling office at Pittsburgh, they are not being received in this part of the state, while on the other hand, the Ohio and Indiana fields receive more cars than they can load.

Speaking in opposition to the Government control of railways, Z. T. Vinson, coal operator and lawyer, in the course of a speech before the Rotary Club of Huntington, claimed that only 52 cars were furnished for every 100 car capacity produced. In Alabama he said the decrease in the supply of cars has been only 1 per cent.; in other words that there are 99 cars for every 100 cars of coal produced; in Oklahoma and Arkansas, 97 cars; southwestern Virginia, 89 cars; Illinois, 82 cars; Indiana, 80 cars; Ohio 75 cars; Pennsylvania, 80 cars; but in West Virginia, which he described as the greatest coal field in the world, there are only 52 cars for every 100 cars produced. Mr. Vinson also claimed the division of the market into zones was unfair to coal producers.

Following on the heels of the meeting of the American Mining Congress at Washington, Apr. 23, coal operators of the state will meet at Huntington on Friday, Apr. 26 to form a state coal operators' association. Interest taken by operators in the approaching meeting presages a very large attendance and the formation of a strong organization at the outset.

PENNSYLVANIA

Anthracite

Scranton—Under the terms of an agreement recently entered into between the New York, Susquehanna & Western R.R. and the Jermyn Coal Co., operating a mine at Old Forge, the latter promises to pay the owners 70c. a ton for all prepared sizes, while for the smaller sizes, including culm, dust and slush 50c. a ton must be paid. Compared with royalties of five years ago, the new agreement is a 100 per cent. jump. The fact that culm and slush are included is also something new.

Hazleton—New regulations to promote safety in and about the anthracite coal mines were suggested recently by officials of the Lehigh Valley Co. They are as follows: Men operating machinery should not wear flowing neckties, loose clothing or torn gloves. Men oiling machinery should not wear gloves along moving line shafts. Carpenters should not throw blocks on floors in workshops. Breaker employees should see that their shoes are tied before descending steps. Don't wear oily clothing while firing furnaces. Watch for protruding nails in timbers. Submit to surgical treatment for every injury regardless of its supposed minor character.

Special mention has been made by the Lehigh Valley Coal Co. of the record of William E. Hamor, veteran foreman of the Jeanesville colliery, where no fatalities have occurred within three years. It is said that few mines in the anthracite field can claim this distinction.

Millersburg—The McClellan coal storage yards, the largest in the country, closed down for an indefinite period on Apr. 20 because of lack of coal to store. The plant when running at full capacity employed from 50 to 100 men. The fires were withdrawn from under the nest of boilers and only about nine men will be retained, who will make extensive repairs to the plant during the summer. The yards are owned by the Susquehanna Collieries Company.

Tower City—A fire discovered in one of the breasts in the East Brookside colliery caused considerable excitement for a short time. Men were sent for at once and they worked for about 24 hours putting out the fire and beating back the gas to avoid an explosion.

Pittston Junction—Property owners who have suffered heavy damages from mine caves have banded together as the Pittston Surface Protective Association and have decided to start injunction proceedings against the White Coal Co. and others who are removing the supports from beneath Pittston homes, which is alleged to have caused thousands of dollars worth of damages. For the past three years there have been mine settlings in and around Pittston, but in the recent past the caves have become more numerous and far more disastrous. About 50 homes have been damaged.

Mt. Carmel—The Susquehanna Collieries Co. and the Philadelphia & Reading Coal and Iron Co. have been asked by the War Department to rush to Washington as speedily as possible the names of all miners and expert mechanics drafted for the army. The Government proposes to withdraw such experts from the infantry and assign them to specially organized units of engineers to be sent to France. Several hundred miners, laborers and mechanics have been sent out of this district through the draft and are in army camps or in France.

Tamaqua—It was announced during the week that Liberty Bond subscriptions at the Lehigh Coal and Navigation Co.'s Panther Creek Valley collieries had reached $383,000, about 94 per cent. of the employees having subscribed. An effort will be made to make it 100 per cent.

Hazleton—Two extensive contracts in the Hazleton region have been discontinued for the present. Dick & Co., contractors for the Lehigh & Wilkes-Barre Coal Co. at Audenried, are unable to work due to the scarcity of men. At Harleigh the strippings have been closed until labor conditions are better.

Upper Lehigh—The Upper Lehigh Coal Co. engineers are getting out the plans for a steel breaker to replace the present wooden structure, which will be continued in operation while the new breaker is in course of erection.

Bituminous

Punxsutawney—The Juneau Coal Mining Co., of this place, operating the Juneau mine on the Buffalo, Rochester & Pittsburgh Ry., near here, has sold the operation to the Empire Coke Co., of Geneva, N. Y. The entire production will be shipped to the byproduct ovens of the Empire company. The mine is being operated under the name of the Juneau Operating Company.

Johnstown—The attendance at the examination held by the various state mine inspectors of western Pennsylvania last week, for certificates of mine foremen and firebosses, was the smallest for years. The reason given in most cases was that the young men were in the Army. The average age of the applicants this year was considerably above that of previous years.

Indiana—Work has been started on the erection of the large repair shop of the Rochester & Pittsburgh Coal and Iron Co. here. It is located on Oakland Ave. at the corner of the Buffalo, Rochester & Pittsburgh Ry. All the mine cars, etc., for the various mines will be built here as well as the general repair work. It is also planned to cut the lumber for the houses at this plant, thus saving time and waste in putting the houses up at the mining towns.

Uniontown—J. H. Oilman, Jr., of Pittsburgh, recently closed a deal for two tracts of coal land in Luzerne township, representing an investment of over $90,000. Mr. Gilman purchased a two-third interest in the Henry Cox farm, consisting of 111 acres, at $792 an acre, and the coal underlying the farm of George Hibbs, comprising 90¾ acres, at $840 an acre.

Washington—The Lilley Coal and Coke Co., of West Brownsville, has purchased 200 acres of coal land east of Washington from the estate of John Shrontz. The purchase price was $65,000. The company had previously acquired several hundred acres in the immediate vicinity and is now preparing to sink a shaft.

Latrobe—Officials of the Greensburg-Eastern Coal Co. have purchased the Daily and Showalter tracts of coal, near this place, the consideration being $40,000.

WEST VIRGINIA

Bluefield—An epidemic of grip and measles throughout the Pocahontas coal fields has cut down coal production to less than 50 per cent. normal. During the past week operators say production was cut down 100,000 tons because of illness of miners. The epidemic came just at a time when the car supply was better than at any time during the past six months.

Newlyn—The Weewyn Coal Co., recently incorporated with a capital of $25,000, is now developing about 200 acres of coal lands at the mouth of Arbuckle Creek. The company is planning for additional development work. H. P. Thomas is president and manager; P. H. Henry is vice president.

Charleston—Examination for mine foremen and firebosses will take place at Charleston on May 21, 22 and 23; Fairmont, May 28, 29 and 30; Thomas, June 4, 5 and 6; Mount Hope, June 11, 12 and 13; Welch, June 18, 19 and 20; Logan, June 25, 26 and 27.

Charleston—There were 33 fatalities in West Virginia coal mines during the month of March, according to the monthly report of the State Department of Mines. Fourteen deaths were caused by roof and coal falls, ten by mine-car accidents, four by explosives, one by a motor accident, three from miscellaneous causes and one happened outside the mine workings.

Clarksburg—Though delayed by the failure to secure steel for its switch, the Bowery Coal Co., of Lost Creek, having completed the development work at its new plant, will be ready to ship coal just as soon as switching facilities are provided.

Madison—The Bradley Coal Co., recently chartered, has perfected an organization by electing S. E. Bradley as president, O. C. Chambers as secretary treasurer, and W. W. Bradley as superintendent. Construction of the company's plant has been under way for the last month and by July 1 the company believes it will be able to ship coal.

Grafton—Repairs are being made to the plant of the East Grafton Coal and Coke Co. at Thornton in the renewal of the sinking shaft and by the addition of several boilers to the power plant.

Philippi—The Philippi Gas Coal Co. expects to start shipping any time now. It is owned by Clarksburg capital.

Mannington—A tract of coal land, which includes 2419 acres in Mannington district, in Marion County, and Grant district, in Wetzel County, has been transferred and the transaction recorded in the county clerk's office, indicating early development. The tract lies just above the Rachel Gas Coal tract at Downs. Attorney Charles F. Kefover, of Uniontown, Penn., recorded the papers.

Fairmont—U. G. Wilkinson Co., of Pittsburgh, engaged on the transfer of the Empire tract (Davis and Elkins tract) to the New England Fuel and Transportation Company, since last August, complete their work here this week. The New England Fuel and Transportation Co. took over this big tract and resold a great deal of it.

Matoaka—The Wright Mining Co., a wagon mine, is engaged in shipping coal from the No. 3 Pocahontas seam. The capacity at present is two cars daily. R. T. Wright is manager. H. D. Harman and Lathrop O'Keefe are also interested.

The Pawama Coal and Coke Co. is doing its "bit," having produced a record tonnage for the month of March. The plant is newly painted, and six new houses have been completed. All the company's houses have recently been put in first-class condition and new miners are coming in for work daily. Superintendent Roy T. Wright is to be congratulated on these improvements.

KENTUCKY

Earlington—The St. Bernard Mining Co. has announced its intention of constructing a large power plant here to furnish power for all of its string of mines, including Morton's Gap, some 20 miles from the new plant, which will cost between a quarter and a half million dollars. Several of the contracts have been placed, the main electrical contract going to the Westinghouse company, and arranging for completion inside of seventeen months. The company recently lost its power plant at Shamrock by an explosion followed by fire, that having been the largest mine power plant in western Kentucky at the time.

Madisonville—The Sunset mine of the Coil Coal Co. has resumed operations after being down for several days as a result of a breakdown in the power plant, necessitating sending away for parts.

Harlan—The Wallins Creek Collieries Co., capital $500,000, has purchased the property of the Wallins Creek Coal Co., containing three equipped mines capable of producing 1500 tons daily. The new owners plan increasing the output to 2000 tons. Officers of the company are W. D. Boyer, Scranton, Penn., president; S. C. Boyer, Nashville, treasurer; W. J. Nixon, Chattanooga, general manager.

TENNESSEE

Harriman—S. P. Sparks, George W. Chandler and others interested in the ownership of the Babahatchie coal mines, on the Queen & Crescent R.R., near Harriman Junction, plan reopening the mines, which have been down for several years. Capt. A. W. Evans, an engineer, has been secured to supervise the reopening of the mines.

INDIANA

Petersburg—The Muren Coal Co., with a capital stock of $375,000, the directors being Clark Whitman, J. C. Muren and A. H. Taylor, was organized recently. The new company owns the Muren mine, along the Southern R.R., which employs 125 men.

Oakland City—E. Hacket, of Louisville, Ky., owner of a large mine near here, is making tests preparatory to the sinking of another shaft. The new mine is to be electrically equipped and will be capable of producing a large tonnage.

Bicknell—The Bicknell Coal and Mining Co. has started to sink a new mine in the Bunting addition which will give employment to about 500 men when completed. This is the fourth new mine to be sunk here in the last year.

Terre Haute—An explosion which fatally burned three men occurred in the shaft mine of the Deep Vein Coal Co. Tuesday, Apr. 23. Searchers are unable to penetrate far, owing to the accumulation of smoke, and the fate of the other men cannot be determined. The property loss will not be heavy, but the mine's production of coal will be halted several days.

ILLINOIS

Springfield—An agreement has been reached between employees of the Jones & Adams Coal Co. and the Illinois Traction Co. relative to improved passenger service between Springfield and the mine. The miners filed a petition some time ago with the State Public Service Commission for better service. This will now be withdrawn.

H. A. Converse, fuel administrator for Sangamon County, announces in a bulletin that the railroads have consented for discarded ties to be gathered for fuel, instead of being burned by the section men to get them out of the way, and persons living near the railroads are urged to arrange with local station agents for gathering them up and utilizing them as fuel.

Johnson City—Superintendent Ralph Mitchell and Mine Manager W. B. Miller have made the Ernest mine here a 100 per cent. mine by selling every man employed there one or more Liberty Bonds, making a total of $33,000.

Gillespie—Business men of Gillespie have organized a company and are sinking a mine just north of the town to avert the anachronism of a coal famine, which often occurs, in a town that is surrounded by some of the largest mines in the world. It has often happened that no coal could be obtained from the big mines for local use for a week at a time because the entire output was needed for filling orders. The new mine is intended to supply the local needs exclusively or to at least give them the preference.

Herrin—One of the largest sales in the past year in the southern Illinois field was that recently closed when the Chicago and Carterville Coal Co. sold its mines A and B near here, with the washer and dry screening plant, to the Chicago, Wilmington and Franklin Coal Co., for $1,500,000. Five thousand acres of coal and mining rights in Williamson and Franklin Counties, with 4000 acres of farming lands and valuable city property in Herrin is included. This is the largest single transaction ever made of Williamson County property. The new owners have two mines in Franklin County, one at Orient and one at Benton.

Foreign News

Montreal, Canada—Operators in the west of Canada say the output of coal the coming year will be much less than hoped for, especially in British Columbia. Labor supply has been limited since the war and is growing scarcer. Continued strikes have prevented anything like a proper production, but even with the strike situation eliminated, operators say individual miners are prepared to do only a certain amount of work each day and when they have accomplished their self-appointed quota refuse to work until the following day.

Victoria, B. C.—The Canadian Collieries (D). Ltd., has opened its No. 5 Mine, and D. Morton has been appointed overman. He was head overman at No. 4 Mine, Extension, which has been closed down.

In the reorganization of the Merritt Collieries under the firm name of the Fleming Coal Co., Joseph Graham has been appointed general manager; A. E. Smith, mine manager; and John Brown, overman. These mines under the Inland Coal and Coke Co. have produced as high as 15 000 tons a month. The new company is taking hold vigorously, as is shown by the fact that last month, although the work may be said to have just started, 4000 tons was produced.

Personals

Leroy Waldbridge, mining engineer with the Cranberry Creek Coal Co., at Hazleton, Penn., has been named to succeed **J. E. Anderson** as chief engineer.

Alex Sharp has been appointed mine manager of the Colman Collieries, Princeton, B.C., which have been reopened. It is understood that considerable development work is to be undertaken.

J. W Montgomery, formerly mine manager of No. 7, Canadian Collieries (D), Ltd., has assumed the duties of mine manager of Nos 5 and 6, while J. G. Quinn, formerly in charge of the two latter mines, has gone to No. 7.

T. B. Fisher, until recently mine foreman of mines at Twin Branch, W. Va., has been employed by the Pawama Coal and Coke Co. in same capacity. **R. Q. Mahoney** has resigned and will return to work for the Turkey Gap Coal and Coke Co., Dott. W. Va., No. 2 mine.

Edward Solomon, formerly in charge of the Solomon-Peabody mine south of Auburn, Ill., is to take charge of the new mine being sunk by the Panther Creek Coal Co., two miles north of Auburn. Mr. Solomon's successor at the Solomon-Peabody of mine is **C. C. Chadwick.**

Lloyd G. McCrum, of Somerset, Penn., general manager of the Victor Coal Mining Co., operating at Holsopple, Somerset County, Pennsylvania, on the Baltimore & Ohio R.R., was recently appointed Lieutenant-Colonel in charge of the United States Government arsenal at Rock Island, Illinois.

H. R. Bissell, of Independence, Preston County, West Virginia, has resigned as general superintendent of the Preston Coal Co. and as secretary and treasurer of the Grafton Coal Operators Association, effective Apr. 22, to accept the position of general superintendent of the Cambria Collieries Co., with headquarters at **Bellaire,** Ohio.

J. E. Anderson, who served with Pardee & Co., for many years as chief engineer at the Cranberry workings, and later with the Cranberry Creek Coal Co., of Hazleton, Penn., which now operates the mines, has resigned and will locate in the Wyoming Valley. During his stay at Cranberry the colliery has been completely electrified, saving in one portion of the workings the services of 20 mules.

George L. Fraser, for some time an employee of the Granby Consolidated Mining and Smelting Co., has been transferred from the company's smelting center at Anyox, B. C., and has taken over the duties of general manager of the company's new collieries on Vancouver Island. He will have associated with him as mine manager, **J. W. Powell,** late of the Canadian Consolidated Coal Co., of Kentucky.

C. W. Murphy has been appointed superintendent of the Weyanoke Coal and Coke Co., Lowe, W. Va. **W. A. Craven,** whom he succeeds, is appointed superintendent of the S. J. Patterson Pocahontas Co., a company composed of practically the same stockholders. **C. W. Connor,** who until recently was superintendent of the S. J. Patterson Pocahontas Co., has resigned to engage in the mining business.

Obituary

James Vincent, assistant manager of the Whitner-Kemmerer Co., of Pittsburgh, Penn., died Apr. 17 at his home in Pittsburgh. He was a well-known coal man and was formerly sales manager of the old Pittsburgh-Buffalo Co. in Pittsburgh He was buried in Alliance, Ohio, Apr. 19. He was aged 42 years and leaves his parents, two sisters and one brother.

Coming Meetings

Illinois and Wisconsin Retail Coal Dealers Association will hold its annual convention June 26 and 27, at Hotel Wisconsin, Milwaukee, Wis.

International Railway Fuel Association will hold a convention May 23 and 24, in Chicago, Ill., under the auspices of the United States Fuel Administration and the United States Railway Administration. Secretary, J. G. Crawford, 702 E. 51st St., Chicago, Ill.

American Institute of Chemical Engineers will hold its summer meeting June 19-22 at Berlin, N. H.

American Association of Engineers will hold its fourth annual convention May 14 in Chicago, Ill. Secretary, A. H. Krom, 29 South La Salle St., Chicago, Ill.

National Coal Association will hold a meeting May 8 at the Bellevue-Stratford, Philadelphia, Penn. Secretary, J. D. A. Morrow, 707 Southern Building, Washington, D. C.

Illinois Mining Institute will hold its next meeting May 23, 24 and 25, at **Peoria,** Ill. Secretary, Martin Bolt, Springfield, Ill.

American Institute of Electrical Engineers' annual convention June 26-28 at Atlantic City, N. J. Secretary, F. L. Hutchinson, 29 W. 39th St., New York City.

American Society of Mechanical Engineers will hold its spring meeting June 4-7, at Worcester, Mass. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

American Concrete Institute will hold its annual meeting June 24-26, at Atlantic City, N. J.

Industrial News

Frankfort, Ky.—Among the principal late incorporations of coal companies are: Harvey Jellico Co., Louisville, Ky.; capital $30,000, incorporators E. E. Lanning, J. M. Dougherty and Edward H. Niehaus. Virginia Mining Co., Allen, Ky.; capital $9000; W. G. Gray, R. L. Smythe and L. B. Harwell. Harlan-Peacock Coal Co., Pineville, Ky.; capital $24 000; E. L. Shell, Henry Broughton and J. M. Gilbert. Bull-Dog Coal Co., Calvin, Ky.; capital $10 000; E. W. Miracle, W. G. Cugg and R. W. Miracle. Cooper Fork Coal Co., Middlesboro, Ky.; capital $6000; James Richardson, H. B. Broughton and Edward Broughton.

Louisville, Ky.—The Louisville Board of Education is taking no chances with the coal supply this winter, and is spending about $10,000 in constructing coal-storage bins at a number of the public schools which have little storage space available. A contract has also been made with the Louisville Coal and Coke Co. for furnishing 5000 tons of western Kentucky mine-run coal at $2.40 a ton. Bids were rejected on 1000 tons of nut and slack, and will be readvertised. The board annually consumes about 8500 tons of coal but only has storage capacity for about 6000 tons.

Charleston, W. Va.—The largest coal company, when authorized capital is taken into consideration, ever incorporated, is the Federal Coal Company, which will have its main office here. The capital stock is $3,000,000. It will operate in Boone County. The incorporators are John E. McCully, of Philadelphia. Judson Harney, of Scranton, and H. R. Van Dusen, William W. Hall, and E. M. Johnson, of Charleston.

New York, N. Y.—Out of a quota of $25 000 000, the Coal Trade Committee of New York City announced on Apr. 23 that it had obtained subscriptions to the Third Liberty Loan amounting to $6 072,150. Of this sum the subcommittee, appointed by M. F. Burns, the chairman of the Coal Trade Committee, to solicit the wholesale trade has secured subscriptions amounting to $2,142,650.

The subscriptions secured by the various Borough Committees are as follows: The Bronx, $92,200; Brooklyn, $402,000; Manhattan, $3,350 100; Queens, $30,200, and Richmond, $13,950.

The individual subscriptions include the following: Williams & Peters, $200,000; Burns Brothers, $100,000; Delaware, Lackawanna & Western R.R., Coal Department, $2,000 000; Scranton & Lehigh Coal Co., $75 000; O. H. Perry & Co., $25,000; John E. Berwind, $100 000; E. J. Berwind, $200,000; Clinchfield Coal Corporation, $100,000; Warren Delano, $120 000; Texas & Pacific Coal Co., $100 000; Robert Gordon & Son, $15,000; New Central Coal Co., $50,000; M. F. Burns, $25,000; J. A. Renahan, $10,000; F. A. Potts & Co., $50,000; Weber-Bunke-Lange Coal Co. $10 000; O. J. Stephens, $10,000; James A. Hill, $10 000; Jagels & Bellis, $20,000; Dexter & Carpenter, $10,000; Vinton Colliery Co., $120,000; Pennsylvania Coal Co., $1,000 000; Pennsylvania Coal and Coke Corporation, $300,000; Sanders A. Wertheim, $25,000; American Coal Co. of Allegheny, $50,000; Meyer-Denker-Sinram Co., $10,000; Hencken & Willenbrock, and employees, $14,900; Madeira, Hill & Co., $25 000; West End Colliery Co., $40,000; R. C. Hill, $25,000; Price-Pancoast Coal Co., $40,000; Thomas Dickson & Co., $20 000; Rideewood Coal Co., $20 000; Heilner & Son, $10,000; Joseph B. Dickson, $50,000; Thomas Dickson, $10,000; Jesse L. Eddy, $25 000; J. Rheinfrank & Co., $10 000; Watkins Coal Co., $16,200; Thedford-Eltz Coal Co., $10 000; Willard-Sutherland & Co., $18,000; Pawama Coal and Coke Co., $10,000; F. R. Long & Co., $10,000; Adelphia Coal Co., $15 000; S. M. Schatzkin, $10 000; Bacon Coal Co., $20 000; Z. O. Nelson, $10,000; Richmond Coal Co., $10,000; Bulah Coal Mining Co., $11,500; S. Tuttle & Sons Co., $25,000; and Utah Fuel Co., $100,000.

St. Louis, Mo.—J. H. Anderson has organized the Reliance Coal and Supply Co. and will open an office at 718 Equitable Building and engage in the jobbing of coal.

Columbus, Ohio—The Daniel Boone Coal Co., which is a subsidiary of the Maynard Coal Co., of Columbus, is now operating the second opening in the Hazard district in eastern Kentucky. The first opening has been worked for more than a year. The second mine is fully equipped with shaker screens and conveyor and has a capacity of 2000 tons daily. The first mine has the same capacity. The Daniel Boone Coal Co. is busy on a third mine to be located in the Lots Creek district of Kentucky on a branch of the Louisville & Nashville now under construction. The third mine will be opened about Aug. 1.

Charleston, W. Va.—Thirty-three fatalities as results of accidents occurred in the mines of West Virginia in March, according to the report of Chief Earl Henry, of the State Department of Mines. They occurred in the following counties: Kanawha, two; Braxton, Brooke, Marion, Mercer, Putnam, Tucker and Wyoming one each; Fayette, three; Harrison, four; Logan, two; Marshall, two; McDowell, seven; Mingo, four, and Raleigh two.

Philadelphia, Penn.—The annual statement of the Philadelphia & Reading Coal and Iron Co. has created much interest in coal circles It is shown therein that the profit of the company for the year 1917 is approximately five and one-half million dollars, being an increase of nearly three million dollars over 1916. For over 40 years previous to the present boom in the anthracite industry this company, with the single exception of one year, has shown a deficit This loss has always been met by the holding concern, the Reading company, as it is known, accepting the bonds of the coal company to the extent of each year's loss. It was always claimed that this former annual deficit in operation of the premier anthracite company was due to the heavy capitalization incident to the purchase of the thousands of acres of virgin coal land during the McLeod régime in the Reading companies.

Baltimore, Md.—The United States Industrial Alcohol Co. has awarded a contract for the construction of its proposed new steel tipple at the Curtis Bay plant. The structure is estimated to cost about $100,000. The Ansonia Copper and Iron Works, Curtis Bay, is the contractor.

Cincinnati, Ohio—A general tie-up of coal and other traffic on the Ohio River was threatened for a few days last week, when engineers on towboats operating on the river caused a cessation of operations by refusing to run their boats until a demand for higher wages was met. The engineers asked an increase of $30 a month, making their pay $150 a month instead of $120, as formerly. The difficulty was settled amicably, however, by a conference held at Point Pleasant, W. Va., between representatives of the engineers and the transportation executives of several leading coal companies, and the advance asked was granted, at least by the Otto Marmet Co., the E. J. Hickey Co. and the Campbell's Creek Coal Co.

St. Louis, Mo.—The Coal Service Bureau has compiled the following items of increased cost in the distribution of coal this year as compared to last year: Drivers' wages, 22.8 per cent.; stablemen's wages, 33.7 per cent.; pay of weighers, 38.9 per cent.; pay of yardman, 10.3 per cent.; clerk hire, 20.2 per cent.; timothy hay, 60 per cent.; oats, 100 per cent.; mixed feed, 109 per cent.; lumber, 83 per cent.; car service, 300 per cent.; iron and steel, 75 to 100 per cent.; harness and leather, 200 per cent.

St. Louis, Mo.—Bids were opened Apr. 18 by United States engineers here for the construction of 13 steel barges for the conveyance of coal and other commodities on the Mississippi River. Three of the bids were in excess of the price limit. The other three were all close to $90,000 for each barge. The award has not been made

MARKET DEPARTMENT

Weekly Review

No Change in Coal Situation—Anthracite Production Affected Adversely by Labor Shortage—Bituminous Output Shows No Betterment—Mines Still Working Short Time—Lake Navigation Opens

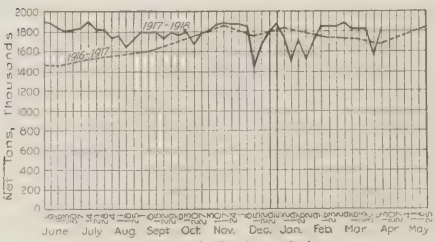
NO CHANGE of any consequence can be noted in the coal situation this week. Shipments of anthracite show a slight improvement. Orders from domestic consumers are still piling up, and retail dealers continue to worry whether they will receive enough coal to take care of the orders now on their books. The scarcity of labor in the hard-coal regions prevents the mines from working to utmost capacity, and the draft is making still further inroads on the men who are left. The situation is serious.

The steam-coal market has tightened noticeably, and there is an urgent demand for practically all the smaller sizes. The Fuel Administration's order curtailing the supplies of coal to pottery and brick manufacturers would indicate that a sharper line will be drawn between so-called essential and nonessential industries.

The bituminous situation continues to preserve its demoralizing aspect. Inquiries for soft coal are many, with deliveries inadequate. Though production for the week ended Apr. 13 was 10,947,000 tons, an increase of nearly 18 per cent. over the output of the week preceding, it must be remembered that there was a decided falling off in production for the week ended Apr. 6. In order to avoid a coal shortage next winter the weekly output of soft coal should be over 11,500,000 tons. This average not been reached any week this year.

Reports show that there is no appreciable betterment in the car supply to the mines. Many operations are still working short time. The Fairmont region of West Virginia, however, was receiving a better supply of cars the early part of this week.

In spite of reports to the contrary, the question of what price the railroads are to pay for fuel has not been settled. The practice of assigning cars to certain mines at the expense of others is to be stopped, however, and will undoubtedly result in more even working time for all operations.



Distribution facilities this summer will not be materially enhanced either by the railroad administration's order for 100,000 coal and freight cars or the taking over of the Erie Canal. Intensive use of the canal waits on the building of barges, and it will be well along into the fall when the new freight cars are placed in service.

The coal-zoning plan is still undergoing changes. The consensus of opinion seems to be that it is working out well, in spite of the apparent hardships wrought by the system here and there.

The lake trade has opened, and coal is moving from Ohio, West Virginia and Pennsylvania to the lower lake ports. On the opening of navigation last year more coal was sent to the lake docks than the vessels could handle. This year shipments to the lakes should be made on a basis that would enable both the railroads and the lake vessels to handle it expeditiously and not overtax the available motive power.

COAL PRODUCTION

Production of bituminous coal increased 1,600,000 net tons or over 17 per cent., during week ended Apr. 13 compared with the preceding week. The total production of bituminous coal (including lignite and coal made into coke) is estimated at 10 947 000 net tons, an average production per working day of 1.824.000 net tons, compared with an average of 1.777,000 tons for the past year and 1,680 000 tons in April, 1917. Production for the first two weeks of April is estimated at 20,264,000 net tons, approx-

imately 19 per cent. below the production of the same period of March, 1918. The total production of beehive coke is estimated on the basis of railroad shipments at 672,000 net tons, an average per working day of 112,000 net tons compared with 103,000 for the week previous.

Anthracite shipments rose from 32,223 cars last week to 37,760, an increase of over 17 per cent.

Beehive Coke—The reports of conditions in the Connellsville and adjacent coke regions for the week ended Apr. 13 show slight improvement. Sixty-eight of the principal operators in the Connellsville, Greensburg and Latrobe districts reported production of 311,080 net tons, or 67.8 per cent. of their full-time capacity. Labor conditions improved, losses due thereto decreased from 15.4 per cent. last week to 13.7 per cent. Less coke cars were available than during the preceding week, losses due thereto amounting to 13.9 per cent. compared with 12.8 per cent. The same operators produced 162,300 net tons of coal.

Byproduct Coke—Performance of byproduct coke operators during the week ended Apr. 13 slightly exceeded that of the week of Apr. 6. The ratio of production to maximum capacity rose from 87.5 per cent. during the preceding week to 87.9 per cent. Out of 12.1 per cent. of maximum capacity which the byproduct plants of the country failed to realize in actual output, 5.5 per cent. was lost through lack of coal; 0.5 per cent. because of labor trouble; 5.2 per cent. on account of repairs to plant; 0 3 per cent. due to no market and 0.6 per cent. for all other causes. Operating conditions in the several states varied but little during the week ended Apr. 13. Kentucky was the only state to record a material increase. Maryland production of 100 per cent. week ended Apr. 6 decreased to 98.8 per cent. during the past week.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS

	Week Ended: Mar. 23	Mar. 30	Apr. 6	Apr. 13
Bituminous shipments, 123 roads	191,127	189,546	160,178*	189,952†
Anthracite shipments, 9 roads	42,487	43,642	32,223*	37,760†
Beehive coke shipments, 4 roads	13,643	13,320	12,743*	13,801†

* Revised from last report. † Subject to revision.

BUSINESS OPINIONS

Dry Goods Economist—This has been an eventful week in textile circles. Raw cotton dropped 6¼c. in six days, raw silk dropped 25 cents in Yokohama, but recovered slightly. Dealings in wool continue entirely suspended pending a definite statement of the Government's needs for army purposes. Announcement was made that British authorities have released some linens for export to this country.

Bradstreet's—Speeding up of war work, supplemented by continued heavy buying for Governmental account, excellent news regarding staple food crops, large purchases by country merchants, and improvements in transportation, stand out as the prominent currents in a rapidly moving stream. But the energies of the Government, with embargoes of preferences, make it difficult for merchants to get supplies, and at the same time further restrictions upon so-called nonessential industries operate to cut down outputs, which conditions in the aggregate militate against the freest movements in civilian lines.

Marshall Field & Co.—Current wholesale distribution of dry goods is ahead of the corresponding period of a year ago. Road sales for both immediate and future shipments show good increases over the same week in 1917. Merchants have been in to market in slightly smaller numbers. The market on domestic cotton goods continues strong. Collections are ahead.

Iron Age—Operating conditions at blast furnaces and steel works have improved steadily. The leading producer in the Pittsburgh district had 96 per cent. of its rated blast-furnace capacity active last week and 98 per cent. of its Bessemer and openhearth steel capacity. While all companies did not do so well, it is probable that April production of both pig iron and steel will exceed the excellent showing made in March. These results will attract more than usual attention now that the Government is calling for an increasing proportion of the output. The Carnegie Steel Co. is now giving war requirements practically 100 per cent. of its rolled product and at other Central Western plants 75 to 90 per cent. of the shipments are on Government account. Surprisingly little is heard of hardship to any metal-working industry because steel mills are paying small attention to ordinary trade. Stocks are playing a part now that will be missed later.

Atlantic Seaboard

BOSTON

Car shortage unrelieved. Assigned cars rapidly being abolished, including Storrow coal all-rail. Latter is likely now to be sent to Tidewater. Increasing tonnages for New York dumping and transshipment inland from sound ports. Apprehension over any plan to exclude all-rail shipments from Tidewater territory. Conference of all-rail shippers. Hampton Roads supply curtailed by car shortage. Anthracite shipments by water continue light.

Bituminous—At this writing the New England railroads are congested with engine fuel at their various depots. Appeals have even been made to the fuel authorities for disposition, such has been the accumulation of cars under load. It is not altogether so much a piling up of large reserves as a matter of labor and facilities for unloading. However, it is a sign that the roads are much easier for coal than six weeks ago.

The requisitioning of high-grade low volatiles from central Pennsylvania for bunker use is another subject that needs to be dealt with. So long as there is a chance of getting the bunker premium the operators will be disinclined to make commercial contracts. Car supply has been so poor the past month that the general situation has not been greatly affected by this one item, except psychologically, but when the car percentage increases it will doubtless be a lively factor. The car shortage is causing real alarm not only in this territory but in Pennsylvania itself. Again there are diversions in favor of Government industries and "contracts" made with New England consumers have so far shown a light yield. It is nothing unusual for a plant using 5000 tons monthly to have had but three or four cars shipped since Apr. 1.

It is understood that assigned cars are now in process of being wholly given up. If that proves to be the fact, in the judgment of many a real gain will have been made. For some time there has been a theory that to transship by water will mean economy of transportation, but the New York loading piers are in the midst of the most congested area anywhere; and if no improvement can be made in dumping coal the proposed expedient is likely to leave some of our industries high and dry.

Today it is apparently impossible by water to keep supplied those points in Connecticut, for instance, that have usually been regarded as tributary to New Haven and other rehandling piers. Delays are such that movement by that route is shown to be inadequate, and if now no emergency supply is allowed to come all-rail there are pretty sure to be shutdowns among important plants.

There is an increasing disposition on the part of fuel authorities to limit the area into which rail shipments should be sent. A good deal of hard work has been put into this question lately, and some of it was brought out in the conference of all-rail shippers called by Mr. Storrow on Apr. 22. It is clear that cars are coming through via the Boston & Maine and the Boston & Albany in eight or nine days now instead of thirty, yet there continues to be much talk about relieving congestion on the originating lines.

The Hampton Roads situation continues uneven. Some days there is more coal than there are bottoms waiting; other days conditions are reversed. The net recent result, however, is a 20 to 25 per cent. deficiency in tonnage brought to the piers on the three roads. Car supply and not labor shortage is the difficulty. The zoning system seems not yet in full operation and then again there is much complaint over the extent to which the Virginia railroads have had their equipment scattered. Norfolk & Western and Chesapeake & Ohio open-top cars have appeared in large numbers in New England, and it was only last week that railroads here like the Boston & Maine were ordered to return foreign cars. This was temporarily an embarrassment at the rehandling wharves for the reason that a large number of New England cars have been sent to the mines for railroad fuel when the roads were making great exertions to replenish their storage piles.

The normal route for at least 50 per cent. of New England's steam coal is by water, and the largest proportion of this tonnage should come from Hampton Roads. Could that be followed through it is probable that with an all-rail movement equal to 1917 all but the less essential industries would be cared for measurably well. At the same time the outlook is none too bright.

Anthracite—A recent announcement by the anthracite committee makes it clear there was no intention to limit the shipments to any consignee for any one month to the tonnage shipped the corresponding month in 1916. Some of the company sales agents were insisting upon such a provision, and it is a relief to know it was not authorized.

All-rail deliveries are coming through in good volume, but it should be noted they include a heavy tonnage of buckwheat and other substitutes for bituminous. Water shipments are still limited by lack of towing power, and although there are assurances of improvement there is as yet nothing visible. There are also questions of water freight to be worked out. At present there are wide variations in the cost alongside, and to such extent is this true that retail dealers in the same cities are allowed different selling prices based by local fuel boards on cost, the latter being dependent on the source of supply.

Present prices f.o.b. Port Richmond, Philadelphia, for New England shipment follow, this being the April schedule of the Philadelphia & Reading Coal and Iron Company.

	W. A.	R. A.	Lykens
Broken	$6 25	.....	$6 70
Egg	5 85	6 05	6 30
Stove	6 10	6 30	6 70
Chestnut	6 20	6 30	6 70
Pea	4 60	4 70	4 95

NEW YORK

Anthracite stocks far below demand, with consumers demanding their winter supplies. Retail dealers' books filled with orders. Miners appealed to by the companies to "do their bit" in producing coal. Car supply reported improved the first of the week.

Anthracite—Supplies here continue to be far below demand and dealers, who heretofore have insisted upon placing orders for and receiving only what they wanted, are now willing to take any of the larger sizes of coal. Consumers have religiously obeyed the mandates of the Fuel Administrators in placing their orders for the winter supply and are now urging the dealers to make the deliveries. As a result of this urgency the dealers have their books filled with orders sufficient to carry them throughout the summer and well into the fall, unless this market is able to secure larger shipments. As it is at present the trade fails to see any encouragement ahead and is fearful of a shortage next winter.

Reports from the mines are hopeful. Operations are on a full-time basis whenever possible, and reports for the week ended Apr. 13 show that shipments amounted to 37,760 cars, an increase of 5547 cars over the previous week, or 17 per cent. This makes a total of 69,983 cars for the first two weeks of the month as compared with 87,072 cars the first two weeks in March.

The benefit to be derived by the utilization of the Erie Canal recently taken under Government control, for the carrying of freight, including coal, has been a topic for discussion by the trade. It is expected that the transportation situation will be somewhat improved, but not to any great extent, pending the construction of barges.

Stocks at the loading docks are not large. For the seven days ending at 6 a.m. on Monday of this week reports show that but 6818 cars of anthracite had been dumped.

Buckwheat No. 1, which under ordinary conditions would at this time of the year be plentiful, is about as hard to get as either of the larger sizes. Rice, barley and culm are easier. The two latter are plentiful owing to the scarcity of bituminous with which they are mixed. Quotations for barley are slightly easier than they were a week ago.

Current quotations, per gross ton, f.o.b., Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.15	$6.90
Egg	6.05	6.80
Stove	6.30	7.05
Chestnut	6.40	7.15
Pea	4.90	5.65
Buck	4.45@5.15	4.80@5.50
Rice	3.90@4.10	4.80@4.50
Barley	3.40@3.65	3.00@4.00
Boiler	3.65@3.90	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—Operators report better car supply and that on Monday some mines which had been idle because of the absence of cars were that day receiving some.

The ruling of certain fuel administrators that no carload or bargeload lots should be delivered to individual consumers as they have been heretofore, unless permission shall have at first been obtained from the local fuel administrator, has been modified to the extent that where consumers have been accustomed to obtain their supply in this manner in the past they should be permitted to do so, unless there is some special reason to the contrary. The practice, however, should not be extended. This ruling, which was obtained by the Wholesale Coal Trade Association of this city, also applies to industrial or other concerns which supply their employees with coal for domestic purposes. Much objection had been made to the original ruling which deprived shippers who had served certain consumers in this way for several years from this business.

Car supply has continued poor and stocks at the local docks show no enlargement. Demand is heavy and consumers are anxious to stock up. While some contracts have been closed at the Government price, these are comparatively few. There is no free coals in this harbor, everything coming here either being on priority orders or purchased before shipment.

Local operators breathed a sigh of relief on Monday upon the receipt of information that the miners in the DuBois region had decided not to strike but had requested the Fuel Administration to investigate wage conditions. The employees had demanded an increase in wages on the ground that they should receive at least part of the recent increase granted in the Government price for coal. It was reported to the miners in convention that the increase did not allow for a wage increase.

The revision of coals of the smokeless variety suitable for bunkering purposes has not resulted in any more free coal in this market. It was reported early this week that some shippers who heretofore supplied bunkers but whose coals were not now included in the pools designated by the Government were offering their stocks at slightly lower prices. It was also reported that there was to be a further change in the pools.

BITUMINOUS PRICES

	F. o. b. New York Gross	Mine Price Net	Gross

PHILADELPHIA

Anthracite deliveries do not improve. Retail orders grow heavier. Public anxious for fuel. Conflict of opinion as to deliveries. Heavy tide shipments. Price rumors will not down. Labor troubles of retailers. Dissatisfaction with distribution plan. Coal now well prepared. Steam coals in heavy demand. Bituminous situation still serious. Car supply unimproved.

Anthracite—With orders piling up at an alarming rate, and no particularly great improvement in shipments, the dealers are growing restless. The urgent appeals to the public through the local fuel administration has caused the retailers to be flooded with business. It has been estimated that the orders now on file amount to 750,000 tons, being an increase of a quarter of a million tons over the preceding week. It would seem, however, that the dealers overlook the fact that they have 20 weeks before them in which to make the deliveries, and that probably the bulk of the spring and summer business has now been spoken for by the consumers.

There are some in the trade who continue to insist that all prices are likely to be revised by the authorities in Washington, and that action is sure to be taken before fall that will eliminate the individual differential of 75c., or at least bring all prices to the same basis. It is reported that some retailers who are entirely dependent upon shipments from individual shippers are experiencing some difficulty in inducing their customers to place orders. Many customers have refused to pay the higher retail price and have placed their business with dealers selling company coal. Even at that the retailers with the high-priced coal do not seem to have any difficulty in disposing of all the coal they can get, the only difference being that they are not so heavily booked for the future as their competitors; and some of them are just a little anxious on this account.

All shippers are not in harmony with the system of distribution based on the shipments to dealers during the period from April, 1916, to March, 1917, inclusive. It is becoming apparent that the officials purpose to control the distribution, despite the opposition that is being manifested. While most shippers have averaged their shipments for the foregoing period and ship accordingly, there were some concerns who started out earlier in the month to try to match the shipments month by month as

compared with the period of two years ago. It is understood now that they have also adopted the plan of averaging the shipments. Thus many customers who had not been taken on by these customers until late in the year 1916 have recently been receiving some coal. The National Fuel Administration has also notified the operators that while they may distribute any surplus tonnage over and above the period of two years ago to their customers, yet it must be considered that this tonnage is being held in reserve for the use of the Government, to be distributed later in the year, and that any portion of such surplus that is now distributed will be counted against the dealer's allotment later if it shall be necessary at that time for the authorities to call for coal for emergency use.

The steam coal market has noticeably tightened recently and many inquiries are received by the shippers for increased tonnages of practically all the smaller sizes. Recently the Fuel Administration sent out a circular notice to all operators asking them what tonnages of steam sizes they could ship to certain large plants working entirely on Government orders.

The prices per gross ton f.o.b. cars for line shipment and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$4.90	$6 05	Buckwheat	$3.15	$3 75
Egg	4 50	5 70	Rice	2 65	3 65
Stove	4 75	6 05	Boiler	2 45	3 55
Nut	4 85	6 10	Barley	2.15	2.40
Pea	3.45	4.35			

Bituminous—The trade has lost none of the serious aspect created by the shortage of cars. It is not possible to report any improvement in the car allotment to the collieries, with the result that numerous operations are on short time. The calls for fuel are insistent, with deliveries inadequate. Yet it cannot be said that any plants hereabouts that are engaged in the manufacture of material vital to the Government have suffered.

The latest move in the zoning arrangement is the cutting off of Pennsylvania R.R. shipments into Baltimore territory. Hardly a week passes without some modification of the original zoning rules, and the general opinion seems to be that the system is working itself out along the lines of least resistance; or, in other words, shipments will, as they have in normal times, follow the lines of least resistance in a competitive sense.

Conditions among the jobbers do not seem to have changed much, although a number of them are receiving fair consignments from their shippers. Others are in a bad way and claim to be hardly making expenses on account of receiving such a small proportion of their former shipments.

BALTIMORE

Many changes under zoning system cause of some confusion in trade. The receipts of soft coal easier, but still short of local needs.

Bituminous—After several days' experience with the zoning system here, which prevents shipments of soft coal over the Pennsylvania into this territory, the trade feels that, while there are complications of a more or less serious nature, the move will probably prove of benefit to this section rather than otherwise. This view is based upon the belief that when coal begins to run better over the Baltimore & Ohio and Western Maryland, as compensation for cutting off Pennsylvania shipments, it will mean an increased dumping in this region. These two systems are so far not embargoed north. It is expected among other things that considerable coal originally marked for points north will be congested at junction points in the Cumberland gateway and will be diverted here to clean up the railroad jams. The past two weeks saw several hundred cars shifted to delivery here in order to lift congestion at Keyser, Cumberland, Hagerstown and Martinsburg.

There is some concern felt over the apparent Government plan to have Newport News and Norfolk handle all the all-water coal to New England, as much coal has been handled over the piers here for the east coast. Meanwhile the receipts over the Baltimore & Ohio have improved under a better car movement, although they are not sufficient to care for all wants at once.

Anthracite—While the Fuel Administration is urging consumers to get their anthracite supplies early, and while much business has been placed on the books, a large proportion is still out. The coal men have not been urging the taking of coal early, as receipts have not been of a nature to warrant it. The next month's deliveries here will set the pace for the retail trade in a large measure.

Lake Markets

PITTSBURGH

Coal in box cars. More Ohio than Pennsylvania coal offered. Little talk of lake shipments yet.

Coal loaded in box cars has been growing rather plentiful, at least for such an anomaly. In many cases the cars are destined to experience but one loading of coal, being intended for use in the West for grain loading, but they are permitted to carry coal to the zone limits. Box cars with Pittsburgh district coal are found only occasionally, but in Ohio they are much more numerous. Such coal usually requires a little argument in order to produce a sale, but brokers report they are generally able to move it, and collect the 15c. commission from consumers at the same time, an evidence that there remain consumers decidedly in need of coal.

Occasionally there are offerings of coal at less than the Government price, but the cases are not sufficiently common to be considered in quoting market figures, and, as a rule, they apply only to Ohio coal. Such offerings, however, are sufficient to show that the market is not altogether the one-sided affair that prevailed for so many months.

Practically nothing is being heard of lake coal, and it is evident that this movement will be taken up slowly, in accordance with the ability of the railroads and the lake vessels to get the coal through, once it leaves the mines. The common experience in the lake coal trade has been that of much more coal being sent to the lake ports, on the opening of navigation, than the vessels could handle, and nothing of that sort is to be permitted this year.

The market remains quotable at the set limits: Slack, $2.20; mine-run, $2.45; screened, $2.70, per net ton at mine, Pittsburgh district. Brokers are permitted to charge 15c. brokerage to consumers and retail dealers, beyond the set prices.

BUFFALO

Car shortage not improving. Hard to get any bituminous, especially Pittsburgh. Much going to the lakes. Anthracite begins to move by lake. Local supply not large.

Bituminous—The jobber who is getting coal enough to supply any great part of his trade is hard to find. It is practically impossible to get any Pittsburgh coal, and certain of the Youghiogheny companies have notified their old customers that the zoning regulation has cut them out of this market. No more No. 8 will come here till that division is dropped. The lake trade is now taking a great amount of bituminous, and that reduces the supply for this section. It is already predicted that next winter's shortage will exceed any we have had so far.

At the same time certain parts of Canada are full of coal. Much demurrage has been assessed in Toronto and the surplus coal there is not out of the way yet. The reason for that is that the margin of profit allowed to jobbers is larger than it is here. Preparations are making for heavy water shipments down the St. Lawrence River as soon as the ice is out of the way, which will be in a few days. A water rate of $2.90 net has been paid on cargoes loading at Ohio for Montreal, though this does not appear to be fully established yet.

Such a rate is considerably higher than the all-rail rate, but it insures prompt movement; and that is much when everybody is eager to get a supply early. A large fleet of steamers that can pass through the Welland Canal will go into that trade. Buffalo does not ship bituminous by lake, the limit being Erie, Penn., and Toledo, both of which do a large business. The carferries across lake Erie are active, but those from Rochester to Canada are still hampered by ice.

Prices for bituminous coal remain at $4.45 for thin-vein Allegheny Valley, all sizes, and $4.25 for Pittsburgh lump, $4 for mine-run and $3.75 for slack, all per net ton, f.o.b. Buffalo; supply scant, demand good.

Anthracite—The demand exceeds the supply, though the distribution is said to be more than it was a year ago. At the same time the careful consumer, especially if he is located away from the source of quick supply, is buying a few tons of three-quarter bituminous, which he will mix in with the anthracite next winter and perhaps get along with little or no distress and anxiety as to his fuel supply. Buffalo will hardly do that generally, being so near the mines that enough ought to be obtainable if the winter is not too severe. It appears to be the idea that some sort of precaution is needed to make sure of plenty of fuel.

The lake season is at hand and two or three caroges have been loaded by one company, but no rate has been made and loading will not be general for some weeks yet. Steamboat fuel is not only scarce, but no price has been fixed for it and the coal shippers, who usually provide enough for the tonnage they take, are at a loss to know what to do about it. No very regular rate was made last season, but it seems to be necessary now.

DETROIT

Receipts of bituminous coal maintain good volume. Anthracite is not plentiful. Lake movement starts.

Bituminous—Shipments of bituminous coal are holding good proportions, the receipts providing comfortably for requirements of the Detroit market, which at present are chiefly from users of steam coal. The movement of bituminous is not unduly large, however, and it continues to be almost impossible to locate free coal on tracks in or around the city. The demand from manufacturing and industrial plants continues in a satisfactory degree, and buying proceeds with much regularity, maintaining a steady tone in the market.

The greater part of the coal apparently is going to steam plants, and a few are reported to have been moderately successful in accumulating reserve stocks. Many have no facilities for storing coal in quantity greater than is needed for a few days' supply, their requirements necessitating regular receipts to avoid suspension of operation.

Some of the retail dealers are reported also to have obtained a fair amount of bituminous for supplying needs of household consumers. The customers, however, are rather slow to place orders.

Anthracite—Household consumers are finding it difficult to get anthracite. The quantity of coal coming into Detroit is less than was expected, and few dealers have been able to fill orders as received. Some are declining to receive orders which they cannot fill immediately. With the market deprived of Pocahontas and New River coal, those who have been using smokeless stock are added to the number who rely on anthracite. The controversy between Detroit coal dealers and W. K. Prudden, Michigan fuel administrator, in reference to the amount of margin permissible on coal delivered to domestic consumers, continues unsettled and is said to be responsible for inactivity in the matter of providing for next winter's needs of household consumers.

Lake Trade—Ice is still blocking the St. Clair River. Considerable ice still remains in St. Marys River, while the Straits of Mackinac are clear. The movement of coal over the lake route has already started, and more than a half dozen freighters loaded at Lake Erie ports have arrived in the Detroit River, where they are awaiting the opening of the St. Clair River. No attempt will be made to force an opening, risk of damage to the ships being too great.

COLUMBUS

Domestic demand is strong in every section. Steam business is rather quiet as mine-run is still quite plentiful. The lake trade is opening in a burst of activity.

The coal trade in Ohio has been rather active during the past week. This is due primarily to the good demand for domestic sizes which is reported from every section. Consumers are taking the advice of operators and Federal and state officials and are laying in their fuel for the coming winter. Dealers have been doing a much larger business than usual during the month of April, and consequently there is an outlet for the total production. On the other hand steam business is rather quiet because of a large production of mine-run. The tone of the market is good and future prospects are bright.

The steam business is in a peculiar shape, which is somewhat unusual for this time of the year. Practically all large users have accumulated reserve stocks which exhaust their storage spaces. The smaller users are still buying from the open market, but their requirements are generally light. The railroads are also good purchasers as they are stocking up at every available point. But on the whole the large amount of mine-run on the market has become somewhat of a

drug and some is being sold at lower than the market price.

Retail trade is active in every way. Dealers have all available trucks and teams at work as domestic users are anxious to get in their next winter's stock of fuel. As a result the movement from the yards to the bins and cellars is exceedingly good. The greater bulk of the domestic trade is in Ohio-mined varieties from the Hocking Valley and Pomeroy Bend districts. Little Pocahontas is arriving in the local market. Anthracite is also a scarce article at this time. Retail prices are firm at the levels which have prevailed for some time.

The lake trade is now formally opened and coal is moving from Ohio and West Virginia districts to the lower lake ports. Quite a few vessels have been loaded and will be moved soon. Reports from the Northwest show that the docks are pretty well cleaned up with the exception of mine-run and slack. The Lake Pool will rush as large a tonnage to the upper lake region as possible.

Production in Ohio fields has not been up to the records of previous weeks. This is due largely to a shortage of cars. Strenuous efforts are now being made to get a better car supply, but so far have not met with success. In the Hocking Valley the output has averaged about 65 per cent. of normal and the same figures are reported from Pomeroy Bend. In eastern Ohio the output is still curtailed by shortage of transportation facilities.

CINCINNATI

Small deliveries, on account of car shortage, continue to worry trade, as demand is insistent and record-breaking spring business could be handled if coal were available.

The extreme car shortage at mines in West Virginia and eastern Kentucky continues at this writing, to the detriment of the entire trade and of consumers as well. With a car supply averaging only two or three days a week, mines cannot forward coal to take care of the demand which dealers and agents are receiving from all quarters, and the storage of coal, for which the public is ready, cannot therefore proceed as desired. Action by Federal authorities under which railroads will hereafter not be permitted to dictate coal prices in return for furnishing cars is expected to help the situation materially, by giving all mines participation in the supply of cars available; but so far this effect, resulting from a relief measure which should have been taken long ago, has not had time to make itself felt. In the meantime, with domestic and industrial consumers alike wanting coal both for immediate consumption and for storage, the trade is unable to supply the demand, on account of the non-arrival of fuel in anything like normal quantities for the spring season. The urgent advice of coal men and of the Fuel Administration to consumers to store coal against next winter's requirements has been taken fully to heart, and orders have been placed in unprecedented volume; but deliveries against these orders cannot be made in any quantity, for the reasons indicated.

LOUISVILLE

Domestic demand continues strong. Demand for steam coal checked somewhat. Buyers refusing contracts and buying on open market. Labor and car situations both bad.

There has been some slight improvement shown in the car supply in eastern Kentucky, which is now relatively 51 per cent. of requirements. However, mines are not operating more than about 40 per cent. capacity, and labor is much dissatisfied and shifting from place to place in an effort to secure steady employment. There is an active demand for domestic coal, but dealers are asking for 4-in. block and are refusing small coal, while in steam coal the demand is for clean run-of-mine. Steam coal is rather draggy and industrial plants are not laying in supplies.

The western Kentucky situation is almost the same, except that some of the small mines (wagon mines, etc.) have been having trouble in securing markets and have been selling some coal at less than the mine price in an effort to create business. The larger operators have not been having much difficulty in creating markets. However, contracts can only be offered at the same figures as upon the open market, and industrial consumers of steam coal are laying off for the present and refusing to sign up season contracts.

BIRMINGHAM

Domestic market strong and supply short and hard to obtain. Steam trade good, though the situation is somewhat easy, with consumption and production nearly on a parity. Production heavy, as a whole, but far below plant capacity.

There is strong and heavy demand for lump coal and other domestic sizes from every quarter of the Alabama zone. Dealers are having great difficulty in securing coal for stocking and are making slow progress along that line. Many yards in the district have only one or two cars on hand, and although householders are not showing much concern about laying in winter requirements sufficient orders are coming in to most of the dealers to prevent any accumulation. Dealers' prices as announced by the local fuel board allow a gross margin of $2.50 per net ton on mine prices plus freight and switching charges, retail prices ranging from $5.25 to $6.85 per ton.

The steam trade is holding up well and the demand is good, though the situation is characterized as easy, some instances being reported of deliveries being temporarily suspended by consumers. However, there is little chance for stock accumulation under existing operating conditions.

Complaint is general in regard to the indifference shown by mine workers to regular working schedules, and undoubtedly the bulk of the shortage in output in this field is attributable to this cause. Representatives of the Alabama operators are now in Washington in conference with the Fuel Administration in regard to a further readjustment of wages, but the consensus of opinion is that increased compensation will not serve to increase the production of coal; rather it will hinder it. Labor has registered no complaint against the present schedules.

Coke

CONNELLSVILLE

Car supplies continue irregular. No important improvement since early March. Vagaries in reporting car supplies.

Car supplies in the Connellsville coke region have continued irregular, being on some days approximately double the supplies of other days, and operators have a hard time maintaining their work. It is still necessary to hold coke in ovens longer than is good for it, with resultant deterioration of quality, but the situation is not altogether as bad as it was a month ago.

Of late the railroads have sometimes figured their car placements not against the full rating of the operation, but against the number of cars the operation could use. If, for instance, an operation running full is rated at 10 cars a day and it has half its ovens out, a five-car supply might be called "100 per cent." The divergence from the old method of figuring car supplies is not universal, but it has obtained often enough to confuse the figures. As a rule operators find that their loadings, averaged for a week, fall short of the reported "car supplies" on the individual days of the week, averaged together. This divergence the operators frequently have difficulty in impressing on their customers, and friction has resulted, blast furnaces feeling, on the basis of railroad reports as to car supplies, that they ought to be receiving more coke than the operators furnish.

On the whole it can hardly be said that car supplies have increased materially since early in March, and coke shipments are still 10 to 20 per cent. below the furnace requirements. There are not nearly so many furnaces banked as formerly, but many are gaited and are not turning out their maximum product. The Carnegie Steel Co. has put in operation all its banked furnaces, now operating 49 of its 59 stacks, but some of the 10 idle furnaces it would blow in if coke were available. A Valley interest has sought coke in the open market for more than a fortnight, to blow in an idle furnace, but has not accumulated enough to justify putting the stack in blast.

The market, such as there is, remains quotable at the set prices: Furnace, $6; 72-hour selected foundry, $7; crushed, over 1-in., $7.30, per net ton at ovens. The Fuel Administration in a recent ruling called attention to the fact that to be sold as "72-hour selected foundry" coke must really be selected according to the usual trade practice.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Apr. 13 at 334,291 tons, an increase of 1226 tons, and shipments at 314,376 tons, a decrease of 8022 tons. While there was a decrease in shipments, which were less than reported production, it was the week in which a "100 per cent. car supply" was reported for each of the first three days.

Buffalo—All coke is hard to get. The contracts of last year have mostly expired and cannot be renewed. At the same time the coke producers are handicapped by the scarcity of cars, while at the same time they must sell all their output at the Government prices of $6 or $7 at the ovens. Some of the furnace companies, directly or through auxiliary companies, make more coke than they need and are selling it to others. A residue of fine stuff, called "coke breeze," is obtained by jobbers, who sell it to consumers mostly for making steam, as it mixes well with coal for that purpose. It is practically impossible for jobbers to get beehive coke to sell.

Middle Western

GENERAL REVIEW

The general situation clarified by the ruling of Dr. Garfield on railroad coal.

Since Apr. 1 the situation in the Middle West has been in a turmoil because of the attitude of the railroads regarding their fuel supply for the coming year and has been instrumental in decreasing tonnage in this section. Evidences of discontent are noticeable among the miners. Many are changing from one mine to another; some are going to the farms, expecting to return to the mines in the fall; others want to work on the solid instead of in machine mines. In mines where they work on the solid they claim they can make more and easier money than by loading coal after it is machine-cut.

Working time during the past week did not exceed 60 per cent. full time, and many mines report that they only worked two days the past week, or 33 per cent., full time. During the week several large contracts were closed for southern Illinois coal which called for shipments to be made in the Chicago switching limits.

Market conditions are bullish on any good grade of well prepared size coal, but the slack and screenings market is stagnant. Few storage orders for fine coal have been placed as yet, and the situation is that of a begging market on the finer steam sizes. No doubt within the next few days this condition will be bettered, as it is expected there will be considerable buying by the railroads of fine coal as soon as they are thoroughly convinced they will be compelled to pay the Government price, which now seems almost certain.

MILWAUKEE

Dealers and consumers of coal anxious for more light in regard to orders for future delivery. First cargo expected within a few days.

Little new can be said of the coal situation at Milwaukee. At the present time there appears to be a surfeit of administration and a woeful lack of information. Consumers are being importuned to place their orders for coal at once if a coal famine is to be avoided next winter, and on the other hand dealers are being exhorted to speed up deliveries. The problem which faces the consumer is to know just what he can order. He has been told that there will only be a limited quantity of anthracite, that there will be no Pocahontas, and that he cannot get hard coal if he has been burning soft heretofore. The dealer is equally in the dark on these points and is puzzled to know how he can speed up deliveries when there is no coal to deliver. Authentic information regarding supply and price is needed to clarify the situation.

Scores of complaints have been registered that dealers are refusing to accept orders, not knowing how much coal they will be able to get and when they would receive it. Others refuse orders because the customers are slow in paying. To meet the latter objection a movement is on foot to help finance consumers who have not been able in the past to put in their entire fuel supply at one time.

Coal yards will be allowed to supply consumers who provide their own delivery conveyance provided the regulation questionnaire is filled out. Considerable coal is dispensed in this way.

The first cargo by lake is expected to reach port before the close of the month. All yards are making preparations as if a liberal supply of coal was expected at the start.

CHICAGO

Domestic trade is buying heavily. Movement of size coal to the consumer satisfactory.

Satisfactory conditions prevail among domestic dealers as far as their ability to get and deliver Illinois and Indiana coal is concerned. The present demand for well-prepared sizes is such that the yards are having all they want to do. No doubt the occasion for this unusual spring demand is the result of the campaign that has been waged by the state and local fuel administrators, urging the public to get its coal early and not be caught like last winter. Another helpful feature is the continued winter-like weather, necessitating more or less heat in all office and apartment buildings.

Quotations in the Chicago market are as follows, per net ton f.o.b. cars at mines:

	Williamson and Franklin	Saline and Harrisburg	Fulton and Peoria	Springfield	Carterville	Grundy, La Salle, Bureau and Will
Steam lump	$2.65@2.80	$2.65@2.80	$3.05@3.20	$2.65@2.80	$2.65@2.80	$3.35@3.50

The supply of anthracite coal coming into the Chicago market is light. There is no other eastern coal whatever, due to the zoning system. It is generally understood that all the anthracite coming into this market will be via lake, and that system of transportation did not open until this week. Meanwhile the all-rail movement has been extremely light.

ST. LOUIS

Market continues weak on standard coal, both steam and domestic. In a general way conditions show some improvement, especially in high grade. Transportation has been extremely slow and discouraging and railroads show no inclination to speed up. Car supply still short. Railroads not buying and steam users are trying to drug the market. No outside coals.

The local situation is a peculiar one, inasmuch as it is impossible to get enough Carterville coal to take care of anywhere near the demand, even at the higher retail prices. The retail trade is not buying anything but the Carterville at the present time, with the exception of such anthracite as may come in. The great problem right now is to get Carterville in sufficient quantities to take care of the orders now on file, and everything indicates that the tonnage of this coal, small as it is now, will diminish as time goes on.

One of the greatest handicaps in the getting of Carterville coal is the unwarranted neglect to move that coal into the St. Louis market on the part of the carriers. It takes the Iron Mountain R. R. from two to three weeks to move a car of coal less than 100 miles. The Illinois Central is almost as bad, and in a general way indications are that the carriers in this section are not trying to do their best in the movement of fuel. Not only are the carriers that way, but the Terminal Association is not giving the service that it should under present conditions. The car supply in the Carterville field is extremely bad.

There is practically no coal coming into this market from the Duquoin district at the present time. The car supply is bad, but some railroad coal is going out.

In the Mt. Olive field conditions have improved the last week. Practically all the coal available is moving forward and finds a ready market at the maximum price, the same as the coals from the Carterville and Duquoin districts. The car supply and working conditions in this field are extremely good and there is nothing to complain of.

In the Standard field the same lagging conditions continue. The Missouri & Ohio and Illinois Central are in bad shape for car supply, giving the mines only two days a week, and the movement of this coal is not good.

Throughout the field there is a scarcity of orders and screenings have gone as low in this market as $1.65, with mine-run at $1.90 and lump coal as low as $2.25. This is principally for coal moving into St. Louis proper.

If the scarcity of Carterville continues then the market for Standard will improve, but there is little retail domestic demand for Standard coal. The steam condition here is one that would indicate that large buyers are playing the market for low prices by holding off buying for several days, thus forcing it down.

There is little anthracite moving in and practically no Arkansas.

The market here, with the exception as noted above, is about as follows:

	Williamson and Franklin County	Mt. Olive and Staunton	Standard
6-in. lump	$2.65@3.00	$2.65@2.80	$2.65@2.80

Williamson & Franklin Co. rate is 87½c.; other fields, 72½c.

HELENA, MONT.

Mine prices in Montana are reduced 30c. a ton on lump coal and 5c. a ton on mine-run. Trade confused by three price changes in one month.

Lump coal is now $3.75 a ton at the Montana mines. Run-of-mine is $3.10, while the price of slack remains unchanged at $1.95. This is a reduction of 30c. a ton on lump and 5c. a ton on mine-run, making the prices, including jobbers' commission: Lump coal, $3.90; mine-run, $3.25, and slack, $2.10 a ton. This change and the changes made in the Wyoming and Utah mines make the prices uniform in the three districts. Wyoming lump was lowered 20c. a ton and run-of-mine was increased 15c., while slack was increased 25c. Utah lump has been increased from $3.30 to $3.75; mine-run from $3.05 to $3.10, and slack has been cut from $2.80 to $1.95.

The Montana coal trade has been confused as a result of three orders from the National Fuel Administration since the first of March, changing the prices of coal. The first was a reduction of 15c. a ton paid the miner effective Mar. 1. The second was a reduction of 15c. effective Mar. 15, while the third was a further reduction of 15c. a ton to the consumer through the elimination of the jobber. In addition a fourth order was received on Apr. 5 which countermanded the third order

GREAT FALLS, MONT.

Retail prices lowered 10c. per ton.

An order issued by the Cascade County fuel committee reduces the price of coal to local consumers 10c. per ton. The dealers get an increase on the gross margin of profit, but the difference comes through the reduction of 30c at the mines. Following are the margins of profit allowed the dealers: Unforked, load lots or over, $1.75; less than load lots, $1.95 forked, load lots or over, $1.95; less than load lots, $2.20; mine-run, $1.50; steam coal, $1.40 per ton. Coal deliveries of less than one ton 25c. added in addition to the one-ton price. Retail prices are as follows. First figure is for unscreened coal, and the second figure for screened coal: Sand Coulee, $6.22—$6.42; Bear Creek, $8.07—$8.37; Wyoming, $8.44—$8.75; Owl Creek, $8.55—$8.85; Roundup, $7.71—$8.

SEATTLE

Retail coal prices in Seattle advance from 25c. to $1 a ton. New coke prices announced. Dealers overcharges of $7000 recovered.

Forty-four varieties of coal are listed in the new Seattle retail price list for coal just made public by the State Fuel Administrator, David Whitcomb. There are no decreases from the prices charged during the winter just past. Instead, increases range from 25c. to $1 a ton, depending upon the class of coal and the place of delivery. According to the district of delivery the prices are as follows:

Carbonado lump nut	$9.60@10.90
Hyde lump nut	9.60@10.90
National lump	9.35@10.65
National splint lump	8.60@ 9.90
Standard lump nut	9.60@10.90
Roslyn lump egg	8.15@ 9.45
Queen lump egg	8.15@ 9.45
Wellington Ladysmith lump	10.00@11.30
Wellington Ladysmith nut	9.00@10.30
Wellington Nanoose lump	10.10@11.40
Wellington South Wellington lump	10.45@11.75
Wellington South Wellington nut	9.70@11.00
Grand Ridge lump nut	8.00@ 9.30
Issaquah lump nut	8.35@ 9.65
Newcastle lump nut	8.35@ 9.65
Renton lump nut	8.40@ 9.70
Tono lump nut	7.45@ 8.75
Mendota lump nut	7.15@ 8.45
Diamond briquette	9.80@11.10
Black Diamond mixed steam	8.60@ 9.90
Carbonado mixed steam	8.75@10.05
Franklin mixed steam	8.60@ 9.30
Gale Creek mixed steam	8.75@10.05
South Prairie mixed steam	8.75@10.05
Standard mixed steam	8.75@10.05
Carbonado straight steam	8.30@ 9.60
Hyde straight steam	7.75@ 9.05
Navy straight steam	7.25@ 8.55
Kangley straight steam	7.50@ 8.80
Pocahontas straight steam	7.95@ 9.25
Standard straight steam	8.30@ 9.35
Wellington Ladysmith steam	7.65@ 8.95
Wellington Nanoose steam	7.25@ 8.55
Wellington South Wellington pea	8.30@ 9.60
Roslyn mine-run	7.75@ 9.05
Queen mine-run	7.75@ 9.05
Grand Ridge pea	5.45@ 6.75
Issaquah pea	6.50@ 7.80
Newcastle pea	6.50@ 7.80
Newcastle buckwheat	6.25@ 7.55
Issaquah buckwheat	6.25@ 7.55
Issaquah sludge	4.50@ 5.80
Newcastle sludge	4.50@ 5.80
Tono mine-run	6.35@ 7.65

Coke producers in this state have been permitted to charge $7.50 a ton for gas coke f.o.b. cars at ovens, $10 a ton for blast-furnace and smelting coke made in beehive or byproduct ovens, and $11 for 72-hr. selected foundry coke made in beehive ovens. These prices will result in an increase of 50c. a ton in the byproduct smelting coke, and a decrease of $1 to $2 a ton in the coke produced at the beehive ovens at Wilkeson, Carbonado and South Willis.

To date the state fuel administrator has recovered $7000 in overcharges made by coal dealers above the maximum prices set for coal by the National Fuel Administrator, and is being held by him for ultimate refunding to the consumer. Prosecutions under this recovery will not be undertaken, as many of the overcharges were made because changes in prices had not been given to many dealers. Violations by jobbers of the ruling which until Apr. 1 limited their gross profits to 15c. a ton appear also to be due to misunderstanding of the ruling. All violations hereafter will be prosecuted, however, the state administrator promises.

Six thousand tons of coal were recently purchased by the State Board of Control for its various institutions from the following companies: Roslyn Fuel Co., Roslyn Cascade Coal Co., South Willis Coal Co. and the Superior Coal Company.

COAL AGE

Volume 13 NEW YORK, MAY 4, 1918 Number 18

Hope Dawns

By Floyd W. Parsons

FOUR weeks ago there was a serious falling off in coal production. The outlook was dark. The following week, however, there was no "Liberty Loan" holiday and no "Mitchell" day, so the miners got back on the job and output increased 12 per cent. The next week output increased 4 per cent., and last week it showed a further increase of 5 per cent.

If the bituminous output of the last week in April—which was close to 12 million tons—is maintained, we will have a fighting chance to get across this year with our war and industrial programs. If an additional half million tons can be added to this most recent weekly output, the Nation will be out of the woods, and the fuel problem will be largely solved.

Notwithstanding the Railroad Administration's picayune policy of abolishing its statistical department on the plea of economy, the work of gathering figures of daily and weekly freight shipments will likely be continued at the expense of another Government department, whose conception of its duty does not begin and end with the production of favorable net earnings.

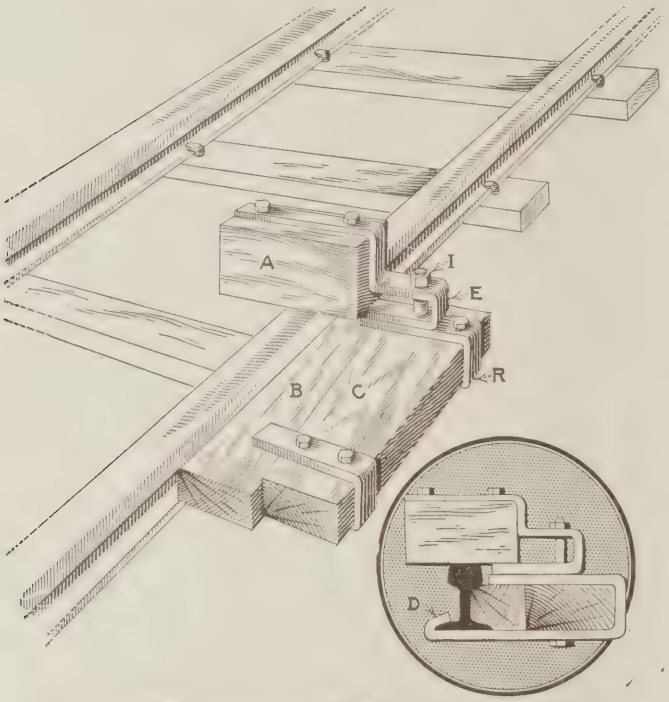
Little by little the people of the United States will force home the conviction that the present purpose of our Government is to win the war quickly. The President will be backed up in such a stand, and he will frown on those who persist in their adherence to certain practices and principles of economy that were fine in times of peace, but are false in wartime. What do we care if the railroads lose a half billion dollars under Government control, if thereby they are operated so effectively for war service that the conflict is shortened and American youth is conserved. This is no time to value lives in a measure of dollars.

The people have a right to know what is being done. If a statement of results reflects on someone, let it be so—no good is accomplished by hiding the truth. On the other hand, we are reaching a point where our industries must change. The man making scissors must manufacture only half as many, and must substitute trench knives or surgical instruments or rifle parts to make up for his curtailment. Our average American wants to know why he can't do business as usual, and the only way to make the point clear is to let him know the truth about the necessities of the situation, excluding only secret information of military value.

A greater accomplishment than winning an important battle in France was the creation of the President's War Cabinet. No longer can one department of the Government profit at the expense of another. No longer can any one branch of service extend itself out of all proportion to other coöperative lines. No longer will it be possible to locate new war plants, and certainly not peace industries, in regions where output is already limited by inadequate railroad gateways.

Back of the whole problem is fuel. More and more it will become evident that the coal mines must have a full car supply. Already it has been determined by the railroad administration that 50,000 of the 100,000 cars to be ordered immediately shall be coal cars. More than 1000 locomotives have been added to the Nation's transportation equipment since the first of this year. Two hundred and fifty of these locomotives were built for Russia; 100 were built for France and the remainder were in fulfillment of domestic orders. Such a helpful contribution to a serious situation is noteworthy and augurs well for future months.

The Railroad Administration appears confident, and although its optimism seems premature, we hope it will be justified by subsequent developments. Mr. McAdoo will be back in Washington next week, and that will mean the ending of the railroad-fuel controversy. This will undoubtedly bring a blessing in the form of equitable car distribution. However, this correction of a long-standing evil will likely come at the cost of a flat reduction in the price of all bituminous coal. If, added to this outcome, there also result adjustments of price inequalities that now exist in certain localities, of which Colorado is a good example, the coal industry will then at least know where it stands; and both producer and consumer can commence to do business with uncertainties removed.



IDEAS AND SUGGESTIONS

Safety Block for Use Near the Face

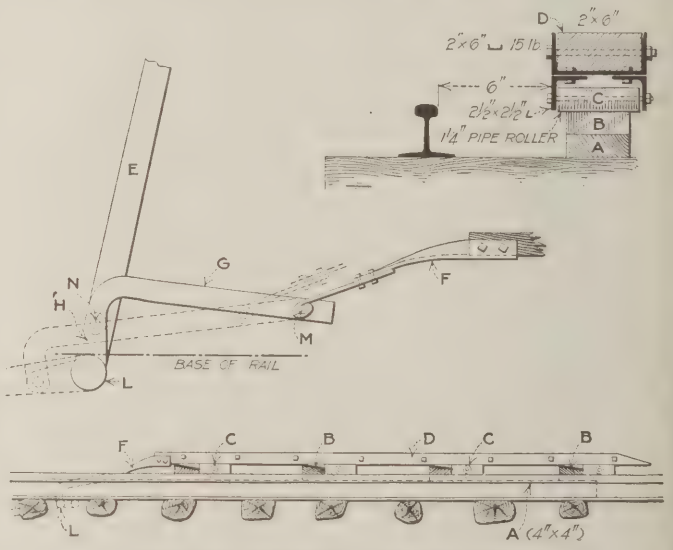
BY J. REAY
Seanor, Penn.

The accompanying illustration shows a safety block, for use in coal mines, in rooms or on heading tracks, when going to the rise. It is simple to make and to use, and easy to move forward when this is required.

The block is made as follows: *C* is a plank 2 in. or more in thickness, according to the size of the rail used.

THE SAFETY RAIL BLOCK WEDGED TO THE RAIL

This plank is cut to make the wedge *B*. The straps *R* extend several inches over this wedge to hold it firmly in place. These straps *R* go under the plank and extend beyond it to the point *D*, where they are turned back so that they grasp and fit neatly the flange of the rail. When the block is put in place the wedge *B* is driven firmly against the rail. *A* is the block proper, which is made of a piece of 4 x 4-in. timber fastened to the strap *E*, through which a bolt is passed at *I*, thus allowing the block to swing as if on a hinge.



Readily Constructed Mine Car Retarder

At the Franklin colliery of the Lehigh Valley Coal Co., near Wilkes-Barre, Penn., there are a number of ingenious contrivances due to the foresight and energy of the outside foreman, James Piatt. Among such devices are two types of car retarders. One is in operation at the tower hoist of the breaker and the other is placed near the head of an outside slope near the breaker.

The former retarder handles the heavy work incident to the control of loaded trips at the foot of the car hoist; the latter device slows down more gradually the short trips of cars as they come over the knuckle of the slope.

The accompanying illustration shows the construction of the retarder at the head of the slope in question. Its operation is simple, and the spragger can readily be made at the colliery shop. Its construction is as follows: A 4 x 4-in. or a 4 x 6-in. timber (*A*) about 16 ft. long is drift-bolted to the track ties, leaving about 4 to 6 in. clearance from one rail—at the side of the track most easy to operate the device. On this foundation, at intervals, are placed the blocks *B*, so shaped as to form inclines on which the rollers *C* may run and thus raise the 2 x 6-in. timber *D*. This timber *D* constitutes the active member of the retarder, which rises when the lever *E* is thrown forward. As the timber *E* rises, the top engages the mine car journal and tends to lift the car. Thus friction gradually stops the car.

As to further details of the construction and operation of the retarder: The timber *D* is held in a 2 x 6-in., 15-lb. channel by horizontal bolts. At regular intervals, on the under side of this channel, are rollers journaled in 2½ x 2½-in. 8-lb. angles, which are bolted

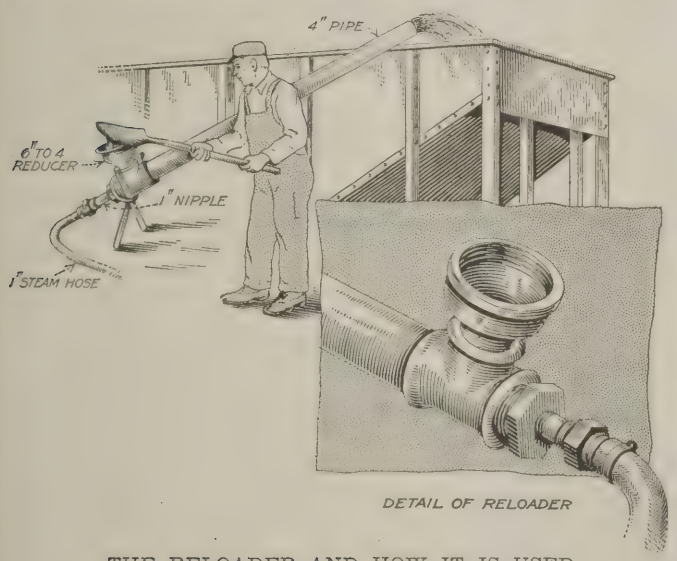
DETAILS OF MINE CAR RETARDER

to the channel as shown in the illustration. The blocks *B* are shod with sheet iron and act as inclined planes for the rollers *C*.

The forward end of the timber *D* and its inclosing channel is connected with the hand lever *E* by the iron *F*, the bent link *G* and the short lever *H*. The short lever is mounted on the axle *L*, to which is attached the hand lever *E*. The extreme forward position of the lever *E* and connecting parts are shown dotted; the short lever is now on dead center and tends to resist backward movement until thrown back by the hand lever. The irons *F* and *G* are pivoted at *M* and *N* to permit of free motion.

The majority of the mine cars at the Franklin col-

liery lend themselves nicely to this method of spragging. The exceptions are a certain type of car having bolt heads on the under side of the journal. This bolt rips up the surface of the 2 x 6-in. timber as the car slides over the wood surface of the retarder—a plea for further standardization of equipment.



A Successful Reloader

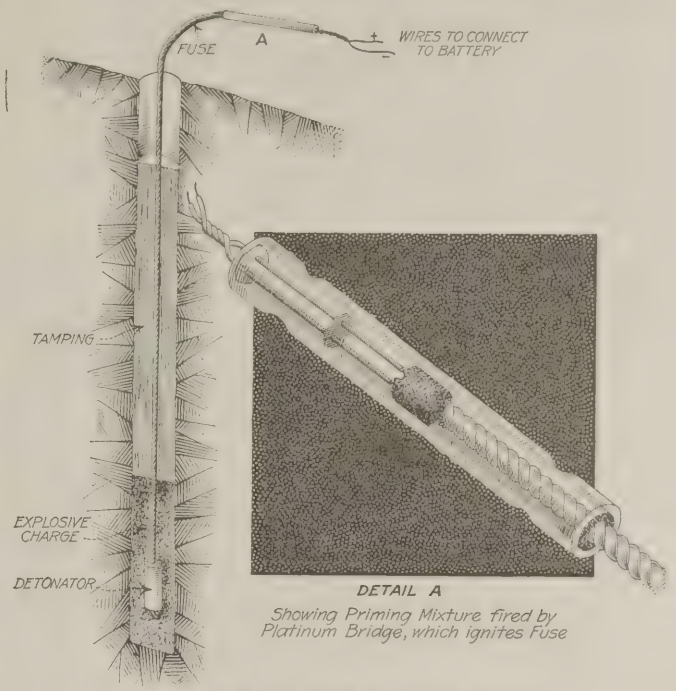
By R. L. Sinyard
Summit Hill, Penn.

Truly, necessity is the mother of invention. The arrangement shown in the accompanying illustration resulted from the scarcity of labor and the ingenuity of the power-house foreman.

Prior to the last suspension, an anthracite coal company had quite a number of cars of power coal dumped at a point convenient to the boiler rooms, to be used in case of a strike. The favorable result of negotiations between miners and operators, however, involved the reloading of this coal into the railroad cars that it might be transported to the boiler rooms. Now as the coal had been unloaded on a slope it represented considerable labor to reload it, and here is where the power-house foreman solved the problem.

Securing a length of 4-in. pipe, long enough to reach from the coal pile over the side of the car, he fastened a tee to one end and screwed a 6 x 4-in. reducer in the outlet opening, reducing the other run opening of the tee with a bushing to 1 in. A nipple long enough to go halfway through the tee was screwed inside, while

THE RELOADER AND HOW IT IS USED



the outside was coupled up to take a 1-in. steam hose which was attached to a steam line run from the power plant.

The result surpassed all expectations. The steam end of the contraption was placed in the coal pile and two men shoveled the fine coal into the reducer and the steam jet did the rest. As a part of the coal pile disappeared the pipe was merely moved and the coal shoveled into the open end. It was estimated that two men with this steam reloader equaled the work of 12 or 15 men shoveling it directly into the cars. In the course of a short time, comparatively speaking, the coal was reloaded.

Delayed Action Fuses

By M. Cranston
Pocahontas, Alberta

In reviewing some of the contributions on safety contained in *Coal Age*, I thought it might interest some of its readers, who follow shaft sinking, or rock work, as a profession to learn of the following safety device in blasting. The procedure here described was adopted,

DETAILS OF THE SAFETY FUSE

after the occurrence of a fatal accident, in the course of sinking the Lewis Merthyr Colliery shafts at Ogmore Vale, Wales.

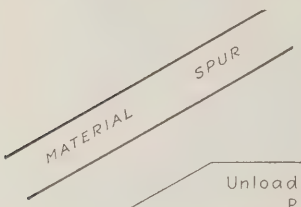
Where a round of, say, 10 shots are to be fired simultaneously, with an electric battery, it sometimes happens that one or more of the shots misfires or does not detonate, and the person doing the firing has no means of knowing this, except by going down the shaft (if such is the character of the work) and making an inspection. Sometimes the unfired shot is covered under débris, which hides the fact of its failure to explode until possibly the detonator is struck with some tool, with fatal results.

In the method submitted the time fuse is used in charging, and each fuse is cut 2 in. longer than its predecessor, the ends being connected to electrical detonators, as shown in the accompanying illustration. The electrical detonators are consequently all ignited at the same time, the difference in time of detonation between each shot being caused by the unequal length of fuses. This enables the shotfirer to count each detonation and satisfy himself that all shots have gone off. This arrangement was a "delayed action fuse."

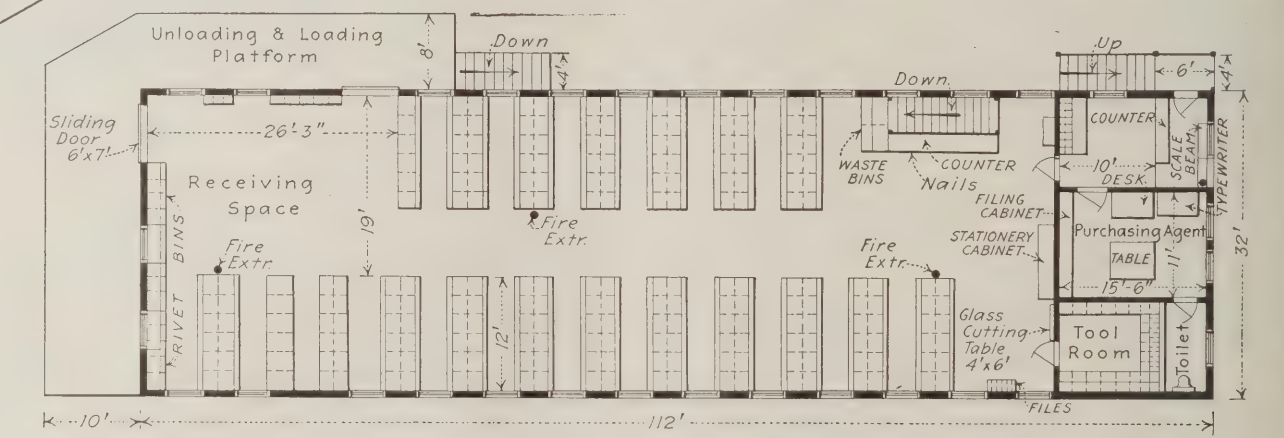
Soot burns very slowly in the furnace gases because the oxygen is greatly rarefied, the gases containing only a few per cent. of free oxygen; it burns rapidly in the bomb calorimeter or in mixture with potassium chlorate because it is surrounded with highly concentrated oxygen ready to combine with it.—*Bureau of Mines Bulletin No. 135.*

Handling Material and Supplies at Coal Mines

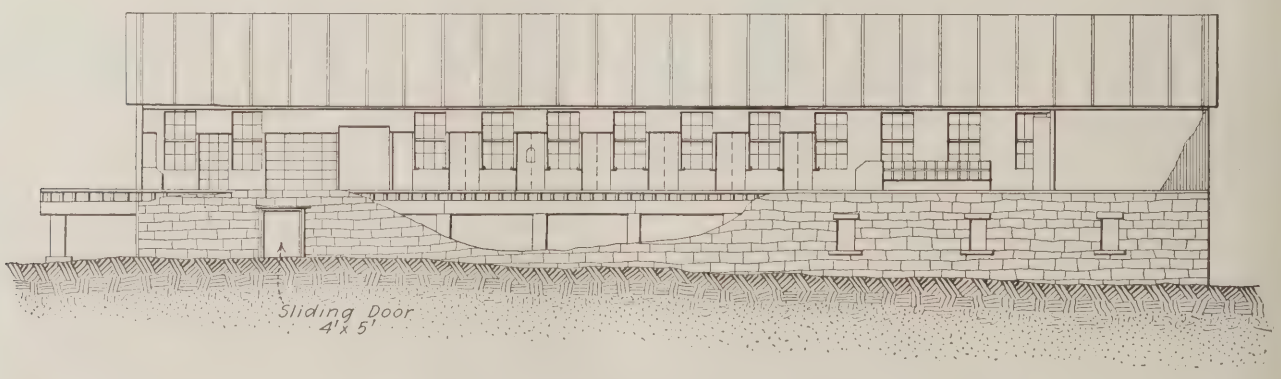
By R. M. MAGRAW
General Superintendent United States Fuel Co., Hiawatha, Utah



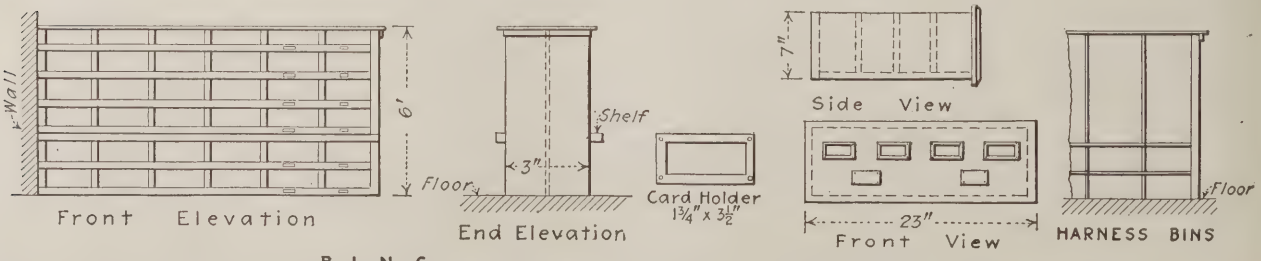
SYNOPSIS—*The cost of materials and supplies is an appreciable item in the total cost of producing coal. A centralized material storage wherein everything is kept strict account of is the only practical method of reducing so far as possible the expense for supplies and preventing either an excess stock or a scant one.*



TO THE up-to-date coal-mine official the material and supply account, or as it is usually abbreviated, the "M. & S." account, presents features of vital interest, since it usually constitutes one of the principal charges entering into the cost of production. Consequently too much care cannot be exercised in purchasing, storing and issuing the material required by the operations. The foregoing statements, always true, have not always been practiced; consequently many otherwise capable officials have been discredited and their companies have lost much in the way of invested capital, as well as efficiency, as the direct result of carelessness or ignorance in the handling of supplies.



Extravagance is to be deplored at any time, but at present it is a crime hard to condone, since in the final analysis it means the deprivation of the necessities of life or even life itself to someone, somewhere.



President Wilson has said that if this war will teach the American people economy that the result will justify all the cost in material things. However, from our standards these will constitute but a fraction of the cost.

The project on hand is the greatest that ever con-

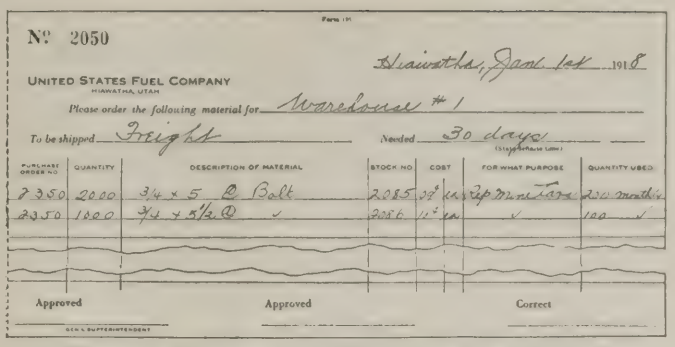
FIGS. 1 AND DETAILS OF A CENTRALIZED MATERIAL STORAGE WAREHOUSE AND BIN SECTIONS

fronted us or any other people, and it is just as essential for those who stay at home to keep the wheels of industry moving smoothly and surely as it is for the men in the trenches to do that which we know they will do. Without our aid the others will make a useless sacrifice.

The wheels must not only run smoothly, but efficiently and economically; this latter term is used in its broader sense and is not meant to signify niggardliness. Wage increases have been necessary in practically all branches of industry, consequently the cost of production has risen in all lines, in many cases 100 per cent. or more, giving, if any specific excuse were necessary, an added argument in favor of economy.

Wages being fixed at coal mines, the only methods of reducing operating costs are by increasing the efficiency of the man-power employed and by the economical handling of supplies. It not being the purpose of this article to discuss the first of these methods, it may be passed over without further comment.

Many companies are deprived of the benefit of the latter method, due to false ideas of economy which prevent the erection of suitable storehouses; others with adequate housing facilities are handicapped by faulty interior arrangements; and still others fail through incomplete or careless accounting; and some through a combination of all three of these causes.



Few of the older generation of coal-mine superintendents had more than a perfunctory knowledge of accounting, consequently many of them looked with suspicion upon anything but the simplest forms and statements. This attitude was expressed succinctly by an oldtimer some years ago as follows: "They say figgers don't lie, but the bloody clark does." It is needless to say that the operations under this man's charge reflected his mental attitude.

At most small mines, and many of the larger ones, a few years ago, any abandoned shack, regardless of location or design, was considered as a satisfactory depository for whatever material absolutely had to be under cover. Consequently much time and no little material was lost, not to mention delays to the plant, through inability to locate repair parts that some one had mislaid.

The difficulties attending the maintenance of an adequate stock of supplies under conditions as they exist today are familiar to all. It is safe to say that most companies are carrying 100 per cent. more stock than they were two or three years ago, and it is also safe to say that unless warehouse facilities and accounting methods have kept pace with the increased stock much valuable time and material will be ultimately wasted through duplication of orders and failure to find material as and when it is needed.

The methods used by the United States Fuel Co. at its central warehouse at Hiawatha, Utah, while admittedly not perfect, are believed to embody features which may be of interest to many who are desirous of systematizing the handling of material.

The present warehouse building replaced several smaller structures, and when stock was finally got under one roof and an accurate inventory taken it was found that there was an overrun of something like $10,000, most of which was accounted for by the fact that previously no one had known just where to look for the stuff that was needed.

full of insulators. Upon being asked as to how they came there, the mechanic in charge stated that he did not need them so had dumped them behind the partition to get them out of the way. Investigation disclosed the fact that the company was purchasing the same class of material right along, but no one in authority had known of this cache.

At another place several hundred twist drills were discovered which someone had ordered as a result of inexperience and which were found to be unsuited to the drill arbors in use. Consequently they were stored away for years, although they represented a total cost of several hundred dollars, and new arbors to fit the drill shanks could have been made or purchased for a few dollars apiece.

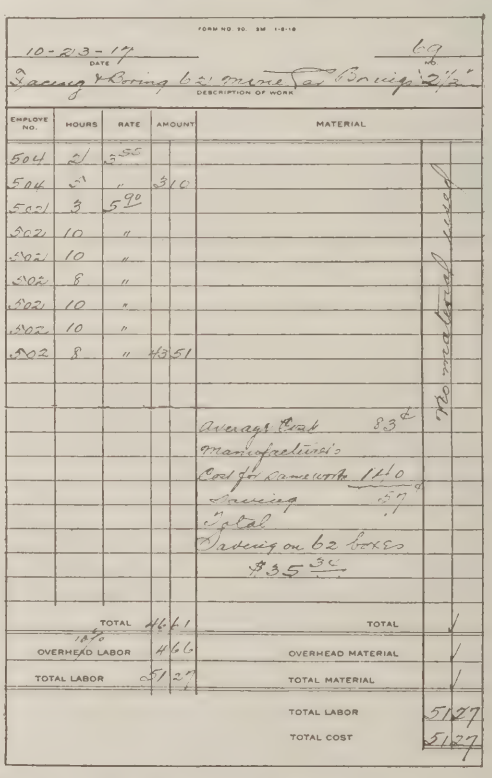
Examples similar to these could be cited indefinitely, and no doubt many of the readers of *Coal Age* have had personal experiences along the same lines.

The warehouse is built close to a spur railroad track, so that material can be handled from cars to platform without difficulty. The basement extends under the full length of the building, the doors being so arranged that incoming and outgoing material is handled with a minimum of effort.

Figs. 1 and 2 show the detailed arrangement of the main floor, which gives a maximum of storage room with a minimum floor space. The basement is used almost entirely for the storage of heavy articles, such as bare and insulated copper wire and cable, wire rope, nails, spikes, heavy fittings, spare machinery parts, etc. Iron and mild steel for use at the shops are stored in a rack between the material house and central shop. Pipe is also stored in a special rack outside of the building.

All tool steel and small tools carried in stock are kept in the warehouse. However, the tools are stored in a toolroom under separate lock from the main storeroom.

Lumber, ties and rails are stored in the yard surrounding the shop and material house. Hay and grain, of course, are stored at the various mine barns, a report covering quantities used being rendered by the barn boss at the end of each month. An approximate inventory of barn supplies is taken every three months by a man from the material house as a check against the barn boss' report, and an actual inventory is taken at the regular inventory period.



Separate buildings are maintained for storage of cement, lime, sand, oil, etc. Little oil is used as compared with former times, because all power is purchased, power plants having been dismantled and sold, thus eliminating the use of cylinder oil almost entirely. A hard grease is used for lubricating mine cars and consequently the demand for black oil is practically *nil.* What little oil is used is stored in iron barrels to prevent waste, but were the consumption of oil greater storage tanks would be essential.

A small warehouse, 20 x 40 ft., was moved to the material yard where it is utilized to store second-hand stuff which is of too great value to be scrapped. This building is equipped with bins similar to those in use in the larger warehouse, and material is sorted and stored until it is required.

The central warehouse carries the surplus stock for all mines and also takes the place of an individual warehouse for the Black Hawk mine. A limited stock of necessary repair parts and supplies is carried at the other mines in buildings arranged similarly to the larger establishment.

It was found, however, that by concentrating the bulk of the stock in one place it could be reduced from 30 to 40 per cent., for where from $80,000 to $90,000 was carried at one time, stock was reduced to between $50,000 and $60,000 without in any way interfering with the operations.

At the present time, owing to war conditions, stock has been increased until it has reached a total of over $100,000. The increase has been due, not only to the necessity of purchasing in larger quantities as a pre-

cautionary measure against delays of various kinds, but to the higher price of all classes of material, in many cases the increase being 100 per cent. or more.

Many companies having ample storage room fail to reap full benefit therefrom because of lax methods of storing and issuing the supplies as required. In cases

of this kind the approach of the inventory period is fraught with anxiety for the mine superintendent and the material clerk, and it is a safe guess that their fears are well founded.

The system adopted by the United States Fuel Co. probably does not embody any new features, and it undoubtedly is susceptible to improvement, but since it has been in vogue it has worked out satisfactorily from every standpoint. There has been no shortage at any inventory period, and the little extra labor involved in handling the stock properly and in making up the various reports is counterbalanced many times by the economies effected.

Form No. 195, Fig. 3, shows a requisition for material not in stock, or for addition to stock. This is to be made out as required by mine superintendents, or heads of departments, giving quantity, description and for what purpose used. The columns, purchase order number, stock number, cost and quantity used are filled in by the purchasing department as part of its record. The requisition is then submitted to the general superintendent for approval, and if it runs the gantlet successfully, an order is made out on form No. 213 (Fig. 4). The duplicate is stamped and filed to be used as a check when goods are received. All incoming goods are checked against invoice and order.

Comprehensive Stock Card Is Used

After goods have been checked and stored, information from invoice is entered on form No. 92 (Fig. 5), which shows commodity or name, description, size, etc., maximum and minimum number it is desired to carry in stock at one time, stock number, section number or letter and bin number, date ordered, order number, quantity ordered, date received, from whom received, invoice number, cost, quantity invoiced, date issued, cost sheet account number to which chargeable, quantity issued and balance on hand. It will be noted that no valuation is shown on card covering material issued, this information being shown on the daily report of material issued.

Bin sections, as shown in Fig. 2, are 3 x 12 x 6 ft., subdivided longitudinally in the center. The transverse subdivisions are movable, so that storage space can be adapted to different articles. Several sections are equipped with drawers which are subdivided for storage of small bolts, screws, and other repair parts for mining machines, motors, pumps, etc. One section had longitudinal subdivision and shelving left out entirely, substantial hooks being fastened to the transverse subdivision to be used for storing harness. Thus storage, equal to 36 lin.ft. of wall space, was secured at the expense of 36 sq.ft. of floor space.

Bin sections are alphabetically arranged, and each individual compartment is numbered. Thus the first section to the left opposite the stairway is A, the left-hand side being A-1 and the right A-2, The compartments on each side are numbered consecutively, and are denoted on cards as A-1-1, A-1-2, A-2-1, A-2-2, etc. Each subdivision is equipped with a brass card holder and small card, on which is typewritten the name and dimension of the article, if this is essential, and the stock number corresponding to the number carried on form No. 92 for that particular article.

When material is wanted from the warehouse, requisition for it is made out on form No. 110 (Fig. 7). This is signed by someone duly authorized, quantity and description of article only being given. This form is filled in in triplicate, the original being presented at the warehouse, duplicate sent to the mine superintendent's office and the triplicate kept for reference. Columns giving price, amount, stock number, etc., are for

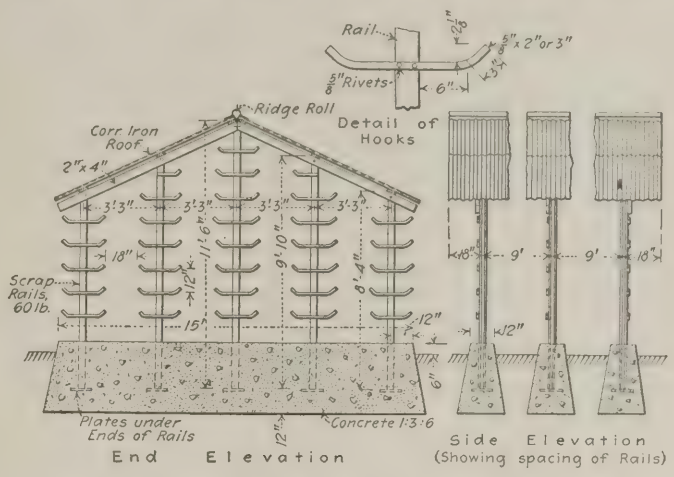

FIG. 10. STOCK RACK FOR BAR IRON AND PIPE

the convenience of the warehouse force. The requisition is presented at the warehouse, where the clerk refers to a card index, locates material by section letter and bin number, and issues the desired article with no loss of time or energy.

After issuing the requisitioned material the stock clerk enters the price and amount on the requisition, and at the end of each day all requisitions are tabulated on form No. 148 (Fig. 6), a report being made for each mine. This report is made out in triplicate, one copy for the mine superintendent, one for the auditor, and one for filing at the material house. The superintendent can see at the end of each day just what has been charged to his operations, and is thus in a position to govern his cost with no fear of a big charge coming in at the end of the month to upset his calculations.

The copy going to the auditor is checked as to calculations and total amount, and at the end of each month the total charge for each mine is computed, which figure must agree with those submitted by the supply department on a form, which is compiled from the daily reports and shows the total material charge for the month, subdivided according to cost sheet account numbers.

Account number 4 on the cost sheet is devoted to hauling, and has 19 sub-accounts. Consequently in charging the Beagle mine harness, shown on form No. 92, the clerk refers to cards, where he finds that this is chargeable to account 4, sub-account 1, or account hauling, sub-account harness and shoeing.

Forms 145-A and 145-B (not reproduced here) are the cost sheets used by the United States Fuel Co. Labor is charged direct from the payroll distribution sheet, which is somewhat similar to the form which is compiled from the daily reports. The voucher column is used to take care of indirect charges from the auditor's office, such as depreciation, power expense, etc.

Form No. 192 (Fig. 8) is used in transmitting invoices to the auditor, and shows the number of invoice,

number of order, to whom invoice is in favor, the amount of invoice, amount of freight charges, whether amount was charged to material purchased or to some construction or other account direct.

The foregoing constitute all the reports or forms used in connection with the storehouse, with the exception of the monthly trial balance rendered to the auditor's office, which must agree with figures on general books and job order cards, Fig. 20, used in connection with the central machine shop. The machine shop is engaged extensively in manufacturing frogs, switch points, etc., for the several mines, also in finishing various castings and other materials purchased in the rough. These items are all carried in material stock until released by proper requisition, hence it is necessary to have exact cost of machine work in order to keep records clear.

The job order card shown herewith was copied from one turned in upon the completion of 62 mine-car boxings, which were bored and faced. The saving shown is well worth while, and is only one of the many items proving the economic value of a well-equipped shop and material house.

Fatality Rates in Pennsylvania Mines

The accompanying tables compiled by Dr. Downey, special deputy of the Department of Insurance of Pennsylvania, cover fifteen years of experience in the anthracite and bituminous mines of the state. It is gratifying to note that whereas in the first five-year period 131,000 tons of coal were produced in anthracite mines for an ordinary fatal accident, in the last five years the production per ordinary fatal accident has increased to 157,000 tons. The bituminous mines have shown an even greater increase in safety from ordinary, as opposed to catastrophic, accidents. Whereas 276,000 tons was formerly mined for one ordinary accident, now

1903	103,713,982	402	17	385	269

in the last five-year period there is an ordinary accident to every 370,000 tons of production. Thus the anthracite region has improved its record 20 per cent. and the bituminous region 34½ per cent.

While the catastrophic hazards in anthracite mines seem but little changed in the fifteen year period, the bituminous mines have clearly made progress. There were 516 catastrophic accidents in 1903-1907, whereas despite the large increase in production there were only 183 in 1913-1917. However, the general turn for the worse in the last year in all except the catastrophic bituminous figures is a real occasion for shame and regret after a season of such satisfactory progress. The chart is furnished as by Rush N. Hosler, supervisor of coal mine schedule rating at Harrisburg.

A FATALITY CHART IN WHICH CATASTROPHIC ACCIDENTS DO NOT ENTER

In general, it may be said that the more complex a molecule of combustible is, the slower is its combustion in any given concentration of oxygen.—*Bureau of Mines Bulletin No. 135.*

The Value of an Engineer to the Operator

Instead of Being Regarded as an Added Burden or a Necessary Evil, the Mine Engineer Should Be Considered One of the Valuable Assets of the Company

By "INSPECTOR"
Windber, Penn.

IT IS frequently difficult to convince the operator of a small mine or mines, and sometimes of a larger mine, of the importance of regular and accurate surveys of the mine workings. He usually considers the engineering only a bill of expense with no returns whatever. In other words, the cost of mining, haulage, power and other items is necessary to secure an income, but the engineer collects the money (usually about the time a new survey is required) and the operator receives nothing in return except a map which has no market value.

Article 2 of the bituminous mine law, approved June 11, 1911, requires that the operator or superintendent of any bituminous coal mine shall make or cause to be made by a competent mine engineer or surveyor an accurate map of the mine, on a scale of not less than 200 ft. to the inch, which map shall give the following information:

First, all the openings, excavations, shafts, slopes, drifts, tunnels, planes, main entries, cross-entries, rooms and the name and number of each.

Second, an accurate delineation of the boundary lines between the mine and adjoining mines or coal lands; the relation and proximity of the workings of the mine to all adjoining mines or coal lands; and also the direction of the air currents when requested by the mine inspector.

Third, the elevation above or below mean tide at Sandy Hook of the top and bottom of each shaft and slope, of all drifts, tunnels, planes, and of the face of entries, as found at each semi-annual survey, and in rooms and entries adjacent to boundary lines between such mine and any adjoining mine or mines at points not more than 300 ft. apart; also the number of last survey station and the date of such survey on the entry; the location of streams, rivers, lakes, dams or any other bodies of water on the surface, with their elevations plainly and accurately marked; the location and elevation of any body of water dammed or held back in any portion of the mine, giving the true area of said body of water, unless inaccessible before the passage of this act; the location of all boreholes penetrating the coal strata, and the location of all oil and gas wells, and all oil and gas pipe lines.

The map shall show such portions of any adjoining mine or mines which may be within 300 ft. of the boundary lines between the two properties. This map shall be brought up to date at least once every six months.

A plan shall be kept at the mine showing all stationary electrical apparatus in connection with the mine electrical system, including permanent cables, conductors, lights, switches and trolley lines. The scale of this plan shall not be less than 200 ft. per inch; shall state thereon the capacity in horsepower of each motor, in kilowatts of each generator or transformer, and the nature of its duty. This plan shall be corrected as often as necessary to keep it up to date, at intervals not exceeding six months.

In addition to these requirements a mine map should show all rock faults, clay veins, areas of bad roof, measurements of the coal seam at various points and projections of future development; all worked out and abandoned areas; all buildings, public roads, railroads, sidings, tipple and mine buildings, and the outcrop of the coal seam where known; preferably on a scale of 100 ft. per inch as this is the scale preferred by most mine foremen, owing to the ease with which it can be read and full data shown on it. A map drawn to a smaller scale is both harder to make and read. Many companies also have a map drawn to the scale of 400 ft. to the inch, showing all property lines, mine workings, contours and any other available information.

Comprehensive Mine Map Great Aid

If a mine foreman is furnished with maps showing the foregoing data, he is able to lay out his work systematically, keep informed as to the proximity of the mine workings to boundary lines and adjoining mine workings which may contain dangerous accumulations of water and gas, prevent any encroachment on other properties which may result in expensive litigation and settlements of damage claims, avoid the loss of coal caused by not driving the entire distance to the boundary lines, and avoid the loss of coal due to squeezes and creeps caused by cutting into other places not shown or not accurately shown on the mine map.

Some of the smaller companies, which cannot afford to employ an efficient engineer regularly, have their mines surveyed semi-annually merely to comply with the mining law, not taking into consideration the advantages and benefits to themselves both in increased and economical production and percentage of coal recovered either of which may be credited directly or indirectly to having proper surveys made. There are few mines so situated that they cannot arrange to secure the services of an independent or contracting engineer, as often as necessary to have their mine maps kept up to date. The interval between surveys should be governed by the size of the mine and property, number of men employed and amount of development being done, few mine maps being kept up to date properly with surveys over four months apart. At most mines where the surveys are made semi-annually, numerous rooms are driven to their destination and the work of drawing pillars started; or places not driven to their destination are abandoned for

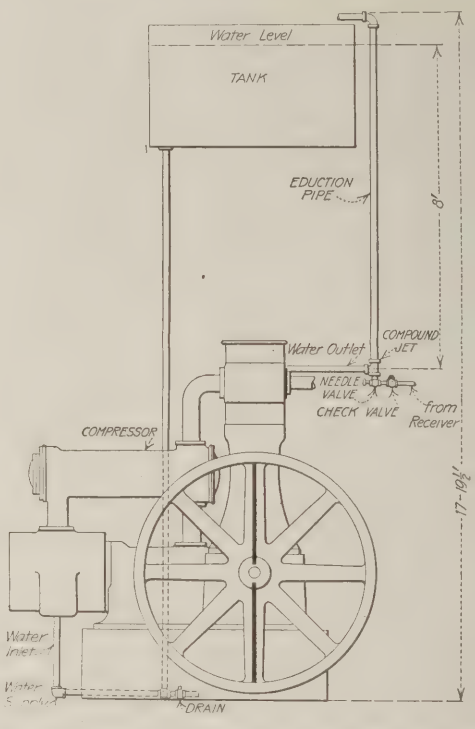
different reasons and sometimes cave between the visits of the engineer. In the meantime probably some advance work has been held up because sights were not set.

When the engineer visits the mine after an absence of six months he must depend on the mine foreman for considerable information as to the pillars extracted since the last survey, distances of the unfinished and fallen places, etc. As he is not always correctly informed, on account of a change in mine foremen or the desire of the mine foreman to cover up negligent work, the map sometimes shows an area worked out when it may have been lost on account of a squeeze or creep or bad roof. In this case the mine map does not furnish a means of checking the efficiency of the mine management and no correct calculation of the percentage of the seam recovered can be determined.

The engineer, realizing the feelings of the operator in this matter, frequently does not spend enough time to get certain important data, not wishing to increase the expense of the survey any more than absolutely necessary. At the same time the survey is rushed through in the shortest time possible; and often an error is discovered after reaching the engineering office, which may be located some distance from the mine.

Surveys Should Be Made Each Year

A better plan is to arrange with a contracting engineer to make a certain number of surveys per year and depend on him to furnish a map to comply with the mine law in every respect. An additional day or so will be spent on the surveys when necessary. When new work of any kind is contemplated, arrangements can be made to have the regular engineer do the work or employ one making a specialty of the particular kind of work.



There are still operators who depend on the mine foreman to do their engineering. It is a great advantage to the mine foreman to have some knowledge of surveying; at least enough to enable him to read a map intelligently, use a scale and protractor, and calculate distances, elevations and grades.

When the mine foreman is required to set sights for entries and rooms he must neglect his regular duties to do so. This work is usually done with a compass and a loss of coal generally follows, owing to the inaccuracy of the work. On the other hand, a competent engineer, in addition to making the mine surveys correctly can frequently see ways to shorten the haulage; improve the ventilation; secure more effective drainage; increase the efficiency of the power and machinery and decrease the percentage of accidents, all of which leads to a lower cost of production. He also assures accuracy in installing new machinery, building miners' houses and other mine buildings, tipples and sidings.

If all of the coal companies had correct surveys made, it would undoubtedly reduce the amount of coal lost in mining, which at this time is the subject of much discussion. At the same time it would tend to reduce the cost of production in several ways; more coal would be recovered with the same yardage cost and new work started right would save the usual expense of groping in the dark. In short, proper surveys would cause: Greater efficiency in mine officials, less waste of coal in mining, less encroachments and fewer bad friends.

Circulating Jacket Water by Air Lift

The accompanying illustration shows how the air lift system of pumping can be utilized to form a simple and effective method of supplying cooling water to air compressor cylinder jackets. A small tank is placed about 8 ft. above the compressor, which gives sufficient height to permit the water to flow by gravity through the jackets. Instead of using a pump to elevate the water to the gravity tank again, a needle valve, or, still

CONNECTIONS FOR CIRCULATING WATER BY AIR LIFT

better, an air-lift mixing tube controlled by means of a pin valve, is placed at the base of the riser, just outside of the water jacket discharge. This valve is connected by a small pipe with the air receiver and a small amount of air is thus forced into the riser pipe, acting to carry the water from the cylinder jacket back to the elevated tank.

The amount of water required depends, of course, on the size of the compressor. Excellent results are secured and the heat in the water is reduced to a considerable extent by the expansion of air in the riser or eduction pipe.

The illustration shows the system as installed for a two-stage angle compound compressor. It is of course even simpler with a single-stage machine. In the installations thus far made no trouble whatever has arisen, and the system has kept the compressors properly cooled.—*Mine and Quarry.*

Nova Scotia's Strong Position

Coal fields are quite usually found inland. Those of the United States on the eastern coast are all a long way from the ocean. On the other hand the Nova Scotia coal is not only near the ocean, but under it, and it forms, as F. W. Gray remarks, the only deposit which may be correctly defined as being on the Atlantic Seaboard.

Byproduct Coke and Coking Operations*

BY
C. J. RAMSBURG †
AND
F. W. SPERR, Jr. ‡

Second Installment

COMING now to an examination of the natural surfaces of the blocks, we may, in the first place, disregard the color as being relatively unimportant. It depends largely upon the method of quenching, and, to some extent, on the quantity of the water used; the use of large amounts of water causing a dark color, while with the careful use of a minimum quantity of water a light gray color can always be preserved. The majority of cokes produced from the standard coking coals rich in hydrocarbon production and low in oxygen have close-textured, even surfaces, with possibly a few narrow, transverse zones of slightly larger cell openings interspersed between the two extremities. Many cokes from coals of the Connellsville (Penn.) type show the same silvery, glossy skin that used to be so much prized in beehive coke. This is probably indicative of a very heavy deposit of carbon, especially favored by slow and uniform evolution of a very rich gas.

Other cokes, fully equal in value to those just mentioned, are characterized by a peculiar shaggy appearance, as if they were covered with blotches of dark moss. This appearance is usually found in cokes produced from mixtures of eastern coking coals with the somewhat more highly oxygenated coals of the central field. Oddly enough, both types of coal usually make smooth coke if carbonized separately.

Certain cokes present transverse pebbly seams—usually not more than two or three. These seams are narrow and quite coherent, and may be shown to be composed of small globules of quite pure carbon, with no apparent cellular structure. This phenomenon again appears to be characteristic of the more highly oxygenated coals.

The surfaces always show more or less transverse and longitudinal cracks, significantly at right angles—either parallel or perpendicular to the wall of the oven. Naturally these are an element of weakness, and their presence to an excessive degree is one of the surest "first-hand" indications of an inferior grade of coke that we have. The amount of fracturing can be controlled to a surprising extent by proper method of heat treatment.

By breaking a piece of coke and examining the fresh surfaces we find revealed the cellular structure that is characteristic of all cokes and which cannot be seen in its true development simply by inspecting the dense natural surfaces. No definition of coke is complete that does not take this cellular structure into account.

The usual way—and the easiest—to examine the cell

FIG. 9. NO. 4 STRUCTURE COKE

*Presented by Mr. Ramsburg at a joint meeting of the Mechanical and Engineering Section and the American Society of Mechanical Engineers.

†Second vice president, the H. Koppers Co., Pittsburgh, Penn.

‡Chief chemist, the H. Koppers Co., Pittsburgh, Penn.

structure is to break a piece of coke crosswise and note the appearance of the fresh surfaces. Great care must, however, be taken, in comparing one coke with another by this method, to break the pieces at approximately the same distance from the wall end, since the size of the cells is apt to increase considerably from the wall to the center. Oddly enough, in many cokes there is a characteristic difference in the two surfaces of a break. No matter where the piece is fractured, the surface on the wall side has almost a granular appearance, with a steel-gray luster and well-defined cell openings. The opposite surface (that is, looking toward the center of the oven) has a characteristic graphitic luster, with the cell openings flatter and possibly not so sharply defined.

For any accurate comparison of the cell structure of different cokes we prefer to make longitudinal sections with a thin emery wheel—such sections as are shown in this article. If this is done, the danger of confusing

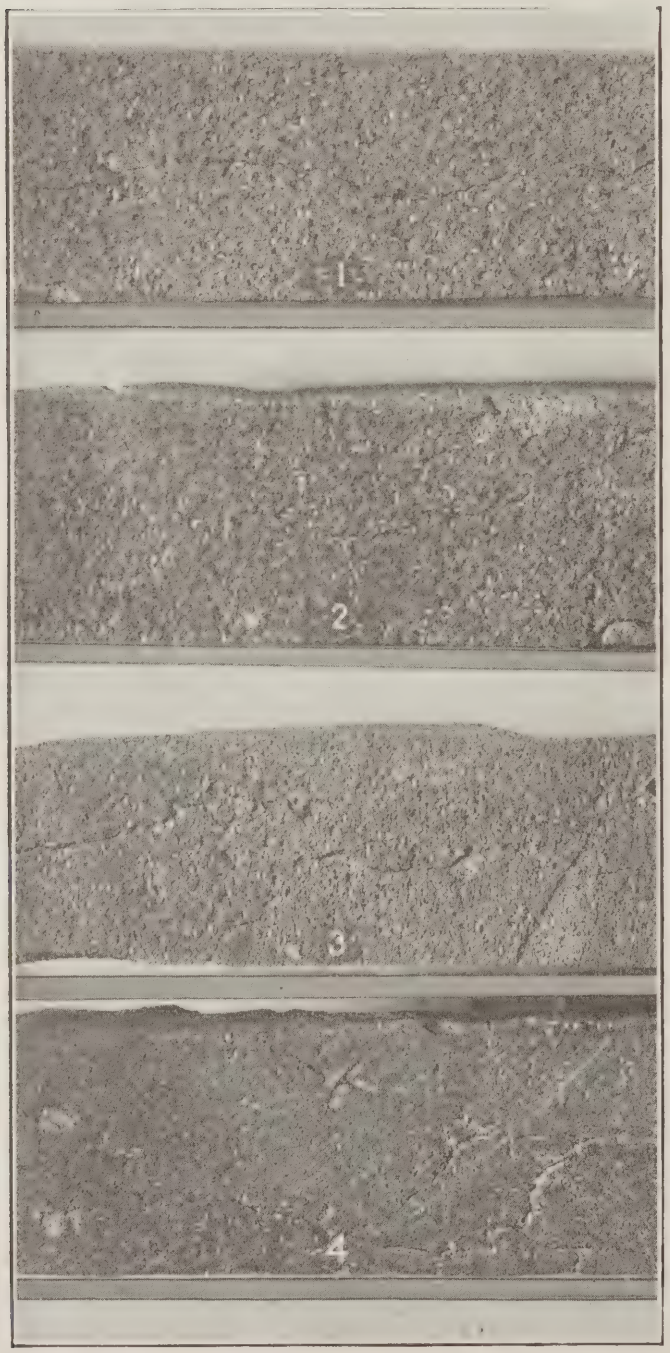


FIG. 10. STANDARDS FOR GAGING CELL STRUCTURE

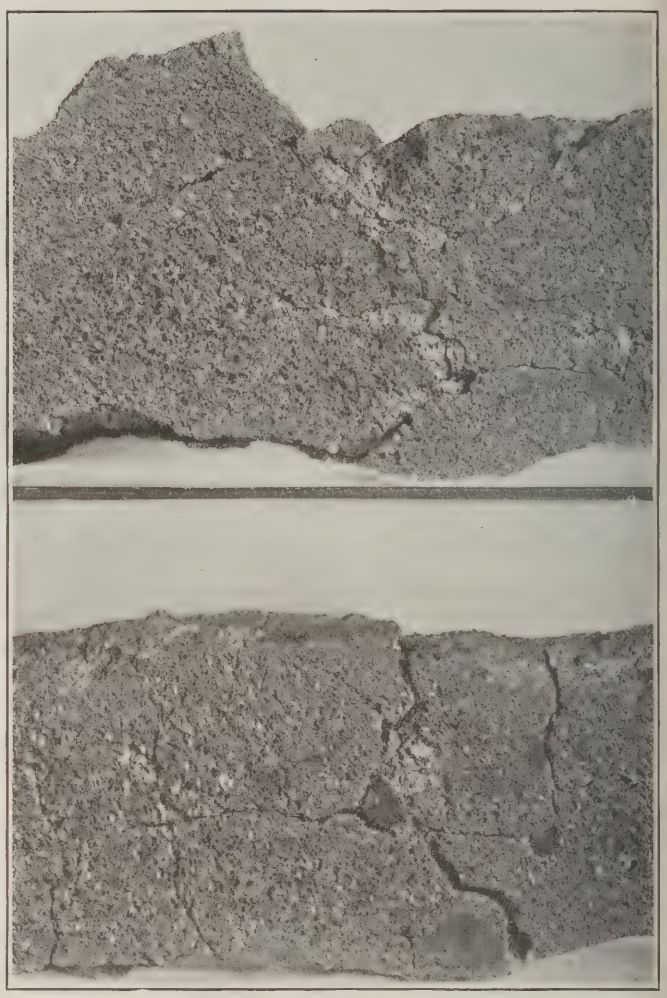

FIG. 11. NO. 1 STRUCTURE COKE

sections made at different distances from the wall will be largely eliminated. It must be mentioned that breaking a piece of coke longitudinally so as to reveal the real cell structure is a decidedly difficult matter. Almost always the break will be found to be made along the plane of a natural longitudinal fracture, and the exposed surfaces will be found to be covered with deposited carbon.

Great importance has been attributed to the cell structure of coke by all authorities on the subject, and especially by blast-furnace operators, and yet the subject is very poorly defined and no standards of comparison have been established. We have recently begun the use of a simple system, analogous to the scale of hardness used in the study of minerals, which we hope may come into general favor. At present we employ a set of our standards, shown in Fig. 10. These are all longitudinal sections, cut from blocks of typically different coke. The sections are the same length, and each is cut beginning 1½ in. from the wall end. The sections are numbered 1 to 4 in order of decreasing cell size. With such a set of standards it is easy to grade any coke according to its cell structure, and the grading will convey a much more definite idea than the loose terms of "dense," "close," "rather close," "fairly open," "medium," etc., that have hitherto been used. No term in our usual technical vocabularies has been so overworked as the word "medium," as applied to the cell structure of coke.

In addition to grading cokes according to the size of

the cells, we may also classify them as regular or irregular in cell structure. The standards would all be considered as regular in structure. This does not mean at all that the cells are of the same size, but their general arrangement gives an easily perceived impression of regularity. What we mean by irregular structure is well illustrated by the section shown in Fig. 9. This sort of coke has alternate patches of close and open texture, and is frequently produced by the more highly oxygenated class of coking coals, as well as by mixtures of coals having different characteristics.

It might possibly be thought now that an interesting table could be prepared grading the cell structure of cokes produced from various typical coals. Such a table would be well-nigh valueless, unless the data were carefully qualified by details regarding preliminary treatment of each coal, dimensions of ovens, temperatures, coking time, and several other factors, each of which plays a part in the development of cell structure. It may be more profitable to show a few sections of different cokes that have given successful results in blast-furnace and foundry practice in various parts of the country. Figs. 9, 11, 12 and 13 illustrate some specimens that have been carefully selected to be as representative as possible.

Sometimes too much reliance is placed in the determination of the specific gravity and porosity of coke. Figures as to porosity or the percentage of cell space in the total volume of coke are almost valueless, unless supplemented by an examination of the actual size of cells

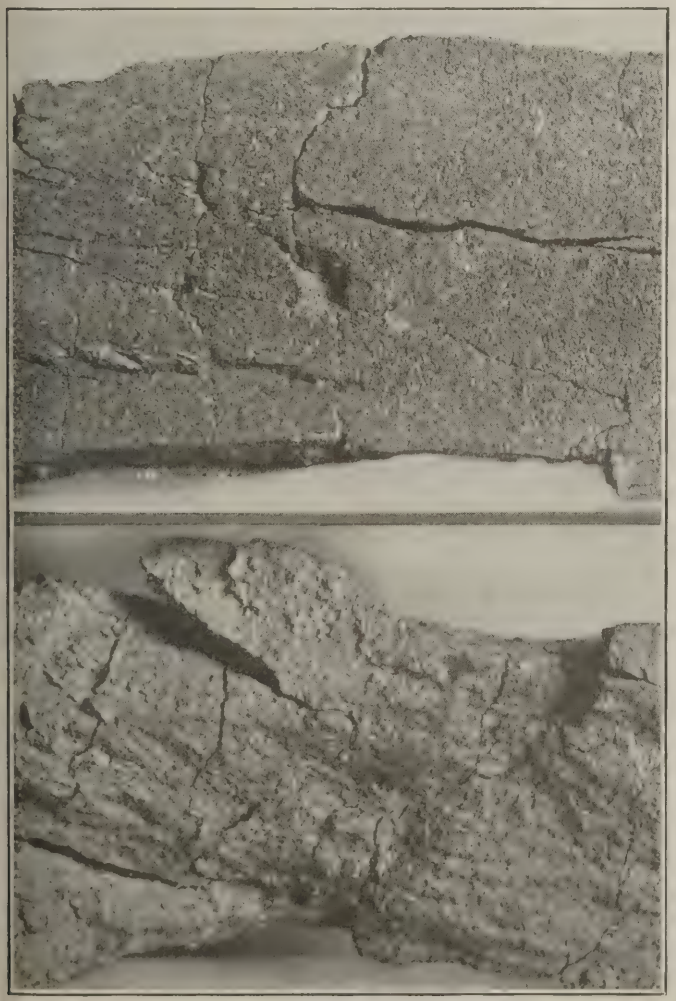

FIG. 12. NO. 3 STRUCTURE COKE

FIG. 13. NO. 2 STRUCTURE COKE

and thickness of cell walls. A coke of close texture and thin walls may have the same percentage of cell space as one having large cells and relatively thick walls. As John Fulton[1] the pioneer investigator of coke, said, 34 years ago: "Mere cellular space . . . cannot be used as an element in the practical determination of the value of cokes for blast-furnace use. Furnace gases cannot act on cell spaces; they can only act on exposed surfaces." It is the cell walls and surfaces that are the most important. Cell space and porosity, which is the measure of it, are merely incidental.

The following table of specific gravities and porosities of the coke specimens, some of which are illustrated in this paper, will show that there is really no relation between cell structure and porosity:

TABLE III. SPECIFIC GRAVITIES AND POROSITIES OF COKE SPECIMENS

Cell Grading	Figure	Apparent Specific Gravity	True Specific Gravity	Porosity
4 (Standard)	10	1.097	1.917	42.8
4	9	0.924	2.006	53.7
3 (Standard)	10	1.007	2.028	50.4
3	12	1.138	1.948	41.6
2 (Standard)	10	1.071	1.831	41.6
2	13	1.053	1.917	45.1
1 (Standard)	10	0.943	1.988	52.6
1	11	0.917	1.921	52.3

In passing from this subject of the examination of coke sections we should take occasion to point out the interesting field that is here open for the application of petrographic methods to an exhaustive investigation of the material. The actual chemical and physical state

[1]Trans. "Am. Inst. Min. Eng.," October, 1883.

of the carbon produced from various coals under various conditions is an important matter from a practical standpoint. Differences in the true specific gravity of coke are frequently found that cannot be explained by variation in the content of inorganic matter. The actual condition of this inorganic matter after carbonization, the amount of reduction of the various oxides, the possible effect of the finely disseminated mineral matter in strengthening or weakening the cell walls are all very important. Inorganic matter does not necessarily constitute an element of weakness. Large particles, especially if segregated, are injurious, but finely divided mineral matter may actually strengthen the cell walls. High-ash cokes are frequently stronger than low-ash cokes from the same kind of coal. Some experiments in washing and coking coals of moderate ash content have shown that where the original coal gave a strong coke, the washed coal gave a weaker coke, the difference being undoubtedly due, to some extent, to the removal of some of the mineral matter, although the high moisture content of the washed coal might have had some effect. Simmersbach gives some evidence to show that iron present in combination with carbon and silicon, and silicon present as a silicon carbide, may be the cause of the remarkable hardness of some coke.

(To be concluded)

Convention of the International Railway Fuel Association

The International Railway Fuel Association, an organization composed of the officers of American and Canadian railway fuel departments and coal operators, recently tendered its services to the Government to aid in the effort to stimulate coal production and to enhance economy in its use. This offer has been accepted by the United States Fuel Administration and by the United States Railroad Administration, and these two Government departments, in coöperation with the officers of the Fuel Association, have arranged for a convention to be held in Chicago on May 23 and 24, 1918. The tentative program for this convention is as follows:

1. Introductory Address—E. W. Pratt, President International Railway Fuel Association
2. The Fuel Problem in the War—H. A. Garfield, United States Fuel Administrator
3. The Railroads and Their Relation to the Fuel Problem—C. R. Gray, Director Division of Transportation, United States Railroad Administration
4. What Can Be Done for Our Northern Ally—Sir George Bury, Chairman Canadian Railways War Board
5. The Need for Fuel Conservation—P. B. Noyes, Director Conservation Division, United States Fuel Administration
6. The Coal Operator and His Responsibilities in the Fuel Situation—Edwin Ludlow, Vice-President Lehigh Coal and Navigation Co., Lansford, Penn.
7. What the Men on the Locomotives Can Do—W. S. Stone, Grand Chief, Brotherhood of Locomotive Engineers
8. What the Coal Miner Can Do to Help the Government, the Railroads, and the Men at the Front—John P. White, Labor Advisor, United States Fuel Administration
9. The Motive Power Department and Fuel Economy—R. Quayle, General Superintendent Motive Power and Car Department, Chicago & North Western Railway
10. What the Coal Operator Can Do to Help Win the War—H. N. Taylor, Vice-President Central Coal and Coke Co., Kansas City
11. The Railroad Industrial Army—A Component Part of the American Expeditionary Force and the Allied Armies—W. S. Carter, Director, Division of Labor, United States Railroad Administration
12. The Supply and Distribution of Fuel—J. D. A. Morrow, Director, Distribution Division, United States Fuel Administration
13. Relation of Locomotive Maintenance to Fuel Economy—Frank McManamy, Director, Division Locomotive Maintenance, United States Railroad Administration
14. The Transportation Department and Fuel Economy—E. H. De Groot, Jr., Assistant Manager, Car Service Section, Division of Transportation, United States Railroad Administration
15. More and Better Coal—Eugene McAuliffe, President Union Colliery Company, St. Louis

The two Government administrations and the officers of the Fuel Administration believe that this convention will provide an opportunity to arouse renewed interest in the fuel problem and to stimulate greater effort on the part of all concerned in the production and use of fuel; and they hope to attain these ends through a series of inspiring addresses by representatives of the various interests involved, which, by appeals to patriotism, shall seek to stimulate enthusiasm and to enlist coöperation. The speakers on this occasion are all men of national prominence, whose previous experience or present contact with the fuel situation will enable them to speak with authority to mine operators, mine workers, railway officers and railway employees. Through the coöperation of the two Government bureaus there is certain to be in attendance at this convention a large audience composed of men, who, in their daily work, can directly affect the production of coal, both as regards quality and amount and its economical use on the railways of the United States and Canada. The fact that the railways use nearly one-third of all the coal produced is, in itself, an earnest of the importance which the Government attaches to its conservation and to this convention.

The general arrangements for the convention are going forward under the direction of C. R. Gray, Director of the Division of Transportation, United States Railroad Administration, and P. B. Noyes, Director of Conservation Division, United States Fuel Administration. The details of the program are being arranged by a committee consisting of E. W. Pratt, President, International Railway Fuel Association; J. G. Crawford, Secretary of this Association; Eugene McAuliffe, President, Union Colliery Company, of St. Louis, Mo., representing the United States Railroad Administration; Major Edward C. Schmidt, representing the United States Fuel Administration, and Morgan K. Barnum, Assistant to the Vice President, Baltimore & Ohio Railroad.

To Test Explosibility of Coal Dust of Illinois Mines

The Government intends to conduct a demonstration of the explosibility of the coal dust of Franklin County, Illinois, on May 6 and 7, at the Government Experimental Mine, at Bruceton, Pennsylvania. The tests will be made under the direction of the Bureau of Mines.

Coal Industry of Vancouver Island

By ROBERT DUNN
Victoria, B. C.

THE coal industry of Vancouver Island, British Columbia, was never in a more flourishing condition than at the present time. From east to the west of Canada has gone forth the order "more and yet more coal," and the companies of this section are speeding up to an extent only limited by their ability to obtain equipment and men. The Canadian government has intimated that the western Provinces this year would be expected to produce two and one-half million tons more coal than in 1917, the object being to meet the local demands for fuel for industrial and domestic purposes as far as possible, if not entirely, from local supplies. Thus, it is hoped, Canada's present dependence on the United States, a condition which was very apparent last year at a time when the United States could least spare the coal, will be to some extent relieved.

With the situation as thus sketched before them the coal-mine operators of Vancouver Island, no doubt in common with those of all the western section of the Dominion, look upon themselves as in duty bound, from the viewpoint of the best interests of the British Empire and her Allies, apart from the question of whether it is or is not good business, to do their utmost to swell the monthly output. Last year there was an exceptional demand, and the Island collieries, rising to the occasion, marketed 1,698,235 tons in comparison with a total for 1916 of 1,492,761. But then there was not the special application of the spur that recently has been brought to bear upon them, with the result that the first three months of 1918 find practically every mine with returns considerably in excess of the corresponding periods of the previous year. And it may be said now with assurance that, at the pace set, 1918 will find the Vancouver Island output of coal much ahead of the past twelvemonth, while the same may be said with confidence, although the writer has not the figures before him to substantiate it, with regard to the combined totals of the collieries of the Province of British Columbia.

Record Made By Western Fuel Co.

The Western Fuel Co., one of the largest producing companies of the Island, established a record for the month of March of 70,000 tons, which is larger than that of any previous month in its fifty-year history of operation. One of its recent enterprises was the reopening of an abandoned mine known as the Harewood. It had been standing for several years, a former management having decided that it could not be expected to pay expenses. In March the Harewood's output ran up to the useful total of 19,000 tons. This, however, is not all. The company has possession of a considerable area of coal lands in what is known as the Nanaimo Coal Field, which is yet undeveloped. Coal being a national necessity under existing conditions, it has been decided to open up some of these areas and diamond drilling now is in progress with that end in view. The definite intention is to open two new mines and these, it is believed, will be producing coal before the end of 1918.

The Canadian Collieries (Dunsmuir) Ltd. is another company which is busily engaged in the extension of its operations. It is opening a new mine on the Douglas seam at South Wellington, a well-known coal mining center of the Island. Three parallel slopes are being driven to tap this area. A good substantial tipple is being built and a modern screening and cleaning plant is being installed. A large power house has been erected which contains three return tubular boilers of good steaming capacity, while compressors and dynamos for furnishing power for the mine have been installed. There are being laid out, besides, extensive sidings and yard room which will be connected with the Esquimalt & Nanaimo Ry. by a short spur. This will enable the coal to be shipped over the Esquimalt & Nanaimo to the company's wharves at Ladysmith, B. C., whence it may be distributed overseas to the local or foreign markets. Before the end of the year this mine should be one of the Island's large producers.

Further Development Work Going On

About three miles south of the foregoing operation, between Ladysmith and Nanaimo, B. C., is the center of another new and important development of the coal-mining industry of Vancouver Island. Here the Granby Consolidated Mining, Smelting and Power Co., Ltd., has secured, at an outlay of approximately $750,000, a considerable block of coal lands. The opening of a new mine, the installation of the necessary plant for the handling of the coal, the erection of buildings for the accommodation of employees, and the construction of wharves, etc., at a seaboard point known as Cassidy's Landing will involve a further expenditure of at least $500,000. This work is in progress, in fact it has made considerable headway. The company's plans, however, do not stop at this, it being proposed to install at Anyox, B. C., the company's mining and smelting center on the coast of the mainland of British Columbia, a byproduct coke-making plant at an estimated cost of $1,500,000. This will make it possible for the company to mine its own coal, transport it to Anyox for treatment, and thus secure the coke needed for the smelting of its large supply of copper ores.

In the opening of its new coal mine the company is driving three slopes, one of which is to be used as a main haulageway, another for ventilation and the third for a mainway. A large acreage has been cleared, graded and surveyed into lots for building houses; a spur has been constructed from the Esquimalt & Nanaimo Ry. into the mine site; sidings and yards are being laid out and a sawmill is being installed to cut timber for the company's use.

It may be said, with respect to this enterprise, one of the most notable in connection with the coal industry in western Canada for years, that it has been brought about largely because of the determination of the company to be as independent and as self-sustaining in its

operations as possible. It is easily the greatest producer of copper in British Columbia, the total production for the Province in 1917 being, roughly, 59,000,000 lb., to which the Granby company's contribution was, also in rough figures, 34,500,000 lb. In 1916, however, its output was 45,631,600 lb. The decrease is accounted for by the fact that last year, owing to the explosion at the Fernie Coal Mines, Coal Creek, and the ensuing strike, there was a period during which the usual source of coke was unavailable. With these facts in mind the chief object which the management of the company has in mind in its present program is apparent. It is not proposed, in the future, that the operations of the company's mines, its smelters at Anyox and Grand Forks, B. C., shall be interfered with by lack of fuel through industrial troubles for which it is in no way responsible and so can in no way control.

Incidentally at present, but a factor which may enter very largely into the Granby company's activities in the future, are the possibilities of the byproduct ovens and the recovery of those elements of the coal the importance of which has been so strongly emphasized as a result of the disorganization of the old commercial order by the war. Into this branch of industry the company proposes entering very thoroughly, and it is confidently believed that the outcome will be the development in western Canada of a number of profitable subsidiary industries.

The Granby company's coal mine, at the present rate of development, should be prominently on the list of producers before the end of the year.

Vancouver Island's annual production of coal for the past twenty years is shown by the following table:

	Tons		Tons
1917	1,698,235	1907	1,342,877
1916	1,492,761	1906	1,178,627
1915	1,020,942	1905	993,899
1914	1,072,314	1904	1,023,013
1913	973,495	1903	860,775
1912	1,558,207	1902	1,173,893
1911	1,625,122	1901	1,271,744
1910	1,625,930	1900	1,383,376
1909	1,187,985	1899	1,191,008
1908	1,022,673	1898	1,126,531

In the Nicola-Princeton district the output up to the end of February, in comparison with the same period last year, showed an improvement of 20,000 tons. Two collieries have been opened up again which had been closed for a considerable period. The Inland Coal and Coke Co. has been reorganized under the name of the Fleming Coal Co., and its mines at Merritt, B. C., have resumed operations after a suspension which dates back to the middle of the month of March, 1917. The Coalmont Colliery has been reopened after a period of idleness extending from the early part of 1915. The Middlesboro Collieries are the largest producers in this district, being engaged in the operation of three mines. The Princeton Collieries rank second in production but will have a keen rival for second place during the coming months in the Fleming Coal Company.

Since the taking over of control by the Dominion Government of the collieries of what is known as District 18 by the United Mine Workers of America, the mines of the Crow's Nest Field, B. C., which come within that section, have been making a good showing. The production thus far this year is considerably greater than that for the first two months of 1917, the tonnage produced by these mines for January and February, 1917, being 94,295 tons, while in the same period this year it reached 135,986 tons, an increase of 41,691 tons. It is reported that satisfactory progress had been made in cleaning up the mines which were wrecked by "bumps" and explosion last April, and these mines soon will be active producers again.

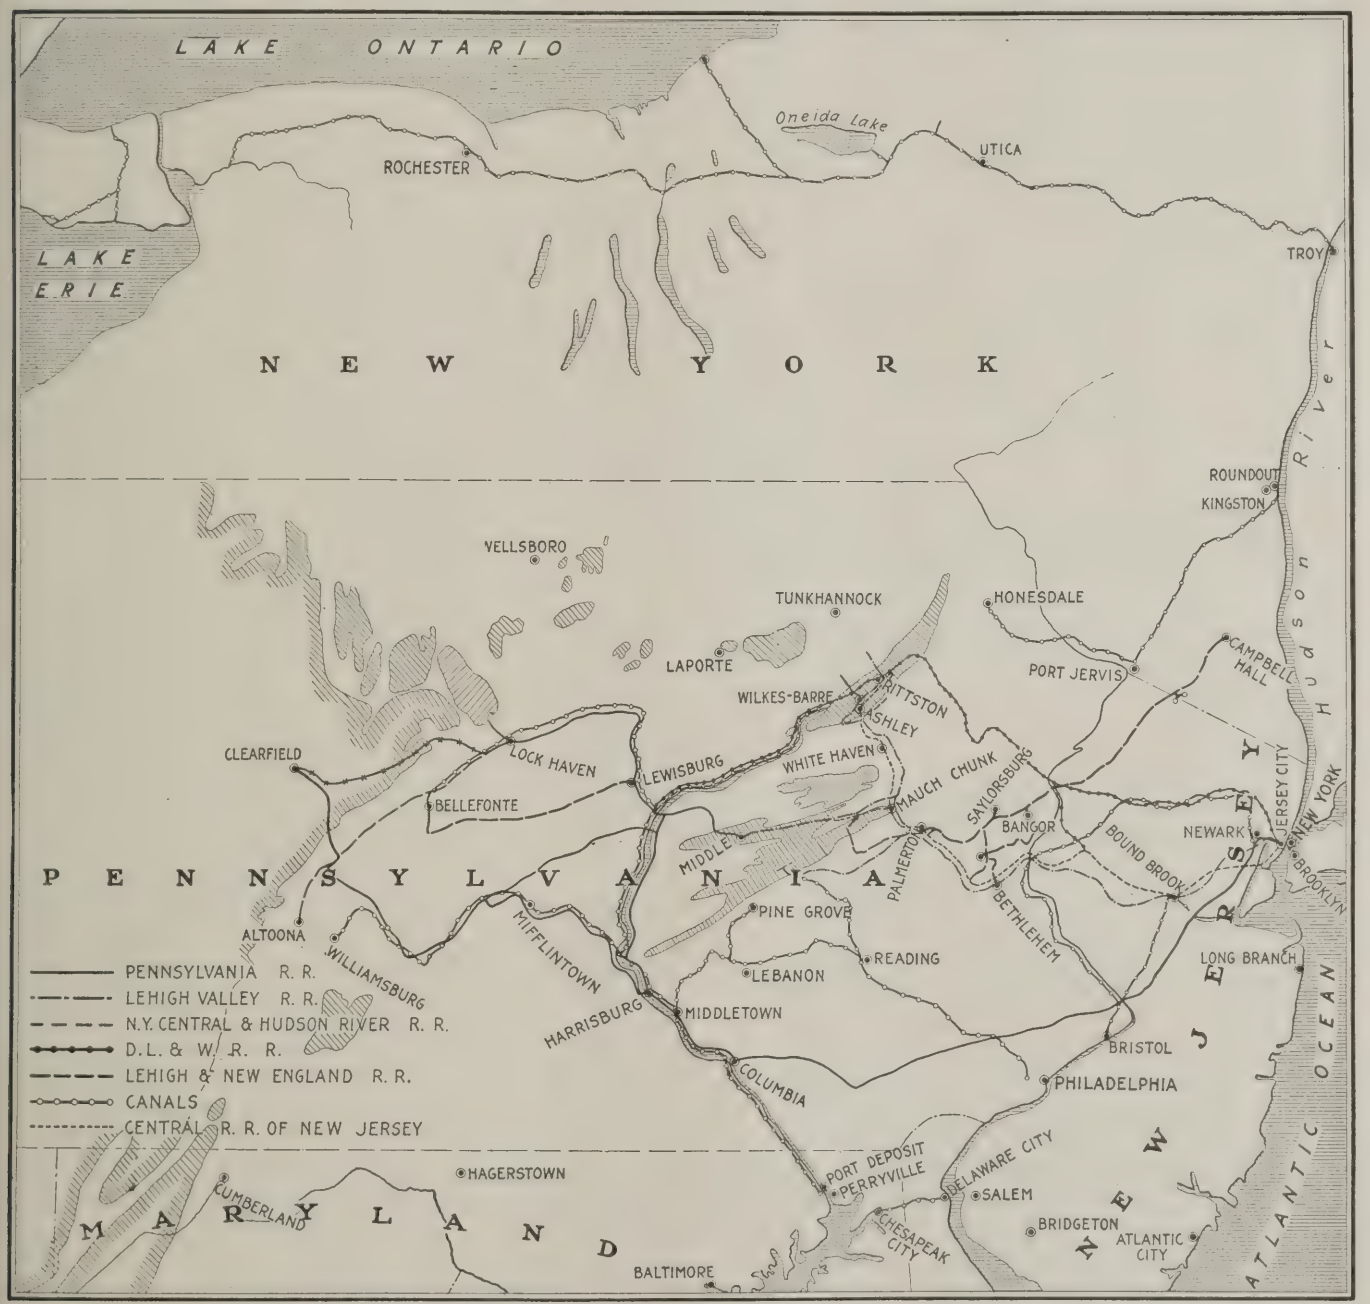
Legal Department

Effect of Iowa Compensation Act—When an Iowa coal operator sued for injury to an employee sustained in the course of employment has previously given notice of his election not to be bound by the provisions of the Iowa Workmen's Compensation Act, the burden rests upon the operator to affirmatively disprove negligence causing the injury sued on. This reverses the general rule of law under which plaintiff in a personal injury action has the burden to prove negligence. By further provision of the act, contributory negligence of the employee in such case does not release the defending operator from liability, unless it was due to willful misconduct or intoxication of the injured employee. The employee assumes no risks of injury traceable to the employer's negligence. In this case, involving liability for fatal injury to a miner who was struck by slate falling from a mine roof, the plaintiff was properly permitted to show that the roofs all along certain roadways and rooms were loose and drummy, as tending to charge defendant operator with knowledge of the existence of the dangerous condition resulting in this accident. That decedent was injured while attempting to temporarily timber a drummy roof in a roadway, after notifying the foreman of the need for timbering, did not constitute such contributory negligence as bars recovery under the Iowa law, although by statute it was decedent's duty to timber his working room and not the roadway, duty to timber that resting on the mine foreman. The accident must be attributed to the primary negligence of the operator in permitting the dangerous condition to remain. (Iowa Supreme Court, Mitchell vs. Sanwood Coal Co., 166 Northwestern Reporter, 391.)

Subleasing of Coal Lands—Complainant, having acquired a lease on Alabama coal lands under an agreement binding him to pay a royalty of 5c. per ton on coal produced, made a contract with one Ellis under which the latter was given the right for 13 years, a period less than the unexpired portion of complainant's lease with the landowners, to mine the coal, on an agreement that Ellis guaranteed a minimum royalty of 7c. on at least 50 tons per day, regardless of actual production, except as the coal might become exhausted before expiration of the 13 years. Ellis assigned his rights to defendant, and defendant, in turn, permitted the Gayosa Coal Co. to mine the property. Under these circumstances, the Alabama Supreme Court, in holding that complainant is entitled to compel the defendant and the Gayosa company to account for royalties to him under the original lease, said: "It is true that the coal companies were not parties to the lease between complainant and Mark Ellis, but the Bruce company admitted a transfer by Ellis to it, and that it undertook to operate the mine under said lease; and we do not see how it can be permitted to accept only so much thereof as it desires and reject such portions thereof favorable to the complainant and made for his protection. The lease provided a fixed price for the coal and for a minimum monthly royalty or rent, until the lease terminated, either upon the expiration of the time covered or until the coal was practically exhausted, and it of course became liable for such royalty or rent as was fixed by the lease. The Gayosa company did not claim to be the assignee of the lease from the Bruce company, but, being a large stockholder in the said company, it undertook to carry out the said lease, and proceeded to mine coal thereunder, and it too is estopped from accepting the benefits and rejecting the burdens. (Bibb vs. Bruce Coal Co., 77 Southern Reporter, 545.)

Water Transportation for Relieving Railroad Congestion

In the issue of *Coal Age* for Mar. 2, Mr. Wotherspoon has written an able article on the canal as a carrier of coal, showing how the new barge canal can be utilized for the distribution of both bituminous and anthracite in the parts of New York state reached by this canal.



The great congestion, however, due to the war is at the large shipping ports, and this congestion is liable to increase rather than decrease, as our necessity for supplying food, munitions, etc., to Europe will continually grow with the increase of our own army on the other side.

The experience in European countries, especially such congested centers as Belgium, northern France and eastern Germany, has been that they have had to utilize the canals to their full limit for all slow-moving freight, in order to enable the railroads to handle the remaining traffic.

The experience in this country has been that the old canals, with their small locks, necessitating a limited capacity for each boat, have not been able to compete with the railroads in moving economically any class of material.

On the Ohio and Kanawha Rivers, however, the Government by putting in dams and creating slack-water navigation has been enabled to utilize the rivers for the shipment of a large proportion of the coal used at the towns along these waterways, even as far as New Orleans. These barges are made up in large flotillas and each is carried down by one steamer at a minimum of expense. The railroads have been thus relieved of this proportion of low-grade, slow-moving freight.

A study of the accompanying map shows that the principal railroads serving the anthracite region all

MAP SHOWING THE PRINCIPAL RAILROADS SERVING THE ANTHRACITE REGION

reach the Lehigh and Delaware Rivers at their junction at Easton. From Easton to Bordentown, a distance of 63 miles, there is still in service the Delaware Division Canal of the Lehigh Coal and Navigation Co. The locks on this canal are so small that the ordinary canal boat has to be made in two halves, one-half locked through at a time. It is impossible under such conditions to transport economically any large quantity of coal. Furthermore, the smallness of the canal necessitates mule haulage, which is both slow and expensive.

The United States Government, under the River and Harbor Bill, can make appropriations for the improvement of the Delaware River as far as Bordentown to enable boats to use the inside passage from Philadelphia to New York through the Delaware and Raritan Canal. An examination of the river shows that no engineering difficulties would be encountered in building dams that would produce slack-water navigation from Bordentown to Easton.

Should Build Coal Docks at Easton

If the railroads centering at Easton, consisting of the Delaware, Lackawanna & Western, Lehigh Valley and the Central Railroad of New Jersey, had coal docks at that point the coal could there be loaded into barges, transported in fleets by steamers in the same manner as on the Ohio and Kanawha Rivers, and these boats delivered in New York Harbor through the Delaware and Raritan Canal. From that point they could be taken to serve all the waterfront yards not only in New York Harbor, but up the Hudson and at points on Long Island Sound. There would be a further extension of this traffic down the Delaware River to Philadelphia and to the growing towns below Philadelphia, Chester and Wilmington, while through the Delaware and Chesapeake Canal at Delaware City inland water connection would be made with Baltimore and Washington.

This might be objected to for the reason that it may be thought impossible to build a fleet of barges at this time sufficient to handle so large a traffic as this would represent, but the experiments that have recently been made in reinforced-concrete construction have shown that it is possible not only to build barges such as have been in service in New York Harbor for some years, but to build ocean-going vessels of as high as 5000 tons capacity.

Easton is only a short distance from the great cement region of Pennsylvania and connected with it directly by rail. The improvement of the existing canal up the Lehigh River to Bethlehem, Allentown, Catasauqua and the cement and slate regions immediately above these points would bring in a large return freight in the way of iron ore to the Bethlehem Steel Co. and the other iron plants and also the shipment of cement, slate and fabricated iron that makes so large a proportion of the bulky freight now produced in that manufacturing region.

This route would also open up a direct line of communication between New York Harbor and the soft coal fields of central Pennsylvania. The Reading R.R., which reaches the Lehigh River at Allentown, carries as much bituminous coal as it does anthracite. The Lehigh Valley and Central Railroad of New Jersey are also large carriers of bituminous coal, and by making traffic arrangements the Pennsylvania could divert its soft-coal shipments for New York Harbor at Harrisburg and send them through to Allentown and Easton and relieve that part of the line which is most congested.

The advantages appear to be in favor of such a method of economical handling of the coal, especially anthracite, during the summer months; the cutting down of the railroad haul on this coal by more than half, the quick return of the cars to the mines and the relief of the congested conditions at all the ports in New York Harbor.

As the Delaware River is a dividing line between the states of New Jersey and Pennsylvania, work of this character is interstate and should be handled by the Government under its rivers and harbors appropriations.

Japan Has Good Metallurgic Coals

The following table, taken from the report of the Department of Commerce and rearranged according to percentages of fixed carbon, shows that Japan has excellent metallurgical coals. Overlooking five coals out of 25, it will be seen that the sulphur in the coal is remarkably low, varying in the 20 samples from 0.07 (an almost impossible figure) to 1.19. The ash is also quite low at times and at no time abnormally high. Most of the coals have the caking quality. Only one of the coals is really lignitic.

ANALYSES OF JAPANESE COALS ARRANGED IN ORDER OF THEIR PERCENTAGES OF FIXED CARBON

	Fixed Carbon	Volatile Matter	Moisture	Ash	Sulphur	British Thermal Units	Nature
Asahi	77.16	14.73	2.27	5.84	8.08	14,598	Caking

Better Light for the Mine Plant

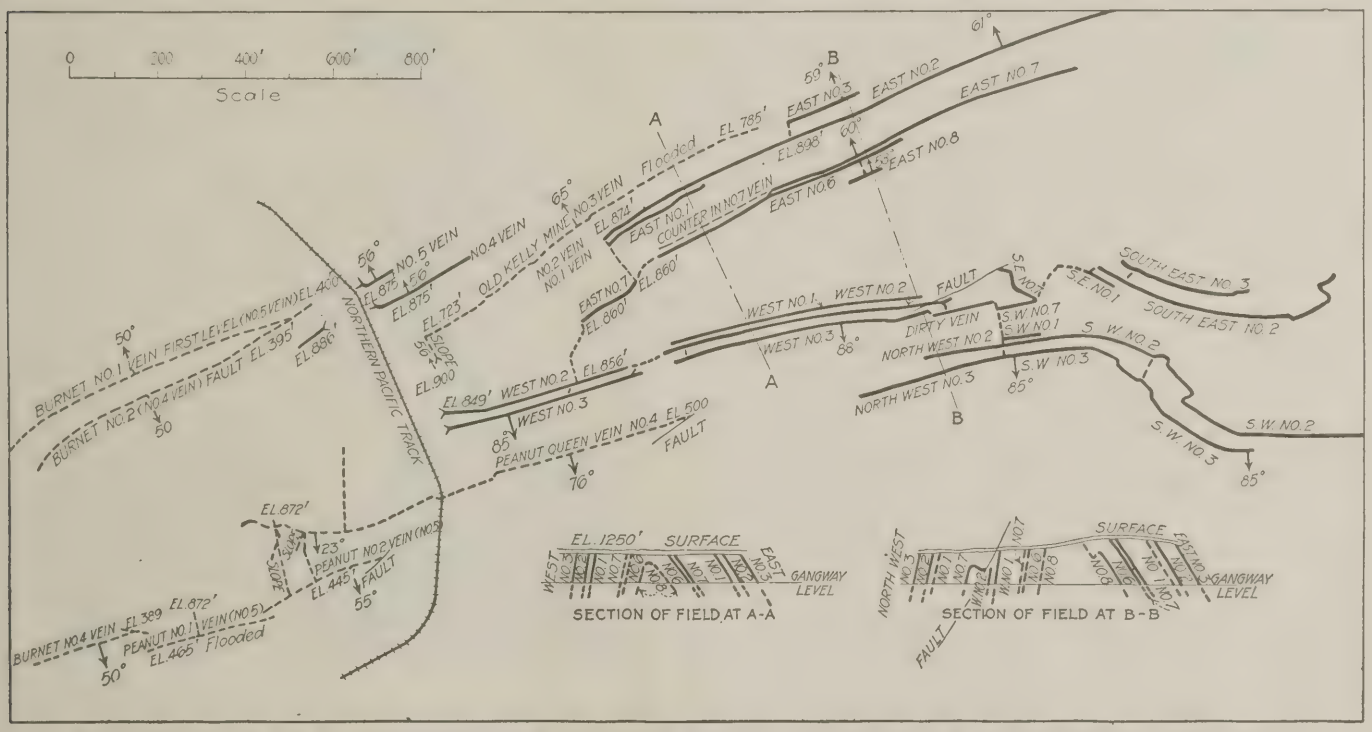
"Laco-dalite" is the trade name of a new article for improving industrial lighting that has just been placed upon the market by the Laco-Philips Co., 131 Hudson St., New York. It consists simply of a special blue glass screen that is clamped over the bottom of the electric light reflector, thus inclosing the bulb. The light thus filtered through the special blue glass, it is claimed by the manufacturers, is equal to that obtained from the nitrogen lamp. It is said to be white and pure and the equivalent of daylight. The question of proper lighting is important in breakers and picking tables. Both here and in the drafting room, as well as in other places, a device of this sort might be worth a trial.

Coal Mining in Washington*

By F. A. HILL
Manager, Cokedale Coal Co., Sedro-Woolley, Wash.

SYNOPSIS—*The coals of Washington vary from brown lignite to anthracite and while low in sulphur are somewhat high in ash. As a result of the variety of conditions the output varies from 1.55 to 5.60 tons per employee.*

COAL mining in the State of Washington offers many interesting problems for the mining engineer, due to the variety of the physical conditions in the different fields, and often in the same mine. The several coal seams worked in the same mine commonly require different mining and transportation methods for economical operation. The coal measures have inclinations ranging from 5 deg. to vertical, and in the same mine the dip of the coal may vary from 30 deg. to 50 deg. In all fields, the seams are extensively faulted, folded, and sheared.



The quality of the coal produced ranges from brown lignite to bituminous coking coal, the following being typical analyses:

	Lignite	Sub-bituminous	Coking Coal
Moisture	23.5	14.30	0.57
Volatile hydrocarbon	31.0	33.03	23.57
Fixed carbon	37.4	41.30	65.55
Ash	8.1	11.37	10.31
	100.0	100.00	100.00

Little of the coal contains as much as 0.75 per cent. sulphur. The brown lignites occur mostly in Lewis and Thurston Counties, and as a rule are mined at low cost. This coal has been successfully used in locomotives of the Oregon & Washington R.R., when equipped with specially designed fireboxes.

The sub-bituminous coals occur in all the coal-mining counties. Their cost of production varies widely, according to the character of the formations, the pitch, and the wall conditions. They make a fairly good steam fuel. The lump coal is used mostly for domestic trade, when the coal is graded into lump, nut, and pea.

The coking coal is used for making coke, and for locomotive and other boiler fuel. It yields a strong metallurgical product, quite high in ash, but seldom containing over 18 per cent. of such impurity. Most of it would be susceptible to better cleaning than it now receives, but it will be difficult from any seams now known, to produce a coke containing less than 16 per cent. ash.

HEADING PLAN OF WASHINGTON MINE SHOWING TYPICAL DIFFICULTIES CONFRONTING OPERATION

Anthracite occurs in Whatcom County. The seams cannot be traced continuously for any great distance, although they outcrop here and there. These deposits lie on the edge of a carboniferous field, but no seams in which commercial mines could be opened have yet been found in that locality. West of that locality two seams have been worked; one has been closed for many years, and the other is producing a small amount of coal. In the Cowlitz Pass section of Lewis County, anthracite has also been found, but the field has not been thoroughly prospected, partly because it is remote from transportation.

With few exceptions, all the coal under 2 in. in size needs washing, and all over that size requires hand-picking to eliminate the rock and heavy bone. Many

*Article to be read at the Colorado meeting, American Institute of Mining Engineers, September, 1918.

of the mines yield as much as 30 per cent. waste, the heavy pitch of the seams precluding any separation of waste underground.

The coal has heretofore been graded as follows: Lump, over a 2-in. screen; nut, 2 in. to $\frac{5}{8}$ or $\frac{3}{4}$ in.; pea, $\frac{5}{8}$ or $\frac{3}{4}$ in. to $\frac{1}{8}$ in.; mine-run includes all but the lump. The coal under $\frac{1}{8}$ in. is called sludge, and its market has been irregular; it will form a satisfactory powdered fuel provided it is mechanically dried before leaving the mine. If wet, it will not run, but will stand vertically in bunkers or cars.

The output of coal per employee per shift ranges from 1.55 to 5.60 tons, in profitably operating mines, the brown lignites producing the highest and the coking coals the lowest amount per employee.

Methods of mining are varied; room-and-pillar, chute-and-crosscut, and an angle system which originated in Washington, are all used. In some cases planes are driven up the pitch, with room-and-pillar workings off the planes. Elsewhere, rooms are driven up the pitch in pairs, with gravity planes to handle the cars. Wherever a high percentage of lump coal is desired the methods followed are not always those producing the cheapest coal. Puncher machines are successfully used in a number of mines. They produce a greater amount of lump at a cost less than that incurred when coal is shot from the solid.

Lump coal has been selling at $3 to $5.50 per ton f.o.b. cars; nut from $2 to $3.75; pea from $0.75 to $1.10; and sludge for any price that could be obtained, some of the coking sludge, however, selling at $1.

Bailey Willis estimates the thickness of the coal measures in the Wilkeson field at 10,000 ft. There are many coal seams in that field; in one locality 10 different seams are being worked, and there are three more that could be profitably mined. One geologist estimates 90,000,000 tons of coal in one 640-acre section.

The main coal field of the state is 56 miles long from north to south, and six miles wide; a large part of it has never been properly prospected, owing to its inaccessibility, the heavy growth of timber, and insufficient demand for the coal.

The opening and equipping of a coal mine in Washington will cost from $2 to $10 per ton of annual output, depending largely upon the cost of development to produce the desired output. Unless the outcrop can be located by surface prospecting the cost of development is hard to determine, even by those best acquainted with the field.

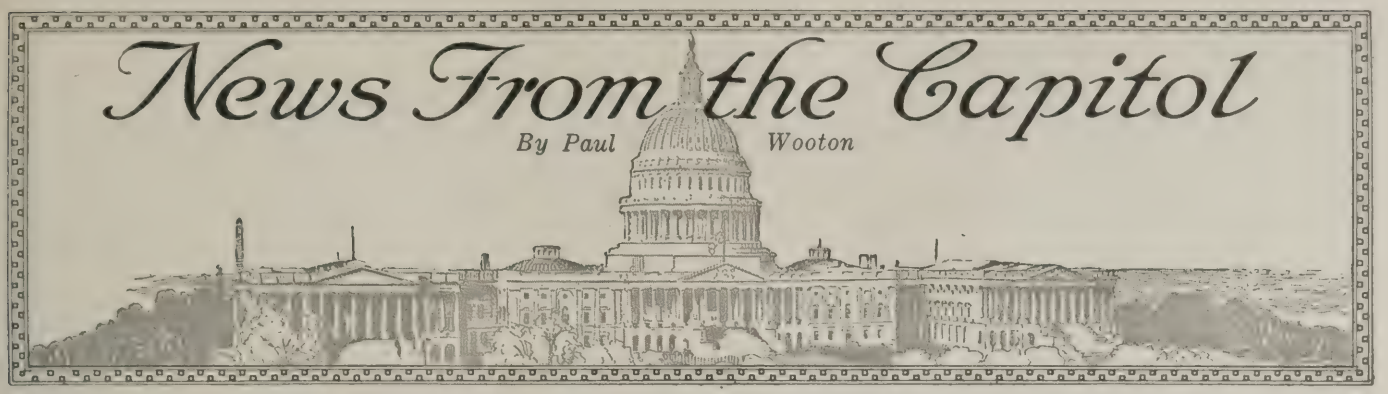
During the past 10 years fuel oil has been selling at coast points from 65c. to 85c. per bbl. Oil has been supplemented by coal to the extent of about 2,000,000 tons annually; hence coal operators, except those producing coke and the better grades of domestic coal, have fared poorly. With fuel oil at $1.50 per bbl. no doubt more coal properties will be opened.

Obviously, mixing is an important factor in combustion. Merely an excess of air in the furnace is not enough; the air must be supplied as near to the surface of the fuel bed as practicable, and be thoroughly mixed with the combustible matter in order that the combustion may be completed in a short time and a small combustion space made effective.—*Bureau of Mines Bulletin No. 135.*

Who's Who In Coal Mining

W. E. E. Koepler

Announcement that W. E. E. Koepler had been elected to the secretaryship of the Pocahontas Operators' Association for the current year, with headquarters at Bluefield, W. Va., was received with pleasure by his many friends in the industry. His sterling personal qualities and unquestioned ability will undoubtedly enable him to carry on successfully the work of the association.



The Pocahontas Operators' Association is comprised of about 50 members and is concerned only with the mining of coal. Its chief object is to speed up production so that the Administration may be saved the embarrassment consequent upon a lack of fuel to coal vessels and run the nation's war industries.

W. E. E. KOEPLER
Secretary, Pocahontas Operators' Association

For the last two years Mr. Koepler has been in charge of financial and kindred advertising on the Philadelphia *Public Ledger*. Previous to that, for a total of about three years, he was with the *Colliery Engineer* and its successor, *Coal Age*. Before that, for a period of seven years, he was connected with *The Black Diamond*, first as advertising solicitor and then as manager and editorial assistant in Philadelphia.

Mr. Koepler was graduated from Westminster College, Fulton, Mo. He is 33 years of age, married, and has two children. Through his long experience among manufacturers of coal mining machinery and equipment, coupled with a fine knowledge of trade and economic conditions, Mr. Koepler is in a position to suggest new ways of winning the war via increased coal production.

Important Zone Modifications

Changes in the bituminous coal zones were made during the week ended April 27 as follows:

Zones A, G, H, N and P—Extension of territory so that producers of smithing coal may ship their product to greatly extended areas. Shipments may be made to all points in the United States west of the Mississippi River, except to North and South Dakota, Minnesota and Wisconsin, north of Zone A by the following mines on the Midland Valley R.R. in Zone A:

Porter, Arkansas Valley Coal Co., Hackett, Ark.; Jones, Backbone Coal Co., Excelsior, Ark.; McMillan, Peter McMillan Coal Co., Excelsior, Ark.; Bassinger, Bassinger Coal Co., Excelsior, Ark.; Hackett, Hackett, Excelsior Coal Co., Hackett, Ark.; Acme, Haskell Coal Mining Co., Stigler, Okla.

Shipments may be made to all points in the United States east of the Mississippi River and south of the northern boundaries of Tennessee and North Carolina and to all points in the United States west of the Mississippi River by the following mines in Zones G and H:

Brookwood, The Alabama Co., Birmingham, Ala.; Blue Creek 3, Tennessee Coal, Iron and Railroad Co., Birmingham, Ala.; Yolande 2 and 3, Yolande Coal and Coke Co., Birmingham, Ala.; Dixiana, Imperial Coal and Coke Co., Birmingham, Ala.; Bradford, Majestic Coal Co., Birmingham, Ala.; Dillworth, Sipsey Coal Mining Co., Empire, Ala.; Etna, New Etna Coal Co., Whiteside, Tenn.; Durham, Durham Coal and Iron Co., Chattanooga, Tenn.

Shipments may be made to all points in the United States requiring westbound movement, provided they are made in returning box or stock cars, by the following mines in Zone N:

Raleigh 3, Raleigh Coal and Coke Co., Cincinnati, Ohio; Winding Gulf 2, Winding Gulf Colliery Co., Cincinnati, Ohio; Cranberry, New River Co., Macdonald, W. Va.; Fire Creek, Fire Creek Coal and Coke Co., Staunton, Va.; Big Q, Quinnimont Coal Co., Quinnimont, W. Va.; Fayette, Fayette Smokeless Coal Co., Fayette, W. Va.; Tams, Gulf Smokeless Coal Co., Tams, W. Va.; Sun 1 and 2, Eccles 3, 5 and 6, New River Collieries Co., Sun, W. Va.; Graham, Tamroy, Oswald, McKell Coal and Coke Co., Glen Jean, W. Va.

Shipments may be made to all points in the United States requiring westbound movement, provided they are made in returning box or stock cars, by the following mines in Zone P:

Mines Nos. 1, 7 and 12, The Consolidation Coal Co., Baltimore, Md.; Kingsland, Maryland Coal Co., New York; 118 and 119, The Consolidation Coal Co., Baltimore, Md.; Jerome, United Coal Corporation, Pittsburgh, Penn.; Zimmerman 4 and 5, Quemahoning Coal Co., Somerset, Penn.; Douglas, Cumberland Coal Co., Baltimore, Md.; Coketon, Davis Coal and Coke Co., Baltimore, Md.; 1, 2 and 5, Blossburg Coal Co., Scranton, Penn.; Maple Hill, East 1, 2 and 3, West 1, 2, 3 and 4, O'Donnell Bros., Morris Run, Penn.; Sonman 2, W. H. Piper Co., Philadelphia, Penn.; Sonman Shaft, Sonman Slope 2, Thorne Neale & Co., Philadelphia, Penn.; Miller 1, Miller Coal Co., Philadelphia, Penn.; Hughes 1, W. H. Hughes & Co. and C. A. Hughes & Co., Altoona, Penn.; Maryland, Berwind-White Coal Mining Co., Philadelphia, Penn.; Henrietta 2, Henrietta Coal Mining Co., New York; Cammos 1, 2 and 3, Heverly Coal Co., Altoona, Penn.; Argyle 1, Argyle Coal Co., Greensburg, Penn.; Logan 4, Logan Coal Co., Philadelphia, Penn.; Lloydell 1, Dexter & Carpenter, New York; Leland 9 and 10, Dexter & Carpenter, New York; Loyal Hanna 6, Loyal Hanna Coal and Coke Co., Philadelphia, Penn.; Ehrenfeld 3, Pennsylvania Coal and Coke Corp., New York; Yellow Run, Mountain Coal Co., Greensburg, Penn.; Standard 1, Standard Coal Co., Altoona, Penn.; Rich Hill 1, Whitney & Kemmerer, Philadelphia, Penn.; Shade Creek, Shade Creek Coal Co., Johnstown, Penn.; Stineman 2, Stineman Coal and Coke Co., Philadelphia, Penn.; Stineman 1, Stineman Coal Mining Co., Philadelphia, Penn.; Bear Rock 1, Bear Rock Coal Co., Lilly, Penn.

Zone B—Extension of territory so that every shipper from Lake docks on the west of Lake Michigan in Wisconsin may ship smithing coal outside of the zone as follows:

That portion of the United States west of the western boundary of North Dakota and South Dakota but not south of the southern boundary of "Zone B," as described in order of March 27, 1918, or subsequent modification thereof.

Zone P—Extension of territory so that producers in northern West Virginia, Pennsylvania and Maryland on the Baltimore & Ohio; Western Maryland and Coal & Coke Ry. (east of Dundon) and their short line connections and all districts north of these lines may ship outside of the zone as follows:

1. Westbound to all points in the State of Ohio.

2. Westbound to all points reached via the carferries of the (a) Grand Trunk Ry., operating between Grand Haven, Mich., and Milwaukee, Wis. (b) Pere Marquette Ry., operating between Ludington, Mich., and Manitowoc, Wis., and between Ludington, Mich., and Milwaukee, Wis. (c) Ann Arbor Steamship Co., operating between Frankfort, Mich., and Manistique, Mich., between Frankfort, Mich., and Menominee, Mich.; between Frankfort, Mich., and Kewaunee, Wis.; and between Frankfort, Mich., and Manitowoc, Wis.

All shipments must be made in returning box or stock cars.

Zone D—Extension of territory so that producers in Indiana many ship outside of the zone as follows:

Westbound to all points reached via the carferries of the (a) Grand Trunk Ry., operating between Grand Haven, Mich., and Milwaukee, Wis. (b) Pere Marquette Ry., operating between Ludington, Mich., and Manitowoc, Wis., and between Ludington, Mich., and Milwaukee, Wis. (c) Ann Arbor Steamship Co., operating between Frankfort, Mich.,

and Manistique, Mich., between Frankfort, Mich., and Menominee, Mich.; between Frankfort, Mich., and Kewaunee, Wis., and between Frankfort, Mich., and Manitowoc, Wis.

Shipments are limited to those which can be made in returning box or stock cars.

Zone F—Extension of territory so that producers in Virginia along the Louisville & Nashville R.R. only; in eastern Kentucky along the Louisville & Nashville R.R. and the Cincinnati, New Orleans & Texas Pacific Ry. and their short line connections; and in Tennessee, along the Cumberland Valley Division of the Louisville & Nashville R.R. and along the Middlesborough R.R. may ship outside of the zone as follows:

Westbound to all points reached via the carferries of the (a) Grand Trunk Ry., operating between Grand Haven, Mich., and Milwaukee, Wis. (b) Pere Marquette Ry., operating between Ludington, Mich., and Manitowoc, Wis., and between Ludington, Mich., and Milwaukee, Wis. (c) Ann Arbor Steamship Co., operating between Frankfort, Mich., and Manistique, Mich.; between Frankfort, Mich., and Menominee, Mich.; between Frankfort, Mich., and Kewaunee, Wis.; and between Frankfort, Mich., and Manitowoc, Wis.

Shipments are limited to those which can be made in returning box or stock cars.

Zone N—Extension of territory, so that the producers in the Pocahontas, Tug River and New River low-volatile coal-producing districts of West Virginia and Virginia along the Norfolk & Western, Chesapeake & Ohio and Virginian railways, and their short line connections, in the Clinch Valley high-volatile coal-producing districts in Tazewell and eastern Russell Counties, Virginia, along the Norfolk & Western Ry., and in the high volatile district along the Virginian Ry. may ship outside of the zone as follows:

That portion of the States of Maryland and Delaware, located on and within the following boundary lines: On and south and east of a line coincident with the eastern and southern bank of the Chesapeake Bay and the Choptank River as far as Cambridge, Md.; thence coincident with the Philadelphia, Baltimore & Washington R.R. from Cambridge, Md., to Seaford, Del.; thence coincident with the Philadelphia, Baltimore & Washington R.R. from Georgetown, Del., through Lewes to Delaware Bay.

Extension of territory so that producers in the Pocahontas, Tug River and New River low-volatile coal-producing districts, in the States of West Virginia and Virginia along the Norfolk & Western, Chesapeake & Ohio and Virginian railways and their short line connections and in the Clinch Valley high-volatile coal-producing districts in Tazewell and eastern Russell Counties, Virginia, along the Norfolk & Western R.R. may ship outside of the zone, in returning box or stock cars, as follows:

Westbound to all points reached via the carferries of the (a) Grand Trunk Ry., operating between Grand Haven, Mich., and Milwaukee, Wis. (b) Pere Marquette Ry., operating between Ludington, Mich., and Manitowoc, Wis., and between Ludington, Mich., and Milwaukee, Wis. (c) Ann Arbor Steamship Co., operating between Frankfort, Mich., and Manistique, Mich.; between Frankfort, Mich., and Menominee, Mich.; between Frankfort, Mich., and Kewaunee, Wis.; and between Frankfort, Mich., and Manitowoc, Wis.

Zone L—Extension of territory so that producers in the State of West Virginia, along the Kanawha & Michigan, Kanawha & West Virginia, Coal & Coke (east of Dundon) railways and their short line connections may ship outside of the zone in returning box or stock cars as follows:

Westbound to all points reached via the carferries of the (a) Grand Trunk Ry., operating between Grand Haven, Mich., and Milwaukee, Wis. (b) Pere Marquette Ry., operating between Ludington, Mich., and Manitowoc, Wis., and between Ludington, Mich., and Milwaukee, Wis. (c) Ann Arbor Steamship Co., operating between Frankfort, Mich., and Manistique, Mich.; between Frankfort, Mich., and Menominee, Mich.; between Frankfort, Mich., and Kewaunee, Wis.; and between Frankfort, Mich., and Manitowoc, Wis.

Zone C—Extension of territory so that producers in Illinois, until Sept. 30, may ship outside of the zone as follows: To all points located on the line of the Minneapolis & St. Louis R.R. between Norwood, Minnesota and Minneapolis.

Extension of territory so that producers in Illinois may ship, from Oct. 1 to Mar. 31, outside of the zone as follows:

That portion of the States of South Dakota, Minnesota, Iowa and Wisconsin, located on and within the following described boundary lines: On and south and east of a line coincident with the Chicago, Milwaukee & St. Paul Ry., from Hudson, S. Dak., to Sioux Falls, S. Dak.; thence coincident with the Great Northern Ry., through Pipestone, Minn., to Granite Falls, Minn.; thence coincident with the Chicago, Milwaukee & St. Paul Ry., through Benton Junction to Norwood, Minn.; thence coincident with the Minneapolis & St. Louis Ry., to Minneapolis, Minn.; thence coincident with the Minneapolis, St. Paul & Sault Ste. Marie Ry., through Chippewa Falls and Abbottsford to Amherst Junction, Wis.; thence coincident with the Green Bay & Western RR., to Kewaunee, Wis.

From Oct. 1 to Mar. 31, producers in Vermilion County, Illinois, who are operating mines along the Wabash R.R., may ship outside of the zone as follows:

All stations and points of delivery located on the Wabash Ry. within the State of Indiana, including all points of delivery within switching limits on all other railway lines connecting therewith.

From Oct. 1 to Mar. 31, producers in Sangamon County, Illinois, having operations along the Cincinnati, Indianapolis & Western R.R. may ship outside of the zone as follows:

All stations and points of delivery located on the Cincinnati, Indianapolis & Western R.R. as far east in the State of Indiana as to and including Indianapolis, including all points of delivery within the switching limits of other railway lines connecting therewith.

The foregoing orders are not to apply to railroad fuel, to shipments to Canada or Mexico, or to shipments by inland waterways other than the Great Lakes.

Deadlock in Railroad Fuel Controversy

Until the Director General of Railroads has had an opportunity to go into the railroad fuel matter personally, there is every reason to believe that the deadlock which now exists will remain unchanged until that time. Like the situation on the western front, however, Fuel Administration officials feel that they are winning in being able to halt the ambitious plans of the railway purchasing agents and of their chief, John Skelton Williams. In case they should be compelled to pay the Government prices for coal, the railroads expect immediately to go before the Interstate Commerce Commission with a request that an increase be granted in freight rates.

Weekly Production Statistics

Bituminous coal production during the week ended Apr. 20 was 11,230,000 tons. This is an increase of 3.4 per cent. over the week preceding and brings production back to the normal level. Telegraphic advices covering the week ended Apr. 27 show that even a greater production was obtained during that week.

Anthracite forwardings for the week ended Apr. 20 were 39,147 cars, which is the best showing made in April. Beehive-coke production for the week under review was 655,000 tons, a decrease as compared with production in the week preceding. Byproduct coke production was 471,013 tons. Byproduct production was at 88 per cent. of the capacity of the ovens.

The figures given above are taken from estimates made by C. E. Lesher, the geologist in charge of coal statistics for the United States Geological Survey.

Increase in Price on Export Coke

Authority to add 60c. to the Government's export price of coke has been granted by the Fuel Administration. The price is to apply on coke shipped to a possession or dependency of the United States. In addition to the 60c., the operator may add the cost of transportation from the ovens to ship side. No coke is to be exported, however, without special permit. Exports from the Pacific Coast of coke manufactured east of the Mississippi also take the 5 per cent. increase.

More Changes in Coke Prices

New coke prices have been announced by the Fuel Administration as follows: Made at Coalmont, Tenn.: Blast furnace, $7.25; 72-hour or selected foundry, $8.25.

Made from Pratt seam coal in Alabama: Blast furnace, $8; 72-hour selected foundry, $8.75.

Made in Marion and Harrison Counties, West Virginia: Blast furnace, $6.25; 72-hour selected foundry, $7.25.

Made in Barbour and Randolph Counties, West Virginia: Blast furnace, $6.75; 72-hour selected foundry, $7.75.

Made in New Mexico: Furnace and smelting, $8.50; 72-hour selected foundry, $9.50.

Railroad Administration Orders Discontinuation of Statistical Bureaus

By ordering discontinued the statistical bureaus of the various railroads, the Railroad Administration is taking a step which disorganizes the whole statistical system of the Fuel Administration. It is from these bureaus that much important statistical data are obtained on which the Government depends in compiling the figures which enable the public to know at all times the exact status of coal production and movement.

The order will abolish the Bureau of Railway Economics, the Bureau of Tidewater Coal Statistics, Ohio Bureau of Coal Statistics, Illinois-Indiana Coal Traffic Bureau, St. Louis Coal Traffic Bureau, Buffalo District Coal Traffic Bureau and others. Some of these bureaus have been in existence for 25 years.

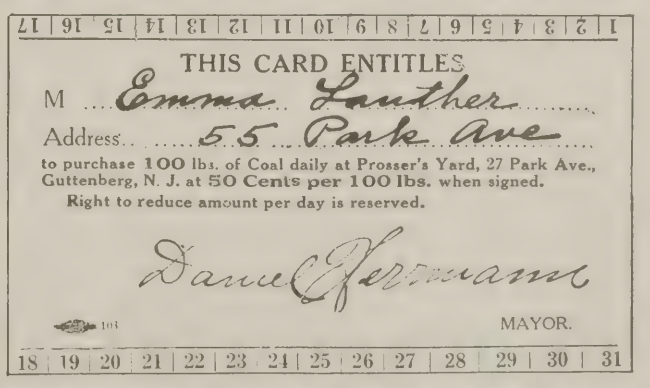
Since it will be necessary for the Geological Survey or for the Fuel Administration to take over the statistical work which has been done by these bureaus, it would mean no saving in expense to the Government. It would, however, disrupt the work which has been carried on for many years in a very successful manner.

Price Changes for Virginia Mines

New prices for Virginia mines have been announced as follows: Mines in Lee County operated by the Darby Coal Mining Co.; Black Mountain Mining Co.; Virginia Lee Co.; Old Virginia Coal Co.; United Collieries Co.; Benedict Coal Corporation and the Imperial mine of the Virginia Iron, Coal and Coke Co.: Run-of-mine, $2.65; prepared sizes, $2.90; slack or screenings, $2.40.

Brief Washington Notes

D. C. Botting, of Seattle, has been appointed district representative of the Fuel Administration for the state of Washington.



Formal denial has been made by Dr. Garfield of the report that the Fuel Administration was considering moving to Pittsburgh.

Representatives of the commercial florists of the country have agreed with the Fuel Administration to curtail their use of fuel by 50 per cent.

The lightless night order has been suspended until Sept. 1. The action was taken by Dr. Garfield, at the request of the Liberty Loan Committee. Since the change in time by the daylight saving law the use of electric signs has been for a shorter period and was an important factor in influencing the suspension order.

Coal Cards Used Near New York City

During this winter, Guttenberg, N. J., on the Hudson River cliffs just across that river from New York City, being extremely short of domestic fuel, distributed coal by the coal card, of which the following is a reproduction. The Mayor, Daniel Herrmann, for some time received four to eight tons of coal a day from

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17

THIS CARD ENTITLES

M .... Emma Lauther

Address .... 55 Park Ave

to purchase 100 lbs. of Coal daily at Prosser's Yard, 27 Park Ave., Guttenberg, N. J. at 50 Cents per 100 lbs. when signed.

Right to reduce amount per day is reserved.

Daniel Herrmann

103 MAYOR.

18 19 20 21 22 23 24 25 26 27 28 29 30 31

Burns Bros. at the docks in West New York, formerly used by the Herbert Coal Co. It had been found that some persons came three and four times a day and so got more than their share, so the cards were adopted. Thus hoarding in the time of severe shortage was prevented. No back orders were filled, only 100 lb. being sold on any one card per day. The distributing times were so arranged that the men working at factories had ample time to get their share. Coal tickets could be purchased on the "workless" Mondays as the Mayor's office was kept open.

EDITORIALS

Placing Responsibility

IF THERE is a serious fuel situation in this country next winter, the public will immediately seek to place the blame upon someone. Last winter Dr. Garfield was the object of censure, and to him was attributed responsibility for all the sorrows of the consumer. Although he did not come into office until the end of August, when the most favorable season of the year for storing coal had already passed, the press of the country repeatedly carried the statement that the Fuel Administrator during the summer months had advised against storing coal.

Now that the Administration is urging all consumers to purchase as much coal as they can possibly secure to fill their requirements, and since attention is called to the fact that production so far this year is far less than the estimated needs, certain elements are already taking advantage of this situation and of these warnings to declare that the fuel administrators are seeking already to pave the way for the failure that they believe inevitable, and to shift the blame onto other shoulders.

Such critics assume that if we have a coal famine the fault must lie entirely with the Fuel Administration. They pretend to ignore what must be evident to everyone, that the Fuel Administrator and his associates do not control the railroads and have no power to purchase and place locomotives and cars in the coal fields where they are so badly needed. When the time arrives that empty cars are placed on the sidings at our mine tipples, and these cars are not loaded immediately with coal for prompt shipment to market, then the Fuel Administrator and the coal operators have failed and public condemnation of them is justified.

Let us briefly view the situation in the United States today as a whole. In the West the mines are not operating because in many districts they lack orders; the reason for this sorry situation is that the railroads refuse to commence now purchasing and storing coal for use next winter. The Fuel Administration has urged the necessity of the railroads making purchases now when the mines need such orders to keep them operating. But Mr. Williams says, "No, the situation is unsettled, we'll buy coal later," and in the meantime dozens of mines are idle, and the operators have the problem of their lives in retaining miners through this period of idleness. In the East many mines have been shut down during past weeks, because of a lack of transportation facilities. And here again the railroads are the transgressors. The time may come, and it may be soon, that the operators and the Fuel Administration will be to blame for failure to meet the situation, but so far that moment has not arrived; and whatever defeat we have met in carrying out our 1918 program up to the present time, has been due to the weak offensive and lack of coöperation on the part of our National transportation system.

One-third of the present year has passed, and the production of coal is 17,000,000 tons less than the output conservatively estimated as necessary to meet urgent requirements this year. During the remaining eight months of 1918 it will be necessary, therefore, to make up this shortage, and if we fail to accomplish this end, the curtailment of industrial activity next winter will be more severe than any contraction of effort that has so far occurred.

Give Away What They Can't Sell

THE *United Mine Workers Journal* is to be given to each of the 400,000 affiliated members of the union. It will thus have a wonderful circulation, and its power for good or evil will be immensely increased. Believing that the average union man still thinks well of his employer and does not like to see him scolded in every issue of his paper, we do not wonder that the *Journal* has not been a marked success.

The good-natured workingman has been a little troubled at the stand taken by his industrial organ. He likes, as we all do, to scold on occasion, and often he finds that occasion without much diligent hunting; for operators and their agents are both pleasantly and unpleasantly human. But on the whole the mine worker is a good-hearted fellow, and his soreness does not last very long. For this reason he does not like the paper of his leisure moments to be so full of bitterness and so sparing of facts. The union has a lot of correspondents available and, if it pleased, its summary of the recent labor events might be an unqualified treat. Furthermore, many a real inequity could be removed if conservatively presented and incisively analyzed.

We believe the mine workers should occasionally look at an operator's publication, and we are sure that operators should often look at the publications of mine workers; but we doubt if the *United Mine Workers Journal* has its due influence on the employer. He realizes that it has little else but criticism of him, and that it is unfair to his cause.

The union forgets, just as the operator too often forgets, that the majority of union men are the best type of red-blooded, hard-headed, honest chaps. They will stand by the right. They will applaud the truth. A few of the rabid who know nothing but vituperation will object to anything which verges on altruism appearing in the columns of the paper they read. But this is a new era. The employers' papers are being humanized, and it seems time for the workmen's papers to drift magnificently into the same current.

The editor of the *United Mine Workers Journal* has recently offered his body to Great Britain for service against the foes of America. When he returns, will he be any less courageous in the affairs of his mind? Will he continue to be a mere partisan after self-sacrificing work in the world army? We think not.

Merely as a business proposition it seems a mistake to continue on the old track in the publication of the organ of the mine workers. The paper will henceforth, so to speak, be a "house organ." No one will be able to tell whether it is really read and approved by those who receive it, for it will be delivered alike to the pleased and to the hostile. The members of the house will have to take it whether they want it or not. But this we do know. It has been run hitherto at a loss, which for 1915 alone reached $65,800. It has reached only one-tenth of the members of the union. Clearly there is something amiss in the editorial policy—not in editors, be it noted, but in their policy only.

Line up the *Journal* with the conscience of the union; line it with the sentiments and the actions of the principal labor leaders; line it with the trend of twentieth century thought and fill it with facts—and there would be no difficulty in trebling the circulation on sheer merit. The *Journal* has had a trend toward liberalism and education, but the trend has been slower than might have been hoped. Now is the time to accelerate that trend. We wager that the great conscience of the miners of America, whether in war or in peace, will respond with alacrity to the new and better spirit.

If our readers will bear with us, we will make a confession. We hope that we see in the appointment of Robert H. Harlin as acting editor a determination toward a more constructive policy. We wish to gain credit for suggesting that policy, but we cannot deny that we believe that Mr. Harlin "saw it first."

Relative Value of Labor and Capital

THE American laboring man, with his keen insight into matters, is little disposed to forget the part that capital has in promoting the service of labor. It is clear that though machinery cannot be run without labor, labor is at a loss to produce without machinery and that the designer of that machinery, and the man who supplies that machine, is worthy of his reward.

Labor might pile wood on its back and tie it with withes of stripped bark and carry it into market. It would be entitled to regard that as a service to which it exclusively contributed. It would be typical of the cruel and, as we now regard it, unnatural suffering which goes with such labor as is compelled to operate without the aid of capital. Such labor is full of pain, sweat and inadequate accomplishment. When capital arrives, it smoothes the road, it supplies rails and cars to carry the burden, furnishes a locomotive to pull it, and the draft on labor is reduced. Who shall say that, in such an example as this, capital has not performed even the greater part of the service? While a human hand turns the throttle, it is the unseen steam that moves the engine.

We are learning gradually that reconstruction, no matter how radical, cannot mean the extinguishment of capital. It will at most only involve an end of private ownership. The workman will never be allowed to use all he produces. Some part of his work will have to be diverted to the development of the means for new and advanced methods of production, such as will make labor in the future more effective.

Profits are the seed corn of labor. There can be no progress without them. The workman dresses himself, steps on the car, or the train, in the morning and comes to his home at night and says labor has provided all these things. But capital has coöperated more than labor. Were it not for capital, labor would be living like a cave bear, and surely no one would be willing to go back to that state of affairs. We shall always be obliged to put by and put by, or we shall cease to progress.

Had we put by more in the past our feet would not have been so terribly entangled by our limitations as we now find them to be. To many of us it has always seemed our duty to spend as much as we made. Everyone was entitled, we declared, to receive and expend all that his hands produced. As a result there has been a limitation of development, waste and inefficiency. We have not measured up to our capabilities, partly because our labor is untrained to the point desired and partly because our capital savings have not been large enough to provide the necessary tools for our hands.

The Corporate and the Aggregate Ego

THE GOVERNMENT of the United States represents the corporate action of its citizens. It is said that prices made to this corporate ego should be reasonable, presumably because it is corporate. On the other hand, there is no tendency to regulate nearly so closely the profits on goods sold to the individual, and in many cases prices are not regulated at all.

It seems quite reasonable to declare that where prices are regulated they shall be the same to the corporate ego as to the aggregate ego. The same people pay that price either corporately or in the aggregate. If a certain price is the right price for the individual to pay it is the right price for the Government railroads to pay. If the buying of the individual is to be speeded the buying of the Government railroads should likewise be undelayed. If the individual should be patriotic, then the Government should not be lacking in patriotism.

A fair price should not cause the Government railroads to balk and the Government should not grant privileges as part compensation for paying an unfair price. The aggregate ego gets no consideration in most of its purchases. The price of dry goods, for instance, is entirely unregulated. The stores mark these goods upward continually. The same goods remaining unsold at the end of one day are marked up before they are placed on sale the next. The aggregate ego has to pay the bill. But the corporate ego is balking at paying prices which that same corporate ego has already declared are reasonable and necessary for the maintenance of production. No one can see why this should be.

The railroad administration (the corporate ego) is utterly indifferent to the true interest of the people (the aggregate ego). The railroads can always get coal winter and summer. All that it is necessary to do is to seize the fuel on the tracks. Next winter the aggregate ego may go cold, the factories of the aggregate ego may be closed, but the corporate ego will be warmed and be active, being supplied with fuel by its unlimited powers of condemnation.

THE LABOR SITUATION

EDITED BY R. DAWSON HALL

General Labor Review

The world is at war; therefore this is no time for domestic readjustments. With this in ever present view we have repeatedly spoken about the evils of the attempted unionization of nonunion territory at this crucial period. We have regretted that the union did not everywhere show an accommodating spirit, worthy of the occasion, such as would be exhibited if it forbore strife wherever nonunion mines are operating.

On the other hand, fairness would have caused us to express opposition to any change in attitude toward "ironclad" contracts. These documents forbid unionization to employees who sign them to such an extent that union leaders who permit locals to be formed where such contracts have been signed subject themselves to imprisonment. But as the matter was at issue before the courts it seemed well to say nothing.

HITCHMAN COAL AND COKE CO. WITHDRAWS SUIT

We cannot forbear, however, from expressing ourselves as greatly pleased that the Hitchman Coal and Coke Co., probably by reason of patriotism, has decided to withdraw its long-drawn injunction suit against the union. We congratulate the Hitchman officials on their decision. A long and expensive action had been taken, and success appeared likely to be secured. No one knows better than those who conduct such proceedings how the striving for success becomes almost a greater incentive for continuance of effort than the object aimed at.

It is the more to the credit of the Hitchman Coal and Coke Co., therefore, that on Apr. 23, after long and diligent striving, that company decided to discontinue its action, an action older by far than our entry into the war. May the union learn moderation from the considerate action of its most bitter opponent. The world is at war, and it is time for a profound peace behind the battling lines.

AND ALL IS PEACE BEHIND THE BATTLING LINES

The anthracite region is wrapped in an industrious silence broken only by the rattling of the coal in the spirals and the slate pickers and by the sound of the plunging of the jigs. The operators are said to be planning to stimulate the patriotism of the mine workers, if possible, to even greater degree by a lecturing campaign in which the cruelty of the Germans and the rapacious purposes of the German government will be laid bare. The anthracite region is the abode of a fervent patriotism already. Those who direct the campaign will do well to avoid inflaming the people beyond control, for while some need the excitement of such a recital, others rather require a reasoned appeal for moderation.

Central and western Pennsylvania have no labor troubles outside of some action, as in Johnstown, against those who will not buy Liberty Bonds. West Virginia has only a small strike to report. It took place at Brown, in Harrison County, a point which might be described as in the Clarksburg field, though a little remote from that city. It arose from dissatisfaction with the scales at the mine and was of only short duration.

In our issue of Mar. 9, page 464, appeared an account of the demands of the miners in Belmont, Harrison and Jefferson Counties for a differential for those who were working in the rider of the No. 8, or Pittsburgh seam. Because of the thinness of that measure, which is known as the No. 8A, the miners thought that a better rate per ton should be granted.

Consequently, on Apr. 24 a joint conference was held in Bridgeport between the operators and the officials of subdistricts Nos. 5 and 6, the meeting being convened in the offices of the United Mine Workers. The operators took the stand that the matter must be submitted to President Wilson for decision. However, on Apr. 25, John Moore, the president of United Mine Workers in Ohio, announced that a satisfactory wage scale had been arranged, but that the terms were being kept secret, as to reveal it "would only stir up dissatisfaction among the other men."

In Alabama the unionization of the coal mines is spreading to the iron mines, where the conditions of operation are not at all dissimilar from those in coal mines. The unionization there also caused strikes and threatened more. At one time six companies were fearing a suspension of operations. Wage increases have been granted.

WHY WE ARE ALL BUYING LIBERTY BONDS

Illinois is beginning at last to realize that we must beware of trying to fight the Germans here instead of "over there." The measure of peace and order here is likely to be the measure of success in France. Only by quietly and industriously working here can we put arms into the hands of our boys in the trenches. Reference is made in another column of this department to the developments in the Prager case and to idling at the "Old Ben" mine and to the appropriate action taken by the Federal authorities.

In Washington State, Sam Caddy has been elected district member of the international board of the United Mine Workers of America, and Ben Farrimond becomes vice president of the district. The vacancy which Caddy fills arises from the appointment—an admirable appointment in our

belief—of Robert H. Harlin to be international statistician of the United Mine Workers and also acting editor of the *United Mine Workers' Journal*. Farrimond fills the unexpired term of Ernest Newsham, who retired from the vice presidency to become secretary-treasurer of the district when William Short resigned to become president of the Washington State Federation of Labor. A regular election will be held next November to fill all district offices.

The suspicions of the Nova Scotia mine workers have been aroused and they are willing to believe anything about their employers. As we recorded they first believed that the operators were deliberately subsidizing local papers to tell about an Allied retreat in France which these mine workers, alone of all the world's population, refused to accept as true. Now they claim that the labor embargo in Newfoundland is being supported by their employers with the idea of making the necessity for importing coolie labor appear more imperative. Reference is made to this in another part of this department.

Labor Shortage at Hard Coal Mines

The unfriendly attitude toward foreigners in the anthracite region in relation to the purchase of Liberty Bonds was discussed last week in this department at some length. This attitude is highly important because of the extreme shortness of labor in which not only the coal operators, but the boards of trade also, are interested. The industrial bureau of the Scranton Board of Trade recently passed a resolution asking that steps be taken to secure the release of 16,000 Italian anthracite miners fighting on the Italian front on condition that they would return to America and dig coal. It was suggested that an equal number of Americans might be sent over to Italy to fight in the Italian lines, in this manner testifying to the Italian people our hearty coöperation with them in their efforts to keep their hearths and homes inviolate from the foreign foe.

The bureau condemned the misleading advertising of the outside employment agencies, and moved that the local newspapers refuse to print advertising which had for its purpose the depletion of the scant labor of the anthracite region.

However there has been some improvement in the number of men employed in the anthracite mines, though the numbers are far below the 177,000 who were working before the war first commenced. The anthracite region has done more than its share in supplying men to the army, in fact to all the many armies. Enlisting freely, so freely in places that more men enlisted than the quota of the region required, the draft nevertheless took more men away. Thus it has been that the anthracite region which might have been, and indeed should have been, spared did more than twice its share. However, active colonization work and increased wages have improved matters a little as the table shows:

Occupations	—Men Employed— Sept. 17, 1917	Feb. 18, 1918	Change
Miners	42,020	42,638	Increase 618
Miners' laborers	23,018	22,069	Decrease 949
Company men (inside)	40,427	42,695	Increase 2,268
Company men (outside)	40,940	42,483	Increase 1,543
All other employees at collieries	5,671	5,289	Decrease 382
Total	152,076	155,174	Increase 3,098

The Liberty Loan situation does not appear to have occasioned any actual strikes, although such strikes have often been threatened. The attempt to secure an adherence to the union somewhat similar to the adherence demanded to the nation did, however, cause the Luke Fidler colliery to close down. Here not more than half the men had paid their monthly dues and a strike was entered into to bring the delinquents into line. On two occasions in the week before last the Mammoth Locust Gap colliery belonging to the Philadelphia & Reading Coal and Iron Co. was closed by button strikes, and several independent collieries were similarly laid idle.

The mine workers appear to think that the operating concerns are becoming more favorable to the institution of the check-off which would make the nonpayment of dues at least less frequent. Many a man would hesitate to notify the company employing him that he would not authorize it any longer to contribute part of his pay to the union, whereas he would think less of omitting to make payment of his dues. However, the idea of the mine workers is a check-off system which would contain closed-shop provisions. The leaders of the mine workers have been urging their members to compel or urge solidarity in union support in some other way than by button strikes, for striking reduces the output of coal.

Bloomer Girls Appear at Mines

Several graduates of the Nesquehoning High School on Apr. 23 took positions at the mines of the Lehigh Coal and Navigation Co., purposing to act as timekeepers, weigh-scale tenders, switchtenders and in other capacities. They wore bloomer uniforms and middy blouses, while caps covered their hair, the outfit being supplied by the company.

Apparently the union objected to women thus assisting in the mine work, despite the shortage of mine workers in the anthracite region, for Thomas Kennedy, president of the United Mine Workers of America in the Seventh district, has announced that S. E. Button, the chief of the Pennsylvania Department of Mines, agreed Apr. 27 to issue orders against the employment of girls in and around anthracite mines.

Lackawanna Gives Bond Bonuses

The Delaware, Lackawanna & Western R. R. Co. has been distributing Liberty-Bond bonuses to all its employees who are on a monthly salary and who receive less than $3000 a year. This is in accord with an arrangement made last December. The whole distribution amounts to $625,000. Employees receiving $600 a year and less get a $50 bond; from $601 to $1200 a year, a $100 bond; from $1201 to $2000 a year $150 of bonds; from $2001 to $3000 $200 of bonds. The bonds given are of the second 4 per cent. issue.

It will be noted that this increase is given to salaried men only, who have probably not prospered as greatly in recent months as have the day workers and miners. As a proof that miners in general are doing well it is recorded that Schuylkill County has been divided into five sections for internal-revenue collection. It used to form a single district, but the number of miner taxables has made it necessary to make this more minute division.

Lack of Safety Used as Strike Excuse

The "Old Ben" mine, No. 11, at Christopher, had an explosion on Nov. 29 in which 17 men were killed. The men complained that there was a lack of safety appliances and demanded the installation of several devices. These were provided by the company, and on Feb. 1 the inspectors and Federal officials announced that the mine was in condition for a resumption of work. But the mine workers refused to return to work, giving excuses that the Government investigators declare "trifling and frivolous."

On Monday, Apr. 15, Robert Childs, a special assistant of the United States Attorney-General, and Assistant District Attorney McCawley Baird of East St. Louis went to Christopher and a mass meeting was held Tuesday night, and an appeal was made to the men, on patriotic grounds, to return to work, but no satisfactory assurances were received. Another meeting was held on the night of Apr. 25 and the miners were given plainly to understand that they would be tried immediately for conspiracy to diminish the fuel supply unless they returned to work. Next morning they resumed.

The mine normally employs about 500 men and is a thoroughly well-equipped operation, the property of the Old Ben Coal Corporation. With an adequate mining force it would easily produce 4500 tons a day. Recently there have been a number of "loyalty" demonstrations at Christopher and adjacent mining towns, which were said to have

been made by idle Christopher men. The so-called "loyalty" outbreaks are just now under suspicion. Much of the loyalty in southern Illinois is mere hoodlumism such as Samuel Johnson knew so well how to stigmatize.

Mine No. 3, Edwardsville, Madison County, has been closed for several days as there are differences between the owners and the operators. The miners are willing to continue at work if their wages are guaranteed.

Illinois Becomes Less Rabid

Illinois is recovering from its rabid attitude toward alien enemies. The state is not going to allow race riots against foreigners, or negroes either, for that matter. Brigadier-General Wells of the Illinois National Guard and two members of his staff have just completed a tour of inspection through the southern Illinois coal fields, and Wells assured the officials of the various counties that troops would be sent into the district if there were any further disturbances.

The Madison County grand jury has shown that it has no sympathy with lynching by returning 12 indictments charging murder and four indictments charging malfeasance. Of the 12 men charged with the murder of Prager eight are mine workers. Of the four Collinsville policemen charged with malfeasance three were at one time similarly engaged.

Five of the men charged with murder were held by the coroner's jury and have been in jail since the inquest. They are Joseph Riegel, Wesley Beaver, William Brockmeier, Richard Dukes, Jr., and Enid Elmore. Six others were arrested under the indictments: John Hallsworth, Calvin Gilmore, Charles Cranmer, Frank Flannery, James de Mattias and Cecil Larremore. The twelfth man had not yet been arrested at last reports from our correspondent. The four policemen are Fred Frost, Martin Futcheck, Harry Stephens and John Tobnick. Tobnick has resigned from the force, but the other three, after capiases were served on them, gave bond and were allowed to remain on duty.

Moses Johnson, subdistrict board member of the United Mine Workers, who has charged that Prager was disloyal, but has failed to substantiate his charge, conferred with the miners after they were arrested and promised to obtain bond for them. Though warrants for the arrest of the mine workers were placed in the hands of deputy sheriffs on Liberty Day, the authorities did not take action as they feared there would be a riot should the men be arrested during the patriotic celebration. It appears that the authorities are still somewhat afraid to take appropriate action. Perhaps they are not to be blamed, but certainly the spirit of the citizenry of Collinsville is subject to the gravest of criticism.

While the grand jury was still investigating the Robert P. Prager lynching, the local union, unabashed at the crime committed, met and fined John Tonso, Paul Schrieber and Joseph Robino $50 each because they indorsed the application of Prager when he applied for membership in the union. The specific charge was that they had violated the constitution of the Illinois branch of the United Mine Workers by certifying that Prager was an experienced miner though he had only had 28 days experience in the mines. One would have imagined that these Collinsville mine workers would have tried to forget the horrible tragedy except insofar as they combined with the authorities to bring to justice all those whom they knew were guilty of that highly criminal offense.

It seems like a gruesome joke to fine anyone for assisting a postulant to gain admission to such an unworthy local union, membership in which could scarcely be regarded as a privilege or an honor. The local belatedly has arrived at some niceness in its selection among postulants, though the choice is apparently not one based on moral qualifications. If this local had been as precise at an earlier date in demanding moral qualifications as it is now in requiring experience, Prager would not have lacked defenders when the assault was made on him in the village streets of Collinsville.

Tennessee Company Submits to Pressure

The Tennessee Coal, Iron and Railroad Co., believing in running a nonunion operation, has strenuously refused till recently to accept the recommendation of the United States Fuel Administration, because it regarded that document as tantamount to a recognition of the union. The company argues that it has always been a good employer, that in the matter of providing good homes, healthy conditions and safety it has set the pace in the South, just as the H. C. Frick Coke Co. and the United States Coal and Coke Co., its related concerns, have set the pace in the North.

But the union has pressed for the coöperative bargain and the Fuel Administration has granted it, not indeed to the union as a whole, but to the men employed at any one plant. These men when organized by the United Mine Workers of America and financed by them are not to be distinguished from that organization. They are Company J, let us say, of the United Mine Workers industrial army. The union does not disguise it and the T. C. & I. is not to be blamed for realizing that in recognizing their men they really recognize the union in which their men belong.

The Tennessee company therefore for a long time refused to submit to the recommendation. Now they accept it without signing it. They merely promise compliance. One might suggest that as their word is as good as their bond, they might just as well have signed as have refused to do so. Probably, however, they hoped that their compliance would not be recorded and that it would be for them merely a matter between Dr. Garfield and themselves. However pressed by George Huddleston, the representative in Congress from the Ninth Alabama District, which covers Jefferson County, Dr. Garfield, about Apr. 17, revealed that the Tennessee company was committed to the Fuel Administration's recommendation. The difficulties between the company and its employees will in future be arbitrable by Judge H. C. Selheimer, of Birmingham.

The terms of the recommendation to which the company adheres, and which were published in our issue of Jan. 19, were as follows, the last item being finally determined by the agreement of Apr. 20 recorded last week in this department:

The right of employees to belong to any union without discrimination being used against them by the employer. Reëmployment of men discharged for joining the union. Recognition of mine committees. Right of men to join in peaceful assembly. Creation of tribunals for the adjustment of disputes. Right of men to place checkweighman on tipples and right to have wage of said checkweighman collected in manner prescribed by employees. Establishment of the eight-hour workday. Readjustment of tonnage and yardage rates July 1, 1918.

Nova Scotia Miners Fear Coolie Labor

An order in council has been passed by the government of Newfoundland forbidding unmarried men between the ages of 20 and 35 from leaving that "Ancient Colony." This seems an appropriate way of conserving for war service the man power of the colony, but it so happened that when it was passed a number of agents of the Amalgamated Mine Workers of Nova Scotia were busy recruiting men for the mines in that province of the Dominion of Canada. The order in council appeared, and may possibly have been, directed at these labor emissaries.

It seems, however, that the "Amalgamated" saw in the action of the council the long arm and hand of the Dominion Coal Co. Could it be possible, they declared, that the Dominion Coal Co., anxious to secure coolie labor, is unwilling that its needs should be supplied by our kindred in Newfoundland? Is the Dominion Coal Co. seeking to embargo Newfoundlanders so as to make the introduction of Chinese the only possible alternative? The suspicious mine workers suspect some such explanation is back of Newfoundland's action. Yet what is more natural than that a government like Newfoundland, which is establishing conscription should prohibit the migration of its citizens even to the provinces of an allied government.

DISCUSSION BY READERS

Buying Liberty Bonds

Letter No. 1—Reading the editorial entitled "Do We Really Want to Win the War?" *Coal Age*, Mar. 30, p. 596, set me to thinking; and I wondered how many of us, here in America, are in dead earnest and willing to make the sacrifices that the occasion demands. Many have sent their sons to the war with the strong expectation that they may not see them again. That is real sacrifice; but, beyond this, few of us are feeling the burden of the war.

It is no material sacrifice for a man to buy Liberty Bonds, which is a good and safe investment; and, yet, we find many men in our mining camps who refuse to buy a Liberty Bond and offer the excuse that it helps to kill their sons and brothers.

One cannot but sympathize with the foreigner who has left his wife and family in the old country and come to this land seeking a fortune, in the hope of going back to his homeland with means sufficient to buy a farm. As the war goes on, however, this excuse grows less acceptable every day.

In the selling of the first Liberty Bonds, I took an active part. Judging from my own experience in this work, there are scores of foreign-speaking men who refuse to buy a bond, but who have laid by thousands of dollars earned in this country. While, formerly, such were quite generally excused by reason of their attachment to their homeland, it is time now that that excuse be brushed aside and the foreigners living and working in this country make a just return for the privileges that they have enjoyed since they came here.

FACTS AND FIGURES—THE PRICE OF LIBERTY

The writer of the editorial to which I have referred estimates that the raising of $5,000,000,000 would mean the giving of $250 by each family in this country. While I would not be willing to say that every family could lay by $5 a week to make up this amount in a year, I am sure that there are thousands of families among our miners who are able to make this contribution toward the cause.

Wages have never been so high as at present. Indeed, a mine foreman cannot interest the miner whom he wants to hire, unless he can show him a place where he can make $6 or $7 a day; and it is no sacrifice for such a one to put by $5 a week to assist in maintaining the liberties he enjoys.

In the present campaign for the Third Liberty Loan I believe that justice alone demands that every foreign-speaking man, regardless of his nationality, be expected to subscribe his share in the undertaking.

The argument that "this is a free country and every man can do as he pleases with his own," cannot apply when that freedom is at stake and looks to every loyal citizen for its support. This campaign should be general and all companies should coöperate. Every employee who subscribes to a bond should have a button and that button should be his passport or recommendation for employment wherever he goes among the mines. Without it, his chances should be slim.

While I realize that many will shake their heads in disapproval of such action, it appeals to me as justifiable, under the conditions that bind all freedom-loving people together by a common yoke. We should all pull together and work for the success of what will insure to us a free country to live in. THOMAS HOGARTH.

Heilwood, Penn.

Coal Production and Booze

Letter No. 9—Whether coal miners are more addicted to the use of strong drink than workmen employed in other industries is uncertain. That many of them have inherited a great thirst for drink from which it is almost impossible for them to break away cannot be denied. The charge, coming from many quarters, that coal miners are indulging in strong drink to the extent that they neglect their work and the production of coal is thereby shortened seems to be true.

When miners go on a strike over what may prove to be a trivial disagreement with the management, the production of coal is naturally cut off for a time. In that case, however, there would appear to be a shadow of an excuse, justifying their act in closing down the mine. But, for miners to stay out of the mine for no other purpose than to satisfy their thirst for drink, at a time when the nation needs every ton of coal it can get for the successful prosecution of the war, there is no justification. Such an act on the part of any miner can only be regarded as next to treason to his country.

I was forcibly struck with the statement of John Buggy, in his letter, *Coal Age*, Feb. 9, p. 300, that in his town of 375 persons there is consumed 200 gal. of intoxicating drink a week. This would average more than two gallons a month for every man, woman and child in the town, and, yet, Mr. Buggy adds, "all the men in the place are not confirmed drinkers." It is certain, then, that those who do indulge are heavy drinkers. If the cost of liquor is as high in that town as it is here ($6 to $10 per qt.) the habit must cost the drinker a large amount.

WHERE THE SALOON IS EXCLUDED

The town in which I am living has a population of about 2000, and I feel safe in saying that 200 gal. of intoxicating drink is not brought into the place in a year. A few years ago the saloons were voted out of town. Previous to that time, I have known miners to draw over a hundred dollars on payday and blow it all in at the saloons in two or three days.

The exit of the saloon, however, has brought a great change and taken the boozers to other places. You never see a miner here under the influence of drink and

one seldom hears it mentioned. Since the saloons disappeared, the town has had better schools, better streets and better people.

The suggestion that the Government limit the amount of liquor a miner should drink in a given time does not appeal to me as a means of curtailing the drink habit among miners. Allowing that coal production is as great a factor in winning the war as claimed, it would seem that if the supply of coal is being curtailed through the drink habit of miners, *the Government would be amply justified in taking the liquor question in hand and settling it for all time, by prohibiting the manufacture and sale of intoxicating drink throughout the length and breadth of the land.* To my mind, that would be the surest way of dealing with the matter.

Government regulation has been exercised in respect to other industries where such action was necessary to avoid interference with the prosecution of the war. Why, then, should not the manufacture of intoxicating liquor be dealt with in the same emphatic manner.

It is said that the Government must rely upon its army of miners as certainly as upon its army of soldiers, the one fighting at home and the other fighting at the front. But, drunken soldiers are worthless, and a drinking miner cannot perform his part in the great struggle. There is every reason, therefore, for the Government to take a hand and eliminate this greatest evil of the times.

In another letter, Feb. 2, p. 259, under the caption "Miners and the War," a miner has drawn a picture of schools in the heart of the anthracite coal field being closed down to save fuel, depriving the children of needed education, while their fathers are grouped around a hot stove in a bar-room, unfitting themselves for the work of producing coal.

Let the Government Answer

The question comes home to us, *Why does our Government permit the heating of saloons when the schools are closed to save fuel? Why are the people rationed on bread when bushels of grain are being converted into liquor in the breweries?* These questions cannot be answered without revealing facts that are a burning shame to any honest government.

The statement made in the same letter that "the saloon is the last thing the miner sees in the morning when going to work and the first thing he strikes on his return from the mine" reveals a deplorable state of affairs in the mining town or camp to which it refers. But, miners who are true and loyal to their country's interest will not spend their time and money in the saloons when their services are needed in the mines; and the men referred to by this writer are surely not American miners.

In conclusion, let me say that it is encouraging to note the rapid growth of sentiment for national prohibition, among the better element of miners of all nationalities. The patriotic and sober miner is disgusted with his fellow worker who indulges in strong drink and absents himself from the mine where he is needed. Miners are making good money and the opportunity is afforded them by the Government to invest it at a good rate of interest where it will be safely kept against the time of need.

It is always a sad sight to see an old miner, who has passed his sixtieth year, and whose head is gray and form bent under the burden of his years, still digging coal as the only means of obtaining a living. In his younger days he has made good money and regrets now that he did not lay it aside for the future, instead of spending it in a way that did him more harm than good. Let every young miner, today, take this to heart and resolve that such will not be his condition later in life.

John Rose.

Dayton, Tenn.

Storage-Battery Locomotives

Letter No. 2—I was interested in reading the letter of "Engineer," *Coal Age*, Mar. 16, p. 513, in which he alludes to the great advance the storage-battery locomotive has made since it was first introduced in mining a few years ago. The following items may be of interest in this connection:

There are, today, several types of storage-battery mine locomotives in use. I believe I have the honor of being one of the first to adopt this type of locomotive for use in the mines, in this particular field, having employed them during the past four years.

The first locomotive of this kind introduced into our mine was a 5½-ton machine equipped with 48 lead-battery cells. This locomotive was used for one year in the work of gathering coal from rooms and delivering it to the tipple, with an average length of haul of 3500 ft. In some places there was a 3 per cent. grade against the load. The locomotive hauled 125 cars, in a 9-hour shift. The loaded cars weighed 4 tons, gross, apiece and were equipped with roller bearings.

After working this machine one year on the long haul mentioned, it was used six months longer for gathering cars from the rooms and placing them on the main line switch, and the life of the battery then expired. During this period of 18 months, this locomotive had taken the place of four mules and three drivers and had operated continuously with a total cost for repairs of $86.45 exclusive of replacing exhausted cells by new ones.

Advantage of Improved Types

Storage-battery locomotives are very simple to operate, and it is my opinion that the many late improvements in respect to durability and the recharging of the battery have earned for it a permanent place in the gathering of coal in mines. A battery is now being placed on the market having a 10-year guarantee. This battery can be fully recharged in 3½ hour, for an 8-hour shift, which overcomes the necessity of operating the power plant and employing a man to watch the locomotive at night. The arrangement is such that the battery is automatically cut out as soon as it is fully charged and retains its full capacity of power.

Storage-battery locomotives possess many advantages over the trolley-and-reel locomotives. The necessity of installing a trolley wire and bonding the track is eliminated. One advantage worthy of consideration is that the motorman, not having to divide his attention between the trolley pole and the reel is in a position to watch his helper more closely, whereby many accidents are avoided.

Another consideration is the fact that where mines are supplied with power from a central station, it fre-

quently happens that the power is cut off at intervals, which renders the trolley locomotive helpless on the main road. When this happens it is possible to run the storage-battery locomotive out on the main line and thus keep the coal running to the bottom of the shaft.

Sovereign, W. Va. SUPERINTENDENT.

Mine Cars

Letter No. 7—As may appear from a previous letter of mine published in *Coal Age*, Mar. 9, p. 468, asking for accurate information on mining equipment of different kinds, I have been deeply interested in the letters relating to this subject.

My attention has been particularly drawn to a letter signed "Experience," Mar. 16, p. 514, in which the writer attempted to give the comparative costs of lubricating plain- and flexible-bearing mine cars. His estimate of $16.64 per car as the total yearly cost for oiling plain-bearing cars leads me to think that he has not based his calculations on actual facts; but has, like the small boy, "thunk them all out of his own head."

Kindly permit me, then, to present a few actual figures based on carefully kept cost-records of the past year. The prices of oil and grease quoted are the war-time prices in this district, and the labor is according to the latest wage scale. While very few mines run 300 days in the year, I will use that figure for the sake of convenience.

Estimated Cost Based on Practice

In our mine we have 420 cars in use and permit none of them to remain idle except when laid up for repairs in the shop. Our cars average a run of 12 miles per car, per day. The records show that we use an average of 2 bbl. of oil in three days when the mine is running. Estimating on operating 300 days in the year, this would mean two hundred 50-gal. barrels of oil, costing, at 12c. per gal., $1200 a year; or $1200 \div 420 = \$2.86$ per car, per year.

We pay our oiler $4.36 per day, which would amount to $1308 a year of 300 working days. This would show a labor cost for oiling, $1308 \div 420 = \$3.11$ per car, per year. The total cost for oil and labor would, therefore, be $\$2.86 + \$3.11 = \$5.97$ per car, per year.

Now, by way of comparison, it will be observed that "Experience" gives the total cost of oiling roller-bearing cars, per year, as $1.60 per car; and deducting the 40c. given as the cost of labor leaves $1.20 as the price of the grease used per car, per year, which he quotes at 10c. per lb. From this, I assume that he estimates 12 lb. of grease per car, per year. But, at the present price of 16c. per lb., this would make an expenditure of $12 \times 16 = \$1.92$ per car, per year, for grease.

From information at hand, I estimate the labor of greasing would be 35c. per car, per year, which would make the total cost of greasing, including labor, $\$1.92 + \$0.35 = \$2.27$ per car, per year. This shows a difference in favor of flexible roller-bearings of $\$5.97 - \$2.27 = \$3.70$ per car, per year.

However, inquiry shows that it will cost about $50 per car to make the change from plain to flexible roller-bearings. That being the case, the advisability of making such a change will depend on what other savings can be realized by the use of roller bearings.

The user of mine equipment of any description must always be on his guard against misleading statements, and claims made by manufacturers of different types of the same kind of equipment. As in the case to which I have referred, the statistics given are frequently based on inaccurate information. Actual working conditions soon prove the fallacy of accepting these claims and statements as gospel truths. To illustrate this point, allow me to cite a single instance, which I believe most mining men will agree was a greatly exaggerated statement on the part of the manufacturer.

In a display advertisement of a leading firm, exploiting a new device for the handling of cars on the shaft bottom, the statement was made that after said device had been adapted to the style of mine cars in use, one of the items saved would be a 50-per cent. reduction in the labor required at the bottom of the shaft. It is difficult to understand how from 700 to 1200 cars a day can be hoisted in a single shaft and avoid the employment of from five to seven men.

Statistics of Actual Performance Wanted

It might be assumed that I am not supporting the use of up-to-date mining equipment. But on the contrary, I am a firm believer that both the flexible roller bearing for mine cars and the storage battery motor for gathering coal at the face, as well as many other types of improved mine equipment, have come to stay. The point I wish to emphasize, however, is that what the operator needs and must have, before installing new equipment, is reliable information giving actual statistics in respect to the durability and upkeep.

Some operations may be nearing completion and will not warrant replacing the old equipment with improved types. At the same time, the operators may have future plans in view, and it behooves all mining men to keep posted on the latest mining methods and equipment. This is all the more important, because in a few years competition will be close and costs will be the main topic among operators.

Allow me to say, in closing, that our cars are kept well oiled and dry wheels are practically unknown in our mines. I believe that the time to oil an old-fashioned wheel is every time you look at it. In our mines, this work is not left to half-grown boys, but is in charge of a responsible man, who has other duties to perform, such as coupling cars and assisting in the general work on the shaft bottom. J. S. GELSTON.

Nobleston, Penn.

Removing Worn Locomotive Tires

Letter No. 1—In looking over a recent number of *Coal Age*, my eye rested on an article entitled "Retiring Mine Locomotive Trucks," by J. L. Ball, in the issue, Mar. 23, p. 530.

In that article, Mr. Ball describes his method of removing wornout tires from locomotive trucks, by boring a ¾-in. hole entirely through the center of the tire to be removed, and then expanding the tire, so that it can be slipped off from the truck, by inserting a drift in the hole and driving it in with a sledge until the tire is loosened.

While this method described by Mr. Ball can be used to remove tires that are too badly worn for

further use, it is clear that it cannot be employed to remove tires that are to be turned down and used again. We all know the life of locomotive tires can be greatly extended by turning down worn tires; and it may be possible to do this, at times, without removing the tires from their trucks.

Where the arrangement in the shop is such that the tire must be removed from its truck before it can be turned down, the usual method to employ is to expand the tire by heat, until it is sufficiently loose to drop off when struck with a sledge.

In order to remove a tire by expanding it by heating, the truck is turned up on end and supported, in a vertical position, on bricks in a mound of earth so arranged that the entire center of the wheel is protected and the tire alone exposed to the heat of the fire, which is then built around it. Wet mud is filled in between the spokes and above the center, so as to fully protect that portion of the wheel from the heat of the fire.

Care must be taken to apply a fairly moderate heat, distributed uniformly over the whole surface of the tire. As the iron warms, the tire expands and a few blows from a sledge will soon cause it to drop from the truck, which must be at once removed from the fire. The success of the operation depends largely on building a quick wood fire, by which the heat will be applied more uniformly to the tire without reaching the wheel.

It sometimes happens that after turning down the tires, the locomotive sits too low on the track. To overcome that difficulty, it is necessary to block up the body of the machine under the springs. In heating new tires that are to be shrunk on the wheel, do not place two tires together, but separate them by putting bricks between, which will enable the heat to be applied more uniformly and give better results.

Logan, W Va. Guyan Machine Shop.

Safety in Shotfiring in Mines

Letter No. 3.—In the Foreword of *Coal Age*, Feb. 23, there appears this statement, "Recently sticks of dynamite have been found mixed with coal in several coal cars. Investigation has shown that the explosives were placed in the cars at the mines." Permit me to express the opinion that most of this is due to carelessness on the part of some miners, rather than any intent of alien miners to destroy life or property.

There are employed in the mines at this time many careless and inexperienced men who are handling explosives, and it should not be thought strange if occasionally one or more sticks of dynamite are found mixed with the coal. I have seen as much as a whole stick of a poor grade of dynamite that had failed to explode, mixed with the coal at the face, and I have heard other miners say that they have seen the same thing, but in loading the coal into the cars most generally but not always the miner sees them and throws them out.

In this time of war, we are all on the lookout for the enemy everywhere, and the finding of an unexploded stick of a poor grade of permissible explosive in a car of coal receives more attention now than in a time of peace. I have known, personally, more than one instance where miners have failed to take a keg of powder out of the car, before loading the car at the face, and the powder was hauled out of the mine and dumped into the chute.

One instance occurred where the coal was loaded into a car on top of dynamite and the whole was tipped into the chute. On another occasion the coal was loaded into a car that was more than half-full of props and coal and props all went into the chute. I mention these instances to show to what an extent the carelessness of miners prevails in loading their cars.

At the present time, every safety measure possible should be adopted and strictly practiced in mining, in order to prevent alien enemies from getting explosives in their possession. I fully agree with the suggestion made in the Foreword to which I have referred that the appointment of shotfirers who merely ignite the shots loaded by miners, would not prevent alien enemies from getting hold of explosives.

Present Custom an Unsafe Practice

As long as the present custom of permitting all miners to handle explosives continues, there will always be many opportunities for aliens to get possession of the dangerous stuff. As a protection to life and property, and a safe guard against the placing of explosives in coal cars and other places for destructive purposes, as suggested in the Foreword, all shots in all mines should be fired by shotfirers, who must be competent, careful, honest, sober and practical miners and have in their charge all explosives.

The miners should be required to bore their holes, prepare the tamping material and have it at the place; but the shotfirers must place the charge, tamp and light the shots. Under such a system, no doubt many badly located holes would be left uncharged and unfired, but in the end this would have a good effect, as it would tend to make the miner use the pick more, and be more careful in arranging his shots.

Shotfirers Should Be Employed in All Mines

At first, the employment of shotfirers may appear to be unnecessary and expensive in the opinion of many operators; but, after a little careful figuring it will be found less expensive in the end, than for miners to prepare and fire their own shots. As suggested in the Foreword, there would be a reduction in the number of accidents caused by the careless use of explosives by inexperienced miners, and there would be fewer damage suits to be settled in the courts.

With practical shotfirers the number of shots to be fired would be reduced, and the amount of coal broken down increased. The amount of explosives used would thus be materially lessened and there would be fewer overcharged shots. There is no question but what many miners to-day are not using the pick sufficiently and giving their shots enough clearance, but are depending upon excessive charges of exposives.

I think the mining departments of the several states should take this matter in hand and enforce such regulations as will be effective in preventing alien-enemy miners from handling explosives in and about coal mines. There seems to be a strong tendency on the part of some inspectors to have all mines put on shotfirers. Where the authority is not already given

by law to do this, the inspector himself should require that it be done.

The district and assistant mine inspectors of the states are more interested in the safety of miners in their territories than any one else; and the question of the employment of shotfirers, as a means of safety to miners and to prevent alien-enemy miners from handling explosives in and about mines, should be turned over to the mining departments. As suggested, "This is not a time for halfway measures."

Dayton, Tenn. SAFETY FIRST.

Straightening Brittle Mine Rails

Letter No. 1—When reading a back number of *Coal Age*, a short time since, I came across an inquiry asking for the best method to be used in straightening brittle rails in mines [Vol. 10, p. 613]. It was explained that the rails had become crystallized, and were so brittle that when an attempt was made to straighten them the iron would break.

In the reply given to this inquiry, the crystallization was attributed to the pounding and vibration to which the rails are subjected in motor haulage. It was recommended that such rails should be annealed, for which purpose they would have to be heated and that required taking them out of the mine.

I want to suggest that such a proceeding is not necessary, as the rails can be straightened without heat and without being broken. The process is a very simple one, the only cost of the operation being the wages of the man doing the work.

The scheme is, I believe, quite well known to the majority of miners and it will hardly be necessary to more than refer to it, by way of drawing attention to the lack of necessity for taking the rails out of the mine. If desired, however, I can describe the method, or someone else can do so if they choose.

——, Penn. MECHANIC.

[*Coal Age* and its readers will be glad to have this correspondent describe the method of straightening brittle rails, in mines, without breaking them and without resorting to the usual process of annealing the iron to make it more pliable.—Editor.]

Working 10-Ft. Inclined Seam

Letter No. 2—I was interested in the inquiry of "Superintendent," *Coal Age*, Mar. 23, p. 561. In answer to his request for suggestions as to the best method of working a 10-ft. inclined seam under a weak roof, kindly permit me to submit the following:

This seam, outcropping on the surface, should be opened by two separate slopes driven on the floor of the seam 100 ft. apart. These slopes should be 9 ft. wide. Owing to the height of this seam and the weak roof overlying it, at least 3 ft. of the coal should be left up, which will make a fairly good roof.

Steel timbers should be used at the opening, and, if necessary, steel crossbars should be used on the main haulage road. Owing to the short period of time the cross-entries will be kept open, wooden crossbars can be employed, and these should be hitched at least 9 in. into the coal on each rib. Under the conditions named, it is important to protect all entries by leaving ample pillars; and I would suggest the use of 60-ft. center pillars and 100-ft. barrier pillars on all entries. Owing to the great thickness of entry pillars, it may be possible to drive the crosscuts 100 ft. apart.

The cross-entries should be driven on the strike of the seam, in pairs, 400 ft. apart. Rooms should be turned on 40-ft. centers to the rise of each pair of cross-entries. The room necks should be driven 9 ft. wide for a distance of 20 yd., where the room is widened to 15 ft., leaving pillars 25 ft. wide between adjoining rooms. The rooms are driven up a length of 100 yd., which will leave a barrier pillar 100 ft. wide between the face of the rooms and the pair of cross-entries above them.

Owing to the softness of the sandy shale forming the floor of the seam, a systematic method of timbering should be adopted. Props should be set not over 4 ft. apart and crossbars used over the roads in each room. Other props should have a broad cap piece and foot board, which will afford a better support for the roof coal. Pillars should be drawn back to within 60 ft. of the entry and the entry pillars and stumps withdrawn when the rooms are finished. A large percentage of the roof coal can be recovered when drawing back the pillars.

IMPORTANT PRACTICAL CONSIDERATIONS

It is very important that this mine be kept well drained. All rooms and entries should be driven on sights established by competent engineers. An accurate map of the mine should be made and kept up to date by frequent surveys. Besides the entries and rooms that form the mine workings, the map should show all surface features such as streams, rivers and other bodies of water, besides all buildings and other improvements. A map of this kind will give the mine foreman valuable information when robbing the pillars.

It is my opinion that punching machines will be found best adapted to the mining of this coal. These machines provide a good undercut from 12 to 16 in. in height at the face of the coal, which will be found a great advantage when the coal is blasted, as it will assist in keeping the roof strong. I would suggest taking out this coal in two benches, each 3½ ft. thick, making a total height of 7 ft. to be extracted in the first working.

Motor haulage could be used to good advantage in this mine. The trolley wire can be carried on one side of the entry, which is high enough to insure safety from the accidental contact of men and animals with the wire. There should be maintained a clearance of 2½ ft. on one side of the road, with shelter holes every 45 ft. on the same continuous side of the entry. This will provide ample safety for persons traveling the haulage roads when the motor is in operation.

The mine should be ventilated by a fan, and the air current directed to the face of the workings, by building good concrete, brick or tile stoppings in the breakthroughs, and using brattice cloth in the rooms when this is necessary to cause the air to sweep the face of the coal. The split system of ventilation should be employed, which will give each district its own supply of fresh air and provide the greatest safety.

Dubois, Penn. ROBERT WILLIAMS.

INQUIRIES OF GENERAL INTEREST

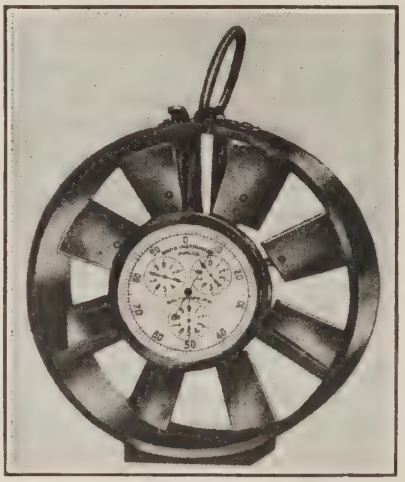
Measuring Air Velocity in Mines

Kindly permit me to ask, What is considered the most accurate method of measuring the velocity of air currents in mine airways? Is the velocity at the center of the airway generally accepted in practice, or is an average velocity obtained by taking readings at different points in the cross-section of the airway, such as at the sides, roof, bottom and center; and would this average more correctly represent flow of air for the entire sectional area of the airway? Also, kindly state what make of anemometer is the most reliable for taking velocity readings varying from 50 to 5000 ft. per minute.

Coral, Penn. INQUIRER.

The measurement of the quantity of air passing in a mine airway, by taking velocity readings at a given point in the airway is attended with numerous difficulties that render the results obtained more or less approximate. There are many conditions that make it practically impossible to determine accurately what is the average velocity of the air current in a mine airway.

As is well known, a straight airway that is unobstructed, permitting a uniform flow of air through it, will not give the same velocity readings in close proximity to the sides, top and bottom of the airway as at the center. The friction between the passing air and the rubbing surface of the airway acts to retard the flow of the air in contact with that surface.



Again, where bends occur much of the air is deflected from its course in the airway, and crowds the outer curve of the bend where the velocity will be the greatest. Owing to the same cause, the velocity at the inner curve of the bend will be less than at any other point of the airway.

Again, because of a difference in temperature or gaseous condition of the air passing into the mine and that filling the workings and many void and abandoned places, the warmer or lighter air will crowd the roof of the airway, while the cooler or heavier air travels along the floor. This may give a different velocity of the air current at the roof and the floor. The same effect is observed in dips and rises in the airway, where the bulk of the air may crowd the roof or the floor of the passage as the case may be.

An important factor to be considered, in taking measurements of the velocity of air in an airway, is the obstruction that the observer's body presents to the even flow of the air. It is impossible to make any accurate allowance for this obstruction, which always acts to increase the reading of velocity, but not in proportion to the decrease in sectional area by reason of the observer's body.

Not infrequently has it happened that a crafty mine foreman, knowing that his mine was short of air, would affect to be much interested in the readings taken by the mine inspector, hoping that the inspector would not realize that his presence in the airway would give a higher reading, which was his real intent and purpose.

Notwithstanding these practical conditions that affect the accuracy of velocity readings in airways, the prevailing practice is to measure the volume of air passing by taking anemometer readings at a selected point in the airway, where the sectional area has been carefully measured, using for that purpose the Biram anemometer shown in the accompanying figure. In my opinion, the chief point to be considered is that these readings should always be taken at the same point in the airway and under similar conditions, so that the comparison of the readings taken from time to time will be of greater value than if these readings had been taken at different points and under varying conditions.

THE BIRAM ANEMOMETER

When taking the velocity readings the observer should stand facing a rib of the airway, with his back against or near the opposite rib. He should hold the anemometer at arm's length, say a foot or so beyond the center of the airway. It is well to take a one-minute reading, say 2 ft. above the bottom and another like reading 2 or 3 ft. below the roof. We would suggest that an attempt to obtain an average reading by moving the anemometer about in the airway, except under particularly favorable conditions, is not generally satisfactory.

In closing, *Coal Age* would recommend, in general mining practice, the use of a reliable Biram anemometer such as shown in the figure to which we have already referred. An instrument of this kind is manufactured by the Davis Instrument Mfg. Co., Baltimore, Md. The 5-in. Biram anemometer is made to register a velocity up to 10,000 ft. per min. In this connection, we would refer to a description of this instrument and its use that appeared in *Coal Age*, Vol. 4, p. 655.

While the readings of the anemometer, taken with proper care, are generally accepted in the measurement of air volumes, in common mining practice, when greater accuracy is required engineers employ a Pitot tube, which is an instrument designed to measure the velocity of air in a conduit, as determined by the pressure head producing such velocity. This instrument is not adapted to general use in mines, however, and requires more skill than average mining men possess.

EXAMINATION QUESTIONS

Miscellaneous Questions

(Answered by Request)

Ques.—An airway is 4 x 4 ft. in section and passes 9000 cu.ft. of air per min.; what would an airway 9 x 9 ft. in section pass, if the length and pressure are the same in each of these airways?

Ans.—For the same length and pressure, the quantity of air passing in an airway is directly proportional to the square root of the cube of the area and inversely proportional to the square root of the perimeter of the airway. In other words, the quantity of air passing is proportional to the potential factor $a\sqrt{\frac{a}{o}}$, in which a equals the sectional area and o equals the perimeter of the airway. Finding the value of this potential factor for each of the airways given, we have as follows:

First airway,

$$a = 4 \times 4 = 16\ sq.ft.;\ o = 4 \times 4 = 16\ ft.$$

Second airway,

$$a = 9 \times 9 = 81\ sq.ft.;\ o = 4 \times 9 = 36\ ft.$$

The value of the potential of each of these airways is then,

First airway,

$$a\sqrt{\frac{a}{o}} = 16\sqrt{\frac{16}{16}} = 16$$

Second airway,

$$a\sqrt{\frac{a}{o}} = 81\sqrt{\frac{81}{36}} = 81 \times \frac{9}{6} = 121.5$$

Therefore, letting x denote the required quantity of air circulating in the second airway, under the same pressure that passes 9000 cu.ft. in the first airway, and making the quantity ratio equal to the potential ratio, we have

$$\frac{x}{9000} = \frac{121.5}{16};\ \text{and}\ x = \frac{9000 \times 121.5}{16} = 68{,}343+\ ft.\ per\ min.$$

Ques.—Four airways, A, B, C and D have the following respective lengths: A = 200 yd.; B = 400 yd.; C = 600 yd.; D = 800 yd. Taking the sectional area of A as 50 sq.ft., find the respective areas of the other three airways such that each of the four airways will pass 50,000 cu.ft. of air per min., under the same unit pressure.

Ans.—Assuming a square cross-section for each of the four airways A, B, C and D, for the same pressure and quantity of air passing, the sectional area in each airway will vary as the fifth root of the square of its length. In other words, the ratio of the sectional area of each of the airways B, C and D to that of the first airway A, will be equal to the fifth root of the square of the ratio of the length of said airway to that of the first airway.

In the use of ratios, the solution is much shortened by taking the relative lengths of these airways as 1, 2, 3 and 4, instead of their actual lengths. Doing this, the respective areas of the airways B, C and D are found as follows:

B, $\frac{x}{50} = \sqrt[5]{\left(\frac{2}{1}\right)^2}$; and $x = 50\sqrt[5]{2^2} = 66\ sq.ft.$

C, $x = 50\sqrt[5]{3^2} = 77.6\ sq.ft.$

D, $x = 50\sqrt[5]{4^2} = 87\ sq.ft.$

Ques.—A direct-current motor takes 40 amp. at 500 volts pressure for 100 hours; what horsepower does it consume?

Ans.—The horsepower that will produce a current of 40 amp. under a pressure of 500 volts is

$$H = \frac{EC}{746} = \frac{500 \times 40}{746} = 26.8\ hp.$$

Ques.—Assuming an air shaft 5 x 5 ft. in section and 200 ft. deep, passing 20,000 cu.ft. of air per min. under a 2-in. water gage, how much would this shaft have to be enlarged to reduce the power one-half?

Ans.—In answering this question, what applies to the enlargement of the shaft will apply to a similar enlargement of the airways; and neither the depth of the shaft nor length of the airways enter the solution. For a square cross-section and a constant length of air passage and quantity of air in circulation, the sectional area of the passage will vary inversely as the fifth root of the square of the power on the air. In other words, under the conditions named, the area ratio is equal to the fifth root of the square of the inverse power ratio. Thus, the original sectional area being $5 \times 5 = 25$ sq.ft., and calling the required sectional area x,

$$\frac{x}{25} = \sqrt[5]{\left(\frac{1}{0.5}\right)^2} = \sqrt[5]{2^2} = \sqrt[5]{4}$$

$$x = 25\sqrt[5]{4} = 25 \times 1.32 = 33\ sq.ft.$$

Since $\sqrt[5]{33} = 5.74$, or say 5 ft. 9 in., this shaft would have to be enlarged 9 in. on each side, in order to pass the same quantity of air under one-half the power.

Ques.—When, if necessary, is it advisable to change from animal to a mechanical system of haulage?

Ans.—Animal haulage should be replaced by a suitable system of mechanical haulage as early as the development of the mine will permit. The distance of haul from the inside parting to the shaft bottom should be at least 400 or 500 yd., and the daily output sufficient to keep the system running.

NOTE—In the fifth question, on page 806 of the last issue of *Coal Age*, the weight of the T iron should be 25 lb., instead of 35 lb. per yd.; and the cost, in the answer, should be estimated on "gross tons" (2240 lb.), instead of short tons (2000 lb.); thus, $800 \times 25 \div 2240 = 3.928$ gross tons, making the cost $8.928 \times 50 = \$446.40$.

In the sixth question, the velocity being given as "450 ft. per minute and a half," the quantity of air passing should be estimated, in the answer as $\frac{2}{3}(450 \times 72.3) = 21{,}690$ cu.ft. per minute.

COAL AND COKE NEWS

Harrisburg, Penn.

Shipments of anthracite to 19 states are now barred by order of the Federal Fuel Administration, according to a statement put out on Apr. 26 by the anthracite operators' committee, with headquarters in Philadelphia. These states are forbidden to draw on the anthracite supplies to protect the supply of the Middle Atlantic and New England States, which particularly require and are the greatest normal users of anthracite. Continuing, the statement says: "The states to which no anthracite may now be shipped either directly or indirectly are Alabama, Arkansas, California, Colorado, Florida, Georgia, Idaho, Kentucky, Louisiana, Montana, Mississippi, North Carolina, Oklahoma, Oregon, South Carolina, Tennessee, Texas, Washington and Wyoming."

Two hundred and fifty coal operators have formed the Central Pennsylvania Bituminous Producers' Association, J. P. Cameron, district fuel representative, announced on Apr. 26. The organization will keep the members informed on matters of importance in the coal industry, and an executive secretary will have offices in Altoona. Harry Boulton, Clearfield, was elected president, and John Lloyd, Jr., Altoona, vice president and secretary-treasurer. T. H. Watkins, New York, chairman of the executive committee, will conduct all negotiations between the Government and the association.

The cause of the discontent among the miners of District No. 2, central Pennsylvania, is a shortage of cars. There are approximately 40,000 members of the miners' organization and about 30,000 nonunion members in the district. In many of the mines, it is said, the men are given only seven or eight hours' work a week because there are no cars in which to load the coal. If it were possible for the men to be assured of five or even four days' work weekly, there would have been no demand at the Dubois convention last month for an increase in the price paid per ton for mining and the day wage scale. There seems to be an actual inability on the part of the railroads to handle the traffic, although there are plenty of miners who openly accuse the railroads of deliberately tieing things up in order to convince the public that the Government is not capable of conducting the railroad business of the country. No matter how that may be, one thing is certain. The mining question would be solved in central Pennsylvania if there were plenty of cars for all mines.

Among the operators there is a great deal of dissatisfaction over the placing of box-cars at mines where they must be loaded by hand. The added labor cost per ton is extremely heavy, and the Fuel Administration has declined point blank to make any allowance for the extra expense of loading. Besides, in the central Pennsylvania district these box cars, when loaded, can be shipped only in a westerly direction and cannot go beyond the limits of the zone. In other words, that coal must be sold in a field, like Pittsburgh and eastern Ohio, where there is plenty of native coal.

Scarcity of mining timber is a serious problem that confronts the anthracite industry. Intensive methods are being used to husband every foot of wood, for practically all the mountains in the anthracite region have been stripped of their young growth and cut to meet the demand. The cost of mine timber has steadily advanced, and the coal companies are ready to pay any reasonable market price for the needed timbers.

Shipments of heavy gangway, slope and shaft timber for general uses from the South have been largely cut off by the huge Government demands for lumber, and, in many instances, timber shipped from Georgia consigned to the mines has been commandeered by the Government, which is also taking lumber from retail yards. Throughout central Pennsylvania contractors are cutting every available stick of timber, and fabulous sums are asked for what useful tracts remain. These are generally held by estates.

Despite the report of the United States Forest Service that forty billion feet of lumber, enough to build 2,000,000 bungalows, was produced in this country during 1917, lumber is scarce. This preliminary estimate is based on the reports of 17,000 mills to the Government. It is significant to note that the reports of 700 mills—whose production is almost equal to the aggregate production of the remaining 49,000 other mills—show that the total of lumber cut by these mills in 1917 was 600,000,000 ft. less than the total shipped. High labor costs and transportation congestion have been chief factors in curtailing production of lumber, plus the prices fixed by the Government for its supply.

Birmingham, Ala.

As a result of the readjustment of wages announced for May 15, conditions in the mining districts of Alabama today present a most serene appearance. Under the new arrangement day labor at the mines will receive better pay, and as a result of the marked spirit of contentment that has settled upon this section a maximum production of coal at all mines is expected.

The Alabama coal mines are doing their share toward a material increase in production urged upon the mining centers of the country, according to figures compiled by the United States Geological Survey. These figures for the second week in April, just made public, show that the increase of bituminous mines in this country was 1,630,000 net tons, or more than 17 per cent. over the production of the previous week. The total production for the week ending Apr. 13 was 10,947,000, as compared with 9,317,000 for the previous week.

Coke production is also being maintained along most encouraging lines. Coke ovens at Jasper, in Walker County, and at Trussville will soon be operating under capacity restriction, but little of this added production is expected to reach the open market as the demand already passes the probable output. More than 1000 tons of coke could be handled were its manufacture possible, and until more ovens are in operation there is little possibility of much overflow into the open market.

As is the case in the pig-iron market, the limit in coke making has been reached in Alabama. This is the spur that is speeding up construction of the 154 byproduct coke ovens of the Tennessee Coal, Iron and Railroad Co. at Fairfield, and has led to the prediction that developments along the same lines will be announced by two and probably three other companies within the next 15 days.

Alabama added another coal company to its list of industries during the week, the newcomer being the Donaldson-Stobert Coal Co. capitalized at $25,000, and which filed its papers of incorporation in the Probate Office recently. The company is now developing coal lands in the vicinity of Henry-Ellen and Leeds, in the northeastern section of Jefferson County. A large mine will be producing coal in that vicinity within the next few months, the company announces. J. M. Donaldson is president of the new company, Thomas Berry, vice president, and Tom Stobert, secretary-treasurer. The company will maintain its general offices at Henry-Ellen.

Fairmont, W. Va.

It was feared for a few days that the railroads had determined to show up the coal operators in the Fairmont district by putting a bigger car supply in the region than it was possible to load, labor having been depleted by the poor car supply of recent months. On Monday and Tuesday of last week the cars furnished tested the capacity of the mines, but the plentiful car supply was shortlived. On Wednesday it fell down, and on Thursday there was a still greater scarcity of cars, the week finishing with only two really big days.

The car supply in the Pocahontas field has been greater than could be loaded since Apr. 1, and that condition is assigned to the labor shortage as well as to an epidemic of measles and grip. These were the only districts in the state that had more cars some days last week than could be loaded.

The Fairmont district has waged a bitter war for cars through the Central West Virginia Coal Operators' Association, and it was embarrassing when the empties began to come to the region in greater numbers than it was possible to load under existing circumstances.

A condition exists in Bluefield, W. Va., which is probably without duplication in the country. Bluefield, a city of 20,000, is located at the very mouth of the most important coal producing region in the country in war times, and yet there is a scarcity of coal imminent through a peculiar combination of circumstances.

A ruling of the Fuel Administration provides that in case of necessity the County Fuel Administration may divert cars "consigned to any point within the state." This does not solve the problem at Bluefield, however, for the coal produced in the Pocahontas field is consigned altogether to points outside of the state, Bluefield being in one corner of the commonwealth and having more direct relations with Virginia than with West Virginia, in which it is situated.

The consequences have been that Bluefield has needed coal when demands for consumption greatly exceeded production, and F. J. Howe, the district representative of the Fuel Administration, has had instructions day after day to get every car possible to the Navy or to other points where the demand seemed to be most imperative. The local dealers, not being familiar with the manner in which fuel matters were being handled, appealed to the county coal committee, making the contention that Bluefield faced a coal famine.

J. Walter Barnes, federal fuel administrator, was appealed to and found that it required special effort on the part of dealers and domestic consumers, and coöperation with the district representative of the Fuel Administration, to supply the local needs. There had been one embargo lasting from Mar. 29 until Apr. 25, which was lifted on the very day that the federal fuel administrator arrived at Bluefield. This made it possible to secure coal if orders for it had been entered in advance.

It was emphasized that it was just as necessary for industrial and domestic consumers in Bluefield to buy coal early as those who were located at points distant from the coal fields, and that Bluefield consumers, like those elsewhere, could not be particular regarding the kind of coal they could obtain, but were to consider themselves lucky to be served at a time when smokeless coal was in great demand by the Government.

The new executive committee of the West Virginia Coal Association will meet at the Frederick Hotel on Saturday afternoon, June 1, in accordance with the decision reached at a mass meeting of coal operators of West Virginia held at Huntington Friday afternoon and night of last week. At this meeting it was also decided to perpetuate the state organization and name a new executive board, which is to consist of a member from every coal district, to be selected by the district association between now and June 1.

C. H. Jenkins, president of the Central West Virginia Coal Operators' Association, of the Fairmont district, vice president of the West Virginia Coal Association, presided at the meeting as Col. T. F. Houston, the president, could not attend. W. H. Cunningham, the present secretary of the organization, read the call determined upon at a meeting of the executive committee held Apr. 12 in New York. A committee on resolutions consisting of Quin Morton, of Charleston; A. Brooks Fleming, Jr., of Fairmont, and Capt. D. H. Barger, of Bluefield, condemned as untrue a statement given to the press by ex-Gov. W. A. MacCorkle, chairman of the Third Liberty Loan in West Virginia, in which the latter charged that the coal operators were "passive" regarding the loan.

A meeting earlier last week called for Washington, to consider a state organization as a part of the American Mining Congress, did not attract wide representation and it was decided there to postpone action until the Huntington mass meeting. The question of affiliating with the American Mining Congress did not come up here.

although the opinion prevailed that co-operation with that organization was likely to come about; but not in such a way that the same cooperation could not be given the National Coal Association, the splendid work of which was praised by nearly every speaker who has been in touch with its work.

Charleston, W. Va.

Little or no relief has been secured from the dearth of coal cars in this district as a result of the visit of local coal operators to Washington last week. John L. Dickinson and others held a conference with Director General McAdoo and other Government officials, but were unable to secure any promises of a definite nature. It was explained to them that lack of shipping facilities at Tidewater, where thousands of cars are tied up, and the tardiness of manufacturers despite high demurrage rates, in unloading cars on their sidings, was chiefly responsible for the car shortage in this and other regions.

Coal operators in the Kanawha district are in a quandary as to what other steps to take to improve the car situation. Cars are as scarce in this section this week as they were a week and a fortnight ago, causing a material curtailment of production, some of the mines, it being asserted, only being able to mine coal for two and a half days a week. Approximately 250 operations are affected by the car shortage, which has been averaging for the last few weeks only about 50 per cent. of the normal supply; and a large proportion of the cars received are for preferential shipments. Kanawha district operators contend that car supply conditions are worse than in any other section of the state at the present time.

The Supreme Court of the state has reversed the decision of the Logan Circuit Court which found for the defendant in the case of the Producers Coal Co. against the Mifflin Coal Mining Co. and has remanded the case, holding, among other things, that the general manager of a coal-mining corporation is a general agent and has implied authority to bind his principal by such contracts and modifications thereof as are reasonably necessary in conducting the business of mining and selling coal. The suit was for the breach of an alleged contract of sale to the Producers company of the output of the Mifflin company's mine for a year, beginning Apr. 1, and ending Apr. 1, 1917, the Mifflin company having as successor to the Mifflin Coal Co. taken over a four-year contract under which it was to pay 10 per cent. commission to the Producers company for selling the coal. The contract was changed as of Apr. 1, 1916, being signed by the general managers of the two companies, and under the terms of that contract the Mifflin company agreed to dispose of its output to the plaintiff at $1 per ton. Directors of the company contended that its general manager had no authority to enter into such a contract.

Holdings of the Consolidated Coal Co., in Harrison County, were increased last week when that company, for the sum of $259,249, paid in royalties, secured from the Monongahela River Railroad Co. 516 acres of coal lands on the waters of the West Fork. Title to the property was acquired under the terms of a lease by which the coal company paid royalties of 6c. a ton on 4,319,150 tons of coal mined.

Columbus, Ohio

A most important order emanating from Director General of Railroads McAdoo, has been received by Ohio coal carrying roads, which effectually puts a stop to the development of new mining concerns in all sections. The order, which was dated Mar. 2, was received by the T. & O. C. R. R. only recently, and no explanation was received why the order was delayed so long from the date of issue. The order which was signed by A. H. Smith, regional director, is as follows:

"Under existing conditions, it is felt that the expenditure of money and labor is inadvisable for the construction of branch lines for the opening of new coal mines, in view of the necessary unproductive work incident to such undertakings; unless there is some special reasons other than those generally applicable to such cases, in which event the matter should be submitted to this office, with full information, in order that proper investigation may be made to determine if the proposed development is in keeping with the general policy of the Director General."

This ruling comes as a complete surprise and disappointment to operating interests in Ohio, as it was believed that Federal officials were encouraging new operations, especially the opening of mines which would be capable of producing large tonnages. Many new operations in Ohio which were under way except where switches had not been constructed, are effectually stopped.

An important ruling has been received by Ohio coal operators from the Director General of Railroads relative to the payment for spurs and switches built to coal mines. Under the practice which has prevailed for some time, the operating interests were compelled to pay for the materials and work of construction of all spurs, and the property on the right-of-way of the railroad company reverted to the railroad. In other words, the railroads got the benefit of the construction, and if dismantled the value of the materials, including ties, rails, frogs and all other property. Under the recent ruling the railroad is compelled to construct and maintain the track as long as it uses the right-of-way of the railroad company and the operating interests construct and maintain the track when off the right-of-way.

H. S. McCauley has been appointed inspector for Southern Ohio, Pomeroy Bend and Mason County, W. Va., by W. D. McKinney, a representative of the Federal Fuel Administration in Ohio. Mr. McCauley was formerly in charge of the Ohio mine car and was actively engaged in putting out mine fires. He is a practical miner. His duties will be to inspect all coal produced from the mines in his territory in the interest of clean coal, which is being pushed by the Southern Ohio Coal Exchange.

Toronto, Canada

An important conference of coal operators, representatives of coal miners and railroads and government officials was held at Ottawa, Apr. 17 and 18. Sir George Foster, Canadian Minister of Trade and Commerce, presiding. Among those in attendance were Mr. Neale, representing the United States Fuel Administration; C. A. Magrath, Canadian Fuel Controller; W. H. Armstrong, director of Coal Mining Operations at Calgary; H. P. McCue, Assistant Fuel Controller for Canada at Pittsburgh; Hon. T. W. Crothers, Canadian Minister of Labor, and W. P. Hinton, representing the railroad companies.

The conference was private, but at its close Fuel Controller Magrath submitted a memorandum covering the chief developments. It contained the important statement that information had been furnished by the United States Fuel Controller to the effect that anthracite coal supplies to points in western Canada will be materially restricted, rendering it safe to predict that no American anthracite will be available for shipment to points west of Winnipeg. It is also proposed to restrict shipments of anthracite to Canadian lake ports during the early part of the present season, and the public must be given to understand distinctly that conservation of coal must be practiced to the utmost extent.

The memorandum further stated that Sir George Foster had been able to announce that the attitude of the United States Fuel Administration was that Canada would receive precisely the same treatment as the states of the Union. The Western states had been given to understand that they must use the softer coal of the West, and that the available anthracite would have to be conserved for the supply of the Eastern states and the provinces of Ontario and Quebec.

A memorandum from the Western mine operators stated their ability to increase the production of coal by 1,280,000 tons, and of lignite coal by 1,225,000 tons. These increases would represent the amount of coal that could have been mined during the time the mines were idle last year owing to strikes and want of railway transportation. The figures given would not hold good unless the same amount of labor was available as last year, and unless the railways were able to furnish the transportation required. The operators urged that dealers and the public take a large portion of their supply during the summer months, when the railroads are in a position to handle it.

A memorandum presented by the Nova Scotia operators stated that the production of the mines of that province had been estimated at 5,950,000 tons, but the production actually attained was 5,660,000 tons. They reported considerable improvement in transportation facilities and pointed out that scarcity of labor had been the main factor in the curtailment of output. The suggestion was made that the government should ask J. C. Walters, president of the Dominion Trades and Labor Council, to visit the mining centers and appeal to workmen for the greatest possible production. It is estimated that the output in 1918 will be 230,000 tons less than the production of 1917.

In outlining what could be expected of the transportation companies, W. P. Hinton stated that provided that the coal mines started shipping immediately and continued to ship uniformly until Sept. 30, the railways are prepared to haul to the different points from Winnipeg west 50 per cent. or more of the actual amount required. Under similar conditions, subject to ordinary circumstances, the railways will be prepared to handle the balance of the coal required after Oct. 1, and throughout the winter. He emphasized the necessity of a start being made at once and not at a later period in the summer.

PENNSYLVANIA

Anthracite

Nesquehoning—The town of Little Italy, near here, with 900 inhabitants, is being gradually moved to New Columbus, across the Nesquehoning Creek in Packer township. All the houses in the new town are occupied, and new buildings are going up right along. Little Italy is underlaid with coal, which will be mined by the Lehigh Coal and Navigation Co. as soon as the entire town has been moved to its new site.

Dickson City—The Delaware, Lackawanna & Western R. R., Coal Department, is contemplating the erection of a new breaker at the Storrs colliery. The breaker, it is said, will cost in the neighborhood of $250,000 and will be all concrete and steel construction.

Wilkes-Barre—At the spring meeting of the Carnegie hero fund held on Apr. 26, among those cited for heroism, were two coal miners, whose families have been awarded bronze medals and cash. David A. Cadwalder, deceased, bronze medal and $10 a month to the widow, with $5 a month additional for each of four children. Cadwalder, a laborer, died attempting to save Leroy D. Winters from suffocation at the Wilkes-Barre Colliery Co. mine, Oct. 17, 1917. An explosion of firedamp occurred, and the two men and others hurried from the face of the tunnel to seek safety. John Harry, the other miner, was awarded a bronze medal for attempting to save Winters from suffocation, but was overcome with gas and was forced by other rescuers to go to the surface.

Bituminous

Uniontown—Morgantown interests have bought the mine and plant of the Johnson Fuel Co., at Percy, for $100,000. The tract consists of 324 acres of coal land in the Sewickley seam. J. L. Hatfield and R. L. Morris are among those interested in the new company.

Connellsville—An item appearing under this head, in the April 13 issue relative to the 15 per cent. increase granted by the H. C. Frick Coke Co. to its employees, did not apply to this company, as erroneously stated, but only to the United States Steel Corporation.

WEST VIRGINIA

Clarksburg—Abandoning the use of compressed air, the J. W. McDonald Coal Co. is having all its mines in the vicinity of Rosebud electrically equipped.

Fayetteville—With the installation of new motors, coal loading has been commenced at the Price Hill mines in this county, with Sam Dixon in charge of the operation.

Beckley—Beckley Coal Co. has purchased 550 acres of coal land on the Baltimore & Ohio between Weston and Hornor, from T. S. Stalnaker and Thomas E. Miles, of Hornor, and will arrange to develop the property at once.

Logan—Extensive improvements are contemplated by the Main Island Creek Coal Co. at its Logan County mines. Three large twin tipples will be erected at Littles Creek and 50 houses will be built.

One hundred new houses will be built for miners of the Amherst Coal Co. on Buffalo Creek in Logan County, the contract having been let to the Diamond Construction Co. of Huntington.

With the tipple at its mine at Wilbour on the Guyan River nearing completion, the Guyan Mining Co. expects to begin shipping coal early in May.

Fairmont—A shaft is being sunk by the Helens Run Coal Co., near this city, to develop a 300-acre tract of Pittsburgh coal.

Stotesbury—Included in the equipment recently added to the plant of the E. E. White Coal Co. is one 10-ton mainline and

three 6½-ton gathering locomotives, and 50 more mine cars to handle the increased number of men and tonnages.

Glen White—The present tipple at the Glen White plant of the E. E. White Coal Co. will be removed to make way for a new steel tipple, the contract for the erection of which has been awarded. The new structure will cost $150,000. It is possible, however, that no attempt will be made to build the new tipple until the end of the war.

Charleston—A large new tipple is to be built by the Mallory Coal Co. at its No. 2 mine on the Guyan Valley Division of the Chesapeake & Ohio.

Fifty new houses will be built by the Loraine Coal and Dock Co. at its Lorando plant in Logan County.

Two tipples will be erected in the near future by the Moyer Purseglove Co., of Cleveland, at its mines at Chauncey, where grading is being done for a new siding.

The Huff Mining Co. plans to begin shipping coal from its mine in the Guyan valley territory early in May, a new headhouse and tipple now nearing completion.

Two new electrically driven mining machines will be placed in the mines of the Wyatt Coal Co. at Sharon on Cabin Creek.

INDIANA

Terre Haute—The Eureka Block Coal Co. has sold the Dixie Bee coal mine, 12 miles south of this city, to Edward Shirkie, of Terre Haute, and C. A. Bicket, of Chicago, owners of the Bicket Coal and Coke Co., of Chicago. The purchase price was $400,000. The mine production will be increased from 400 to 2000 tons a day.

Sullivan—W. H. McGrew has leased the Klondyke mine, west of the city, to W. C. Brown, a Chicago capitalist, who will make extensive improvements and sink a new air shaft. He expects to employ a number of pick miners. He has leased the mine for seven years.

ILLINOIS

Schopen—A new coal mining town, to be called Standard, has been platted adjacent to the new Standard Oil mines near here. The real-estate operations are being promoted by D. K. Rice, of Gillespie, and F. M. Davis, of Alton. Mr. Rice promoted a similar town called Wilson near the new mine of the Northwestern Railroad Co., in the Gillespie neighborhood.

Freeburg—A thin partition between two rooms in the St. Clair mine near here is alleged to have been the cause of the death of one miner and the injury of another on April 20. The two men were shotfirers. They had touched off the fuses in one room and had gone to another when the shot in the first room blew the partition in on them.

OHIO

Beaumont—The Beaumont Coal Co. will soon start loading at its mine at this place, located on the Hocking Valley R. R. The mine is a shaft operation and its capacity will be in the neighborhood of 1200 tons daily when all equipment is installed. The property consists of 400 acres of No. 6 seam. The product will be sold through the Ajax Block Coal Co., of Columbus. W. T. Fassig is president; J. R. Schwartz, vice president, and T. C. Collins, secretary and treasurer.

Athens—The L. D. Poston Coal Co., chartered recently with a capital of $100,000, has taken over mines on the T. & O. C. R.R. at Millfield, which is nine miles west of Athens. Extensive improvements are contemplated, and it is desired to bring the daily capacity up to 1500 tons. The guiding spirit in the new mine is L. D. Poston, a grandson of the late L. D. Poston, who operated the first coal mine in the Hocking Valley district.

KENTUCKY

Providence—The Tax Supervisors of Hopkins County have handed the coal operators something of a jolt in assessing the mine property of the county, a number of big raises in the tax assessments having been made. The St. Bernard Mining Co. was raised $537,000; the Carbondale Coal Co., $42,000; Norton Coal Co., $49,000; Reinecke Coal Co., $80,000; Sunset Coal Co., $39,000; Coil Coal Co., $29,000; Rose Creek Coal Co., $57,000; Circle City, $27,500; and the Crabtree Coal Co., $29,000.

Nortonville—The high prices now being paid by coal-mine operators for labor is shown in the offers made by the Norton Coal Mining Co., which has been endeavoring to obtain men for loading coal. The company offers to men who have never been inside a mine $4 to $6 a day. The inside wage scale includes $4 a day to drivers; machine cutting, 10c. per foot, breast; 9c. per foot continuous; track layers, $4.25 a day; track helpers, $3.75; loaders, 40c. per car, No. 11; 35c. per car, No. 9; pumpers, $3.75 a day; timber men, $4 a day. These wages would be high for steady employment, and in fact are high in any event; but even at such wages it is a hard problem to hold men unless the mines can secure full supplies of cars, or at least better than a 50 per cent. supply.

Jackson—The Buckhorn Coal and Lumber Co., recently incorporated with a capital of $150,000, plans the development of 6000 acres of land on Middle Fork River. This land is covered with white oak timber, which the company proposes to cut mainly into railroad ties, some of which will be utilized in laying railroad lines in to get at the coal.

Middlesboro—J. T. Franklin, president of the United States Coal and Coke Co., was recently in Middlesboro, en route to Knoxville. Mr. Franklin stated that the company had increased its capacity to 30 cars a day, and expected to get the production up to 60 cars before long.

Personals

Lieut.-Col. Warren R. Roberts, president of the Roberts & Schaefer Co., engineers and contractors, of Chicago, Ill., is executive officer in charge of the construction branch of the "Construction Division" of the United States Army. This division does all the construction work in the United States and its possessions for all other divisions or

LIEUT.-COL. WARREN R. ROBERTS

bureaus of the army. Lieut.-Col. Roberts has been in engineering and construction work for 30 years. Some 20 years ago he organized the Roberts & Schaefer Co., which has since gained national prominence in the designing and building of all kinds of coal-handling plants, including coal-mining plants, coal washeries, locomotive coaling stations and coal dock bridges. Although Lieut.-Col. Roberts has been in the Government service since October, 1917, he still retains his office as president of the Roberts & Schaefer Company.

E. J. Payne of Charleston, W. Va., has been made sales manager for the Main Island Creek Coal Co. Mr. Payne was formerly with the E. J. Payne Coal Co. and was also connected with the Amherst Fuel Co. His headquarters will be at Huntington.

R. E. Almstead, of Huntington, W. Va., has been appointed as fuel inspector of the northeastern fuel administration district of Kentucky. He will have under his jurisdiction the counties of Boyd, Carter, Johnson, Lawrence, Floyd, Pike and Letcher. Mr. Olmstead has been an inspector of railroad fuel.

W. J. Heatherman, of Maxine, Boone County, West Virginia, has been appointed chief of the State Department of Mines, to succeed Earl A. Henry, whose term expired on Apr. 30. Mr. Heatherman has filled practically every position in the mines. He has been superintendent of the Island Creek Coal Co., in Logan County, and superintendent of the various mines of the Clinchfield Coal Corporation, in Virginia. He is 36 years old.

Obituary

Patrick Dougherty, a member of the mine inspectors' examining board for Luzerne and Carbon Counties, Pennsylvania, died on Apr. 23, after a few days' illness of pneumonia.

George Davis, of Drifton, Penn., one of the first and oldest miners of the Lehigh region, died on Apr. 26, at his home. Up to a few years ago, when he was compelled to retire on account of infirmities he had charge of the coal preparation department of Coxe Bros. Co., and was considered an authority on breaker construction.

Gustav Boehmer, president of the Boehmer Coal Co., who had been in the coal business in St. Louis, Mo., for 30 years as operator and distributor, died Saturday night, April 20, at his home, 5322 Von Versen Avenue, in that city. He was 69 years old. He had been in ill health since he sustained a stroke of paralysis three years ago.

Publications Received

Accidents at Metallurgical Works in the United States During the Calendar Year 1916. Compiled by Albert H. Fay. Department of the Interior, Bureau of Mines. Technical Paper 201. Unillustrated, 17 pp., 6x9 inches.

Technology of Salt Making in the United States. By W. C. Phalen. Department of the Interior, Bureau of Mines. Bulletin 146. Mineral Technology 20. Illustrated, 141 pp., 6x9 inches.

Nineteenth Annual Report of the Mining Industry of Idaho. For the year 1917. Robert N. Bell, state mine inspector. Illustrated, 129 pp., 6x9 inches.

Fifth Annual Report of the State Inspector of Coal Mines, Colorado, 1917. State Department of Mines, James Dalrymple, Chief Inspector. Unillustrated, 96 pp., 6¼ x 9¼ in.

Annual Report of Coal Mines for the Year Ending Dec. 31, 1917. State of Washington. By James Bagley, State Mine Inspector. Seattle. Unillustrated, 53 pp., 6 x 9 in.

Handbook of Instruction for Operating Ironton Storage Battery Locomotives. Ironton Engine Co., Ironton, Ohio. Illustrated, 32 pp., 3½ x 6½ in. Though intended primarily for those who are operating the types A, D and E Ironton storage-battery locomotives, this compact vest pocket handbook contains information that will prove of undoubted benefit to any one operating any type of locomotive. The company states that it will gladly send copies of this book to anyone using electric storage-battery locomotives, whether or not they are Irontons.

Trade Catalogs

Sirocco Mine Fans. American Blower Co., Detroit, Mich. Catalog. Pp. 56; 8½x11 in.; illustrated. Contains valuable data for mine owners and engineers, and includes complete information on mine ventilation, consisting of diagrams, typical arrangements, methods of calculating fan requirements and additional engineering data. It is in reality a textbook on the subject of mine ventilation and will suggest ways of handling particular problems.

Keeping Your Trucks in Service. Cutler-Hammer Manufacturing Co., Milwaukee, Wis. Folder. Pp. 6; 8½x11 in.; illustrated. Describes C-H sectional battery charging

equipment for battery locomotives and industrial electric trucks. Two pages are devoted to illustrating a number of large and small equipments in industrial establishments, piers and railroad terminals.

Mack Motor Trucks. International Motor Co., New York City. Catalog No. 33. Pp. 66; 8½x12 in.; illustrated. Describes Mack Model "AB" trucks of 1, 1½ and 2 ton capacities, with worm or chain drive.

Levin Oxygen and Hydrogen Generator. Electrolytic Oxy-Hydrogen Laboratories, Inc., 15 William St., New York. Bulletin G. Illustrated, 4 pp., 8½ x11 in. Describes a small, compact generator of the unit type and enumerates its advantages over other types.

Mack Trucking Among the Clouds. International Motor Co., New York City. Catalog No. 6. Pp. 70.; 8½x12 in.; illustrated. Contains specfications of the new model "AC" Mack chain driven, heavy duty motor trucks, which are built in three capacities—3½, 5½ and 7½ tons, with wheelbases of 156, 168 and 180 in. in each capacity.

Supplement No. 1 to General Catalog No. 16. Ohio Brass Co., Mansfield, Ohio. Pp. 51; 5⅜x8⅜ in.; illustrated. This catalog contains additions and improvements to the O-B materials listed in the company's large catalog, which describes overhead materials, rail bonds, car equipment, specialties and high tension porcelain insulators.

C-H Pendent Switches. Cutler-Hammer Manufacturing Co., Milwauke, Wis. Folder. Illustrated, 4pp., 3½ x 6 in. A two-color envelope folder which illustrates and describes both single and two circuit brass shell and all porcelain pendent switches. The operating push buttons are a part of the mechanism and do not loosen up, twist or become lost.

Industrial News

New York, N. Y.—The Porto Rico Coal Co., 1 Broadway, has filed notice of an increase in its capital from $250,000 to $750,000.

Shamokin, Penn.—The E. C. Jones Coal Co., 40 North Seventh Street, has taken bids for the construction of a new one-story coal washery at its plant near Shamokin to cost about $20,000.

Baltimore, Md.—In connection with other extensive improvements, the Wright & Gibson Co., of Pittsburgh, Penn., is planning for the construction of a new tipple at its local plant.

Buffalo, N. Y.—The Seneca Coal Mining Co. announces that after May 1 its general offices will be located at 708-712 Fidelity Building. The need for additional space was responsible for the change.

Middlesboro, Ky.—The Hawley Coal Co., which recently increased its capital to $50,000, is now developing approximately 100 acres of coal lands, having a daily output of about 100 tons.

Wilkes-Barre, Penn.—The George F. Lee Coal Co., Miners Bank Building, has completed plans for the construction of a new one-story coal breaker, to have a capacity of 500 tons. Frank B. Davenport, Coal Exchange Building, is engineer.

Pittsburgh, Penn.—The Pittsburgh Coal Co. has contracted with the Roberts and Schaefer Co., of Chicago, for the installation of Marcus picking table screens in its Moon Run and Partridge tipples, in Pennsylvania.

Gormania, W. Va.—The Cover Coal Co., Piedmont, recently incorporated with a capital of $20,000, is planning for the immediate development of about 500 acres of coal lands near Gormania, to have a daily output of about 300 tons.

Fairpoint, Ohio—The Clarkson Coal Mining Co., of St. Paul, Minn., has contracted with the Roberts and Schaefer Co., Chicago, for a large storage plant for run-of-mine coal at Fairpoint. The plant is now under construction.

Clearfield, Penn.—The Potts Run Land Co., miners and shippers of bituminous coal, announces that it has changed its name to the Potts Run Coal Co. The corporation is to continue under the same management as heretofore.

Norton, Va.—The Hurt Coal Co. has completed its organization plans and will commence work at once on the development of 35 acres of coal lands, to have an initial capacity of about 50 tons daily. T. V. Hurt is president and manager.

Jefferson City, Mo.—Wallace Crossley, Missouri fuel administrator, has issued an order prohibiting the shipping of coal in carload lots to persons other than licensed wholesale and retail dealers. The order is intended to check snowbirding.

Whitesburg, Ky.—The Elkhorn Superior Block Coal Co., which recently increased its capital from $35,000 to $100,000, is planning for the installation of new electrical equipment in its plant in connection with other extensive improvements and additions.

Lynchburg, Va.—The Chesapeake & Virginian Coal Co., Inc., Agent, has removed its Huntington, W. Va., office from the Day and Night Bank Building to Rooms 210-211 Robson-Prichard Building. Joseph Maloney is the company's Huntington field agent.

Knoxville, Tenn.—Myers-Whaley Co., manufacturers of shoveling machines for underground and surface work, announces that it has appointed J. P. Cotter, Post Office Box 584, Sydney, Nova Scotia, as agent for its machines in Nova Scotia and Newfoundland.

Chicago, Ill.—The Paragon Electric Co., formerly located at 9 South Clinton St., has moved to larger quarters in the Old Colony Building, 37 Van Buren St. The concern, among a number of other specialties, manufactures "Ironite," which is said to be the strongest wire for mine telephones.

New York, N. Y.—The Bureau of Construction and Repair of the Navy Department has awarded contract to the Amburson Construction Co., 61 Broadway, for the construction of four reinforced-concrete fuel oil and coal barges to be used in New York harbor. Each barge is to have a hold capacity of 800 tons.

St. Louis, Mo.—The St. Louis Coal Committee is sending out license applications to all retailers in St. Louis. Secretary Perrow estimates that 80 dealers with tracks and 400 without tracks will be required to take out licenses. No plan has been worked out here yet for supervision of the dealers in less than wagon-load lots, who are said to number about 800.

Columbus, Ohio—When George A. Borden, president of the Columbus Board of Purchases, went to open bids on approximately 30,000 tons of coal for various city departments, Apr. 2, it was found that none had been submitted. Coal producers and jobbers were loath to bid under present unsettled conditions. It was announced that the city will buy from the open market for the time being.

Charleston, W. Va.—The Federal Coal Co. has been incorporated by E. M. Johnson, of Charleston; John E. McCully, of Philadelphia; Judson E. Harney, of Scranton, and others, with a capital stock of $3,000,000, to operate mines in the Sherman section of Boone County, with offices in Charleston. The company owns a large acreage of land, much of which has valuable coal deposits on it.

Springfield, Ill.—The Springfield Terminal Railroad Co. has filed a petition with the Illinois Public Utilities Commission asking permission to construct an extension of its line to the site of the Clear Lake mine and to cross the Illinois traction system at grade. The object of the extension will be the transportation of coal from the mine to the Chicago & Alton, C. P. & St. L., and other connecting railroads in Springfield.

St. Louis, Mo.—The first annual meeting of the Missouri State Retail Coal Merchants' Association will be held at Jefferson City, Mo., on Thursday and Friday, May 9 and 10. Lieut.-Gov. Wallace Crossley, Federal Fuel Administrator for Missouri, will talk to the dealers, and T. Percy Bryan, of Kansas City, will discuss the retailers' problems. The speaker for the second day will be K. P. Gregg, of Gregg & Co., industrial engineers, who will talk on the matter of trade surveys.

Huntington, W. Va.—The Peter Cave Coal Co. was organized here and will operate on Horse Creek in Lincoln County, with offices here. I. J. Harshbarger is president, B. Pauler is vice-president, L. J. Corbly is secretary and Julius Broh is treasurer. D. J. Pancake will be general manager and Frank Kerns superintendent. All of these, with J. A. Baird, will make up the board of directors. The company has 500 acres of coal, with a 6-ft. vein, and expects to be mining it by June 1.

Ithaca, N. Y.—Federal control of the New York State barge canal may mean the establishment of a terminal at Ithaca, N. Y., for the transshipment of anthracite coal from the Pennsylvania mining region to the main canal line. This waterways system will be operated to relieve the traffic congestion on the railroads, and Ithaca is the logical connecting link between the railroads leading from the mines and the barge canal. Thus coal shipped over the Lehigh Valley and Lackawanna lines to Ithaca may be sent east, either to the New England industrial centers or New York City, or to points west.

St. Louis, Mo.—St. Louis retailers, at a conference with the St. Louis Fuel Committee, asked that action be taken to discourage manufacturers from buying coal in quantity and distributing it among their employees. They argued that it was unfair for the manufacturers to sell to their employees at a considerably cheaper price than the prevailing retail price during the summer months and when coal is scarce in the winter to call on the coal men to supply their needs. They urged that an order be issued requiring domestic consumers to buy from the dealers. The committee has the request under consideration.

Cincinnati, Ohio—At a meeting of bondholders of the Marmet Coal Co., held in Cincinnati a few days ago, a committee representing the majority indicated its willingness to accept an offer of $250,000 made by eastern interests for the company's coal, gas and railroad properties at Butler, W. Va. J. Kapfer, secretary of the committee, will receive the assent of other bondholders up to July 15, after which steps will be taken to wind up the company's affairs. All indebtedness has been liquidated except the bonds, and the company's properties can now be sold to good advantage, their total value being about $1,000,000.

Dallas, Tex.—Wiley Blair, Federal Fuel Administrator for Texas, has issued an order regulating the retail distribution of coal and coke in Texas, and designed to insure a fair and equitable distribution of fuel to domestic users in Texas. The text of the orders follows: "By virtue of authority vested in me by H. A. Garfield, United States Fuel Administrator, it is hereby ordered that carload shipments of coal shall not be sold either directly or indirectly by coal operators, producers, jobbers, commission merchants or retail coal dealers to individuals, firms or corporations, for domestic use, either for themselves or for distribution to one or more domestic customers."

Pittsburgh, Penn.—Effective May 1, 1918, the name of the Asbestos Protected Metal Co., of Pittsburgh, was changed to Aspromet Co. When this company was established in 1905, its sole product was asbestos protected metal. The initial product met with universal favor and resulted in the company complementing the same by adding to its line other building materials that were used and bought by the same people who use and buy asbestos protected metal. Now the company has a complete line of building material specialties, many of which contain neither asbestos nor metal in their make-up. Thus the descriptive name "Asbestos Protected Metal Co.," which originally served so well became restrictive to the point of being misleading; hence the change.

Milwaukee, Wis.—The Wisconsin Coal and Dock Co. is improving its dock near the harbor entrance. By straightening the harbor line about half an acre of storage space is gained. Concrete revetment and new unloading bridges are features of the enterprise, which will consume $100,000 or more. The new dock of the Milwaukee-Western Fuel Co. is almost completed. It extends from Muskego Ave. to Sixteenth St. on the Menomonee River, and is one of the finest receiving yards in the Northwest. It has capacity for storing 200,000 tons. It is equipped with an 8-ton man-trolley bridge capable of unloading 500 tons per hour. Nothing has been done as yet to restore the buildings and machinery in the yard of the Kanawha Fuel Co. at Sixteenth St. bridge, which were burned during the winter.

Columbus, Mo.—Dean E. J. McCausland, of the University of Missouri, has issued a statement, based on experiments at the university to determine the keeping quality of Missouri coal, that deterioration of stored coal is negligible and that there is practically no danger of spontaneous combustion. "The ordinary grades of coal used for domestic purposes," he says, "lose very little in fuel value by storage of a few months. Furthermore, dry coal placed in storage in quantities usually needed for the individual householder is not likely to be subject to spontaneous combustion. The coal should not be sprinkled when it is placed in the bins, nor should it be sprinkled during the season of storage to keep down the dust. Better a little dust than take any chances of reducing fuel value or causing combustion of the fuel."

MARKET DEPARTMENT

Weekly Review

Poor Outlook for Next Winter's Coal—Domestic Orders Plentiful—No Great Demand for Steam Sizes—Car Shortage As Bad As Ever—Bituminous Mines Still Working Short Time

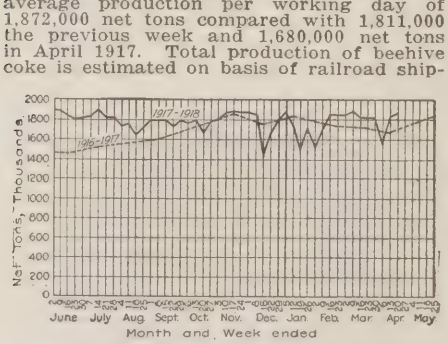
THERE is as yet no good reason to change the view that this country will be faced with a fuel shortage next winter. Only a very rapid and a very material betterment in car service can prevent what now seems inevitable. The Fuel Administration is disturbed because its eyes are focused on next winter; the Railroad Administration appears serene and seems to be happy in the fact there is no crisis today.

Statistics have been compiled to show that record tonnages of anthracite are being produced, but the consumer is anxious to know what has become of the coal. He cannot burn statistics, though he is being furnished with statistics to burn. The dealer is reluctant to accept any more orders, for he is already at his wits' end to know how he is to make deliveries from the meager stocks in his yard. In the meantime the public in most eastern states has responded to the "order your coal early" pleas of the authorities, and then has had to wait, like Micawber, for "something to turn up"; hoping that the "something" will be a plentiful supply of coal before next winter's frosts. In the West many mines are idle because John Skelton Williams refuses to purchase and store coal for the railroads.

Business in the steam sizes of anthracite is quiet, though here and there a little contract activity in these grades is reported. When the railroads begin to buy soft coal, and when the difficulty of procuring bituminous coal becomes more evident, it is believed there will again be interest in the steam sizes.

In an effort to protect the supply of anthracite to the Middle Atlantic and New England States, the zoning plan was further tightened this week by an order from the Fuel Administration barring the shipments of hard coal to the South without special permit.

The users of soft coal are up against it, too. Bituminous mines will never be able to work to full capacity under existing conditions. More engines and more cars are needed. The fact that this has been known for some time makes it all the more regrettable that a remedy has not been applied before now. Right at this time, when every bituminous mine in the country should be working at full blast, operators from a number of districts are reporting that their men are disgusted with working only one or two days a week and are leaving for other parts and other jobs.



The question of the price to be paid for railroad fuel is still unsettled, and this, too, is having an adverse effect on production. Lack of ships at tidewater, where thousands of cars are tied up, and the tardiness of manufacturers despite high demurrage rates to unload cars on their sidings, furnish additional reasons for railroad congestion and car shortage.

The Government has already recognized that a radical readjustment of transportation facilities is necessary to the speed-up program of our war industries. The Pennsylvania R.R. and the Baltimore & Ohio, which serve the most important eastern coal fields, have practically given over their eastern divisions to the hauling of coal, coke, steel and munitions originating on their own lines. The long-haul business to Chicago has been eliminated.

The large tonnage of coal that must be rushed to the lake ports for transshipment to the Northwest will undoubtedly have its effect on the quantity of coal available for storage in many parts of the East, and it is not likely that much coal will be stored until the lake season closes. This will be sometime during the latter part of October or early in November.

COAL PRODUCTION

The output of bituminous coal increased 366,000 net tons, or 3.4 per cent., during the week ended Apr. 20, compared with the week previous. Total production (including lignite and coal made into coke) is estimated at 11,230,000 net tons, an average production per working day of 1,872,000 net tons compared with 1,811,000 the previous week and 1,680,000 net tons in April 1917. Total production of beehive coke is estimated on basis of railroad shipments at 655,000 net tons, an average per working day of 109,000 net tons compared with 112,000 net tons for the week previous.

Beehive Coke—The 63 operators reporting produced 318.465 net tons of coke during the week ended Apr. 20. The ratio of production to capacity increased from 67.8 per cent. during the week previous to 71.6 per cent. The improvement was made possible by an improved supply of cars, losses attributed thereto amounting to 10.9 per cent. of full-time capacity compared with 13.9 per cent. for the preceding week. The same operators shipped 154.650 tons of coal, or 37.7 per cent. of their capacity.

Byproduct Coke—Byproduct coke operators for the week of Apr. 20 slightly exceeded their performance of the week previous. Production by these operators was equivalent to 88 per cent. of their full-time capacity. Losses attributed to lack of coal rose slightly from 5.5 per cent. the week of Apr. 13 to 5.7 per cent.; losses attributed to labor trouble declined from 0.5 per cent. to 0.1 per cent; losses attributed to repairs to plant declined from 5.2 per cent. to 4.5 per cent; no market losses remained the same as the week previous, 0.3 per cent., and losses attributed to all other causes rose from 0.6 per cent. to 1.4 per cent.

Material increase in production is reported by New Jersey and Pennsylvania. Ratio of production to full-time capacity of New Jersey operators rose from 81.0 per cent. the week of Apr. 13 to 84.7 per cent.; increased production being attributed to improved supply of coal. The ratio of production to full-time capacity of Pennsylvania operators rose from 79.4 per cent. to 81.7 per cent.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS

	Week Ended			
	Mar. 30	Apr. 6	Apr. 13	Apr. 20
Bituminous shipments, 123 roads.	189,546	160,178	188,311*	195,868†
Anthracite shipments' 9 roads...	43,642	32,223	37,760*	39,147†
Beehive coke shipments, 4 roads...	13,320	12,743	13,791*	13,455†

* Revised from last report. † Subject to revision.

BUSINESS OPINIONS

Dry Goods Economist—Prices for cotton fabrics do not seem likely to recede, and, in fact, may go higher. This is due to the fact that cotton for all, or nearly all, current manufacturing has been purchased at market prices and the cost of yarns is therefore established for some time to come. It seems assured that the cost of production will be increased in many cotton goods mills. Bleaching and finishing, too, will cost more next season than it did last.

Wool and Cotton Reporter—The woolen goods market is becoming more conservative in distributing goods at prevailing prices and in regard to the buying power of the ultimate consumer. Whether price regulation is near or far off is not apparent, but a development is expected whereby any accumulations will largely be disposed of. Standardization is believed to be one of the problems which are being worked out, and which require time.

Bradstreet's—While grain crop news continues favorable, low temperatures have deterred farm work and prevented crops already seeded from taking on growth. Further cuts in the output of pleasure automobiles have been ordered, flour milling is below normal owing to lack of materials, and launching of new enterprises of a miscellaneous character are held in check either by war restrictions, fear of being placed in the non-essential class or possible credit restrictions. Labor is in short supply, and further drafts for the respective militant forces tend to further deplete the number of available workers.

Marshall Field & Co.—Current wholesale distribution of dry goods is well ahead of

the corresponding period of a year ago. Road sales for both immediate and future shipments show good increases over the same week in 1917. Merchants have been in to market in about the same numbers. Collections are ahead.

Atlantic Seaboard

BOSTON

Situation drifts without material change. Railroad fuel situation still somewhat mixed. Government requisitions on operators continue for large tonnages. More "contracts" have been made, but there are many steam-users as yet uncovered. Hampton Roads show slight improvement. New River differential not a good sign. Much anxiety over outlook and fuel authorities beset with inquiries. Anthracite deliveries by water gradually increase.

Bituminous—While there is talk of "priority lists" and shipments that are to be ordered from Washington, the volume of coal into New England shows a steady loss as compared with receipts a year ago. There are nearly as many emergency cases presented to the fuel authorities from day to day as there were in January, and with relatively few exceptions industrial plants are forced to run on a hand-to-mouth basis. Shipments of water coal are somewhat larger than a month ago, but there is not the improvement that is necessary to insure the continuous supplies our essential activities will require. The situation is drifting along and already one of the normally heavy months for coastwise shipment has passed.

Assigned cars seem generally abolished, but apparently the railroad fuel problem is not so far advanced toward settlement as was generally supposed. It develops that because of the refusal of railroad purchasers to pay the commission legally established coal factors are busy placing tonnage that heretofore went to railroads, and sundry industrials are the beneficiaries. Some operators have of course been ordered to furnish a large proportion of output for engine fuel, but it is felt that this whole subject will soon be straightened out.

Bunker and other requisitions through Washington continue perplexing. Operators are not free to make commercial contracts to anything like the extent that was hoped and the result is a disappointment to many large buyers and a rather feverish effort on their part to get into line for water-borne coal. Undoubtedly the West Virginia factors are closing up more tonnage than they are likely to have, but the "contracts" are so full of holes that the shippers will suffer only in the opinion of those whom they will be unable to serve. Through Washington a large number of requisitions are being made upon the district representatives in behalf of various industries which are presumably without any contracts that yield shipments in sufficient volume. These orders are apparently rated as "Government" business and are, in fact, intended to be confined to those activities on the list of priorities recently issued under the authority of the War Industries Board. Inequalities in such a system are bound to creep in, and some better coördination should be devised than the routine that is now followed. The tonnages are heavy in the aggregate and, considering the number now on file, it is no wonder that operators are shy of closing contracts with New England plants, whether entitled to priority or not. The great effort now is for consumers to get on the priority list, and unless the latter is dealt with intelligently there is more than a chance there will be a repetition of the priority orders that worked such havoc last fall.

Meanwhile "contracts" are being made, sometimes with factors who really have a chance of securing coal but often with "purchasing agents" whose assurances are based largely on hope. In any case all arrangements are subject to Government orders and the seller assumes little obligation. The curious thing is that a lot of large buyers already feel so optimistic over current receipts, usually by water, that they promptly cease their purchasing of the steam sizes of anthracite or even the less desirable grades of bituminous. New England manufacturers are notoriously sensitive to "weak spots," and more than likely we shall have a period of light buying some time during the summer, notwithstanding the signs multiply daily that next fall and winter will see a much worse condition than last season. There are yet a great many plants that are not "covered," and these are regularly calling upon the fuel authorities for assistance from week to week. The number is larger than might be supposed, and to these should be added those who are relying upon shipments from the Baltimore & Ohio and Western Maryland railroads, where car supply shows regularly a shortage of more than 40 per cent. It is surprising how many New England buyers have put their faith in deliveries from the region tributary to those roads when they have been constantly warned to the contrary. Under present conditions it is hardly a natural all-rail movement to this territory.

The Hampton Roads piers show somewhat increased dumpings as compared with a week ago, but much more will have to be done before results can be regarded with any satisfaction. The New York piers also need radical treatment, and it is one of the hopeful signs that an official will be given the general supervision of dumping at the New York terminals. Tonnage over the Virginia piers is still affected by slow movement to tide and the generally poor car-supply, resulting in much curtailed operations.

The new $2.80 price per net ton f.o.b. mines for New River confers a differential of 35c. and almost the story of the balance of the year can now be written so far as concerns the smokeless coals. The Government departments will certainly bring pressure to bear on the shippers of the lower-priced output, the operators will be more or less indifferent because they cannot help themselves as to price, and generally there will be a heavy loss in tonnage. The big market for prepared sizes is much reduced through Federal regulations, and now through the same agency the New River operators partly because of heavy interest charges are handed a price that makes all the difference between narrow margin and handsome profit. The price will probably not be corrected until the months of heavy output are passed.

Anthracite—Receipts by water are gradually increasing, due more than anything else to the better movement of tows. The settled weather contributes to this result, and with many of the mines on a 90 per cent. output the outlook is a bit more encouraging. Rail deliveries have slackened again because of embargoes, but it is apparent the latter will be only of short duration.

NEW YORK

Shipments far below normal and dealers frantic because they cannot supply the demand. Weather conditions favorable for heavy consumption and next winter's supplies are being used. Public awake to the situation. Mayor Hylan providing for the poor. Bituminous for bunkers shows slight increase in supply. Commercial coal scarce.

Anthracite—The first week of the second month of the coal year finds the situation serious. Stocks are low and the demand for coal continues far above normal. Weather conditions remain unseasonable and favorable for heavy consumption, with the result that coal that should be used next winter is being consumed now. Production is far below what it should be to meet the demand, and operators realize that they could dispose of twice as much coal if they had it.

The public is thoroughly aroused to the situation and there is a fear that the country may be facing a coal famine next winter. They realize that the only salvation lies in the solution of the transportation problem and, having already placed their orders for next winter's supply, are now urging delivery on the retail dealer, while the latter is keeping the shipper hustling. The wholesale offices are thronged with dealers from early until late, all anxious for shipments of any sizes down to and including pea.

Some slight improvement is expected in the situation as a result of the order of the Anthracite Distribution Committee that 19 states are excluded from shipments of anthracite. The statement accompanying the order says that the situation is so grave in New England and the Middle Atlantic States that liberal shipments must be made into this territory, even though such shipments curtail the amount of coal that producers and distributors desire to send into the West.

There was an increase of 1387 in the number of cars shipped during the week ended Apr. 20 over the previous week, according to Government reports. Distribution is being made as equitably as possible under the supervision of the Anthracite Distribution Committee.

Mayor Hylan of this city, in order to prevent a repetition of last winter's situation, when the poorer class could not obtain coal for heating purposes, has directed certain of his department heads to provide for storing not less than 300,000 tons of coal. He says he has been promised the coöperation of the Greater New York Retail Coal Dealers Association, claiming a membership of 3000 coal peddlers.

Efforts to contract for the steam sizes are being made by most large consumers, but shippers are not inclined to sign up; for shipments, which, unless there is a decided improvement in transportation facilities, will be uncertain. Wherever it is possible buckwheat No. 1 is being stored. Rice and barley are free, the latter particularly so.

Current quotations, per gross ton, f.o.b., Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.15	$6.90
Egg	6.05	6.80
Stove	6.30	7.05
Chestnut	6.40	7.15
Pea	4.90	5.65
Buck	4.45@5.15	4.80@5.50
Rice	3.90@4.10	4.80@4.50
Barley	3.40@3.65	3.00@4.00
Boiler	3.65@3.90	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—The only bright spot in the situation here is in the slightly increased quantity of coal available for bunkering purposes. Commercial coal is scarce, and the situation remains serious. Car supply on most lines indicates a slight improvement but Tidewater receipts are about on a level with the previous week.

The trade is anxiously awaiting a decision from Washington with reference to the railroad fuel situation. In the meantime some of the mines have been receiving no cars at all, while others are better favored.

Large consumers are showing a desire to lay in stocks for the coming winter, but are meeting with no success owing to the bad shipping facilities and the fact that most of the coal is either taken by the railroads or by priority orders.

Conditions at the mines, from a labor standpoint, are serious. The miners are disgruntled because of the lack of work and every day it is reported many seek employment elsewhere. Along the Baltimore & Ohio some of the mines reported having received about 40 per cent. of their car requirements last week. This is a slight improvement over the previous week.

The zoning system has not made any material difference in stocks here. Free coals are scarce, while contract holders are not receiving anything like their full requirements.

BITUMINOUS PRICES

	F. o. b. New York Gross	Mine Price Net	Gross
Central Pennsylvania	$5.06	$3.05	$3.41
Maryland:			
Mine-run	4.84	2.85	3.19
Prepared	5.06	3.05	3.41
Screenings	4.50	2.55	2.85

PHILADELPHIA

Anthracite deliveries continue light. Dealers loath to book additional orders. Retailers quizzed again. Rail deliveries held back. Customers anxious for coal. Retail zone plan rumored again. Heavy tide shipments. Culm question up. Bituminous situation unchanged. Lack of cars makes situation most serious.

Anthracite—Conditions as to deliveries show no signs of improvement and the dealers are growing discouraged. On account of the continued dearth of receipts the dealers are showing little incentive to book additional business, which is in somewhat sharp contrast to a few weeks since, when certain dealers made strong efforts to book orders from new customers. It now looks as if the near future will see the dealers holding themselves strictly to the business of their old customers. This was emphasized at a recent meeting of the Philadelphia Coal Exchange, which was addressed by Chairman Lewis of the local fuel administration. Mr. Lewis suggested to the dealers that as he saw the situation it was really useless for them to try to gain each other's customers. He assured them that from his knowledge of the situation every dealer would need all the coal he could obtain for his own customers, and it was for this reason that earlier in the season Mr. Lewis had discouraged any new dealers from engaging in the retail trade. It can be said that the dealers have given full weight to Mr. Lewis' advice, as the trade has a growing high regard for him, as is shown by the increasing number of members in the coal exchange. Adopting his suggestion that he considered it wisdom

under the circumstances to join Philadelphia's representative body of retail coal men, 24 firms presented their names for membership at this week's meeting. This makes a total of 42 within a month.

That the fuel administration is alarmed over the present state of affairs is shown by a recent questionnaire issued from that office. Detailed information is asked for as to April shipments in sizes, unfilled orders in sizes, the names of the delinquent shippers, etc. This refers to domestic coal and it has been made known that strenuous efforts are to be made to induce the shippers to increase this city's quota by at least 10 per cent. over last year. The dealers are also called upon to furnish lists of plants to which they furnished buckwheat coal where bituminous might be utilized. It is also understood they will be forbidden to deliver pea coal to small heating plants for private homes in lieu of No. 1 buckwheat. Last winter, when buckwheat was almost as high in price as pea coal, and sometimes even higher, the dealers were called upon for the latter size and now in many cases it is preferred. The dealers are giving the information as promptly and as thoroughly as possible, yet they are wondering where the buckwheat coal is to come from, as in their previous inquiries to the producing companies they were informed that all this coal was needed for the regular steam trade. For this reason it is not at all likely that the dealers will be able to procure any of this size for domestic use, unless the administration should order it diverted to them.

The dealers are seriously handicapped by the slow delivery of what little coal has been consigned to them. In many cases shipments made in the latter part of March are undelivered, and most dealers have coal outstanding for two and three weeks. One seldom hears of rail embargoes these days, and it is known that the railroads are not tied with coal en route. It is believed that owing to a congestion of general freight coal shipments in this direction are being greatly restricted. It is also known that tide shipments to coastwise points continue especially heavy via the local piers.

Recently the fuel administration announced it was their earnest intention, if possible, to have at least 60 per cent. of this city's family coal for next fall and winter's consumption delivered before the first of October. This is a lengthening of the period, as originally announced, by one month. The public has responded and filed their orders as requested, but the deliveries for April have fallen far short of the proportion as planned by the dealers. One cause for this was the cold and stormy weather that made necessary the delivery of coal in small quantities for immediate use. The fact remains that one valuable month's time has passed with little progress having been made in storing coal. Teams are standing idle, all the costs such as feed, labor and equipment are mounting and the shippers, apparently, are not sufficiently optimistic to quiet the fears of the dealers. Many of the retail customers, now that they have had their orders placed for several weeks, are becoming anxious because no deliveries are being made to them. Since they became impressed with the importance of ordering early they are now becoming insistent that they be given coal. Their anxiety is only increased by the reports in the papers of the record production of anthracite at the mines in March and with promises of even better in April, and when the dealers here say they are not getting the coal they cannot understand it.

We have learned that for several weeks past the fuel administration has been working on a new scheme of distribution for this city. It seems that the city has been divided into zones and it is the intention to call upon the shippers to consign the required tonnage into each zone. It is claimed this will overcome the grievous errors of the past winter when sections of the city with a much smaller population than others, but with a greater number of dealers, received more coal on the latter account.

With the tonnages of soft coal cut by the authorities for the use of florists and breweries the anthracite shippers interested in culm have raised the question whether they will be allowed to offer this material to the above industries. At present there seems to be some hitch, but the culm shippers take the stand that there is an unlimited amount of this fuel to be had, and its sale to the restricted industries can in no way affect the general situation except favorably. The only objection that could be raised would be that of taking cars from other sizes.

The anthracite steam business is practically all sold up and despite numerous inquiries there is no free coal of any size to be had, unless possibly barley coal.

The prices per gross ton f.o.b. cars for line shipment and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$4.90	$6.05	Buckwheat	$3.15	$3.75
Egg	4.50	5.70	Rice	2.65	3.65
Stove	4.75	6.05	Boiler	2.45	3.55
Nut	4.85	6.10	Barley	2.15	2.40
Pea	3.45	4.35			

Bituminous—Some operators are willing to concede that there has been a slight improvement during the past week, due principally to a better car distribution. Certainly any improvement that has been felt is only slight, as reports continue to come in from mines working hardly more than half time for lack of cars. It is freely predicted that the production for April will even be lower than that for March. Despite the fact that the promise was made that the practice of assigning cars for definite loading would be discontinued, quite a fair proportion of empties sent in for loading this week were so designated, although it must be said the number is decreasing. The box-car question continues to agitate shippers, as quite a number of these cars were allotted this week, with instructions still holding that they can only be shipped westward.

BALTIMORE

Big boost in orders for anthracite despite warmer weather. Dealers complain of inability to get shipments. Soft coal supply easier.

Anthracite—Dealers over the city for the most part report a new rush of orders for hard coal deliveries over the summer months. Many of those ordering are urging immediate deliveries, apparently under the impression that they may not be able to get even two-thirds of their needs later. The activity, which has come despite the fact that warmer weather has set in, is undoubtedly due to the several public utterances of State Fuel Administrator Meyer that he would advise consumers to get their fuel supplies as early as possible. On the part of the dealers there is considerable complaint that there is not nearly enough coal coming through to take care of the more urgent of their customers. They rather discount the idea of urging consumers at this time, as it leads to complaint from those who place their orders and who do not see the coal coming through at once. Explanations that the coal will be delivered in the weeks to come and long before it is needed do not satisfy many people. Under this rush coal men can afford to be discriminating as to their deliveries, and in cases of poor pay are requiring checks or money with orders before they are definitely booked for early delivery.

Bituminous—The soft coal situation here eased up under diversions of considerable extent from coal congested at the Philadelphia & Reading connections, and which was originally destined north. This coal came through in large quantity to aid coastwise and export loading, and a considerable amount was also diverted for local harbor and line delivery. This diversion enabled the local fuel administration to care for a number of small canning and packing establishments that were without coal at the start of the food conservation season, and also to take care of those factories on the Pennsylvania R. R. lines which have been cut off from coal from long established mine connections on those roads by reason of the zone embargo. Much coal was loaded on small bay sailing and motor craft to be delivered at packing houses on the eastern shore of Maryland. It cannot be said that there is any surplus coal here, but the recent arrivals have enabled several important industries which were near the danger line to get in a little reserve stock. It is too early just now to predict just how the zone plan is to work out, especially as it is understood that certain railroad and consuming interests are working for modifications, in whole or in part.

Lake Markets

PITTSBURGH

Car shortage more pronounced. Fuel Administration orders get satisfactory preference. Lake shipments light.

There is still more complaint of car shortage at Pittsburgh district mines, and on the whole conditions instead of improving in the past week or two have really grown worse. It is clear that the railroads are quite unable to furnish the amount of transportation service required. They have shown at the same time that they have some measure of control over the situation in that they have been giving almost full car supplies to the mines that are working on Fuel Administration orders whether for munition plants or for railroad fuel; but the extra supplies given such mines simply come out of the general store and leave the mines operating on ordinary commercial orders with correspondingly fewer cars.

There continue to be small offerings in the market of coal loaded in box-cars, but as formerly these are chiefly of Ohio coal. There is hardly any Pittsburgh district coal offered in any kind of cars. The market remains quotable at the set limits, $2.20 for slack, $2.45 for mine-run and $2.70 for screened coal, per net ton at mine, Pittsburgh district, with an allowable 15c brokerage in addition under certain regulations.

Thus far shipments of Lake coal have been light, although there has been a little movement for two or three weeks past merely to cargo some of the vessels for their first trip up the Lakes. The regular vessel movement will not amount to much for several weeks, and meanwhile little coal will be shipped to docks.

TORONTO

Shipments less since opening of navigation. Consumers ordering largely, but deliveries restricted. Conference of retail dealers urged to prepare for shortage.

Receipts of coal from the mines have fallen off since opening of navigation, as much is being shipped by water to the upper lakes. The public generally are acting on the advice of the Fuel Controller and placing their orders early, but dealers as a rule are only supplying 1½-ton lots for immediate requirements. A conference of the Canadian Retail Coal Association held on Apr. 26, and attended by about 300 dealers, was addressed by R. C. Harris, Ontario Fuel Controller, who urged them to prepare for a shortage next winter by placing orders as soon as possible wherever they would be accepted.

Quotations per short ton for best grades are as follows: Retail anthracite, egg, stove, nut and grate, $10; pea, $9; bituminous steam, $9; slack, $8 to $8.50; domestic lump, $10; cannel, $11. Wholesale f.o.b. cars at destination, prices as fixed by Government: Three-quarter lump, unprepared, $6.11; prepared, $6.31; slack, $5.18.

BUFFALO

Coal situation little changed. Bituminous still plentier than anthracite. City distribution said to be better than in former years, but demand is greater. Loading for Lakes under way.

Bituminous—The situation does not change much. Coal is fairly plenty and promises to continue so, though the car supply is not good. Where there are cars in plenty the coal is in sufficient quantity. There are opinions given out by coal men that if cars were plenty a shortage of labor would be apparent, but so long as the labor supply is in excess of transportation it is a matter of doubt. As it is the men are often idle in the mines, waiting for cars.

Little or no surplus of bituminous has been reported, but some easily reached centers in Canada, as for instance Toronto are piled full of it. The reason is that the larger margin of profit given to jobbers there has sent many of them across the border, where they are doing much more business than they have done here since the price regulation was established. It is quite the common idea that the jobber is shelved here, unless he has some very close connections with good mines, which is something that most jobbers are unable to get. A few of them have formed such connections and are selling considerable coal, but that is far from being the rule. Even these say that it is hard to make a fair profit. They add that if what is expended in regulating the trade was turned in to the jobbers' profits the situation would be improved.

Apprehension centers on the situation as it seems likely to appear next fall. If all coal is taken up now as fast as it is offered, what will be the situation then, with the recollection of such a winter as the last one still fresh in our memories?

Bituminous prices continue at Government figures as follows: Thin-vein Allegheny Valley, all sizes, $4.45; Pittsburgh lump, $4.25; Pittsburgh mine-run, $4; Pittsburgh slack, $3.75; all per net ton, f.o.b., Buffalo.

Anthracite—The consumer complains as usual that his orders are not filled, or that at the best only a ton or two can be obtained. His applications are filed away and he must wait till his turn comes. One thing is in his favor. The price is expected to continue without change all summer, so that coal ordered now will not be anywhere up to 50c. a ton higher when he gets it. The shipping agents say that they are

distributing fully as much coal to the city trestles as formerly, and some of them even more than ever before; so they are not disturbed over the situation.

The effort of the consumers to lay in more coal than he needs seems likely to be given up. It was more or less common last year, but the heavy fines, that certain city merchants, mostly in the grocery trade, have been made to pay lately have set the householders to thinking. They do not really care to come under the same sort of regulation. At the same time the fear of running short of supplies is anything but easy to bear, so that the buyer as well as the seller is in a great quandary.

The Lake trade is not active yet. One company has loaded seven cargoes, of which 3200 tons has cleared for Chicago and 1440 tons for Milwaukee. The steamers began to leave here for the Upper Lakes on Apr. 27, a report having been received that the jam in St. Clair River was gone and the entire Lake route was open. The opening is late, but only one other shipping company is as yet ready to load water coal, which it will begin to do at once. The other agencies expect coal soon and are wondering where the newly-mined coal is going, as they should have a surplus here by this time.

DETROIT

Diversion to Lakes reduces movement of bituminous coal somewhat. Anthracite scarcity is not relieved. Much coal loaded on boats.

Bituminous—While the movement of bituminous coal into Detroit continues in considerable volume, jobbers say there is apparently some diminishing of shipments, which is accounted for by the requirements of Lake shippers and is also the result of the demands on transportation companies to supply car and motive power in handling coal from the mines to loading docks on the Lakes. The present supply, however, seems to meet needs of consumers for present consumption, though creating less favorable conditions for stocking up reserves.

Quite a number of large industrial consumers and public utility companies operating in this locality are reported to have made some progress toward acquiring stocks for future use. The circumstance that many of the manufacturing plants are without space available for storing coal in quantities larger than is needed to provide for a few days ahead necessitates maintaining shipments in rather steady volume, especially in view of the fact that nearly all factories and steam plants are being operated at approximately capacity in turning out work for the Government or products necessary for the completion of such work.

The users of steam coal show a well-sustained demand which, in the case of slack, the jobbers at times find it difficult to meet. Household consumers seem not especially eager to stock up with bituminous coal at present. Many of the retail yards have been able to acquire a good supply. The insistence of the state fuel administrator that no higher margin than $2.25 a ton is justified on deliveries to domestic consumers seems to be exerting a deterrent influence on distribution.

Anthracite—Household consumers are waiting for a more liberal supply of anthracite. With continued low temperatures thus far, the amount received has done little more than supply present needs, and dealers have been able to fill few of the orders received for next winter's supply.

Lake Trade—About 25 Lake freighters, many of them coal laden and all icebound, were held, some as long as 10 days, in Detroit River waiting for tugs to break through the ice blocking St. Clair River. The coal is badly needed at some of the upper Lake docks. It is estimated 600,000 tons were afloat May 1.

COLUMBUS

With the Lake trade slow in starting, and steam demand not as good as formerly, the coal trade in Ohio is not as active as in some former weeks. Domestic trade is active.

A state of uncertainty pervades the coal trade in Ohio. With the railroad fuel question partially reopened by John Skelton Williams, purchasing agent for the railroads, operators are at a loss to proceed. One of the effects of the reopening of the railroad fuel question is the backwardness of certain large consumers to place contracts, believing that lower prices may maintain. As a result things are uncertain and the total production is falling off, especially in certain sections.

The domestic trade is still the best feature of the business. Householders are taking the advice of the Fuel Administration and state officials, and many are laying in their coal supply for the coming winter. Dealers are good customers and are buying actively. A large percentage of the orders are for immediate shipment. Retail stocks are fairly large, but buying is continuing as many are desirous of having adequate stocks to take care of the rushing business. Retail prices are steady at the levels which have maintained for some time. Considerable Pocahontas is now finding its way into the local market.

The steam business is quiet, although there is a considerable tonnage moving. Stocks in the hands of the larger users are now adequate, and the smaller users are not anxious to increase supplies. Railroads are only taking fuel for current needs, as the railroad fuel question is still "up in the air." Few steam contracts are being closed at this time.

The Lake trade is also lagging because of ice in the upper Lake regions. Quite a few vessels have been loaded and have started, but most are held up at Detroit. Delay in starting the Lake trade is also caused by slowness in issuing permits by the Lake pool. Mine-run permits are only issued after an inspection of the mine. Thus practically no mine-run permits have yet been issued.

The output in Ohio fields has not been large. This is due largely to a car shortage which apparently is getting worse instead of better. Empties are slow in being returned to the mines. As a result the output in the Hocking field is estimated at 65 to 70 per cent. and about the same in the Pomeroy Bend field. In eastern Ohio car shortage is still bad, and the output is estimated at about 45 to 50 per cent.

Prices of short tons f.o.b. mines are as follows:

	Hocking	Pomeroy	East Ohio
Sized grades	$2.70	$3.05	$2.70
Mine-run	2.45	2.80	2.45
Screenings	2.20	2.45	2.20

CINCINNATI

Cool weather has kept consumption by domestic trade up, and demand for storage also continues strong. Slight improvement in car situation is noted.

Cold and rainy weather has prevailed in this section during the past week, serving to force into the market many domestic consumers who had used their winter's coal supply, and also accentuating the continued demand from those who are making an effort to secure coal for next season. The retail trade is not able to secure any supplies in excess of current deliveries, and the problem of the jobbers and operators also is that of getting enough cars moved to take care of current requirements. Great efforts are apparently being made by the Government authorities in charge of the railroads to improve the car supply at the mines, and incidentally to improve conditions at Cincinnati and other terminal points; but the confusion incident to the change of authority has not yet been straightened out, and this seems to be one of the principal causes for the difficulty in getting empty cars back to the mines. It is believed by operators and railroad men that by early summer there will be a greatly improved condition in transportation, but until the Federal railroad administration gets matters thoroughly into its hands not much relief is expected.

LOUISVILLE

Demand for domestic coal picking up, with consumers stocking much more freely and contracts from steam users showing much more activity. Conditions at mines practically unchanged.

Weather conditions have been such that domestic consumers have been burning fuel coal to a much greater extent than usual for April. However, the demand for immediate consumption is not so great. There is a heavy demand coming from residents, churches, schools, stores, etc., for stocking purposes. In steam coal more activity is being shown, and consumers who had been holding back have been signing up contracts in a lively manner during the past week. While little coal has been yarded by the retailers, indications are somewhat better than they have been. There has been a slight surplus of mine-run on the market within the past few days, most of this coal coming from wagon mines in western Kentucky, which have no open market for their output. In western Kentucky the labor situation is about the same as it has been, while the car supply is estimated at forty to forty-five per cent. of requirements.

The general rumor in Louisville, and one that has been accepted by both eastern Kentucky and western Kentucky dealers and operators, is to the effect that all Harlan and Straight Creek district coal will shortly be taken out of the Louisville market and diverted to the byproducts plants, which will leave Louisville dependent entirely on Jellico and western Kentucky mines. A prominent Harlan operator stated that while no formal action had been taken as yet, he felt assured that it would be forthcoming within a few days.

BIRMINGHAM

Local market active in both domestic and steam channels. Supply of both grades inadequate, and nonessential industries are feeling the shortage in steam fuel. Output improving slightly. Car supply as a whole continues good and adequate.

A strong and steady demand for both domestic and steam grades obtains in this market. Domestic dealers are exercising all diligence to secure every car of coal that they can get hands on, and at that are not making much progress in stocking their yards. There is a serious shortage in the supply of coal from the domestic mines, and unless production is materially speeded up retailers will not be able to secure anything like their winter requirements through the spring and summer months.

Only about three producers have taken the necessary steps to secure the additional 20c. per ton allowed by the Government for extra clean coal. According to the ruling of the Fuel Administration the retailer cannot add this 20c. per ton to his retail price without a permit from Washington. In furtherance of the step taken by the Administration to stimulate the production of clean coal, E. A. Holmes, district representative, has announced the appointment of J. deB. Hooper as chief coal inspector for Alabama, effective May 1.

Preferential shipments of steam coal are being made to essential industries as classified by the Government, and as a result, other classes of users are receiving the residue, the amount of such tonnage being uncertain and inadequate. The free coal supply has been further reduced by a heavy increase in priority requirements of the Southern Ry. during the past week.

This district is not suffering so far from the car shortage prevailing in other fields, and only a few isolated complaints have been reported. An increase in the price of cutting coal and in the wage schedule of mine workers will be placed in effect at all commercial operations May 15.

Coke

CONNELLSVILLE

Car supplies uncertain and no definite improvement recorded. Better supplies of byproduct coke, so that furnaces fare slightly better than in March.

While slightly better car supplies for the Connellsville region are reported in the past few days, the situation in general continues decidedly unsatisfactory. The general judgment is that April as a whole has shown no improvement over March. It is assumed by those familiar with both coke and coal conditions that the railroads are really doing considerable toward carrying out the Fuel Administration's instructions to provide the coke works with cars, in order to stimulate iron and steel production, but this conclusion is reached, not by observing the coke-car supplies by comparison with the requirements, but by observing that they are much better than the supplies furnished the coal mines in this territory, as coal-car conditions are much worse than coke-car conditions.

Taking the blast furnaces of the Central West as a whole, they have suffered less from coke shortage in the past two or three weeks than in March, but the improvement in their position, and only a small one at that, is credited to the production of more byproduct coke. In some cases byproduct operations have had a surplus over the requirements of their attendant blast furnaces, which they were built to serve, and in a modest way they have helped out a few furnaces that normally depend entirely on Connellsville coke.

There are scarcely any market transactions. The set prices remain: Furnace coke, $6; 72-hour selected foundry, $7; crushed, over 1-in., $7.30, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Apr. 20 at 336,876 tons, an increase of 2585 tons, and shipments at 303,932 tons, a decrease of 10,444 tons.

Birmingham—The local coke market continues strong and the demand for both furnace and foundry coke is far in excess of the supply. The fuel administration has

announced a price of $8 per net ton ovens for Pratt beehive coke for furnace use, and $8.75 for 72-hour foundry product. The Blue Creek, Black Creek and Brookwood schedule is $8.75 per net ton ovens for foundry use. Production is still below normal, output being considerably crippled by shortage of coke labor. An increased labor schedule will be effective at all commercial ovens May 15, the furnace producing companies having already granted the increase. Coke is moving better with an improved supply of box-car equipment.

Buffalo—The situation does not improve, especially as complaint continues that the regular ovens are turning out a scant supply on account of lack of cars to carry coal from the mines. This turns the furnace demand to the byproduct plants, and those in this vicinity are producing all the coke possible in order to meet the demand.

Middle Western

GENERAL REVIEW.

The demand for size coal continues to grow, while slack, screenings and washed No. 5 drags.

So far as actual market conditions are concerned, there is a growing feeling that the shortage of size coal is increasing. At the same time fine coal, such as is used by almost all the large consumers, is plentiful on account of the failure of the railroads to start their buying. Some operators report that their business is becoming lopsided, and that they are now declining to accept any order for lump, egg or nut unless such an order is accompanied with an order for fine coal. In some northern Illinois districts operators are piling their fine coal on the ground in order to permit their mines to operate and ship domestic sizes. Maximum production has not been attained in any locality. In some instances tonnage has been curtailed due to the failure of the Central Illinois Public Service Co. to furnish power to the many mines with which it has long-time contracts to furnish electric power for cutting and hauling purposes.

By far one of the largest mining property deals of the year was consummated this week. The entire holdings of the Chicago & Carterville Coal Co., with two large producing mines at Herrin, Ill., was sold to the Chicago, Wilmington and Franklin Coal Co., of Chicago. The purchase price was $1,500,000. The acreage consisted of 5000 acres in Williamson and Franklin Counties, of which more than 4000 acres is farm land.

CHICAGO

Illinois and Indiana lump, egg and nut in demand; fine coal plentiful and sluggish.

Little can be said about Chicago market conditions. It has recently dawned on the public that if they are to be kept warm the coming winter it behooves them to get all the Illinois and Indiana coal they possibly can; therefore no difficulty is had in disposing of anything that is prepared in this market.

The hard coal situation here is not different from that existing in other western cities. Only about one tenth enough is arriving to take care of the requests. Eastern bituminous and Kentucky soft coal is not obtainable. The fine coal market continues to be dull. This is best explained by the fact that many of the large fine coal users have during the past year purchased mines and are producing their own coal.

Quotations in the Chicago market are as below, per net ton f.o.b. cart at mines:

MILWAUKEE

Anthracite advanced 80c. per ton. A liberal supply expected during May. Bituminous being delivered freely at $7.25. Illinois coal zone extended.

The Federal Fuel Administrator has advanced anthracite coal 80c. per ton in the Milwaukee district. Egg is now $10; stove, $10.25; and nut, $10.35, with the usual charge of 50c. per ton for carrying in. Coke is being delivered in one-ton lots at $9.75, carried. Bituminous for steaming purposes is in good supply at $7.65. Hard coal can only be obtained in small quantities at present, but liberal receipts by Lake are expected during May. Consumers who order now are promised deliveries in June and July. A shortage of Pocahontas is expected, especially at the start of the shipping season.

An important readjustment of zone boundaries in Wisconsin has been ordered. It means that Illinois and Indiana coal may be shipped all the year round as far north as a line crossing the state from Kewaunee, on Lake Michigan, through Amherst Junction, Abbotsford and Chippewa Falls to Minneapolis. Formerly the boundary line extended from Milwaukee through Madison to Prairie du Chien. The interlying district heretofore has had to rely upon coal supplies coming via Lake ports Eastern fields.

Advices from the interior of the state represent that the wood-burning movement is spreading, with the result that coal consumption will be materially reduced in many districts.

Fuel Administrator Fitzgerald has been requested by the Washington office to importune the Wisconsin Railway Commission to grant street-car companies in Wisconsin cities the right to reduce the number of stops in order that fuel may be conserved. It is figured that nearly 10,000 tons of coal can be saved in this manner.

ST. LOUIS

An unusual market, with no Carterville available and a demand far exceeding supply. The market is picking up and looks encouraging on other coals, except steam. Car shortage prevalent and movement slow. Domestic business extraordinarily good. No Eastern or Arkansas coals.

The situation locally is more than satisfactory from the viewpoint of the retailer, except that not more than one-half the supply of Carterville coal is available for the demand. The domestic orders on Carterville have piled up so that there is two months' business ahead of the retailers at the present time, and the demand continues. The call for Mt. Olive is fairly good, with that for Standard rather weak as yet.

The call for steam coal is exceptionally slow, with the result that the steam sizes are dragging. Some mines have had to suspend operations on account of their inability to move the screenings.

There are indications, however, that there will be immediate improvement; and this is on account of railroad coal coming in. This will take mine-run and will eliminate the making of domestic sizes.

Conditions in the Carterville field are not good. The car supply is unusually poor and the movement of coal is slow. The slow movement prevents a rapid return of empties, and this is going to be a great factor in the efforts to make a big production this year. It will be the failure of the railroads to properly handle this tonnage.

Apparently, from the layman's point of view, no special efforts are being made by most of the carriers to expedite the movement of coal. Poor wages and inefficient help among the unorganized employees are perhaps the principal factors in this failure.

Somewhat similar conditions prevail in the Duquoin field, with a ready market for everything produced. This also describes the situation in the Mt. Olive field, with the exception that at these mines there were several hundred cars of screenings unbilled that caused a let-up in the tonnage on account of the tracks being congested with unbilled cars. There is a ready market for all the domestic sizes, but steam coal hangs heavily, with no place to put it.

In all of these fields the domestic sizes are bringing the full circular price.

In the Standard field there is a peculiar situation. Screenings have gone as low as $1.40 and lump coal as low as $2.15, for apparently no other reason than that the operators are not making a concentrated effort to produce and market their coal systematically. Even with the restricted zone the proper distribution would prevent a congestion of coal in some sections and a scarcity in others. The pooling methods in use in the East might be used to advantage in the handling of Standard coal here, for the reason that big users play against the market and force some mines to remain idle while they are beating the price down, whereas the maximum tonnage should be produced and a place found for it.

There is a scarcity of cars on the Missouri & Ohio and Illinois Central, and on the Illinois Central the movement is exceptionally poor. The other roads have a fairly good supply of equipment and the movement is almost normal.

Many mines in the Standard field have been idle on account of their failure to move screenings. During the past week something like 2000 cars of mine-run have been sold to railroads at prices ranging from $1.90 to $2.15. Many railroads are still in the market for coal, but feel that they can buy it at a lower price than the operators are now asking, for some operators are asking the full mine-run price, contending that if they do not get it they are going to market their coal for domestic and steam. The conditions in this field are going to be better, and good improvement is in prospect for the next week or ten days.

There is no anthracite coming in from the East, no smokeless, and practically nothing from the Arkansas district.

The circular here is, per net ton f.o.b. mines:

Employment of Women in Mining

By Floyd W. Parsons

NEXT to transportation the serious problem in coal mining is the provision of an adequate supply of labor. Approximately 30 per cent. of the male workers in the United States are now engaged in work that was not a part of our industrial effort previous to the entry of this country into the world war. No stretching of the imagination is necessary, therefore, to realize that this shifting of man power must disturb the usual course of business and make it difficult for the Nation to maintain on a normal basis even the production of essential products.

The anthracite coal industry has been hard hit by the voluntary enlistment of its workers and the later drafting of miners into the military service. One partial solution of the problem seemed to be the greater employment of women in various positions above ground. In line with this thought one of the larger companies moved the younger men employed around the jigs in the breakers to work which they could do at and in the mines. The positions vacated by these men were applied for by hundreds of girls when it became known that women would be used. Arrangements were made at each colliery for rest rooms, etc., to give these girls every reasonable comfort and protection. None of them was to replace any boy who could not be moved into a position that would pay him better.

The work that the girls were called on to perform was neither arduous nor dangerous; in fact it was less dangerous than the work in the silk mills, where a large number of them had been employed formerly. The girls were particularly pleased and were glad of the opportunity to make the additional wages that the coal companies paid for this work of running the jigs. The plan gave promise that the coal corporations, with this new help, would be able to provide a sufficient force of jig-runners to prepare the coal on the basis of pre-war standards, which the Fuel Administration now requires, and which it is difficult to obtain with only a 50 per cent. force.

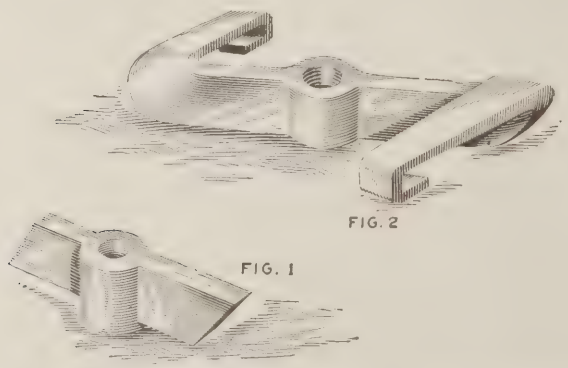
This hopeful outcome, however, has been prevented by the action of certain labor leaders, who have invoked an old law passed in 1891 which prohibits the employment of women at or around the mines for anything except clerical work. This law has been superseded in practically all of its parts by more recent legislation, but unfortunately the old law was never repealed in its entirety, and this clause concerning the employment of women still remains. The attention of the chief mine inspector of Pennsylvania was called to the law, and he was obliged to issue orders for the suspension of the girls until such time as a ruling on the matter can be obtained from the state's legal department.

The disagreeable phase of the matter is the exultation of a certain element of labor over this outcome. One labor organ calls it a victory, and in this assertion it is correct; for it is a victory—for the Huns. It is a victory for our enemies because, if the jigs in the breakers are not operated fully and effectively, the output of the collieries will not be clean coal; and hundreds of railroad cars will be utilized in the useless work of carrying refuse to market instead of fuel.

The anthracite labor force is so depleted that it will be almost impossible to maintain our last year's output of fresh-mined coal. This recent action, springing from animus and suspicion, was certainly an unnecessary interference with the attempts of the companies to maintain their working forces. It has prevented the use of girls in a class of employment, light in character and carried on under the best of hygienic conditions. It was also a work about which they were enthusiastic, and which they were loath to discontinue. It is fortunate that this local trouble does not typify the attitude of labor throughout the Nation. However, it is deplorable that such selfish and unpatriotic action should have occurred in connection with work so vital just now as the production of anthracite coal.

IDEAS AND SUGGESTIONS

An Improved Jack or Rail Bender



BY F. C. J.

The accompanying illustrations show a rail jack or bender—a tool in common use about the coal mines. Referring to the drawing, rail jacks at one time were made in the following manner: A block of iron was first forged into the shape shown in Fig. 1. Then this was chucked in a lathe, the punched hole trued up, and a square thread of about 3 to 4 threads per 1 inch cut. This made the nut part of the jack. The horns, or arms, were then welded to the nut and shaped up in the usual manner. The same operations were gone through when the thread was stripped. The arms were cut off, the nut part was chucked in a lathe, the thread bored out and a new thread cut if sufficient stock remained after boring. If not, a new nut was forged and machined.

The difficulty with this method was that quite often the thread became deformed from the welding and the job was a failure. To overcome this the jack was heated at the bend of the arm and the arm bent backward and inward toward the nut, as in Fig. 2. This made it possible to machine the whole jack, for the arms laid flat on the chuck of the faceplate and did not stick out.

The cutting of a thread in a jack presents many disadvantages, for such jacks often crack or break close to the nut or near the weld. If the former happens, it entails a difficult weld in order to keep from spoiling the nut. Sometimes the nut strips or the thread bar strips as both wear, and it is then necessary to do the expensive forging and machining all over again.

To overcome these defects the jack shown in Fig. 3 was evolved. The jack proper was forged from a solid billet of machinery steel and a 2½-in. hole punched and

FIGS. 1 AND 2. ORDINARY METHOD OF MAKING A JACK

drifted in place of the threaded nut hole. A bar of 3¼ in. diameter machinery steel was then bored and threaded on the inside for the thread bar of the jack. This bar was then turned down on the outside to 2¾ in. in diameter, leaving a head on one end of the original 3¼ in. diameter. A fine pitch thread was cut on the other end for a retaining nut. A ⅜-in. keyway was then cut on this threaded bushing and also in the drifted hole in the jack. The bushing was then placed in the hole and keyed in place, and the retaining nut screwed up tight. The jack was then ready for the thread bar. The advantages of this jack are at once apparent to all

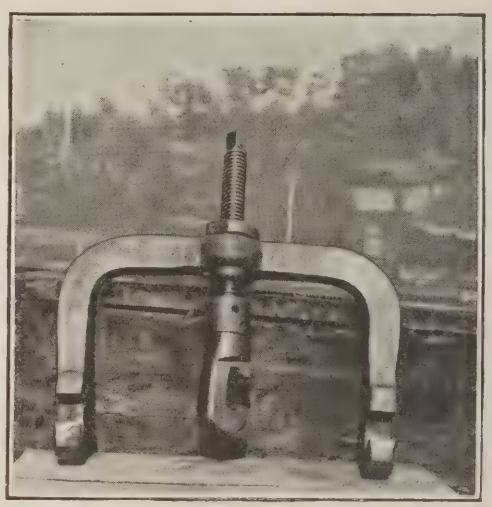


FIG. 3. THE COMPLETED JACK

trackmen. When the thread bar or the bushing strips or becomes worn they are simply taken out and a new part or parts put in place. If the jack should break, the machined parts can be removed and the repairs made without spoiling anything.

Fabric Belt Formula

BY W. F. SCHAPHORST
New York City

The rules as ordinarily given for fabric belts made up in plies are something like this: "A 4-ply stitched canvas belt is equivalent to a single leather belt; an 8-ply belt is equivalent to a double leather belt," and so on. Then, after knowing the equivalent, we have to hunt up the rules of thumb for leather belts before being able to decide on a width necessary for a given drive.

I have hashed over these rules and equivalents and have hit upon a formula that gives a direct result without mentioning leather at all. The formula applies to most ordinary belts made up in plies such as rubber, stitched canvas and balata. It is as follows:

$$\frac{WS}{\frac{2640}{P} + 136} = horsepower = H$$

where

W = Width of belt in inches;
S = Speed of belt in feet per minute;
P = Number of plies;
H = Horsepower.

For example, what horsepower may be transmitted by

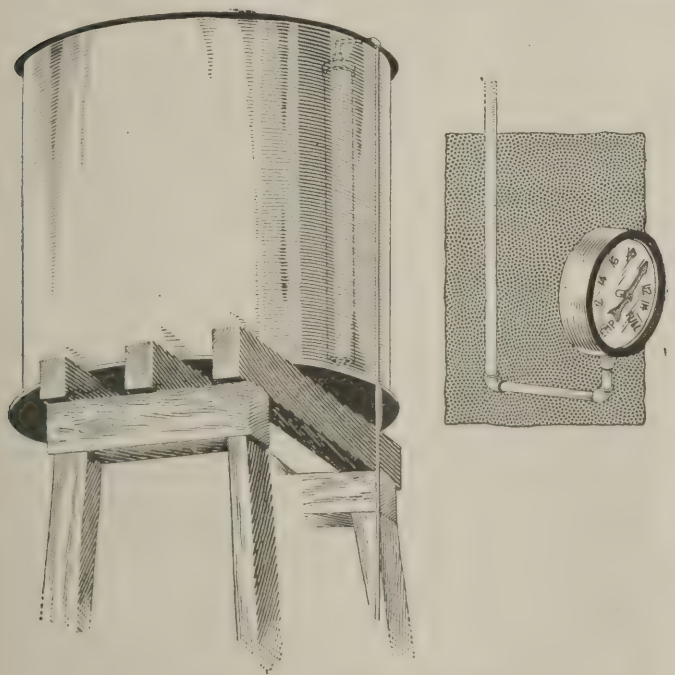
a 10-ply balata belt the width of which is 6 in. and whose speed is 4000 feet per minute? Substituting in the formula we get:

$$\frac{\frac{6 \times 4000}{2640}}{10} + 136 = 60\ hp.$$

Thrown into other forms for the determination of either W, S, or P this formula becomes:

$$W = \frac{H}{S}\left(\frac{2640}{P} + 136\right)$$

$$S = \frac{H}{W}\left(\frac{2640}{P} + 136\right)$$



$$P = \frac{2640}{\frac{WS}{H} - 136}$$

Valveless Tank Indicator

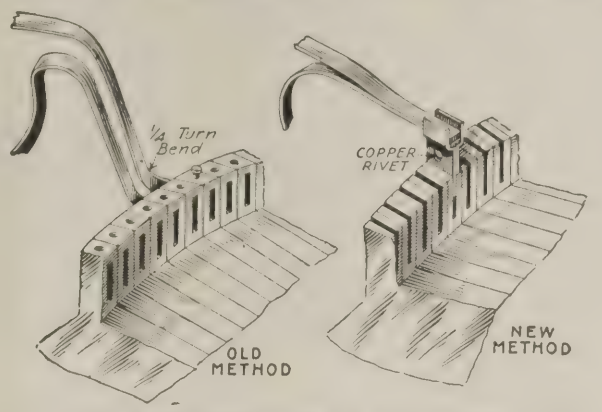
By L. V. Lauther

Guttenberg, N. J.

A convenient water-level indicator for a remote water tank can be made as shown in the accompanying illustration. A 4-in. pipe is vertically installed in the tank, on top of which is screwed a 4 x ⅛-in. reducer, the bottom end of the pipe being left open and supported about an inch from the bottom of the tank. A line of ⅛-in. pipe is run to a convenient point and an old pressure gage attached to it. As the tank fills it is evident that the air entrapped in the 4-in. pipe cannot escape, hence it must undergo compression. As the amount of this compression depends on the height of the water

TANK INDICATOR AND GAGE

level in the tank, the gage reading will thus increase as the water rises in the tank. A dial was placed on the old gage, and by experiment various heights in the tank are marked upon it as determined by trial.



Where the tank is far from the gage, it is better to incline the big pipe in the tank, so that a greater volume of air is entrapped, thus making up for any drop in the small pipe line. Of course, it is a good plan to go up in the tank once a season and check up on the gage.

Improving the Coil Attachment

By John J. Nolan

Linton, Ind.

The accompanying illustrations show an improvement to prevent the armature leads of certain mining-machine motors from breaking. This is a frequent occurrence on certain types of armatures, especially

OLD AND NEW METHODS OF ATTACHING COILS

when the wire becomes crystallized after considerable use or the commutator or shaft is loose, causing the leads to break when a bend and one-fourth turn are close together. I have known as high as 30 hook splices being made temporarily by the machine man or electrician before the armature was changed. In most such cases a new commutator is needed.

The company with which I am connected has equipped approximately 12 armatures in the manner shown and has proved them a success. Flat copper ribbon is used, just thick enough to fill the old slot and about ½ in. wide, and extending 1¾ in. above the riser opened just enough at the top to receive the coil flatwise. The extension riser is double and is riveted near the top, the lower end or single thickness being soldered in the commutator. Under the old method the coil was set on edge and held with a screw. A saving of about 7 lb. of copper is accomplished by this method.

Difficulty in burning bituminous coal in industrial furnaces is due almost entirely to the volatile matter, because this leaves the fuel bed as gases and tars and must be burned in the combustion space of the furnace. Unless enough air is introduced immediately at the surface of the fuel bed and thoroughly mixed with the volatile combustible, the tars and the more complex combustible gases are quickly decomposed or "cracked" into soot and simple gases. The soot thus formed is difficult to burn in the rarefied furnace atmosphere and is apt to pass out of the furnace as black smoke, particularly if the furnace is hand-fired. To prevent smoke and its accompanying heat losses, a considerable excess of air must be used and the furnace must have a large combustion space containing gas-mixing devices. The fixed carbon is easy to burn because it stays on the grade. It burns partly to CO_2 and partly to CO, which in turn can be burned to CO_2, with the additional air introduced above the fuel bed. Practically complete combustion of CO is easily obtained because of its simple molecular structure.—*Bureau of Mines Bulletin No. 135.*

Unit-Built Concrete Dwellings at Youngstown, Ohio*

BY HARVEY WHIPPLE
Detroit, Mich

FORTY acres of fireproof houses and community buildings, in a hill-top setting that has been worked out with an eye as well for attractiveness as utility, are included in the housing scheme of the Youngstown Sheet and Tube Co., East Youngstown, Ohio.

The initial contract was given to the Unit Construction Co., St. Louis, for terraces and double houses, with walls, partitions, floors and chimneys of precast concrete units, to include apartments for 146 families. The work is well under way at this time—begun in July, 1917—with buildings already near completion, having ten apartments, and the "parts" cast and in the yard, practically ready for setting up 50 more dwellings. It is proposed to complete the work now under contract in the coming summer.

While the unit method of construction has been successfully applied to industrial structures, to train sheds and in varied applications of the principle, to railway bridges and numerous other works, the Youngstown enterprise is the first use of the Unit Construction Co.'s patents and methods in dwelling house construction.

The first of the Youngstown unit-built houses—the one nearest completion—is shown in the headpiece. Other apartment groups well under way are shown in other illustrations. Fig. 3 shows, in rough outline only, the scheme of this housing development of buildings now under contract to house 146 families. Fig. 4 shows three typical plans.

The Youngstown Sheet and Tube Co.'s operations are large; great numbers of its employees are not thoroughly Americanized; their living conditions are not always conducive either to working efficiency or to the best citizenship. Many of them have to go too far to and from work; many are in crowded quarters, where houses are so planned as to inflict the necessity—due to their traditional standards of living—of a horde of boarders, to the great detriment of the best domestic development.

To remedy these conditions—to bring the workers closer to their work, to house them comfortably and economically, and under such an arrangement as to minimize the tendency toward overcrowding; to induce a more nearly normal, a more American recreational expansion of the individual, to inculcate a sense of appreciation of the better things in home and community life—with no less ambitious an idea, the problem was

FIGS. 1 AND 2. MIXING PLANT AND CASTING BEDS

*Reprinted from "Concrete," January, 1918, issue.

undertaken by the Youngstown Sheet and Tube Company.

The Buckeye Land Co. was organized; a farm about four miles out from the center of Youngstown was purchased and work was begun. Streets were first laid out, curbed and macadamized, but left without final surface treatment until construction is complete. Sewers were put in, water supply provided. The site is at the top of and on the side of a commanding hill. Grades, therefore, complicated the problem, but they add the feature that must ultimately contribute largely to the attractiveness of the community, in obviating monotony. The variety is enhanced by the irregularity also of the streets, as shown in Fig. 3. While the plans of individual apartments keep very close to the standards shown in Fig. 4, these occur as double houses and as terraces of various lengths, interspersed and not always in a straight line, but with offsets or steps in the front and back line. The variety is still further enhanced by the grades encountered so that in a row of six terraces, floor and roof lines step up 3 ft. for every second house in a row, and with all this variety the units necessary for the construction of the houses are fairly standardized with a very large duplication to

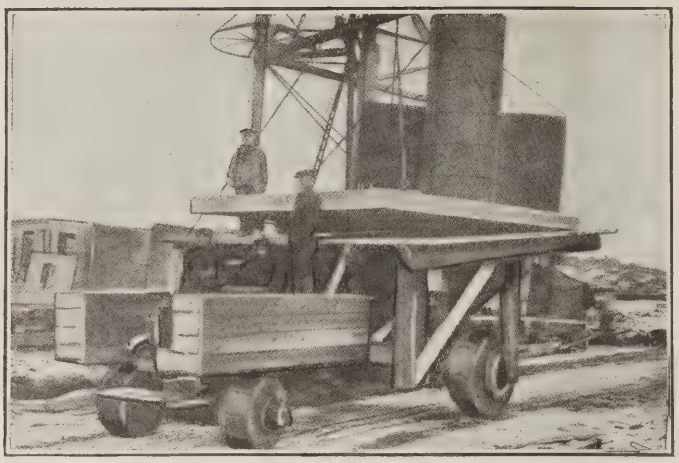

FIG. 5. CRANE LIFTING CONCRETE UNIT FROM "BUS"

effect economy. A single apartment of four rooms, bath, closets, cellar and porches involves less than sixty separate pieces of concrete. One entire wall for a story height comes in one piece; the floor of the largest room, about 16 x 12 ft., is in one slab. Chimneys are hoisted into place in one piece.

The center of manufacturing operations is the mixing plant—a half-yard Ransome mixer, tower, electric hoist and chute, feeding to a car on a tramway, on both sides of which are the casting beds (see Figs. 1 and 2).

Scarcity of good gravel in the vicinity led to the use of slag as the coarse aggregate in the proportion of 1 cement, 2 sand and 4 slag. The cement is about 20 per cent. in excess of good gravel aggregate. Six per cent. of hydrated lime is added.

The concrete is dumped from a 6 cu.ft. push cart, hand operated by two men, on the tramway to short chutes, conveying the mix by gravity to the unit molds on either side of the track, through several hundred feet of casting alleys. As a part of the plant are office building, cement storage building, pumphouse, supplying well water, and a wood working shop.

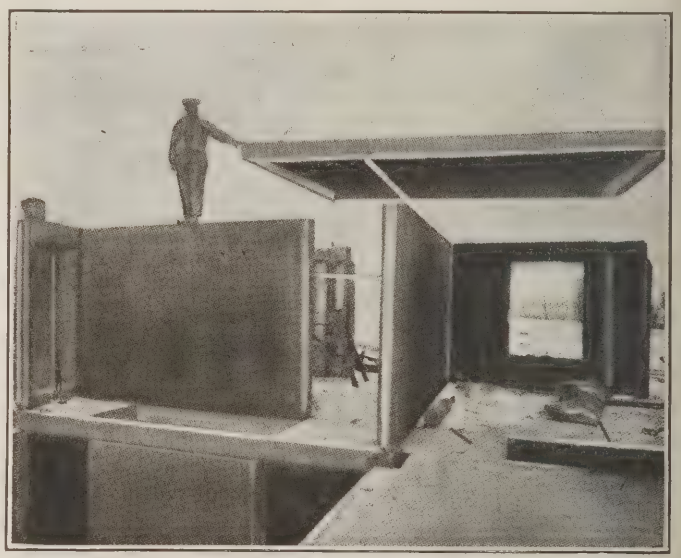
The houses are of precast units, except for 8-in. footings cast in place. Units are reinforced to sustain the loads in the structure and to withstand the strains in lifting, loading and placing.

Exterior wall slabs are of ribbed design (see Figs. 7 and 8). They are usually of story height and of a length equal to a room or entire side wall dimension. They are rabbeted at the ends so that the adjacent slabs as set provide a space for sealing with grout. At present these slabs are cast with the outside down. Ribs, giving a total maximum wall thickness of 7 in., are formed by boards set in the slab forms. The panels between have a thickness of 3 in. Furring strips, asphaltum painted on the back side, are anchored by nails to ribs when the slab is cast. Partition walls are tubular, the vertical coring being provided by means of form boxes set in the slab forms as the concrete is poured, these being withdrawn, the spaces filled with sand and the other side of the slab troweled on. Sand is removed later by washing with a hose.

Floor slabs are beamed (see floor slab being placed, Fig. 6), the central panels being only 2½ in. thick. These are cast ceiling side down over well finished wood cores designed to give a molded trim around the edge of each panel adjacent to the beams. It will be noted that floor slabs are so rabbeted at the outer edge as to fit over the wall slabs, anchoring the work (Fig. 8). Window and door openings are rabbeted and provided with wood-nailing blocks, cast in. Sills, to get a better finish, are separately cast. Chimneys are cast vertically with vitrified flue in place, rabbeted to anchor with the unit slabs when grouted in.

Severe cold and snow caught the plant unawares. The casting beds were deep in drifts before a winter shelter could be completed. The present inclosure has plank sides and a hip roof of 8-oz. canvas-covered panels laid on joists. These panels are all readily removable at any place in the sheltered casting area where cured units are to be lifted out. A boiler has been installed and steam pipes run between forms. Laborers spent several days removing snow. A gas blow-torch has been installed in the mixer, and hot gaging water is used. Except in the severest weather, concreting will continue through the winter. Even in such weather, it is anticipated that the temperature within the inclosure will not fall to a point to endanger the integrity of work done.

Hooks for lifting are cast in the units and cured



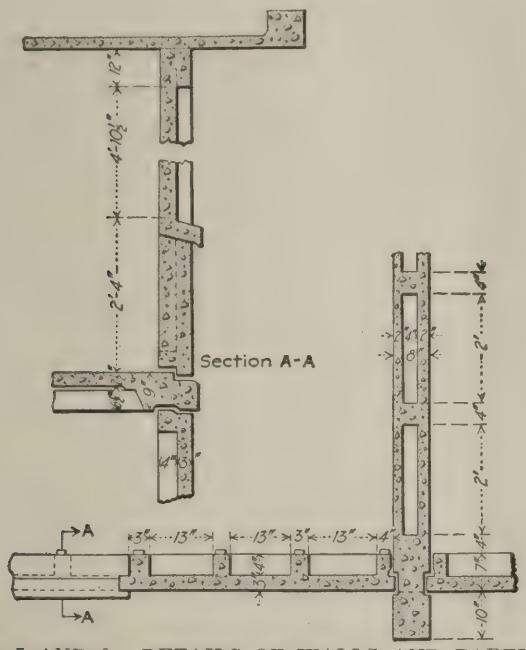


FIG. 6. FLOOR SLAB BEING PLACED IN POSITION

parts are lifted by a locomotive crane, operating on a track throughout the casting area (see Fig. 9) to a "bus." It has wide steel-bound, solid wood wheels, a 40-hp. engine, and a capacity of 11 tons (see Fig. 5). This was largely built on the job. It will take 11 tons of concrete units to a load—some single units weigh as much as 5 tons; travel the ups and downs of the winding roads, and deliver from the casting yard to the farthest corner of the building area, a distance of about 1000 ft., as much as 90 tons a day. A crane operating on rails was regarded out of the question on this particular hillside site. The "bus" solves the problem. At the building site the bus is unloaded by a hoist (see Figs. 7 and 8), each of whose three legs is set on rollers, and counterweighted with gravel by means of the cylindrical hoppers shown in the illustration. A floor unit about to be set by the hoist is shown in Fig. 6.

When the house units are assembled, set, anchored and grouted, the finish is not elaborate. Frames are nailed to the blocks provided at openings, wedged, calked with oakum and plastered over to a neat finish. The

inside surface of exterior walls is lathed and plastered over the furring on the wall ribs; wood floors are laid on sleepers over the unit slabs; interior partition surfaces, plastered exterior wall surfaces and ceilings are painted.

The tubular partitions and the space between sleepers on floors provide space for pipes and conduits. Regis-

FIGS. 7 AND 8. DETAILS OF WALLS AND PARTITIONS

ters are provided in second floor slabs for heat from below. Provision is made for heating with stoves, but a central heating plant is under consideration. There is a bathroom in each apartment, simple but adequate. Stairs are of wood. Exterior walls are given a brush coat of grout (see headpiece), and will be painted with special concrete paint of cream tint. Another note of color will be in the red tile roofs, which are to be laid on wood frame. In spite of this departure from the fireproof material, the fireproofness, to answer most practical purposes, still remains, since a complete fire seal is provided in the attic floor of concrete. Ventilation of this roof space is provided by metal mesh covered openings under the eaves.

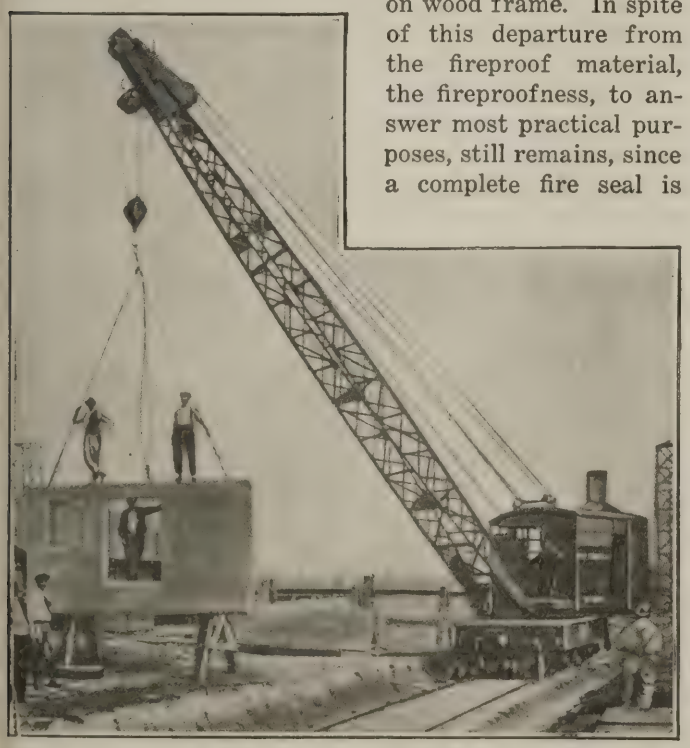

FIG. 9. LOCOMOTIVE CRANE LIFTING SIDE WALL UNIT

These houses, most of them with two rooms upstairs and two rooms below, with small basements, closets and bath, with garden spaces in the rear and a depth of 18 ft. in front for lawn, are to rent for from $12 to $18 per month. With them go liberal plantings of trees, shrubs and vines, shops, public playgrounds, a school, gymnasium, pool and other park and service features as indicated in the general plan.

Alaska Coal No Aid to Pacific Coast Industries

With the Pacific Coast facing a coal famine this winter, the great stores of fuel in Alaska are as far as ever from relieving the situation. For all the good it does, Pacific Coast industrial leaders are satisfied the Government railroad need never have been built. Unless Congress shall enact a more favorable law for the leasing of Alaska coal fields, they are also certain Alaska coal will never be of benefit outside the local demands in the North; and without an export demand the coal tonnage for the new Government railroad will be comparatively unimportant.

The Seattle Chamber of Commerce and Commercial Club has completed statements of fact to accompany its resolutions bearing upon the national need at this time of the development of Alaskan coal and oil resources. The statements are based entirely upon Government reports and include a summary of the British Columbia and Alaska laws. This is graphically shown in the following comparison, which tends to strikingly emphasize the encouragement toward development extended to the pioneers in British Columbia as against the restrictive policy now enforced in the adjoining territory, Alaska.

COAL LAND LAWS COMPARED

Alaska	
Maximum area that may be leased	2,560 acres
Prospecting privilege	None
Rental, first year, per acre	$0.25
Second, third, fourth and fifth years, per acre	.50
Royalty, first five years, per ton	.02
Next 20 years, per ton	.05
Expenditure, first five years, per acre per year	20.00
Bond required, first five years	Half expenditure
Purchase rights	None
British Columbia	
Maximum area that may be leased	6,400 acres
Prospecting privileges, three years:	
Fees and expenditures per year per acre	$0.23
Lease privileges, five years:	
Fees and expenditures per year per acre	.23
Rental per year per acre	.15
Purchase per acre	20.00

Though Matanuska coal, tapped by the Anchorage division of the Government railway, is to be ultimately the export coal of Alaska, and is of a high grade quality, there has been no rush for leases. As a matter of fact, advertisements of the Interior Department recently brought no reply.

The Chamber of Commerce also points out that Alaska has the only coal on the entire Pacific Coast suitable for steaming purposes for the Navy; that it has met every test satisfactorily, and that the Navy is now shipping large quantities of coal by rail from West Virginia to the Pacific Coast at a freight cost of over $9 per ton. It takes from 92 to 100 days for the freight cars to make the round trip.

New Method of Separating Materials of Different Specific Gravities*

By THOMAS M. CHANCE
Consulting Engineer, Washington, D. C.

SYNOPSIS—*By using solutions of various specific gravities a perfect separation of slate and sulphur from coal can be obtained. But the solutions are extremely expensive and as they impregnate the coal they are lost in use. Consequently they are undesirable except for tests of washery efficiency. Mr. Chance has found that a mechanical mixture of water and fine sand created and maintained by agitation will have sustention and therefore selection qualities similar to those of a real solution. Such mixtures are made at low cost and do the coal no harm.*

ALL gravity methods for the separation of ore from gangue, or of slate and other refuse from coal, are based upon differences in the falling velocities, in some fluid medium such as air or water, of the materials to be separated. As all materials falling in a vacuum have the same velocity, independent of the size, shape, weight or specific gravity of their individual particles, it would be more accurate to describe the operation of these methods as depending upon the *retardation* of falling velocities effected by the resistance of a fluid medium, this retardation being greater for small or light particles than for large or heavy particles. This generalization is true also of those appliances utilizing centrifugal force to replace or to supplement the action of gravity.

Making Coal Float by Thickening Liquid.

The separation of materials of different specific gravities by means of a fluid having a specific gravity greater than that of the lighter particles and less than that of the heavier particles has not been applied commercially, or on a large scale, to the separation of ores or to the washing of coal, the method being limited to laboratory experimental work or to laboratory determinations for the purpose of checking up the work of jigs, classifiers, and other types of concentrating appliances. A solution of zinc chloride has thus come into general use in the laboratory to separate coal, bony coal and slate, both to check up the work of coal-washing plants and for the purpose of making tests preliminary to the designing of coal washers.

The use of a heavy solution of some chemical in water has often been proposed for making such separations, especially in connection with the washing or preparation of coal. Difficulties, that are practically insuperable, however, have prevented the commercial development of any such process, these difficulties being both physical and financial. The cost of the chemical used to make high-gravity solutions is usually prohibitive, and the freeing of the coal from all traces of the chemical is found to be practically impossible. Such solutions inevitably penetrate the individual lumps and particles of coal, transfusing into the pores and saturating the joint-planes, and very large quantities of wash water would be required to free the prepared

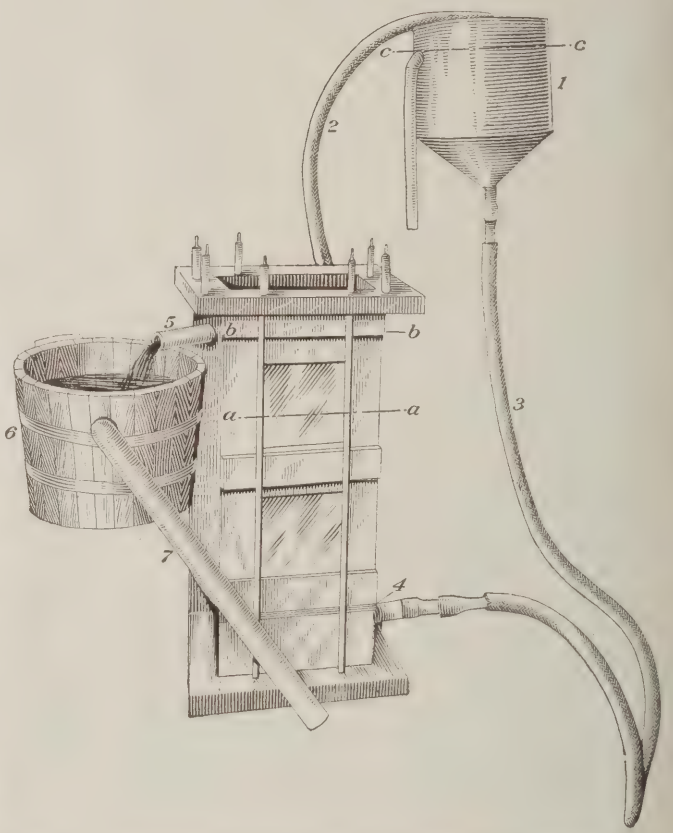

FIG. 1. PERSPECTIVE VIEW OF TESTING APPARATUS

product from the chemical with which it was thus contaminated. The use of large quantities of wash water renders it practically impossible at a reasonable cost to recover the chemical for subsequent use, because this requires concentration of the wash water by evaporation.

The method which it is the object of this paper to describe is based upon the principles that any relatively finely comminuted insoluble solid matter (such as sands), if mixed with a certain quantity of liquid (such as water), can be maintained suspended in the liquid by continuous agitation, and that the mixture, so long as agitation is maintained, will form a mass exhibiting physical properties similar in every respect to those of a fluid of relatively high specific gravity, including its ability to float solid bodies having less specific gravity, while permitting solid bodies of greater specific gravity to sink in it.

The agitation of such a fluid mass may be effected and maintained by any suitable mechanical appliances,

*Abstract of article read before the New York Meeting of American Institute of Mining Engineers, February, 1918. This article receives comment in the editorial section under caption "Chance's Method of Coal Separation."

or by introducing liquid under pressure into the fluid mass, either as jets or as a slowly rising current. When a fluid mass of a certain predetermined specific gravity has been produced in this manner, its specific gravity will remain constant so long as the agitation applied to it is not varied. The specific gravity of the fluid mass will be diminished by increasing the agitation (provided the necessary additional liquid is supplied for dilution of the fluid mass); while its specific gravity will be increased if the agitation be diminished.

It has been found that a mixture of sand and water can be used to produce a fluid mass having a specific gravity suitable for the separation of coal from bony coal, slate, fireclay, pyrite, and other impurities. Sand has been used ranging from 20- or 30-mesh down to 100- or 200-mesh, or even finer, and fluid masses with specific gravities ranging from 1.20 to 1.75 have been easily produced and maintained constant for an indefinite period at any desired gravity within these limits. In the investigations agitation has been effected by stirring arms, by propeller blades, by rotating disks and cones, by hydraulic jets, by upwardly rising liquid, and other means. Combinations of hydraulic and mechanical agitation have also been tried, and it has been found that a very wide range of appliances can be used to produce the desired agitation.

Fluid masses, having specific gravity high enough to float quartz, feldspar, limestone, and other rocks, can readily be produced by using magnetic iron-ore sand and water instead of quartz sand and water. Other heavy materials can be used, such as ore concentrates of galena, metallic copper, etc., for producing fluid masses having very high specific gravities.

Principles Behind This New Departure

For the practical separation of materials of different specific gravities by this method, the following observations are evident:

1. Every particle of material having lower specific gravity than that of the fluid mass will float; that is, the separation will be independent of the size of the materials to be separated. If the fluid mass be contained in a receptacle large enough to permit the introduction of large lumps, it is possible to dump into it the ore or coal, as mined, without any preliminary sizing, whereupon, every particle of less specific gravity than the fluid mass will float, irrespective of its size or shape.

2. As every particle of material, irrespective of its size or shape, having greater specific gravity than the fluid mass, will sink, no preliminary sizing is necessary to insure the sinking of all material having a higher specific gravity than that of the fluid mass.

3. The insoluble material, such as sand, used for producing the fluid mass can readily be washed from the materials which have been so separated, and thus can be recovered and returned to the fluid mass for continuous use.

This method offers facilities for making differential separation of materials which may be of nearly the same specific gravity, because the fluid mass can be so adjusted as to float one material while permitting the other to sink, although the difference in their specific gravities may be slight. This characteristic can be applied to the separation of low-ash coal from high-ash, of coal from bony coal, or of bony coal from slate; and with ores it may be utilized for separating waste rock from rock that contains sufficient ore to justify crushing and concentration, as well as for the separation of ore-bearing minerals of different specific gravities.

The development of this method has been so recent that it has not yet been introduced commercially, every effort having been directed to perfecting appliances suitable for the operation of the method. It is evident that such apparatus may be built in a great many different forms. Much experimental work has been done to determine the conditions under which a satisfactory agitation of the fluid mass can be obtained and maintained, but no difficulty has been found in securing the desired results with many different types of agitators.

An apparatus in which "float and sink" tests may readily be made on coal, bony coal and slate, is shown in Fig. 1, and a working drawing is shown in Fig. 2. The apparatus consists of a vertical box open at the top, 6 in. wide by 8 in. long and 20 in. high. The bottom is closed by a brass plate (4) $\frac{1}{8}$ in. thick, having 48 round holes of $\frac{1}{16}$-in. diameter, spaced 1 in. apart. Below this brass plate is a water-tight box supplied with water under pressure from the tank 1, which receives water from a supply hose 2, and delivers it through the hose 3 to the box below the brass plate. These two boxes are fastened together with eight bolts

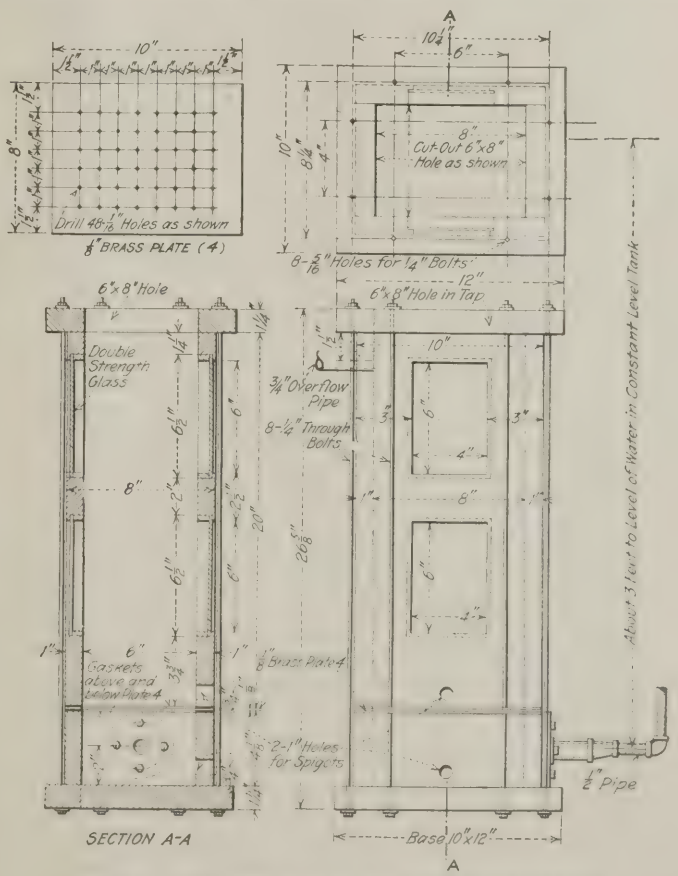

FIG. 2. WORKING DRAWING OF APPARATUS

running from top to bottom, and the joint at the brass plate is made water-tight by gaskets. The vertical box is provided with two glass windows and with an overflow pipe 5 emptying into the bucket 6, in which any sand carried out by the overflow may settle; the bucket has an overflow pipe 7 through which the water is discharged.

The water in the tank 1 is maintained at constant level *cc* by the overflow pipe and hose 8, so that the effective hydraulic head, the vertical distance between the overflow lines *bb* and *cc* is maintained constant, but can be adjusted by raising or lowering the tank 1. If the tank 1 be raised, increasing the agitation, the level of the fluid mass *aa* rises and the specific gravity of the fluid mass is correspondingly reduced; if the tank 1 be lowered, diminishing the agitation, the level of the fluid mass sinks below the line *aa*, correspondingly increasing its specific gravity.

In an apparatus of this type, agitation being effected by hydraulic water alone, it has been found that with mixed sands averaging 80 mesh, and working under a relatively low head, efficient agitation may be obtained by the use of 3 to 10 gal. of water per minute per square foot of superficial area of the apparatus. When mechanical agitation is used in combination with hydraulic water, the quantity of water can be reduced.

The importance of this method as applied to coal washing is illustrated by Fig. 3, which shows the theoretical increase in specific gravity of bituminous coal due to the presence of ash and sulphur (present as pyrite). The specific gravity of coal is naturally increased more by high sulphur percentages (due to

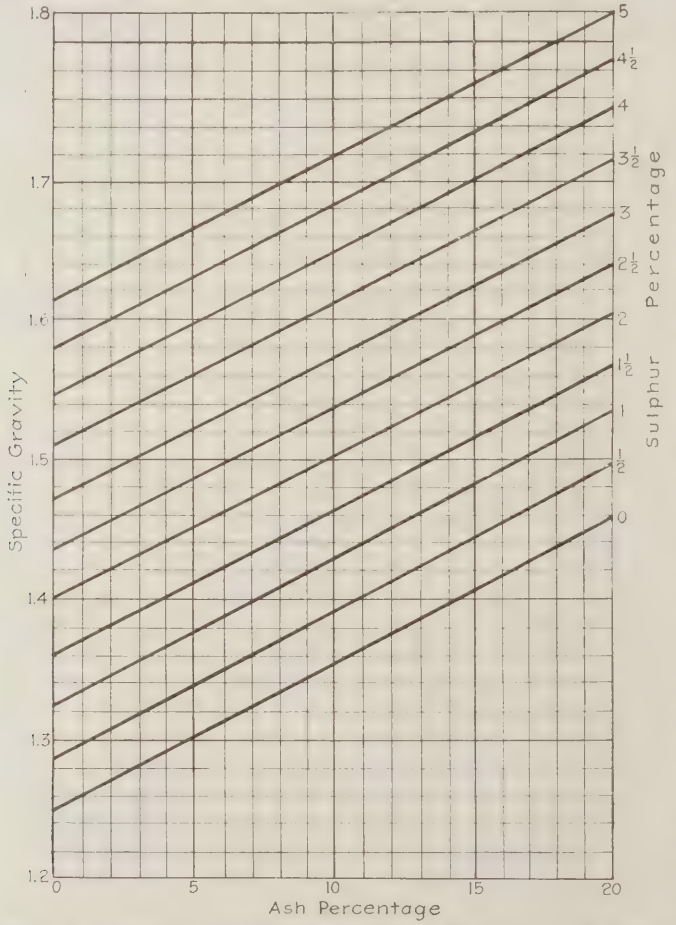

FIG. 3. CHART RELATING SPECIFIC GRAVITY OF COAL WITH PERCENTAGE OF ASH AND SULPHUR

(Based on following factors: Pure coal, specific gravity = 1.25. Clay ash, specific gravity = 2.3. Sulphur, 1 per cent. = 2 per cent. FeS_2, having specific gravity = 4.9.)

the high specific gravity of the pyrite) than by high ash. Thus an "ash-free" coal containing 3 per cent. of (pyritic) sulphur will have a specific gravity of about 1.47, while a "sulphur-free" coal with 20 per cent. of ash would have a specific gravity of 1.46.

As coal of relatively light specific gravity is low in both ash and (pyritic) sulphur, the method offers a means for separating pure coal from that which is relatively impure, without fine crushing of the whole mine product. Assuming the machine be set to produce a fluid mass of 1.40 specific gravity, and bituminous

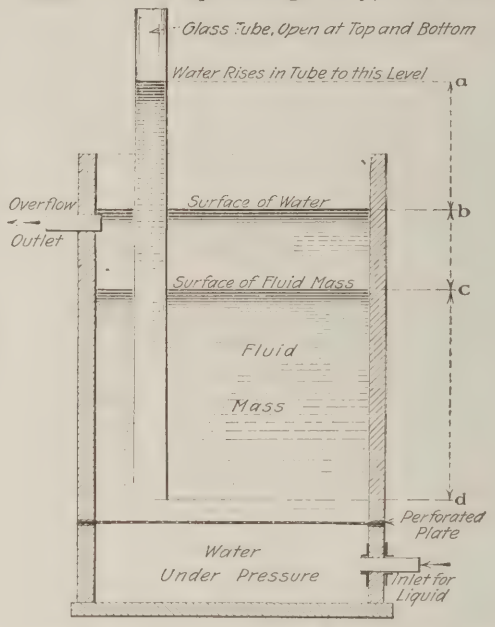

FIG. 4. DIAGRAM SHOWING HOW SPECIFIC GRAVITY CAN BE READILY DETERMINED

coal (run-of-mine) be fed into the washer, every lump and particle of low-ash and low-sulphur coal will float, while every lump and particle of high-ash and high-sulphur coal will sink, together with all the bony coal, slate, pyrite and fireclay. The coal that floats is a very high-grade finished product. The material that sinks can be removed and passed into a second washer, in which the fluid mass is maintained at a specific gravity of, say, 1.60. Here all the slate, fireclay and pyrite sinks, and also the very high-sulphur (4 to 6 per cent.) and very high-ash (15 to 20 per cent. ash) coal, but all the coal of intermediate density will float and constitute a product suitable for general use. If it be desired to improve the intermediate product, this can be done by crushing and subsequent separation in the same or another machine.

In presenting the foregoing paper for the author, who is now in the National service, H. M. Chance showed a working model. For more convenient operation, a small motor-driven centrifugal pump was attached to the overflow outlet pipe 5, Fig. 1, delivering to the inlet 4. The pressure of ingoing water was then adjusted by a valve at 4, and was indicated by the column of water in a vertical glass tube connecting with the pressure chamber. An average pressure of 15 in. of water column was maintained during the demonstration.

The sand used in the test was beach sand, sized by passing through a 20-mesh screen; about 45 per cent. was finer than 80 mesh. The circulation of water was at the rate of about 5 gal. per square foot per minute, and the rising velocity of the water in the box as a whole (not the velocity of the jets) was 6 in. per minute. At this consistency, the specific gravity of the fluid mass was between 1.55 and 1.60.

Mr. Chance estimated that it would be possible to maintain a fluid mass of this consistency, 3 ft. deep, and with an area of 50 x 60 ft. with an expenditure of 15 hp. He then showed how a lump of coal would float on the fluid mass, and also made a separation of slate from coal on a small scale in a wire cage submerged momentarily in the fluid.

Upon immersing a tube, open top and bottom, a certain depth in the fluid mass, the tube is at first filled with the fluid mass and superincumbent water, the water at first standing within the tube at the level *b*, coinciding with the top of the water in the apparatus. After a few minutes the water within the tube rises to the level *a*. This phenomenon is due to the fact that there is no agitation within the tube to prevent the sand from settling, because the tube has no overflow. The sand therefore drops through the tube, settling to the bottom and joining the fluid mass external to the tube, so that the whole tube from the bottom up to *a* becomes filled with water, being sustained at the height *a* by the hydrostatic pressure exerted by the greater specific gravity of the fluid mass.

It is clearly evident that that part of the column of water between *b* and *c* is counterpoised by the water exterior to the tube between the same levels, so that we may neglect this part of the column as having no effect. We are therefore concerned only with the depth of water within the tube between *a* and *b*, and *d*.

$$Sp.gr.\ of\ fluid\ mass = \frac{cd \cdot ab}{cd}$$

For example, if *cd* is 10 in. or 10 ft., and *ab* is 6 in. or 6 ft., sp.gr. = (10 + 6) ÷ 10 = 1.60.

The weight of the solids (held in suspension by agitation) from *c* to *d* is equal to the weight of the column of water from *a* to *b*, irrespective of the specific gravity of the solid matter held in suspension. The depth of water, *b* to *c*, may vary from zero to any desired depth.

Not only can the specific gravity of the fluid mass be determined by this method, but the *actual weight* of the materials held in suspension by agitation, irrespective of the specific gravities of the individual particles (which may vary widely) is exactly equal to the weight of a column of water between *a* and *b*. It will also be noted that this method of measuring specific gravity of an agitated fluid mass gives the average specific gravity from the top to the bottom of the mass; whereas the hydrometer method in common use gives the specific gravity at the depth to which the hydrometer is immersed. In many cases in treatment of ore pulps the specific gravity of a fluid mass may be considerably greater at the bottom than at the top.

It will be evident that the specific gravity of such a fluid mass, and also the weight of the solid matter held in suspension in such mass, can be measured by a pipe or tube *external* to the tank containing the pulp. All that is necessary is to insert a pipe near the bottom of such tank, extending up vertically a sufficient distance above the top of the receptacle. It may also be noted that if the pulp contains considerable quantities of colloidal material, that such pipe can be kept free from this and continuously filled with *clear water* by feeding a small stream of clear water into the top of the pipe.

Britain's Pocketed Coal Mines*

By Don J. O'Byrne

Since the war began Great Britain has been learning many lessons in efficiency, but the most expensive lesson of all comes from the questionable manner in which her coal industries were discouraged. "Carrying coals to Newcastle" was in pre-war times as axiomatic of doing something absurdly unnecessary as anything that could be imagined. Indeed it was an English boast a quarter of a century ago that her mines could supply the coal needs of all Europe, but this ready boast has not been justified by the experience of the present war.

And the main reason why it has not stood the test of time is not the lack of coal but the favoritism displayed in furnishing the necessary mining advantages to certain fields. If a noble lord had coal on his lands it was an easy matter for him to have a railroad pass his way, to form a company for operating purposes and reap his harvest in dividends. If a small landowner discovered coal it would be this same noble lord who would make it his business to see that he could not operate as a competitor.

He would make sure that the railroad would detour instead of passing near the small fellow's holdings and, by preventing a possible outlet, annihilate competition. There are hundreds of tracts of coal lands in Great Britain and Ireland that have been treated in this fashion. One of the most flagrant examples is found in the Castlecomer fields in Kilkenny, Ireland.

Castlecomer is a small town of about 1000 inhabitants. Under the town and running for a mile in each direction is one of the beds that has been noted by mining engineers, but when the railroads were being built, and the particular brand of favoritism referred to was going around, this rich mineral bed was left in a pocket, so to speak. Walk or drive any direction from Castlecomer and you must travel from six to eight miles before you will reach a railroad, and you can inquire until your tongue grows tired but no one can furnish any logical reason why the Great Southern and Western railroad detoured six miles from a straight line (from Dublin to Kilkenny) in order to avoid Castlecomer and go through the agricultural town of Ballyragget.

An extraordinarily unfair piece of railroad engineering left the Castlecomer mines practically dead. In a desultory fashion the Welsh owners of the mines have operated them now and again but never with any degree of profit. Full of ambition the Flewellyns and the Llewellyns left their native Wales for this Irish El Dorado seventy years ago. Today the grandchildren of those hardy miners till the soil in the spring, summer and autumn and do a little mining in the winter. They haul their product in donkey-drawn carts to Kilkenny, Carlow or Ballyragget (about half a ton to a load) and exchange it for merchandise. An effort is now being made to have the government bring the outer world and the Castlecomer mines together.

Who will operate the mine? The Flewellyns and the Llewellyns say they will take no chances. They are farmers first and miners last in this generation. The country faces a grave economic question now, where it should have an efficient industrial organization.

Byproduct Coke and Coking Operations*

BY
C. J. RAMSBURG †
AND
F. W. SPERR, Jr. ‡

Third Installment

STUDIES of the character of this article will be largely of academic interest unless correlated with studies of the behavior of different types of coke in the blast furnace and in other types of apparatus in which the material is used. Let us choose the blast furnace for consideration here on account of its tremendous industrial importance.

There is at present some disagreement among blast-furnace men as to the exact function of the coke in the most efficient and economical reduction of iron ore. The majority probably still accept Grüner's theory of ideal working; namely, (as stated by Richards[1]), "All the carbon burnt in the furnace should first be oxidized at the tuyeres to CO (carbon monoxide), and all reduction of oxides above the tuyeres should be caused by CO, which thus becomes CO_2 (carbon dioxide)." It is well known that the reduction of iron oxide by carbon monoxide is the most efficient from the standpoint of heat economy. Richards, however, has pointed out that the direct reduction of iron oxide by carbon is three times as efficient from the standpoint of carbon required as the indirect reduction, and says:

"The ordinary furnace produces at the tuyeres, in order to get heat enough to melt down the charges, more CO gas than is needed to abstract all the oxygen from the charges; under these conditions it is uneconomical to oxidize any carbon at all above the tuyeres. The exceptional furnace, because of pure ores, small amount of slag, pure fuel, high temperature of blast, or dry blast, gives heat enough at the tuyeres to melt down the charges without producing enough CO gas to reduce all the charges; under these conditions, more or less reduction is effected by solid carbon and with the greatest economy in quantity of carbon required in the furnace."

About two years ago H. P. Howland prepared an interesting paper, entitled "Calculations with Reference to the Use of Carbon in Modern American Blast Furnaces," calling attention to the fact that many furnaces are actually operating with higher economy of coke than would be calculated from Grüner's theory; in fact, his calculations on the performance of 26 furnaces seem to show that what Richards regarded as the exceptional furnace is the rule rather than the exception in modern practice.

Howland's tabulation of data on these 26 furnaces is so interesting and pertinent to the subject that we are reproducing a portion of it in Table IV.

Note in the table the performance of the once-despised byproduct coke in modern practice. Of the 19 furnaces using less than a ton of coke per ton of pig iron, 13 are burning byproduct coke and 6 beehive coke. Howland calculates that all the furnaces burning less than 1350 lb. of carbon at the tuyeres are not making enough CO to reduce all the Fe_2O_3 and hence some of the latter must be reduced directly by carbon. He concludes:

"It seems clear, therefore, that in low-coke furnaces one of the most important, if not the most important function of the carbon burned at the tuyeres is to produce heat to enable the carrying on of the direct rather than to produce CO for indirect reduction.

FIG. 14. COKE FROM HIGH VOLATILE COAL

*Presented by Mr. Ramsburg at a joint meeting of the Mechanical and Engineering Section and the American Society of Mechanical Engineers.

†Second vice president, the H. Koppers Co., Pittsburgh, Penn.

‡Chief chemist, the H. Koppers Co., Pittsburgh, Penn.

[1]"Metallurgical and Chemical Calculations," p. 248.

"On this basis, it becomes very essential that our carbon shall burn instantaneously to CO in order that the resulting heat may be localized where needed. This should not be a question of seconds, but of a fraction of a second. If our carbon is of such a nature that this burning to CO is a comparatively long process, more of it will be required than of the quick-burning carbon in order to obtain the same concentration of heat at the desired point.

"We would, therefore, say that the most desirable thing about a coke is that quality in the carbon which will allow of its being instantaneously burned to CO and thus result in the maximum concentration of heat where needed."

W. H. Blauvelt, in a discussion of Howland's paper, says: "In studying the combustion of coke in the furnace, it is clear that the production of the maximum quantity of heat is not of the first importance in blast-furnace operation, or in the utilization of the fuel charged into the furnace. To my mind, the production

FIG. 15. COKE FROM SAME COAL AS FIG. 14, WITH 20 PER CENT. POCAHONTAS

of a high thermal head at the tuyeres is of the first importance, and the best coke is that which reaches the tuyeres in proper condition to produce the highest

NOTES.—BH = Beehive. BP = Byproduct. Conn. = Connellsville.

FIG. 16. 90 PER CENT. HIGH VOLATILE AND 10 PER CENT. POCAHONTAS COAL

temperature at the tuyeres, and in just sufficient quantity to do the amount of work required there under the conditions produced by this maximum temperature. The combustion of a much larger amount of fuel at the tuyeres, under conditions that will fall short of producing the highest possible temperature, cannot produce as good results, either in fuel economy or output. . . . Nothing is more fatal to obtaining the highest temperature than an excess of combustion. In the blast furnace an excess of air dilutes and cools the products of combustion, reducing the maximum thermal head at the tuyeres, and the larger volume carries the high temperature zone too high in the furnace. . . . It will probably be generally admitted that furnace coke should be of nearly uniform size, and many furnace managers are eliminating all coke below $\frac{3}{4}$ in. and above 4 or $4\frac{1}{2}$ in.; also, that the best coke is that which is sufficiently strong to resist undue abrasion and crumbling by attrition with the stock, and of an open porous structure that will permit the most rapid combustion when it reaches the tuyeres. Many large users agree that the coke should never

FIG. 17. 70 PER CENT. HIGH VOLATILE AND 30 PER CENT. POCAHONTAS

FIG. 18 COKE IMPROPERLY MADE

be overcoked beyond the point of producing a sufficiently strong structure, as overcoking quickly reduces the combustibility.

"If Grüner's ideal gives the best furnace operation, we should want a coke that is resistant to the oxygen in the ore, but easily combustible at the tuyeres, which is a contradiction of qualities. If my argument is correct, that the furnace man wants the greatest thermal head at the tuyeres rather than the production of the greatest quantity of heat in the furnace as a whole, then he is willing to sacrifice some coke by solution in the oxidizing gases in the upper part of the furnace, provided he can obtain a sufficient quantity of coke at the tuyeres, of a quality that will permit rapid combustion with the minimum amount of air, thereby giving him the maximum thermal head."

The desirability of the condition which Blauvelt aptly terms "a high thermal head" in the zone of the tuyeres will be readily granted even by those who adhere to Grüner's theory. This condition should be attained even at a sacrifice of some carbon by solution loss ($CO_2 + C = 2CO$), and we are of the opinion that the importance of this solution loss is frequently overestimated. Most laboratory experiments made to determine the loss undergone by different cokes have been of little value, because they have been mostly made with pulverized samples, so that their original physical condition has been greatly altered.

We have lately tested the resistance of a number of cokes to the action of CO_2 at temperatures of 800 and 900 deg. C., and find the loss of coke pulverized to 40 mesh to be very much greater than the same coke prepared in small test pieces, $\frac{3}{8} \times \frac{3}{8} \times 1\frac{1}{2}$ in., so as to retain the original structure.

As furnace conditions are better understood the possibility of the use of coke of a wider instead of a more restricted range of quality will become better recognized, with the express limitation that the supply for each furnace must always be absolutely uniform in quality. This requirement of uniformity cannot be too strongly emphasized, and it is almost equally necessary for the proper operation of the coke plant as the blast furnace; but this does not mean that there is one standard grade of coke to which all plants should conform so far as possible. As a matter of fact, the range of cokes that successfully qualify in practical operation is continually being extended, through necessity of one sort or another, with little general realization of the fact. In illustrations accompanying the preceding installment of this article have already been shown the cell structure of some cokes that are giving good results in different American blast furnaces, and the difference is fairly remarkable.

However, for each kind of coke there is evidently some limiting size for efficient service—that is, just large enough to offer such a minimum surface of attack for CO_2 that the loss on this account is negligible, and small enough so that complete combustion may be effected in a minimum of time at the tuyeres. Hardness of body is usually—though possibly not necessarily—proportional to the resistance of a given coke to oxidation by CO_2 or oxygen. The harder grades of coke should be used in smaller sizes—and this is a compensation automatically provided to some extent by the operation of the byproduct oven. Similarly, cokes of close cell structure are more resistant to oxidation, but this may be offset to a large extent by softness. The coke of more open cell structure will probably require less rigid attention to sizing than the denser coke. The important thing is to determine the practical limits of these elements of size, hardness and cell structure. It may be found that a coke of such structure as No. 4 of our scale may be unsuitable, no matter what may be its size or softness; but this ought to be proved by actual test and not taken for granted.

These considerations are of the utmost importance and encouragement to the coke-oven man, because, with a reasonable choice of coal, his control over the quality of his coke is almost unlimited, and, even with a very restricted source of supply, the possibilities of conforming to the desired standard by proper oven construction and regulation are still remarkably great. We propose to conclude this paper by showing two or three examples of what can be accomplished in the way of control of this sort.

One proposition that frequently presents itself is that of eliminating sponge. Sponge is a characteristic honeycombed mass formed in the center of rich volatile

FIG. 19. COKE SHOWING ELIMINATION OF SPONGE

matter. It seems to be caused by an excess of pitchy material moving along with the fused zone in the coking process, and finally accumulating in the center of the oven, where it is eventually gasified, with the production of this light porous material. Sometimes this sponge is found in loose, detached masses scattered all over the coke as it lies on the wharf after quenching, or, again, it may be found adhering very closely to the ends of the pieces of coke, and sometimes blending, without any clear line of demarcation, into the body of the coke itself.

FIG. 20. COKE FROM SAME COAL—DIFFERENT OVENS

Although the amount of this sponge often appears to be very large, it is so bulky that its actual percentage by weight is small. In one case where the amount of sponge seemed to be very large it was actually found that it amounted to 1.65 per cent. of the total coke. Small amounts of sponge probably do no harm, most of the material being soon broken up in the operations of handling the coke, but the presence of the material undoubtedly occasions a certain loss of carbon, and so we usually try to get rid of it. The customary remedy—and one that always works—is to mix with the high volatile coal sufficient low volatile coal, which has the effect of absorbing the excess of bituminous material and eliminating the conditions of sponge formation. Pocahontas coal is the standard low volatile coal that is employed by many of our plants. It is to be noted that different coals require considerably different percentages of Pocahontas coal to completely eliminate the sponge. Fig. 14 shows a coke from unmixed high volatile coal (about 34 per cent. volatile matter). A large amount of sponge is readily apparent. Fig. 15 shows the coke from a mixture containing 80 per cent. of this same coal with 20 per cent. of Pocahontas. The sponge is entirely eliminated and the structure of the coke improved. Fig. 16 shows coke made from a mixture of 90 per cent. of another coal, containing approximately the same percentage of volatile matter, with 10 per cent. of Pocahontas. This shows a fairly large amount of sponge. A mixture of 70 per cent. of this coal with 30 per cent. of Pocahontas still produces some sponge (Fig. 17), and it required as much as 40 per cent. Pocahontas to eliminate the sponge entirely.

Frequently it is too expensive a proposition to buy low volatile coal for the sake of eliminating a little sponge, and sometimes the low volatile coal may be altogether inaccessible for practical purposes. This does not, however, leave us at the end of our resources. By proper methods of control sponge may be eliminated from a wide variety of coals that produce it under ordinary conditions. If the oven is correctly designed and proportioned, and the temperature and coking time carefully regulated, very satisfactory results may be obtained without the necessity of making a special coal mixture. Fig. 18 shows the coke from one coal which was made in a type of oven unsuited to it, and coked at unfavorable temperatures. Fig. 19 shows coke made from the same coal under proper conditions. The sponge has been entirely eliminated.

Occasionally one of the most difficult problems to be overcome is that of too great density of cell structure. Here, again, we can approach the problem in two ways: One, by mixing in one or more other coals that have a tendency to the production of a more open cell structure, and the other way by suitable preliminary preparation of the coal, careful heat control, and special design of the oven. Fig. 20 shows coke made from the same coal mixture coked at different plants under different conditions. The dense coke shown in the lower part of the figure was greatly improved upon when the nature of the coal was better understood, and the excellent product shown in the upper part of the figure was then made when the coal was treated in the right kind of ovens and under proper conditions.

To insure the best results, a special study must be made of each kind of coal that it is proposed to use, and it would be well, in all cases where a new plant is contemplated, to make this study previous to a design of the plant, because the results may suggest some necessary changes in design that would not otherwise be foreseen.

Production of Fuel Briquets

The output of fuel briquets in the United States in 1917 was 406,856 net tons, valued at $2,233,888, an increase over 1916 of 111,701 tons, or 38 per cent., in quantity, and of $788,226, or 55 per cent., in value, again breaking the record of the previous year. According to C. E. Lesher, of the United States Geological Survey, Department of the Interior, the demand for fuel in 1917 was so strong throughout the whole year that there was no lack of market to limit the production of the briquet manufacturers. Despite the increased cost of binders and of manufacturing, most of the plants profitably operated to full capacity.

Cost Accounting at Coal Mines

By J. B. DILWORTH
518 Walnut St., Philadelphia, Penn.

SYNOPSIS—*Just as a clinical thermometer reveals a healthy or unhealthy condition in a physician's patient, so a judicious cost-accounting system at a coal mine reveals a healthy or an unhealthy business condition. More than this, properly itemized costs reveal not only if trouble exists but the exact location thereof. A study of the costs of going operations would doubtless save many proposed firms from embarking on a career that is at best financially precarious.*

THE cost statement of a coal-mining operation has two main functions. Its primary object is, of course, to show the total average expense of producing a ton of coal over a given period. Secondarily, it should show the cost per ton of each phase of the operation of production—digging and loading in the mine, hauling, handling at the tipple, etc.—and also the allied expenses less directly connected with the physical act of producing the tonnage, such as superintendence, office expenses, royalty, depreciation and others of a like nature.

A properly prepared cost statement is to the mine operator what the clinical thermometer is to the physician. As a rise above normal in the latter instrument indicates an unhealthy condition of the patient, so an increase in the per-ton total on the cost statement above the figure at which coal should ordinarily be produced at the mine in question, shows an abnormal and perhaps unhealthy condition of the mining enterprise.

But even more efficient than the doctor's thermometer is an accurate and complete tabulation of operating costs, for it not only gives notice of unusual conditions in the mine or office but, when properly itemized, it enables the management to locate quite closely the seat of the trouble.

Cost System Neglected by Many Operators

In view of the vital importance of cost accounting to any complicated industrial enterprise, it is surprising how many smaller coal operators keep no accurate record of their production costs, being content with little more than a guess as to what their actual expenses of mining are and giving never a thought to the less apparent items of maintenance of buildings, depreciation of plant and equipment, depletion of coal area, compensation for their own services, and interest on invested capital.

In only too many instances a true and complete cost statement would show that the operation is being conducted at an actual loss and that the average price obtained for the coal has not been sufficient to cover the total cost of production. This may be true even without any serious blunders in management, due merely to the fact that, owing to physical and economic conditions, the coal can not be produced at these particular mines as cheaply as at others affording a similar grade of fuel whose output is sufficient to supply the normal market.

Probably many an operator of this class has gone into the mining business on the comfortable theory that because a nearby mine has been running for a few years and presumably making money, therefore his operation will do the same; and he proceeds cheerfully on his way, satisfied with the fact that he is selling his coal for perhaps 25c. a ton above the cost of labor and supplies. His rude awakening comes when, after a few years of operation, he needs to buy more mine cars, a new locomotive, enlarge his power plant, repair the tipple or drive a pair of headings through an extensive rock roll. He finds that not only has what he calls "mining costs" increased with the extension of the workings, but he is faced with a large expenditure for additions and renewal to meet which no fund has been created.

Should he decide to sell his property and conserve "profits" already secured, he finds that his depleted coal acreage and deteriorated mine plant will return nowhere near the capital invested in it. At this late date the significance of a complete and well considered form of cost accounting will be only too apparent.

Though the evil effects of such a business method are confined mainly to the injudicious operator himself and to those who have invested with him in the enterprise, yet when cases similar to the one cited are multiplied many times, as they have been in the bituminous coal fields of this country, they adversely affect the whole industry.

Lack of System Affects Entire Industry

Such operators, with their false ideas of costs, will, in a dull market, often sell their output at an actual loss, thus lowering prices and unduly reducing the margin of profit to those who are conducting their business on an economically sound basis.

It is a well known fact that the majority of mines in some of our largest bituminous coal districts have been run for years on an unjustly small margin of profit, if not at an actual loss, their owners holding fast as best they might, stinting repairs and improvements and gradually depleting their coal reserves without adequate returns on their investment, waiting for the occasional appearance of abnormal conditions, such as an anthracite strike, a great industrial boom or a world war, to enable them to realize a compensating profit.

Unquestionably this situation has arisen largely from the competition of operators who, being unfamiliar with comparative mining costs, have undertaken to develop properties not economically ripe for mining (because of location, character of seam, quality of coal, etc.). Once being committed to the enterprise, they carry it through to the bitter end by selling their product at or below cost. In some instances they do so knowingly. Having their capital invested, they hope for a turn in the market which will let them out with a minimum of loss. In other cases, however, the low price is due to the lack of a proper accounting system to reveal the true state of affairs. Of course this condition is not peculiar to the

coal-mining business. Former Chairman Hurley of the Federal Trade Commission recently said:

> A preliminary study of industry generally, as made by the Federal Trade Commission, revealed the fact that not more than 10 per cent. of manufacturers know what it costs to produce their goods, and that the remaining 90 per cent. are pricing their goods arbitrarily, either by guess-work or fixing their prices to conform with, or to beat, the prices made, or supposed to be made, by their equally ignorant competitors—and further, that only a very small percentage of manufacturers make any charge for depreciation of plant and equipment—and that therefore their products are priced before reckoning this important and vital item. To this is due the great demoralization in many lines of industry and the high business death rate.

Fortunately these regrettable conditions are rapidly becoming widely recognized, and much is being written on the subject of cost accounting in the technical press of the day.[1]

In the field of coal mining special impetus has been given to the movement toward full and complete accounting by the recent action of the Federal Trade Commission in requiring all coal and lignite operators to submit monthly statements of cost, income and tonnage on specially prepared forms. Four separate forms are prescribed and furnished by the Commission: C-1, for semi-bituminous, bituminous or sub-bituminous coal, or lignite operators producing more than 100,000 net tons per annum; C-2, for such operators producing less than 100,000 and more than 12,000 net tons per annum; C-3, for such operators producing less than 12,000 tons per annum, and C-4, for anthracite and semi-anthracite operators.

Acceptable Statement Form Being Developed

These forms vary in complexity according to the size of the operation reporting, but those for mines producing over 12,000 tons a year require quite a complete statement of expend tures, charges and income, and necessitate a fairly comprehensive accounting system on the part of the reporting operator.

Another recent important move in the direction of better methods of accounting was that of the National Coal Association in appointing a committee to draft a standard form of "Statement of Coal Production Cost and Revenue" and to prepare a "Manual of Cost Distribution." This was to be done in coöperation with representatives of the Federal Trade Commission. Some delay has been occasioned by the failure of two groups of experts to agree on certain items in the schedules considered, but is is to be hoped that a mutually acceptable form of statement will soon be determined upon and submitted to the operators of the country.

Numerous systems of cost accounting are in use at the many mining operations in our extensive coal fields, some elaborate, with a dozen or more headings and scores of minor sub-divisions, others recording little more than inside and outside labor, supplies and general expenses.

While it is not the purpose of this article to recommend any special method of accounting, the "Statement of Coal Costs" reproduced on this page embodies the principal items which a proper cost system should show. It is essentially a form used by a large and well managed mining company of western Pennsylvania, somewhat altered and enlarged to include certain advantageous features in use by accountants of other companies whose records have been examined.

The method of distributing expenses shown in the table may advantageously be altered in detail to suit varying conditions at different operations. Certain items may be wholly eliminated—for instance, most of those under power if electric current is purchased—or others may be subdivided to record certain charges in greater detail. Of course if washing, coking or stripping operations are carried on separate accounts must be opened for them.

But whatever the details of the accounting system adopted, the records should be in such form that the expenses of operation can be periodically tabulated in a

STATEMENT OF COAL COSTS

Mining:	— Labor — Amt. Cents per Ton	— Material — Amt. Cents per Ton	— Total — Amt. Cents per Ton
Pick coal			
Machine coal (cutting and loading)			
Total and average

[1]Of particular interest to coal operators is a paper read before the National Coal Association at Pittsburgh, Oct. 23, 1917, by J. B. L. Hornberger, comptroller of the Pittsburgh Coal Co.; also an address by this gentleman before the American Mining Congress October, 1913, printed in "Coal Age" of Nov. 1, 1913. An instructive paper by R. J. Maxwell on "An Accounting System for Coal Mines," was reprinted from the Canadian Mining Institute Bulletin in "Coal Age" of Jan. 20 and Feb. 3, 1917.

manner similar to the one outlined here so that the costs of the major operations connected with mining can be seen at a glance.

With a set of such tables before him the operator not only knows what the total cost of his product was during each period, but by comparison he can quickly locate the division in which an excessive expense has been incurred and promptly investigate the cause.

In conclusion, let it be noted that a proper system of mine cost accounting not only reveals the cost of the mine output and thus enables those interested to deter mine the financial status of a going operation, but it is of great value in forecasting the probable cost of coal from a new development of a similar character to the one whose costs are known.

If a prospective investor or operator has a proper tabulation of actual costs obtaining at one or more going mines, he can, by a study of physical conditions on a new property and the wage scale likely to apply there, make a fairly close estimate of what operating costs at the proposed mine will be.

Had such data and methods of analysis been utilized more generally in the past, there would be fewer coal-mining ventures doomed to failure through the physical impossibility of producing coal under the given conditions at a cost sufficiently below its normal selling price to net the operator a profit.

Coal Riches in Southern Algeria*

Recently, in the course of training members of the "Foreign Legion" in modern military tactics in southern Algeria, trench diggers struck a rich bed of anthracite coal. The discovery has aroused a great deal of interest in France and Italy, where the coal question is in a most acute stage.

Geologists now recollect that in 1908 G. B. M. Flamant, a scientist specializing on Algerian formations, called the attention of French geologists to the peculiar characteristics of the geological strata in southern Algiers, which were almost identical with those of the Westphalian coal district in western Germany. He suggested that borings be made at different points to determine the presence or absence of coal beds. He even ventured to roughly estimate the area of the coal field as covering 54 x 93 miles. The prospecting was never carried out and France lost an opportunity to be self-supporting in its coal requirements.

Since the accidental discovery of the coal under the training field, several railroads have continued the prospecting and have found in many places, at a depth of only 10 ft., beds of excellent coal varying in thickness between 50 and 80 cm. (20 to 32 in.). Engineers have estimated the deposits within a square kilometer at not less than 30,000 tons, which could easily be handled by the military railway now leading from the training camp to the coast (the Colomb-Bechar road). As coal sells for 150 fr. (about $30) a ton in Algiers, and 350 fr. (about $70) further inland, the find represents a huge fortune, especially as the first 30,000 tons could shortly be followed by many other thousands.

It is not too much to say that had France put down the borings suggested in 1908 it would not be in so critical a position today, in regard to fuel for its factories.

*Translated from "Le Courier Colonial."

Who's Who In Coal Mining

Frank J. Hayes, the Union's President

By K. C. Adams

Just as frank as his name, Frank J. Hayes, president of the United Mine Workers of America, in six months has proved by his steadiness that he is in every way capable of leading the destinies of the world's largest trade union.

Seven years' experience in labor-union work as vice president of the International, and as many more years as secretary-treasurer of the Illinois District organization, abundantly furnished the new miners' chief

FRANK J. HAYES

Born at Whatcheer, Iowa, May 4, 1882, his first office in the miners' union was that of secretary of his local at Breese, Ill. He served as sub-district and district secretary of Illinois miners continuously from 1903 until his elevation to the vice presidency of the International in 1910.

with the equipment he needed to succeed John P. White, whose labors he assumed last October.

When Hayes was elected to the vice presidency he found the job anything but pleasant, for T. L. Lewis, who was then president, was at outs with the mine workers of the Illinois district, from which organization Hayes hailed. Lewis was attempting to force the Illinois men to accept a compromise settlement with their operators. The district organization refused and Hayes stood by the district. Lewis denied Hayes an office at headquarters and point blank refused to supply him with a stenographer. Lewis also withheld from Hayes certain important assignments, which precedent prescribed should be turned over to the vice president's office as part of his established authority in directing the field work of the union organizers. But Hayes stuck to the job. While loitering around headquarters awaiting the president's pleasure during 1910 he pried deep into the affairs of the organization. Where he found abuses and inefficiency he looked for a remedy and obtained facts that served him well in later years.

The fight between the Illinois miners and Lewis continued. Special conventions and board meetings were held almost continuously, and in each succeeding session the battle between Hayes and Lewis grew in bitterness. The Illinois miners finally won, and Lewis' policies were repudiated. Friends of Hayes urged that he aspire for the presidency, but Hayes along with others had urged John P. White, president of the Iowa miners, to oppose Lewis. For this reason Hayes refused to stand for the office. He would have offered himself had he not already declared himself a supporter of Mr. White. He reasoned that he was a young man with time aplenty ahead in which to reach the goal of his life's ambition. The decision of Hayes established for him the reputation of being a leader with strong common sense.

White defeated Lewis overwhelmingly and Hayes welcomed the new leader into office with all the good will and coöperation of his heart. Teamwork so often referred to as essential to progress and so seldom practiced, became a reality. Dual movements organized against the Lewis régime were quickly routed. Successful wage agreements were negotiated for both bituminous and anthracite miners. White and Hayes were pulling the rope at the same time. And during the six years they served together never a single jerk failed to find them pulling with a united effort.

Many times ill-advised friends importuned Hayes to run against White. The politically ambitious of the union ranks repeatedly sought to cause a rupture in the hope of profiting thereby. But always Hayes exercised his strong common sense. As has been well said: "His ability to uncover their true purposes when political schemers advanced fictitious arguments and the readiness with which he rejected all proposals which were linked with hypocrisy caused those designing persons keen disappointment."

And as he has moved on through the years of official life he has cultivated that rare common sense that frankly admits errors, a trait rare among those in political life and one which is unfortunately only briefly retained by those who happen to possess it when they enter that career, with its many pitfalls. His directness and simplicity enables him to be a patient listener and yet to say No when the occasion so demands.

Let me give a few examples of how Hayes has given decisions with telling results: For many years it has been recognized that the per capita tax of the International Union was not sufficient to finance the organization on a basis of assured progress.

Talk per capita increase to the average member and right away you are on the defensive. To the 1918 convention Hayes not only recommended an increase, but urged that the tax be doubled. Immediately there was an organized move to reduce the increase proposed, in part if not in its entirety. Hayes gave the convention two votes on the question and common sense carried the day with a whoop.

During the discussion Mother Jones sought to have Hayes recognize one of her "pet boys" from somewhere in the jurisdiction. Hayes quietly imparted to the "Angel of the Camps" that she was all right, that the boys were all for her and appreciated her efforts, but that on important deliberative questions the Chair had the right to say who was entitled to the floor. There wasn't any camouflage about the incident. Hayes simply stated he was president; the convention accepted his decision with applause and continued business in an orderly way.

The United Mine Workers Journal has been a football in organization politics since it was established in 1891. Great financial losses have resulted from the voluntary subscription plan by which it has been conducted and by the restrictions which have been placed on advertising. All other International unions of consequence have long ago put into effect a per capita subscription. Changes of one kind or another have been suggested at every Board meeting of the International. At the recent meeting of the board Hayes, acting upon the recommendation of a committee in which John L. Lewis, his vice president, was a leading member recommended and put through unanimously a program whereby the official organ will be published semi-monthly and will go free to each of the 400,000 members—an educational move that should have been adopted long ago. With each member receiving the Journal, a copy of every official document published therein, there will be no excuse for any individual remaining in ignorance of the organization's problems and progress.

On Apr. 13 the International Executive Board unanimously approved a telegram offered by Hayes protesting against the inefficiency of the Fuel Administration. The message did not follow the stereotyped lines of resolutions, but pointed out plainly the whys and wherefores of the Fuel Administration's failure, and plainly stated what must be done to solve the fuel problem. Nothing in the telegram savored of selfishness or pettiness. The next day Hayes and his associates wired President Wilson protesting against the attempt made by the Director of Railroads to make good at the expense of the coal industry by hammering down the price of coal. This is another demonstration of Hayes' plain common sense.

In six months Hayes has negotiated a successful anthracite wage agreement. He has raised $800,000 security to appeal the verdict of the Coronado Coal Co. and others against the union. He made all preparations to fight the case of the Hitchman Coal and Coke Co., a decision having been rendered which would prohibit union organization activities from being carried to a successful conclusion. He has established a union legislative committee at Washington to assist labor from being victimized in hurried war-time legislation and he has forced the issue with the Federal Fuel Administration, in such a manner that solid organization of Alabama mine workers is insured.

During his administration the union has purchased over $400,000 worth of Liberty Bonds to finance world-wide democracy. Hayes has served as a member of Uncle Sam's war labor board by which a policy between capital and labor during the continuance of the war has been formulated and accepted. He has reorganized the field forces of the organization and defeated the would-be secessionists of Colorado led by the ungrateful John Lawson. He has convinced the public that he is a man possessed of common sense, a man whose slogan is "sanity first." Watch Hayes, for he is one of the big men of labor and is sure to make a wonderful record.

Zone System for the Distribution of Bituminous Coal

By order of the Fuel Administration the distribution of bituminous coal for the year beginning Apr. 1, 1918, will be controlled by a zone system, which is intended to reduce the burden on the railroads, facilitate shipment of coal, and keep all the mines working at full capacity.

THE factor that loomed largest in the fuel crisis of last winter was the lack of adequate transportation facilities. Under the plan of distribution then followed, a consumer in any part of the country was free to order his coal supply from any producing district, regardless of the length of haul involved. As a consequence, it often happened that cars and locomotives were engaged in delivering coal to distant regions that could have been served far more quickly from fields near by.

Obviously, this complete freedom of choice as to the source of coal used led to cross-hauling in addition to the utilization of railroad equipment in unnecessarily long hauls, the result being a great waste of transportation power. To prevent this needless waste and make possible an increased production to meet the war demands, the United States Fuel Administration, in conjunction with the Director General of Railroads, has announced a zone system for the control of bituminous coal distribution for the year beginning Apr. 1, 1918.

The zone system was adopted only after prolonged conferences with coal producers, jobbers and consumers, as well as with the traffic and operating officials of the railroads. Briefly explained, it divides the country into a number of zones, each of which must obtain its coal supply from mines that are relatively near, thus preventing abnormal and wasteful transportation movements, insuring more nearly equal distribution of cars to the mines and more steady employment of mine labor.

Of course, so radical a change in the methods of conducting the coal business will cause some inconvenience to producers and consumers, and will involve additional expense in some cases. For example, the producers of Pocahontas coal may no longer ship their output to Chicago and Western points by rail; as a result, they must find new markets in the East. Those plants in and around Chicago that have been burning West Virginia coal will be compelled to substitute Illinois coal, which can be obtained with less than half as long a haul.

It is the hope of the Fuel Administration, however, that the consumer and the producer will bear these unavoidable inconveniences in the realization that the readjustment of the distribution of coal is for the welfare of the nation. In other words, they are appealed to on the grounds of patriotism.

There are exceptions to the conditions imposed by the zone system. Certain industries require coals of particular quality or characteristics, as, for example, by-product, gas, blacksmith and metallurgical coals. If a consumer needs coal of one of these kinds and is unable to obtain it from the producing districts that are permitted to ship into the zone in which he is located, permits will be issued to allow the special-purpose fuel to be brought in from other districts.

The zone system does not affect the following bituminous coal:

1. Coal for railroad fuel, for which special arrangements will be made by the Fuel Administrator and the Director General of Railroads.

2. Coal for movement on inland waterways, which is in no way restricted by the system.

3. Coal delivered to Canada, which is subject to regulations of the Fuel Administrator.

To enable the consumer of bituminous coal to determine the districts from which he may obtain his fuel and to show the producer the zones in which he may sell his output, the map inserted as a supplement to this issue of *Coal Age* has been prepared.

It will be seen that the entire territory of the United States has been divided into a large number of irregular zones or sections, colored differently so that they may readily be distinguished one from another, and each marked with a key number. Each of these separately numbered zones has certain definite boundary lines and is restricted to the use of coals from certain districts. The Key to Consuming Zones gives a complete list of all the zones shown on the map, states the districts from which they may obtain coal, and defines the boundaries of each zone.

If a consumer wishes to find out what coals are available for his use, he locates on the map the zone in which he lives and notes its number. Then, in the Key to Consuming Zones, under that zone number, he will find the list of producing districts from which he can obtain coal. In case there is any doubt as to the number of the zone in which he lives, reference to the boundaries given in the key will at once decide the point. Following this key is a list of the meanings of the abbreviations and terms used in the key.

The Key to Producing Districts is intended to show the producer the several zones in which he may market his product. He knows the district in which his mine is located, and on referring to this key he finds the numbers of the zones, as shown on the map, into which the output from his mine may be sent.

A wall map of large size, showing the same zoning in fuller detail, may be obtained from the Coal Zone Map Co., Glen Echo, Maryland.

Key to Consuming Districts

ZONE NO. 1

RESTRICTED TO FOLLOWING COALS—North Dakota, South Dakota, docks.

BOUNDARIES—Northern and Western: Lake Superior and Canada; North Dakota state line and South Dakota state line to Ortonville, Minn. **Southern and Eastern:** From Ortonville via C. M. & St. P. Ry. through Granite Falls and Benton Junction to Minneapolis, thence via M. St. P. & S. S. M. Ry. through Chippewa Falls and Abbotsford to Amherst Junction, thence via G. B. & W. R. R. to Kewaunee, Wis.; western banks of Lakes Michigan and Huron.

ZONE NO. 2

RESTRICTED TO FOLLOWING COALS—Illinois (summer only), docks, North Dakota, South Dakota, Iowa (to points in Iowa only).

BOUNDARIES—Northern: From Kewaunee, Wis., via G. B. & W. R. R. to Amherst Junction, thence via M. St. P. & S. S. M. Ry. through Abbotsford and Chippewa Falls, Wis., to Minneapolis, Minn., thence via C. M. & St. P. Ry. through Benton Junction and Ortonville, Minn., to the Minnesota-South Dakota state line. **Western:** Minnesota-South Dakota state line. **Southern:** Commencing at South Dakota-Minnesota-Iowa state line east to the C. R. I. & P. Ry. line running through Gordonsville, Minn., and Northwood, Iowa, thence south via that line to Mason City, Iowa, thence east via C. M. & St. P. Ry. through McGregor, Iowa, Madison and Watertown to Milwaukee, Wis. **Eastern:** Lake Michigan from Kewaunee to Milwaukee, Wis.

ZONE NO. 3

RESTRICTED TO FOLLOWING COALS—Illinois, Kentucky (Western), Indiana, docks.

BOUNDARIES—Northern and Western: From Milwaukee, Wis., via C. M. & St. P. Ry. to Waukesha, thence via M. St. P. & S. S. M. Ry. to Illinois-Wisconsin state line. **Eastern and Southern:** From Milwaukee, Wis., via Lake Michigan (west bank) to Illinois-Wisconsin state line, thence via that line to M. St. P. & S. S. M. Ry.

ZONE NO. 4

RESTRICTED TO FOLLOWING COALS—Illinois, Kentucky (Western), docks.

BOUNDARIES—Northern: Via C. M. & St. P. Ry. from Milwaukee, Wis., through Watertown to Madison, Wis. **Southern:** Via C. M. & St. P. Ry. from Milwaukee, Wis., through Milton Junction to Madison, Wis.

ZONE NO. 4A

RESTRICTED TO FOLLOWING COALS—Illinois, docks.

BOUNDARIES—Northern and Western: From Milwaukee, Wis., via C. M. & St. P. Ry. through Milton Junction to Madison, Wis., thence via I. C. R. R. to Dixon, Ill. **Eastern and Southern:** From Milwaukee, Wis., via C. M. & St. P. Ry. through Elkhorn to Beloit, Wis., thence via C. & N. W. Ry. through Belvidere and Sycamore to Dixon, Ill.

ZONE NO. 5

RESTRICTED TO FOLLOWING COALS—Iowa, Kansas, Illinois, Missouri Oklahoma, Arkansas.

BOUNDARIES—Northern and Eastern: From Sioux City, Iowa, via C. M. & St. P. Ry. through Rock Valley and Spencer to Nora Junction, thence via C. R. I. & P. Ry. to Cedar Rapids, thence via C. M. & St. P. Ry. through Sigourney to Ottumwa, thence via C. R. I. & P. Ry. to Keokuk, Iowa, thence via Mississippi River to Missouri-Arkansas state line. **Western and Southern:** From Sioux City, Iowa, via C. M. & St. P. Ry. through Manilla and Adel to Des Moines, Iowa, thence via C. B. & Q. R. R. to Albia, thence via W. Ry. to Moravia, Iowa, thence via C. M. & St. P. Ry. to Chillicothe, Mo., thence via W. Ry. to Moberly, thence via M. K. & T. Ry. through New Franklin to North Jefferson City, thence via western boundary of Cole, Miller and Pulaski Counties to St. L. S. F. Ry., thence via St. L. S. F. Ry. through Springfield and Neosho to Missouri-Oklahoma state line, thence south to Arkansas-Missouri-Oklahoma state line, thence east via Arkansas-Missouri state line to the Mississippi River.

ZONE NO. 6

RESTRICTED TO FOLLOWING COALS—Illinois, Kentucky (Western).

BOUNDARIES—Northern and Western: From Arthur, Ill., via P. C. C. & St. L. R. R. to Decatur, Ill., thence via I. C. R. R. through Centralia to Cairo, Ill., thence via Mississippi River to Memphis, Tenn. **Eastern and Southern:** From Arthur, Ill., via C. & E. I. R. R. through Marion to Joppa, Ill., thence via Ohio River to Cairo, Ill., and thence via I. C. R. R. through Clinton and Fulton, Ky., and Dyersburg, Tenn., to Memphis, Tenn.

ZONE NO. 6A

RESTRICTED TO FOLLOWING COALS—Illinois, Kentucky (Western), docks.

BOUNDARIES—Northern: From Madison, Wis., to Woodman, Wis., via C. M. & St. P. Ry. **Southern:** From Madison, Wis., to Woodman, Wis., via C. & N. W. Ry.

ZONE NO. 7

RESTRICTED TO FOLLOWING COALS—Illinois, Iowa (to points in Iowa only).

BOUNDARIES—Northern and Eastern: From Nora Junction, Iowa, via C. M. & St. P. Ry. to Woodman, Wis., thence via C. & N. W. Ry. to Madison, Wis., thence via I. C. R. R. to Freeport, Ill., thence via I. C. R. R. to Dixon, Ill., thence via C. & N. W. Ry. through Nelson to Peoria, thence via P. C. C. & St. L. R. R. to Decatur, thence via I. C. R. R. through Centralia to Cairo, Ill. **Southwestern:** From Nora Junction, Iowa, via C. R. I. & P. Ry. to Cedar Rapids, thence via C. M. & St. P. Ry. to Ottumwa, thence via C. R. I. & P. Ry. to Keokuk, Iowa, thence east of the Mississippi River to Cairo, Ill.

ZONE NO. 8

RESTRICTED TO FOLLOWING COALS—Illinois, Indiana.

BOUNDARIES—Northern and Eastern: From Dixon, Ill., via I. C. R. R. to Decatur, Ill. **Western and Southern:** From Dixon, Ill., via C. & N. W. Ry. through Nelson to Peoria, Ill., thence via P. C. C. & St. L. R. R. to Decatur, Ill.

ZONE NO. 9

RESTRICTED TO FOLLOWING COALS—Illinois, Indiana, Kentucky (Western).

BOUNDARIES—Northern and Western: From Waukesha, Wis., via C. M. & St. P. Ry. to Beloit, Wis., thence via C. & N. W. Ry. through Belvidere, Sycamore, DeKalb, to Dixon, Ill., thence via I. C. R. R. to Decatur, Ill., thence via P. C. C. & St. L. R. R. to Arthur, thence via C. & E. I. R. R. through Mt. Vernon to Joppa, Ill. **Eastern and Southern:** From Waukesha, Wis., via M. St. P. & S. S. M. Ry. to Wisconsin-Illinois state line, thence via this line to Lake Michigan, thence via Lake Michigan to Michigan City, Ind., thence via C. I. & L. Ry. to San Pierre, thence via N. Y. C. R.R. to Wheatfield, thence via C. & E. I. R. R. through Brazil and Otter Creek Junction through Vincennes to Evansville, Ind., thence both sides of the Ohio River, Evansville, Ind., to Joppa, Ill.

ZONE NO. 10

RESTRICTED TO FOLLOWING COALS—Indiana, Illinois (Danville district on Wabash Ry. only). Kentucky (Western, to Jeffersonville and New Albany only).

BOUNDARIES—Northern and Western: From San Pierre, Ind., via N. Y. C. R.R. to Wheatfield, thence via C. & E. I. R.R. through Brazil, Otter Creek Junction and Vincennes to Evansville, Ind. **Eastern and Southern:** From San Pierre, Ind., via C. I. & L. Ry. to New Albany, Ind., thence along northern bank of Ohio River to Evansville, Ind.

ZONE NO. 11

RESTRICTED TO FOLLOWING COALS—Virginia (L. & N. R.R.), Tennessee (M. R.R.), West Virginia (Southern), Illinois, Indiana, Kentucky (Eastern and Western).

BOUNDARIES—Southeastern: From San Pierre, Ind., via N. Y. C. R.R. north to South Bend, Ind., thence via M. C. R.R. to Michigan-Indiana state line. **Western and Northern:** From San Pierre, Ind., north to Michigan City, thence along Lake Michigan and Indiana-Michigan state line to M. C. R. R. from South Bend, Ind., to Niles, Mich.

ZONE NO. 12

RESTRICTED TO FOLLOWING COALS—Indiana, Illinois (Danville district on Wabash Ry. only).

BOUNDARIES — Northeastern — From Monon, Ind., via C. I. & L. Ry. to Indianapolis, Ind., thence via C. C. C. & St. L. Ry. through Greensburg to North Vernon, Ind., thence via P. C. C. & St. L. R.R. to Madison, Ind. **Southwestern:** From Monon, Ind., via C. I. & L. Ry. to Louisville, Ky., thence via Ohio River to Madison, Ind.

ZONE NO. 13

RESTRICTED TO FOLLOWING COALS—Kentucky (Western).

BOUNDARIES—Northern and Eastern: From Cairo, Ill., along Ohio River (north bank) to Louisville, Ky., thence south via L. & N. R.R. from Louisville through Bowling Green, Ky., including Glasgow and Scottsville branches, to Kentucky-Tennessee state line. **Western and Southern:** From Cairo, Ill., via I. C. R.R. through Fulton, Ky., to Kentucky-Tennessee state line, thence east via state line to L. & N. R.R. running from Franklin, Ky., to Mitchellville, Tenn.

ZONE NO. 14

RESTRICTED TO FOLLOWING COALS—Indiana, Kentucky (Eastern), West Virginia (Northern and Southern), Virginia (L. & N.), Tennessee (M. R.R.), Michigan, Ohio (on G. R. & I. Ry. only).

BOUNDARIES—Northern and Western: From Mackinaw City, east bank of Lake Michigan, to Benton Harbor, Mich., thence via C. C. C. & St. L. Ry. to Niles, thence via M. C. R.R. to Michigan-Indiana state line. **Eastern and Southern:** From Mackinaw City via G. R. & I. Ry. and branches to Michigan-Indiana state line, thence west via state line to M. C. R.R. running from Niles to South Bend, Ind.

ZONE NO. 15

RESTRICTED TO FOLLOWING COALS—Illinois, Indiana, Kentucky (Eastern and Western), West Virginia (Northern and Southern), Virginia (L. & N.), Tennessee (M. R.R.), Michigan.

BOUNDARIES—Northern and Western: From Benton Harbor, Mich., via Lake Michigan to Indiana-Michigan state line. **Eastern and Southern:** From Benton Harbor, Mich. via C. C. C. & St. L. Ry. to Niles, thence via M. C. R.R. to Indiana-Michigan state line, thence west via state line to Lake Michigan.

ZONE NO. 16

RESTRICTED TO FOLLOWING COALS—Indiana, Illinois (Danville district on Wabash Ry. only), Kentucky (Eastern), West Virginia (Southern).

BOUNDARIES—Northern: Michigan-Indiana state line from G. R. & I. Ry. west to M. C. R. R. running from Niles, Mich. to South Bend, Ind. **Western:** Via N. Y. C. R. R. South Bend to San Pierre, thence via C. I. & L. Ry. through Monon to Indianapolis, thence via C. C. C. & St. L. Ry., Indianapolis to Greensburg, Ind. **Eastern:** G. R. & I. Ry. from Michigan state line south to Richmond, Ind., thence via P. C. C. & St. L. R. R. to Greensburg, Ind.

ZONE NO. 17

RESTRICTED TO FOLLOWING COALS—Virginia (L. & N. R.R.), Kentucky (Eastern), Tennessee (M. R.R.), West Virginia (Southern).

BOUNDARIES—From Cincinnati north via P. C. C. & St. L. Ry. to Richmond, Ind., thence west to Rushville, Ind., thence south via C. C. C. & St. L. R.R. through Greensburg, thence east to Cincinnati, O.

ZONE NO. 18

RESTRICTED TO FOLLOWING COALS—Virginia (L. & N. R.R.), Kentucky (Southern), Tennessee (M. R.R.).

BOUNDARIES—Northern and Western: Cincinnati, Ohio, via C. C. C. & St. L. Ry. through Greensburg, to North Vernon, Ind., thence via P. C. C. & St. L. R.R. to Madison, Ind. **Eastern and Southern:** North bank Ohio River, Cincinnati, Ohio, to Madison, Ind.

ZONE NO. 19

RESTRICTED TO FOLLOWING COALS—Kentucky (Eastern), Tennessee (M. R.R.), West Virginia (Southern, also Eastern, to points on C. & O. Ry. from Catlettsburg, Ky., to Cincinnati, Ohio).

BOUNDARIES—Northern and Eastern: From Louisville, Ky., via Ohio River and Big Sandy River to Kentucky-Virginia-West Virginia state line **Western and Southern:** From Louisville, Ky., to Lebanon Junction to Bowling Green, Ky., to Mitchellville, Tenn., including Glasgow and Scottsville (Kentucky) branches, thence via Kentucky-Tennessee state line and Kentucky-Virginia state line via Tug River to Big Sandy River.

ZONE NO. 20

RESTRICTED TO FOLLOWING COALS—Virginia (L. & N. R. R.), Kentucky, (Eastern), Tennessee (M. R.R.), West Virginia (Northern and Southern), Indiana, Illinois (Danville district on Wabash Ry. to points in Indiana only), Ohio, Michigan.

BOUNDARIES—Southern and Eastern: From Richmond, Ind., east via P. C. C. & St. L. R. R. to Ohio state line, thence north via state line to Michigan state line, thence via N. Y. C. R. R. to Jackson, Mich., thence via M. C. R.R. to Lansing, thence via P. M. Ry. through Ionia to Howard City, Mich. **Western:** From Howard City, Mich., via G. R. & I. Ry. through Fort Wayne to Richmond, Ind.

ZONE NO. 21

RESTRICTED TO FOLLOWING COALS—Virginia (L. & N. R.R.), Kentucky (Eastern), Tennessee (M. R.R.), West Virginia (Northern and Southern), Ohio, Michigan

BOUNDARIES—Northern and Eastern: From Mackinaw City, Mich., along the eastern boundary of Michigan (lower peninsula) and Ohio to Toledo, Ohio, thence via C. C. C. & St. L. Ry. through Bellefontaine to Dayton, Ohio. **Western and Southern:** From Mackinaw City, Mich., via G. R. & I. Ry. to Howard City, thence via P. M. Ry. through Ionia to Lansing, Mich., thence via M. C. R.R. to Jackson, thence via N. Y. C. R.R. to Indiana-Michigan-Ohio state line, thence south along state line and P. C. C. & St. L. R. R. running from Richmond, Ind., to Dayton, Ohio.

ZONE NO. 22

RESTRICTED TO FOLLOWING COALS—Virginia (L. & N. R.R.), Kentucky, (East-

ern), Tennessee (M. R.R.), West Virginia (Southern), Ohio.

BOUNDARIES—From Cincinnati, Ohio, north via C. C. C. & St. L. Ry. to Dayton, Ohio, thence via P. C. C. & St. L. R.R. west to Richmond, Ind., thence southeast via P. C. C. & St. L. R.R. to Cincinnati, Ohio.

ZONE NO. 23

RESTRICTED TO FOLLOWING COALS—Kentucky (Northeastern), West Virginia (Northern and Southern, also Eastern, along main lines of C. & O. Ry. and N. & W. Ry. to Columbus and Cincinnati, Ohio) Ohio.

BOUNDARIES—Northern and Eastern: From Toledo, Ohio, via south bank of Lake Erie to Sandusky, Ohio, thence via P. C. C. & St. L. R.R. through Columbus, thence via N. & W. Ry. through Circleville to Chillicothe. **Western and Southern:** From Toledo, Ohio, via C. C. C. & St. L. Ry. through Springfield to Dayton, Ohio, thence via B. & O. R. R. through Washington C. H. to Chillicothe, Ohio.

ZONE NO. 24

RESTRICTED TO FOLLOWING COALS—Kentucky (Northeastern), West Virginia (Southern, also Eastern, along main lines of C. & O. Ry. and N. & W. Ry. to Columbus and Cincinnati, Ohio), Ohio.

BOUNDARIES—Northern and Eastern: From Dayton, Ohio, via B. & O. R.R. through Washington C. H. to Chillicothe, thence via N. & W. Ry. to Waverly, thence via C. & O. Northern Ry. to Portsmouth. **Western and Southern:** From Dayton, Ohio, via C. C. C. & St. L. Ry. to Cincinnati, Ohio, thence via north bank of Ohio River to Portsmouth, Ohio.

ZONE NO. 25

RESTRICTED TO FOLLOWING COALS—West Virginia (Northern, also Eastern, along main lines of C. & O. Ry. and N. & W. Ry. to Columbus and Cincinnati, Ohio), Ohio.

BOUNDARIES—Northern and Eastern: From Bucyrus, Ohio, via T. & O. C. Ry. to Thurston, Ohio, thence via Z. & W. Ry. through Fultonham to Zanesville, thence via Z. & W. Ry., K. & M. Ry. to Athens. **Western and Southern:** From Bucyrus, Ohio, via P. C. C. & St. L. R.R. to Marion, Ohio, thence via H. V. Ry. to Columbus, thence via N. & W. Ry. to Chillicothe, thence via B. & O. Ry. to Athens, Ohio.

ZONE NO. 26

RESTRICTED TO FOLLOWING COALS—Ohio.

BOUNDARIES—Northern and Eastern: From Sandusky, Ohio, via south bank of Lake Erie to Lorain, thence via W. & L. E. Ry. through Wellington to Pittsburgh Junction, thence via P. & W. V. Ry. through Mingo Junction to Ohio River. **Southern and Western:** From Sandusky, Ohio, via P. C. C. & St. L. R.R. to Bucyrus, Ohio, thence via T. & O. C. Ry. to Thurston, thence through Zanesville to Athens, thence via K. & M. Ry. through Athens to Middleport, thence via Ohio River (north bank) to P. & W. V. Ry. opposite Mingo Junction.

ZONE NO. 27

RESTRICTED TO FOLLOWING COALS—Pennsylvania, Ohio.

BOUNDARIES—Northern and Western: Along south bank Lake Erie from Conneaut, Ohio, to Lorain, Ohio, thence via W. & L. E. Ry. through Wellington to Pittsburgh Junction, thence via P. & W. V. Ry. through Mingo Junction to Ohio River. **Eastern and Southern:** From Conneaut, Ohio, via Pennsylvania-Ohio state line to East Liverpool, Ohio, thence via Ohio River to P. & W. V. Ry. at a point opposite Mingo Junction.

ZONE NO. 28

RESTRICTED TO FOLLOWING COALS—No change contemplated in this plan, except that low-volatile coal in the Pocahontas, Tug River and New River districts on the N. & W. R. R. and the C. & O. Ry. and the Virginian Ry., and Clinch Valley districts in Tazewell and eastern Russell Counties along the N. & W. R. R., also high-volatile east of Charleston, W. Va., on C. & O. Ry. and east of Iaeger, W. Va., on N. & W. R. R. will be restricted to the District of Columbia, (except C. & O. Ry.) Virginia, (including tidewater terminals) also points in West Virginia on the direct line of the C. & O. Ry. and N. & W. R. R. east and west bound and Virginia Ry. east bound.

BOUNDARIES—All territory east and northeast of Ohio, Kentucky and Virginia, including New England.

ZONE NO. 29

RESTRICTED TO FOLLOWING COALS—Ohio, West Virginia (Northern, also Eastern, to points on the direct lines of the C. & O. Ry. and N. & W. Ry.).

BOUNDARIES—Northern and Eastern: From Chillicothe, Ohio, via B. & O. R.R. to Athens, thence via K. & M. Ry. to Middleport, thence via Ohio River (north bank) to Ironton, Ohio. **Western and Southern:** From Chillicothe, Ohio, via N. & W. Ry. to Waverly, thence via C. & O. N. Ry. to Portsmouth, thence via Ohio River (north bank) to Ironton, Ohio.

ZONE NO. 30

RESTRICTED TO FOLLOWING COALS—No change.

BOUNDARIES—All territory west of the following state lines: North Dakota, South Dakota, Nebraska, Kansas, Oklahoma and Texas.

ZONE NO. 31

RESTRICTED TO FOLLOWING COALS—North Dakota, Wyoming, Montana and other fields east of the Rocky Mountains, docks.

BOUNDARIES—All territory in North Dakota west of the Missouri River.

ZONE NO. 32

RESTRICTED TO FOLLOWING COALS—North Dakota, South Dakota, Wyoming, Montana, docks.

BOUNDARIES—Northern, Western and Southern: North boundary of North Dakota to Montana, thence south to and via Missouri River to Mobridge, S. D., thence via C. M. & St. P. Ry. through Aberdeen to Bigstone City, S. D. **Eastern:** East boundary of North Dakota, thence via Minnesota-South Dakota state line to Bigstone City, S. D.

ZONE NO. 33

RESTRICTED TO FOLLOWING COALS—South Dakota, Wyoming, Montana and other fields east of the Rocky Mountains, North Dakota, docks.

BOUNDARIES—Northern and Eastern: From Montana-North Dakota-South Dakota state line to the Missouri River, thence via Missouri River to South Dakota-Nebraska state line. **Western and Southern:** Western and southern state boundary of South Dakota.

ZONE NO. 34

RESTRICTED TO FOLLOWING COALS—North Dakota, South Dakota, Wyoming, Montana, Illinois (summer), docks.

BOUNDARIES — Southwestern: From Mobridge, S. D., via Missouri River to Sioux City, Ia. **Northern and Eastern:** From Mobridge, S. D., via C. M. & St. P. Ry. through Aberdeen, S. D., to Bigstone City, S. D., thence via Minnesota-South Dakota state line and Iowa-South Dakota state line to Sioux City, Ia.

ZONE NO. 35

RESTRICTED TO FOLLOWING COALS—Iowa, Kansas, Missouri, Arkansas, Oklahoma, Colorado and other fields east of the Rocky Mountains, Wyoming.

BOUNDARIES—Entire state of Nebraska.

ZONE NO. 36

RESTRICTED TO FOLLOWING COALS—Kansas, Missouri, Iowa, Arkansas, Oklahoma, Colorado (Southern).

BOUNDARIES—Entire state of Kansas.

ZONE NO. 37

RESTRICTED TO FOLLOWING COALS—Oklahoma, Missouri, Arkansas, Kansas, Colorado, New Mexico, Texas.

BOUNDARIES—Entire state of Oklahoma.

ZONE NO. 38

RESTRICTED TO FOLLOWING COALS—New Mexico, Colorado, Texas.

BOUNDARIES—All Texas territory west of Pecos River.

ZONE NO. 39

RESTRICTED TO FOLLOWING COALS—Colorado, New Mexico, Arkansas, Oklahoma, Texas.

BOUNDARIES—Northern and Eastern: From New Mexico-Oklahoma-Texas state line east along northern border of Texas to Arkansas-Louisiana-Texas state line, thence south to Logansport, La., thence via H. E. & W. T. Ry. to Houston, via G. H. & H. R.R. to Galveston, thence Gulf of Mexico to Rio Grande River. **Southwestern:** From New Mexico-Oklahoma-Texas state line to Pecos River, thence via Pecos River to Rio Grande River thence via Rio Grande River to the Gulf of Mexico.

ZONE NO. 40

RESTRICTED TO FOLLOWING COALS—Kentucky (Western), Alabama, Texas.

BOUNDARIES—Northwestern: From Logansport, La., via H. E. & W. T. Ry. to Houston, Texas, thence via G. H. & H. R. R. to Galveston. **Eastern and Southern:** From Logansport, La., along Louisiana-Texas state line to the Gulf of Mexico.

ZONE NO. 41

RESTRICTED TO FOLLOWING COALS—Arkansas, Illinois (summer), Iowa, Kansas, Missouri, Oklahoma, docks.

BOUNDARIES—Northern and Western: From Minnesota-Iowa state line directly south of Gordonsville, Minn., to Iowa-Minnesota-South Dakota state line, thence directly south along Iowa-South Dakota state line to Rock Valley, Ia. **Eastern and Southern:** From Iowa-Minnesota state line directly south of Gordonsville, Minn., via C. R. I. & P. Ry. to Mason City, Ia., thence via C. M. & St. P. Ry. to Rock Valley, Ia.

ZONE NO. 42

RESTRICTED TO FOLLOWING COALS—Arkansas, Iowa, Kansas, Missouri, Oklahoma.

BOUNDARIES—Northeast: From Sioux City, Ia., via C. M. & St. P. Ry. through Manilla and Adel to Des Moines, thence via C. B. & Q. R. R. through Chariton to Albia, thence via W. Ry. to Moravia, Ia., thence via C. M. & St. P. Ry. through Seymour to Missouri-Iowa state line. **Western and Southern:** From Sioux City, Ia., via Missouri River (east bank) to Iowa-Missouri state line, thence via Missouri state line, north boundary, to C. M. & St. P. Ry. line running south from Seymour, Ia.

ZONE NO. 43

RESTRICTED TO FOLLOWING COALS—Iowa, Arkansas, Kansas, Missouri, Oklahoma.

BOUNDARIES—Northeastern and Southern: Iowa-Missouri state line from Missouri River to C. M. & St. P. Ry. running south from Moravia, Ia., through Chillicothe, Mo., thence via W. Ry. through Huntsville to Moberly, thence via M. K. & T. Ry. through New Franklin to North Jefferson City, thence via western boundary of Cole, Miller and Pulaski Counties, Mo., to St. L. S. F. Ry. thence via St. L. S. F. Ry. through Lebanon, Springfield, to Missouri-Oklahoma state line. **Western:** Western boundary of Missouri.

ZONE NO. 44

RESTRICTED TO FOLLOWING COALS—Arkansas, Illinois, Kansas, Missouri, Oklahoma, Texas.

BOUNDARIES—Northern and Eastern: From Arkansas-Missouri-Oklahoma state line east to Mississippi River, thence via Mississippi River (west bank) to Memphis, Tenn. **Western and Southern:** From Arkansas-Missouri-Oklahoma state line south to C. R. I. & P. Ry. running from Howe, Okla., through Mansfield, Danville and Little Rock, Ark., to Memphis, Tenn.

ZONE NO. 45

RESTRICTED TO FOLLOWING COALS—Alabama, Arkansas, Illinois (only on lines of St. L. S. W. Ry. and St. L. I. M. & S. Ry), Kansas, Missouri, Oklahoma, Kentucky (Western), Texas.

BOUNDARIES—Northern and Eastern: From Arkansas-Oklahoma state line via C. R. I. & P. Ry. running from Howe, Okla., through Mansfield, Danville and Little Rock, Ark., to Memphis, Tenn., thence via Mississippi River (west bank) to Arkansas-Louisiana state line. **Western and Southern:** South along Arkansas-Oklahoma state line from C. R. I. & P. Ry. Howe, Okla., to Mansfield, Ark., to Arkansas-Louisiana-Texas state line, thence east along Arkansas-Louisiana state line to the Mississippi River.

ZONE NO. 46

RESTRICTED TO FOLLOWING COALS—Alabama, Arkansas, Illinois (only on lines of St. L. S. W. Ry. and St. L. I. M. & S. Ry.), Kentucky (Western), Texas.

BOUNDARIES—Northern and Eastern: From Arkansas-Louisiana-Texas state line east to the Mississippi River, thence along Mississippi River (west bank) to the Gulf of Mexico. **Western and Southern:** Louisiana-Texas state line to the Gulf of Mexico, thence to Mississippi River.

ZONE NO. 47

RESTRICTED TO FOLLOWING COALS—Kentucky (Western).

BOUNDARIES—Northern and Eastern: From Kentucky-Tennessee state line south of Fulton, Ky., east to L. & N. R. R. passing south through Mitchellville, Tenn., through Nashville and Columbia to Iron City, Tenn., including Scottsville and Hartsville, Ky., branches. **Western and Southern:** From Kentucky-Tennessee state line south of Fulton, Ky., via I. C. R. R. to Memphis, thence east via N. C. & St. L. Ry. to Perry-

ville, thence along Tennessee River (east bank) to Alabama-Mississippi-Tennessee state line, thence via Alabama-Tennessee state line to Iron City, Tenn.

ZONE NO. 48

RESTRICTED TO FOLLOWING COALS—Alabama.

BOUNDARIES—Northern and Eastern: From Memphis, Tenn., via N. C. & St. L. Ry. to Perryville, thence via Tennessee River (west bank) to Alabama-Mississippi-Tennessee state line. **Western and Southern:** From Memphis to Arkansas-Mississippi-Tennessee state line, thence east along Mississippi-Tennessee state line to the Tennessee River.

ZONE NO. 49

RESTRICTED TO FOLLOWING COALS—Alabama, Kentucky (Western).

BOUNDARIES—Northern and Eastern: Tennessee-Mississippi state line and Alabama-Mississippi state line. **Western and Southern:** East bank Mississippi River to the Gulf of Mexico.

ZONE NO. 50

RESTRICTED TO FOLLOWING COALS—Kentucky (Southern), Virginia (all Black Mountain and Stonega districts in Lee, Dickenson, Wise, and western Russell Counties of Virginia), Kentucky (Western), Tennessee, Georgia.

BOUNDARIES—Northeastern: From Columbia, Tenn., via L. & N. R. R. to Baugh, Tenn. **Western and Southern:** From Columbia, Tenn., via L. & N. R. R. through Lawrenceburg to Iron City, thence east via Alabama-Tennessee state line to Baugh, Tenn.

ZONE NO. 51

RESTRICTED TO FOLLOWING COALS—Alabama, Kentucky (Southern), Virginia (all Black Mountain and Stonega districts in Lee, Dickenson, Wise, and western Russell Counties of Virginia), Tennessee, Georgia.

BOUNDARIES—Northern: Tennessee-Alabama state line. **Southwestern and Eastern:** Tennessee River.

ZONE NO. 52

RESTRICTED TO FOLLOWING COALS—Alabama.

BOUNDARIES—Northern and Eastern: Tennessee River to Alabama-Georgia state line, thence south along state line to Apalachicola River, thence via said river to the Gulf of Mexico. **Western and Southern:** Alabama-Mississippi state line to the Gulf of Mexico.

ZONE NO. 53

RESTRICTED TO FOLLOWING COALS—Kentucky (Southern, also Western, to points on N. C. & St. L. and T. C. R. R. Nashville to Old Hickory and Hermitage, Tenn. inclusive), Virginia (all Black Mountain and Stonega districts in Lee, Dickenson, Wise, and western Russell Counties of Virginia, also Clinch Valley district in eastern Russell and Tazewell Counties). West Virginia (Eastern, also Southern, on C. & O. Ry. east of Charleston and N. & W. Ry. east of Iaeger, W. Va.), Georgia, Tennessee.

BOUNDARIES—Northern and Eastern: From Mitchellville, Tenn., east along Tennessee-Kentucky state line to Virginia state line, thence via L. & N. R. R. to Norton, thence via N. & W. R. R. through Roanoke, Petersburg (and branches of N. & W. R. R. at Petersburg) to Norfolk, thence south to Virginia-Carolina state line. **Western and Southern:** From Mitchellville, Tenn., via L. & N. R. R through Nashville and Columbia to Baugh, Tenn., including Scottsville, Ky., branch, thence along Alabama-Tennessee-Georgia state line, thence via North Carolina-Tennessee state line, thence via North Carolina-Virginia state line to the Atlantic Ocean.

ZONE NO. 54

RESTRICTED TO FOLLOWING COALS—Kentucky (Southern), Tennessee, Virginia (all Black Mountain and Stonega districts in Lee, Dickenson, Wise, and western Russell Counties of Virginia), Alabama, Georgia.

BOUNDARIES—State of Georgia and all of Florida east of Apalachicola River.

ZONE NO. 55

RESTRICTED TO FOLLOWING COALS—Kentucky (Southern), Virginia (all Black Mountain and Stonega districts in Lee, Dickenson, Wise, and western Russell Counties of Virginia), Tennessee, Georgia, West Virginia (Eastern).

BOUNDARIES—Northern and Eastern: From Georgia-North Carolina-South Carolina state line to the line of the Sou. Ry. running south from Charlotte, N. C., through Chester to Columbia, S. C., thence via S. A. L. Ry. to Denmark, thence via Sou. Ry. to Charleston, S. C. **Western and Southern:** South Carolina-Georgia state line to the Atlantic Ocean.

ZONE NO. 56

RESTRICTED TO FOLLOWING COALS—Kentucky (Southern), Tennessee, Virginia (all Black Mountain and Stonega Districts in Lee Dickenson, Wise and western Russell Counties of Virginia, and Clinch Valley districts in Tazewell and eastern Russell Counties along the N. & W. Ry.), West Virginia (Eastern, on C. & O. Ry. and N. & W. Ry. and Virginian Ry.).

BOUNDARIES—All of North Carolina, and that portion of South Carolina on and east of the line of the Sou. Ry. Charlotte, N. C., through Chester to Columbia, thence via S. A. L. Ry to Denmark, thence via Sou. Ry. to Charleston, S. C.

ZONE NO. 57

RESTRICTED TO FOLLOWING COALS—No change contemplated. Coal to be supplied generally from low-volatile fields.

BOUNDARIES—That portion of Virginia on and north of the N. & W. R.R. Graham, Va., to Norfolk, Va., including branches at Petersburg.

KENTUCKY

Eastern	All mines in eastern Kentucky on Sou. Ry. (Q.&C.), L. & N., C. & O., N. & W. and L. F.
Northeastern	Sandy Valley & Elkhorn Ry., L. F., C. & O., and N. & W. in Thacker, Big Sandy and Elkhorn districts.
Northern	L. & N. in Hazard and Elkhorn districts.
Southern	Sou. Ry. (Q.&C.) and L. & N in Harlan, Jellico and Southern Appalachian districts.
Western	L. & N. and I. C. west of Louisville, Ky.

WEST VIRGINIA

Eastern	C. & O. and N. & W. in low-volatile fields of Pocahontas, Tug River and New River districts.
Northern	K. & M., K. & W. V. and C. & C. west of Dundon.
Southern	C. & O. and N. & W. in Kanawha, Kenova and Thacker districts.

Key to Producing Districts

Location of Producing Districts	Numbers of Consuming Zones to which restricted
Alabama	40, 45, 46, 48, 49, 51, 52, 54.
Arkansas	5, 35, 36, 37, 39, 41,[4] 42, 43, 44, 45, 46.
California	30.
Colorado	30, 31, 33, 35, 36, 37, 38, 39.
Docks[1]	1, 2, 3, 4, 4A, 6A, 31, 32, 33, 34, 41.
Georgia	50, 51, 53, 54, 55.
Illinois (summer)	2, 34, 41.
Illinois	3, 4, 4A, 5, 6, 6A, 7, 8, 9, 10[2], 11, 12[2], 15, 16[2], 20[2], 44, 45[5], 46[3].
Indiana	3, 8, 9, 10, 11, 12, 14, 15, 16, 20.
Iowa	2[4], 5, 7[4], 35, 36, 41, 42, 43.
Kansas	5, 35, 36, 37, 41, 42, 43, 44, 45.
Kentucky:	
Eastern	11, 14, 15, 16, 17, 19, 20, 21, 22.
Northeastern	23, 24.
Southern	18, 50, 51, 53, 54, 55, 56.
Western	3, 4, 6, 6A, 9, 10, 11, 13, 15, 40, 45, 46, 47, 49, 50, 53[5].
Maryland	57.
Michigan	14, 15, 20, 21.
Missouri	5, 35, 36, 37, 41, 42, 43, 44, 45.
Montana	30, 31, 32, 33, 34, 35.
New Mexico	30, 35, 37, 38, 39.
North Dakota	1, 2, 31, 32, 33, 34.
Ohio	14[9], 20, 21, 22, 23, 24, 25, 26, 27, 28[7], 29.
Oklahoma	5, 35, 36, 37, 39, 41, 42, 43, 44, 45.
Oregon	30.
Pennsylvania	27, 28, 57.
South Dakota	1, 2, 32, 33, 34.
Tennessee (M. R. R.)	11, 14, 15, 17, 18, 19, 20, 21, 22.
Tennessee	50, 51, 53, 54, 55, 56.
Texas	37, 38, 39, 40, 44, 45, 46.
Utah	30, 31, 33, 35, 36.
Virginia (L. & N.)	11, 14, 15, 17, 18, 20, 21, 22.
Virginia[8]	50, 51, 53, 54, 55, 56.
Virginia[9]	53, 56.
West Virginia:	
Eastern	19, 23[10], 24[10], 25[10], 29[10], 53, 55, 56.
Northern	14, 15, 20, 21, 23, 25, 29.
Southern	11, 14, 15, 16, 17, 19, 20, 21, 22, 23, 24, 53.
Wyoming	30, 31, 32, 33, 34, 35.

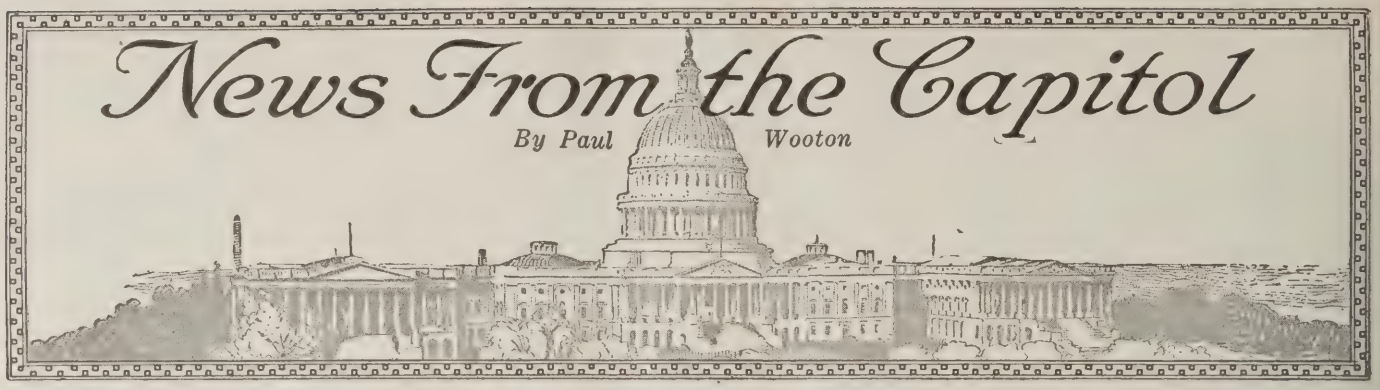
[1]South bank Lake Superior and west bank Lake Michigan.

[2]From Danville district on Wabash Ry. only.

[3]Only on lines of St. L. I. M. & S. and St. L. S. W. Rys.

[4]To points in Iowa only.

[5]To points on N. C. & St. L. and T. C. Nashville to Hermitage and Old Hickory, Tenn., inclusive.



[6]On G. R. & I. only

[7]From mines in Columbiana County, O., only.

[8]All Black Mountain and Stonega districts in Lee, Wise, Dickenson and western Russell Counties.

[9]Clinch Valley districts in Tazewell and eastern Russell Counties.

[10]Along lines of C. & O. and N. & W. to Cincinnati and Columbus, O.

Cyrus Garnsey, Jr., Appointed Assistant Fuel Administrator

Appointment of Cyrus Garnsey, Jr., as Assistant Federal Fuel Administrator, is regarded as being a direct recognition of the work of the engineers' committee, of which Mr. Garnsey was a member. Mr. Garnsey will have administrative charge of all activities of the Fuel Administration, with the exception of distribution and of the oil section. The office of assistant administrator is a new one, so that Mr. Garnsey replaces no member of the present staff.

While Mr. Garnsey is better known as an Alabama operator, he also was for many years an extensive operator of retail yards throughout the South. At one time he operated four retail yards in New Orleans. He is, however, a native of Seneca Falls, N. Y., where he was born Apr. 10, 1861. In 1880 he went to Kansas City as private secretary to the general manager of the Kansas Rolling Mill Co. A few years later he became comptroller of the Kansas City, Fort Scott & Memphis Railroad Co. As the terminus of this railroad was at Birmingham, he was thrown in close relationship with the coal business, with which he became very familiar. In 1899 he became the executive head of the Galloway Coal Co., of Memphis, in which he was financially interested. This company operated mines in Alabama. Mr. Garnsey was one of the proprietors of the Patterson Transfer Co., a large transfer and warehousing concern of Memphis. Mr. Garnsey retired from active business Jan. 1, 1917, at which time he disposed of all his mining interests.

Fuel Administrator Repeals Orders Diverting Coal to New England

Special orders providing for the diversion of coal to New England, issued during the critical period of last winter, were revoked on May 3 by United States Fuel Administrator Garfield. These orders were no longer necessary in view of the inauguration of the zone system, regulating the production and transportation of coal and of the adoption of the system of district representatives of the Fuel Administration facilitating the filling of emergency and other essential requirements for bituminous coal from the different producing fields.

Provision for supplying coal to New England has been made in the zone system recently put into effect by the Fuel and Railroad Administrations. One of the orders issued last winter provided for the diversion of 500 cars of bituminous coal daily, which was consigned to James J. Storrow, Federal Fuel Administrator for New England, with authority to him to place it where most needed. The order of Fuel Administrator Garfield revoking the orders affecting New England became effective May 8, 1918.

Weekly Production Statistics

By producing 11,668,000 tons of coal during the week ended Apr. 27, the mines of the country exceeded any week's production during the last twelve months. Telegraphic advices, however, show that this rate of production was not maintained during the week ended May 4. If the country's full requirements for coal this year are met, the average weekly production must exceed 12,000,000 tons.

Anthracite forwardings during the week ended Apr. 27 were 39,522 cars, nearly 400 cars in excess of forwardings for the week preceding.

Beehive coke production showed a decided trend upward, having been 652,000 tons for the week ended Apr. 27. Byproduct coke production totaled 475,979 tons, practically 90 per cent. of full time capacity of the country's byproduct ovens.

The estimates referred to above were made by C. E. Lesher, geologist in charge of coal statistics for the United States Geological Survey.

Restricts Hard Coal Movement to Canada

Plans for the restriction of the movement of anthracite coal from the United States to Canada during the present coal year have been formulated by the United States Fuel Administration in coöperation with the Fuel Controller of Canada. A representative of the United States Fuel Administrator attended a recent conference of representatives of coal operators, coal miners and railways in Canada, at which this problem was discussed.

The conference reached an agreement as to the movement of anthracite coal into Canada embracing the following: Anthracite coal supplies to points in western Canada will be materially restricted during the present coal year. No American anthracite will be available for shipment to points west of Winnipeg. The Canadian public, both east and west, must be given to understand distinctly that conservation of coal must be practiced to the utmost extent by all classes of consumers.

Harry D. Nims Resigns

Harry D. Nims has resigned his position with the Fuel Administration. Since the founding of the administration, Mr. Nims has occupied a position of great responsibility. He has had an important part in formulating the policies of the Fuel Administration and in defining its procedures. His resignation has been deferred several months at Dr. Garfield's request. He was forced, however, to take the action he did by the fact that he could no longer afford, financially, to contribute his services to the Government. In serving the Fuel Administration the length of time that he has, Mr. Nims feels that he has done his bit and, in justice to his family, must resume his law practice in New York City.

Government Coal Yard in Washington

An item in the forthcoming sundry civil bill will provide for the establishment in Washington of a Government coal yard. The Government's requirements in Washington will be met from that yard, in which a reserve will be built up in an effort to avoid an uncertain fuel supply during future winters. The public also is to have recourse to the yard, in case commercial stocks of coal should become exhausted.

New Prices for Bituminous Coal

New prices for bituminous coal, effective May 1, have been announced by the Fuel Administration as follows:

State or Field	Run-of Mine	Prepared Sizes	Slack or Screenings
Indiana	$2.00	$2.20	$1.70
Brazil Block	2.95	3.25	1.70
Montana	2.70	3.60	1.00
Illinois			
Macon County	2.25	2.50	1.70
Colorado			
Fremont County (operation of Williamsburgh Slope Coal Co. at Florence)	2.25	4.25	1.25
Kentucky			
Knox & Whitley Counties (Blue Gem Coal mined by members of the Tri-county Blue Gem Coal Operator's Association)	3.55	3.80	2.40
Tennessee			
Campbell County (Blue Gem coal mined by members of the Tri-county Blue Gem Coal Operators' Association	3.55	3.80	2.40

Operators who have complied with the Washington wage agreement are permitted to add 45c. per ton to the foregoing prices.

Brief Washington Notes

George E. Warren, of Boston, Mass., has been named chief of the division of fuel and forage of the War Department.

A. M. Ogle, president of the Vandalia Coal Co., of Terre Haute, Ind., has joined the staff of J. D. A. Morrow, who is in charge of bituminous coal distribution for the Fuel Administration.

Albert H. Wiggin, state fuel administrator for New York, has tendered his resignation. This step has been made necessary, he explained, by the increasing work which is falling upon him as chairman of the Clearing House committee. Dr. Garfield has asked Mr. Wiggin if he will be able to continue as fuel administrator if he is furnished additional assistance.

The New York and Philadelphia Coal and Coke Co. must suspend business for five days and is otherwise penalized for violating the regulations of the Fuel Administration with regard to furnishing smokeless coal to ships which have to pass through the submarine zone.

Fuel Session at Spring Meeting of American Society of Mechanical Engineers

Recognizing the importance of the fuel question, the American Society of Mechanical Engineers, which holds its Spring Meeting at Worcester, Mass., June 4 to 7, has announced a session on Thursday morning, June 6, for five-minute presentations of data relating to fuel economy. This session has been planned by the Fuel Conservation Committee of the Engineering Council in order to assist Fuel Administrator Garfield in his nationwide campaign for fuel economy. A feature of this session will be the discussion of problems incident to the adverse fuel conditions of the past winter. A. A. Potter will present a paper entitled "An Investigation of the Fuel Problem in the Middle West."

Legal Department

BREACH OF COAL SALES CONTRACTS—On refusal of a contract seller of coal to deliver at the agreed price, he demanding an advanced price, the buyer, on accepting partial deliveries under the contract at the higher price, is entitled to recover the excess paid above the contract amount in order to secure delivery. But as to quantities called for by the agreement and undelivered, the buyer's measure of damage is the excess of the market value of the coal at the time and place when and where delivery should have been made above the contract price. (New York Supreme Court, Appellate Term; Hencken & Willenbrock Co. vs. Rosenwasser Bros.; 168 New York Supplement, 1097.)

STATUTE OF FRAUDS APPLIED—New York, like the other states, has a law known as the Statute of Frauds under which a contract to sell personal property in excess of a certain price is unenforceable unless evidenced in a writing signed by the party sought to be held, or unless there is at least a partial acceptance of delivery or a partial payment by the buyer. This statute was invoked the other day in defeat of a suit brought to recover $929 as the agreed price of coal dust to be delivered to defendant. The agreement for sale in this case was verbal, and plaintiff, in order to bring its claim within the Statute of Frauds, asserted that there had been an acceptance of the coal dust by the defending buyer. This claim rested on the facts that the fuel had been unloaded at a dock and that the defendant's secretary had orally promised to send a check for the price. It appeared that the next day the defendant wrote plaintiff that the coal dust was "of very inferior quality, full of large lumps, and very sticky and greasy, and not of the quality represented. . . . Before paying this bill, it will be necessary to make us a decided reduction in price," etc. Holding that the plaintiff could not recover, the Appellate Term of the New York Supreme Court decided that there was nothing to show an acceptance of the coal dust, considering the fact that the defendant had a reasonable time in which to inspect the fuel, and indicated in the letter that acceptance would be conditioned upon the making of a deduction in the price. (A. Sidney Davison Coal Co. vs. Empire Brick and Supply Co., 168 New York Supplement, 534.)

EDITORIALS

Chance's Method of Coal Separation

IN THE present issue is given an abstract of Thomas M. Chance's article on "A New Method of Separating Materials of Different Specific Gravities." One may be permitted perhaps to question whether the principles suggested are as "new" as the writer of the article imagines. If the reader will take the trouble to consult Robert H. Richards' monumental and authoritative work on "Ore Dressing," he will find that there are two kinds of settling—free and hindered settling. In the one case—but why not use his own words:

> Free settling is where the individual particles fall freely either in still water or against an opposing upward current, without being hindered by other particles. The classifiers and settling tanks are instances of this principle. Hindered settling is where the particles of mixed sizes, shapes and gravities in a crowded mass, yet free to move among themselves, are sorted in a rising current of water, the velocity of which is much less than the free-falling velocity of the particles, but yet enough so that the particles are in motion. The arrangement of the particles is so positive that if one of them be moved either upward or downward from its chosen companions, it will be found, when set free, to return immediately to practically the same group as before. The jig beds are instances of this principle.—Vol. 1, Chap. XII, p. 464.

Wherein does Mr. Chance's method differ from hindered settling as commonly described? Mr. Chance describes his method merely as an agitation of the liquid "by stirring arms, by propeller blades, by rotating disks and cones, by hydraulic jets, by upwardly rising liquid and other means." The agitation is therefore not necessarily such as to produce an upwardly rising current but, in every case illustrated and in the model presented, he has shown the influx of water as from below as in jigging and classification appliances. In Mr. Chance's separator the diligent inquirer will find more than a faint resemblance to the tubular classifier of Mr. Richards shown on page 611 of his book, the first edition of which appeared in 1903.

So much for the method of agitation and its similarity to that already in use; let us now inquire into the principle of the separator as Mr. Richards and Mr. Chance respectively enunciate it. The particles, as Mr. Richards views them, are shuttlecocks of sand with an uprising liquid as battledore. Mr. Chance, on the other hand, regards the liquid as of higher specific gravity and bases all his argument on the assumption that the artificial fluid of water and sand acts as if it were a syrup or solution of great density.

For this reason he expects that he will not be confronted with the necessity for sizing his material; the large and small will fall or rise together obedient to their specific gravities. In his view it is no more necessary than in the "float-and-sink test" of the ordinary washery to size the material to be treated. Somehow the agitation merely keeps the sand in solution, if that expression may be pardoned.

To Mr. Chance the action seems to be a free settling in a liquid of high specific gravity, and not at all a hindered settling. There is of course a variation in the speed with which such settling takes place. In this speed naturally size and shape will function. But granted that you have a medium for free settlement, eventually all the material heavier than the composite specific gravity of the laden liquid will sink, whether it be large or small, so long as it does not consist of infinitesimal particles. The large pieces will fall first, but all will fall eventually.

So the question arises: Shall we call the Chance separation a free settling in a liquid of high specific gravity or a hindered settling in a liquid sustaining solid matter? The theories are so different that the principles of operation must necessarily be divergent.

But before the matter is dismissed recognition must be given to the fact that Mr. Chance does not use the material being classified as the material for densifying his liquid. His use of sands of varying density modifies the technique. In this his method appears to have real claims to newness. In the hindered settling reliance is placed not on a third body but on the body being settled. Here then is a real divergence, but it is one that makes for difficulty. We can separate coal from slate, but if we keep dumping in the material to be separated and drawing off the product it is only with difficulty that we shall maintain a liquid with any given composite specific gravity. Agitation may cost but little, but the recovery of the sand must be added to the expense. Viewing the matter as from the street, the process promises difficulties which it will take all Mr. Chance's known abilities to solve after the war is won.

Principal Problem for Chemists

OF ALL the problems for chemists, perhaps none is so pressing, and none seems to the tyro so easy, as to discover some way of converting the lower members of the hydrocarbon series—methane, ethane and ethylene—into higher members of the same or other series. If we could make methane and ethane into pentane, hexane and heptane, or ethylene into hexylene, and the like, these being liquids under ordinary conditions, we could convert and so condense some of the gases from byproduct ovens into gasoline and burn the others for power purposes and for coking.

The method would probably be equally available for use in connection with the distilling of coal at low temperatures. It would be possible also to turn the gas from our oil wells into a stable gasoline. If the process was reasonably cheap, it might conceivably be possible even to secure a product from the waste gases of the mines, as Governor Brumbaugh of Pennsylvania has advocated—but that is a far cry

The immediate need is to convert the richer gas of coke and coal-distillation plants into liquids so that there will be a greater profit in operating such plants at the

mines. At present the gas of byproduct ovens has to be wasted if it is not produced in close proximity to points where the demands for power are large.

In converting methane into heptane, if the conversion could be accomplished, 9 per cent. of the hydrogen in the methane would be abstracted. While methane contains 25 per cent. of hydrogen, heptane has only 16 per cent. Ethylene has the same chemical analysis as hexylene. In the other series hydrogen must be added, but these are less important. The trick seems so easy, but Nature often seems firmly resolved to resist taking what appears on first sight to be the obvious course.

May Federal Railroads Lock Out Miners?

WE HAVE all roasted the mine worker who laid idle when the world waited for fuel. We have all berated the strikers and the makers of "holidays," real or feigned. "They had no right to strike. Could they not arbitrate their wages? Let them go on working and justice would be given them."

We believed that we had the Government with us in our censure. It is true, we did have the Fuel Administration with us, but the Railroad Administration, if it sided with this point of view, must have done it with a wink. While the patriotic mine worker could see the point and largely refused to strike when unruly men urged him to do so, the Railroad Administration, blind and determined, did as it pleased; for it has never had the coal shortage burned into its soul. It is well known that the railroads caused the fuel shortage; they are going to cause it again, and yet they go merrily on their way with complete indifference.

The mine worker is required to work at the price set whether he wants more or not. He is told to trust to the fairness of the Fuel Administration and the umpires appointed. But the Railroad Administration feels itself privileged at any time to lock out the mine worker in order to secure a lower price, to quit buying and to bring the nation and the coal industry to terms by class warfare, by the "lockout," in short. It is not willing to pay the Fuel Administration's price, and it will not be put off with umpires, however disinterested. The Government appoints its own arbiters, and it is the Government that goes back on them. It reverts to the supposedly forgotten "class struggle," to that quarrel between buyer and consumer which is analogous to the strife between servant and master.

There is something to be said for this way of doing business, especially in times of peace. But when the Government has preached that striking and locking out with an enemy at the door are inexcusable, on what imaginable basis of equity does this Railroad Administration stand? What excuse has it for its enormity? It would be scandalized if its employees would take an attitude such as it assumes. It would condemn them if they ventured to assert that they could sell their labor at their pleasure and fix their wage to suit their interest whether the nation won or lost the war.

But, to all appearance, the Railroad Administration autocratically believes itself superior to the moral code embounden on its employees and will not buy coal at the price declared fair by the Fuel Administration. It will strike first, and when it starves for coal this winter it will commandeer all the coal it wants and let the world go cold. Never was there anything less logical, more unreasonable, than this Frankenstein of a trust with which we are now confronted.

Fortunately its decision that it will buy only when it can get less than a fair price affects, at present, only certain parts of the country and not the whole, for the private consumer, in general, is not participating in the Railroad Administration's lockout, but is buying coal in accordance with the Fuel Administration's admonition and in harmony with the dictates of both patriotism and prudence.

But this does not exonerate the Railroad Administration. Its culpability is not redeemed by the fact that it leaves the burden of service on the private citizen, and crying "store coal" spikes the switch to its storage yards, causing the mines in certain parts of the country to shut down, muddling the zoning system and causing the coal industry to lose men. The railroads in the hand of the Government have proved more oppressive than when administered by private ownership.

Britain's Pocketed Coal Mines

THERE has been a general belief for many years that the Irish mines have been deliberately kept idle to satisfy the purposes of English landowners and capitalists. As a rule it is more profitable to tap coal fields by railroads and to operate mines than to avoid coal fields in railroad construction and keep them idle. However, conditions do obtain sometimes where contrary policies seem likely to prove profitable.

If, however, the coal fields of Ireland in general and the coal field referred to in the short article entitled "Britain's Pocketed Coal Mines" in particular are such wonderful opportunities for capital the authoritative "Coal Resources of the World" fails to evidence it.

Cole and Lyburn say that in the Leinster field, which O'Byrne so highly praises, only the Jarrow seam remains to be worked in the middle coal measures and even that seam is partly worked out. The coal is often less than one foot thick but in the Jarrow channel it may reach 4 ft. The best coal in the lower coal measures is the Skehana seam, which is in places 2 ft. thick with an average of 20 in. There are no upper coal measures. All the coals mentioned dip heavily and are much faulted. The other fields are but little better though the Ballycastle field of Antrim may contain some 6 ft. coal in spots, and this is tilted from 10 to 50 degrees.

Even if coal were found in Ireland equal to the English coal in quality and operative availability it does not follow that it would be able to hold its own. The English coal being located on the sea coast can be laid down with ease at any point on the Irish littoral. As all the larger Irish towns are along the coast that is an important advantage.

The Irish fields are small and with one exception well removed from the sea. They do not give any evidence of being operable to much advantage and, even if mined, their area is closely circumscribed. All the coal in Ireland over one foot thick and less than 4000 ft. deep if mined and delivered in the United States would supply the demand for only about four brief months; for according to the figures given by Cole and Lyburn there are only 198,000,000 short tons in the whole island from Ballycastle to Fastnet Light.

THE LABOR SITUATION

EDITED BY R. DAWSON HALL

General Labor Review

The very dearth of outstanding labor news argues for the patriotism, the well-ordered patriotism of the mine worker. The mine worker has always been keen to assert his rights, but he has forgotten them now in the exercise of his duty as a citizen. The amazing news from Illinois about the coercion of men who will not work or who will not salute the flag before working shows that the workingman has not been a slow second to the operator in believing that nothing matters now but the war. Both mine operator and mine worker are making generous concessions to the nation and to one another, and that spirit should continue till the war comes to an end.

PANTHER VALLEY MEN OPPOSE WOMEN WORKERS

In the anthracite region the attitude toward the employment of women taken by the employees is unfortunate. We are quite ready to admit that there are parts of the country where there is no such scarcity as calls for the entry of women into industries unsuited to them, but the anthracite region is not one of these. The shortage of labor in that section of the coal fields is inflicting quite a loss on the nation. Anything within reason that will relieve it is deserving of a hearty welcome. However, it is pleasing to see that the men did not strike, but went at the matter the right way, putting the law into operation.

In that region the men who refused to buy Liberty Bonds were in many instances severely dealt with. The mine workers threatened to strike if these men were retained. At the Spring Mountain colliery of the Lehigh Valley Coal Co. one of the prominent union men, a pit committeeman, refused to buy Liberty Bonds and his name was dropped from the rolls by the company. It appears that he took out two bonds in his children's names. His fellow committeemen have threatened a strike should he fail to secure reinstatement.

OKLAHOMA SUFFERING USUAL SUMMER DULLNESS

The lack of orders in Oklahoma is alleged to be causing men to leave the mines for the farms. This condition is not new. Looking at the table on page 587 published in *Coal Age*, Mar. 30 of this year, it will be seen that Oklahoma in 1916 led in shortness of time worked, with only 178 days of operation. Her near neighbor, Arkansas, was next in order with 184 working days. Indiana followed with 187 days and Ohio with 197 days.

Miners living in states like Oklahoma and Arkansas never altogether lose the farming habit. It is likely that they will drift back to the mines this winter as they have in other winters, and the country will be advantaged by the wheat, corn and cotton they will produce. A few months' work will take care of the Oklahoma needs and nothing will be gained by hauling the coal that the state produces into a large territory to which it is not normally tributary. The cars will go to other states where the demand for coal is more stable and factories call for coal the year round.

CONSUMERS WANT THEIR HARD COAL SCREENED

Some of the shortage of work in Arkansas has been due to a disagreement between producer and consumer. The Kansas City retailers have been demanding screened coal from the semi-anthracite producers of Arkansas. The operators declare that they cannot sell the screenings and cannot afford to prepare lump coal at Government prices, dumping the screened coal on the ground. The chairman of the fuel administration of Kansas City, Walter L. Lampkin, is said to have written a letter to Senator J. A. Reed declaring that the mine operators in the semi-anthracite fields of Arkansas were deliberately cutting down production to create an artificial shortage.

The troubles in Canada are apparently not serious. The mine workers of the Nova Scotia Steel and Coal Co. say that promises made to them by minor officials have not been kept and that the head office is only indifferently in touch with labor conditions at the mines. The Glace Bay management satisfies the union, but the union officials declare that the Sydney Mines management is less sympathetic. They claim that in this respect Glace Bay and Sydney Mines have in recent years changed roles. It is likely that the Royal Commission, now in session, will iron out all difficulties without a strike. It seems likely that a compromise will be effected before the month of cool-headed consideration has passed, thus making it legally permissible, though not patriotic and advisable, for the miners to call a strike.

May Do Clerical Work But Not Labor

The abortive attempt of the Lehigh Coal and Navigation Co. to introduce women around its mining plants was described in last week's issue. Other details have since come to hand. It appears that there were 42 girls and women, practically all foreigners, who undertook to perform these services for the company. The conservatism of the mine workers, however, was too great to withstand the shock.

It was not lack of patriotism, though it might well have that appearance. The need for more help in the anthracite region is so acute that any attempt to prevent the furnishing of that labor is saved from the aspersion of disloyalism only by showing that the purpose of disloyalty is lacking.

The employees of the Navigation Company can prove the sincerity of their patriotism by pointing to the large proportion of their numbers that purchased Liberty Bonds whenever they were offered.

Loan	Percentage of Employees Subscribing	Total Employees' Subscriptions	Average Subscriptions
First	54.9	$259,350	$63.18
Second	50.9	222,250	58.50
Third	99.8	562,250	70.00

The reader will note that only two men in every 1000 failed to respond to appeals to buy the third issue of Liberty Bonds, and that the mine workers subscribed an average of $70 per man, which is indeed almost one-third of the average subscription of all the purchasers of the Third Liberty Bond issue throughout the country.

STATE LAW SUPPORTS DEMAND OF LABOR LEADERS

But to return to the bloomer girls, the United Mine Workers gradually concluded that they would not permit the girls to be employed. They declared that, unless the female labor was dispensed with, all the collieries of the Panther Creek region would go on strike.

But patriotism prevented the mine workers from striking as they threatened. They appealed to the Pennsylvania Department of Mines, and on May 1 Seward E. Button issued the following letter:

"Undoubtedly the great drain that has been made upon the mining communities by employment other than mining has deprived the operators of a great deal of the labor necessary to operate their mines to full capacity, but the Department of Mines, impressed with the duty of upholding the mine laws, cannot, without authority, allow any exceptions, and the provisions of the law that prohibit the employment of females about the mines except in clerical work will be strictly enforced."

The following letter has been sent each inspector in the 25 anthracite districts:

"It having come to the notice of the Department of Mines that girls and women were being employed at some of the mines in the anthracite region, the inspector of the district in which the violation of the law occurred has been notified to stop the practice immediately. Under the provisions of the anthracite law, females cannot be employed in or about the mines except at clerical work, and you are hereby advised to see that no violation of this provision is permitted in your district."

Arrest of Disloyal Labor Agitators

Increased activity of Government agents in the Illinois coal fields is resulting in the arrest, here and there, of agitators who appear to be actuated by disloyal motives. Jacob Crawley, 39 years old, a miner who has been working for several weeks at Ziegler, Ill., was arrested a few days ago on information that he had made persistent attempts to induce the 400 men working in the Ziegler mine to go on strike. It is said that Crawley posed as a Secret Service agent, and told the miners that he had been sent to Ziegler to help them get just what they wanted.

Ziegler is only a few miles from Christopher, where the Government agents last week told the miners they could either go to work or face prosecution for a conspiracy to reduce the fuel supply. The men at Christopher decided that they would go to work. McCawley Baird, of East St. Louis, who is assistant to the United States District Attorney, says that if the men at Ziegler quit work at the behest of disloyal agitators, they will be given the same alternative.

Leopold Schwagling, 35 years old, employed at the Kolb mine No. 2, at Mascoutah, Ill., was arrested as a pro-German by a Federal officer because he objected to saluting each morning the flag erected over the tipple. By the demand of the miners flags are displayed at all the mines in that section, and the men are required to salute them.

Gregory Denounces Murder of Robert Prager

Referring to the lynching of R. P. Prager at Collinsville, Ill., Attorney General Gregory, in an address to the executive committee of the American Bar Association, May 6, said: "We must set our faces against lawlessness within our own borders. Whatever we may say about the causes for our entering this war, we know that one of the principal reasons was the lawlessness of the German nation—what they have done in Belgium, and in northern France, and what we have reason to know they would do elsewhere.

"For us to tolerate lynching is to do the same thing that we are condemning in the Germans. Lynch law is the most cowardly of crimes. Invariably the victim is unarmed, while the men who lynch are armed and large in numbers. It is a deplorable thing under any circumstances, but at this time above all others it creates an extremely dangerous condition. I invite your help in meeting it.

"From all the facts I have been able to gather concerning the lynching of Robert Prager in Illinois, I doubt his having been guilty of any offence. Such happenings grow out of a condition of mind where people say 'the Government is giving us no protection; spies are blowing up our factories; they are giving information to Germany; our boys are being shot in the rear, and our duly constituted authorities are doing nothing to protect us and we will take the law into our own hands.'

"This appeals to the excited and drunken mind. Unless stopped, it is going to result in a condition most deplorable."

After saying that "unless the hysteria which results in the lynching of men is checked it will create a condition of lawlessness from which we will suffer for a hundred years," he added:

"There is another potent reason for sternly repressing these disorders. The cry of the mob is that it is protecting the boys at the front. The reverse is true. No greater wrong can be done to our soldiers in France than that of lynching Germans in America. The story of the death of that German in Illinois is being considered in Germany to-day. Such acts will be seized upon by our enemies as justifying severe reprisals on our soldiers in German prison camps. Having sowed the wind, we will reap the whirlwind."

Our Patriotic Mine Workers

From all over the country come reports regarding the Liberty Loan. In another column we have drawn attention to the fact that the Lehigh Coal and Navigation Co. sold the loan to 99.8 per cent. of its employees. The average subscription was $70 per employee, perhaps the largest in the country. A pamphlet issued by the Lehigh Valley Coal Co. records the fact that this corporation, which sold nearly a million dollars worth of bonds, has not a single slacker in its ranks and that the average subscription was $57.01.

The Clearfield Bituminous Coal Corporation reports that though its men bought heavily of the first and second issues of bonds, they were all ready to do their part when the third issue was opened for subscription. As a result the Grassflat district in Clearfield County bought $21,400 worth, the Barnesboro district in Cambria County $7150, the Clymer district in Indiana County $17,000, the Rossiter district in the same county $47,400, and the Clearfield office $3250, a total of $96,200.

Clearfield Bituminous Coal Co. Did Well

This result was obtained by strenuous work on the part of the superintendents of the mines and by the coöperation of the management with the committees in the several counties and districts. The fact that a large percentage of these men are foreign born and many of them unnaturalized, proves conclusively that all of them are loyal Americans irrespective of nationality.

So much from what we are told by A. J. Musser, the purchasing agent of the company. From records which may not be wholly correct, we learn that the Clearfield Bituminous Coal Corporation has about 2000 employees. Its record therefore will compare not unfavorably with the two anthracite companies just referred to, though the figure per employee is somewhat lower and the percentage of subscribers less than 100.

Robert F. Roth, chief engineer of the E. E. White Coal Co., of Glen White, W. Va., informs us that the "patriotism speedometer" in that village registered $1000 per min. for 50 min. on Friday, May 19. This $50,000 subscription represents the bonds taken by the mine employees separate from those purchased by the company. Mr. Roth rates it as $60,000 per million tons of coal produced, and estimates that $38,000,000 would be subscribed by the mine workers of the United States if they all did as well as the mine workers at the E. E. White mines.

Meantime Ohio Had War Saving Stamp Drive

Ohio seems to have taken up more readily with thrift stamps. Three mines in Belmont County have bought $30,000 worth of these stamps, three locals in Athens County purchased stamps to the value of $50,000, and three in Perry County bought stamps of an equal gross valuation.

Under an Amsterdam, Jefferson County, Ohio, date line we are informed that a two-day drive was made for thrift stamps in the middle of April, and $48,000 was subscribed by the miners of the vicinity. Two men were appointed at each mine, the companies paying them for their time and trouble. The subscriptions were taken at every man's working place.

The stamps were subscribed for at the current price of $4.15. Each pay day a stamp will be placed in the pay envelope by the company, and $4.15 deducted from the pay. This rate will be maintained until the amount subscribed is paid. The subscriptions ran from $50 to $500. The employees of the Wolf Run Coal Co. agreed to buy $21,000 worth, those of the Youghiogheny and Ohio Coal Co. contracted to purchase stamps to the value of $16,000, while the men of the Ohio & Pennsylvania Coal Co. undertake to accept in wage payment stamps worth $11,000. The mines are small, and 85 per cent. of the mine workers are foreigners; but the record shows that they do not lack for patriotism.

Less Coal but More Wheat and Cotton

In Oklahoma mine workers are deserting the mines by the hundreds to take up work on the farms. The irregular operation of the mines is given as the reason. Under the zoning system the operators say they are not receiving enough orders to keep the mines running at anything like capacity, and the men, anticipating that work will be even more uncertain as the summer advances, are disposed to turn to the farms, where wages are high and work is steady. Operators are dissatisfied with the zoning system, or at least with the manner in which it has been applied to the Oklahoma mines. They say that most of the people ignore the buy-early appeals and that, for this reason, it is necessary to expand the field of transportation and sale for the Oklahoma mines if they are to be kept producing during the summer.

Commission To Settle Sydney Trouble

Employees in Canada under the Lemieux act are forbidden to strike until a period for conciliation has passed. The Lemieux act resembles the much-discussed Bryan treaties in regard to the making of war, only its application is to labor disputes alone, and the period of delay is a month only and not a year. Lengthy reference to the law was made in *Coal Age*, Apr. 14, 1917, pp. 670 and 671.

The Lemieux act is working badly around the coal mines of Canada. If one may not strike, surely one may take a holiday—and there is nothing to prevent that holiday being unduly protracted. But you can do most anything these days so long as you declare your motives are good.

Want Higher Wage and Union Recognition

The Nova Scotia Steel and Coal Co. has been having trouble with its men who desire more wages and recognition of the union. The men, at first, were disposed to delay their strike to accord with the law, but the ferment ultimately became so general that a "holiday" was declared at four of the collieries Apr. 26. This holiday lasted till Apr. 29.

On that day the Royal Commission arrived to consider the complaints of the employees and the defense of the company. It is composed of Judge Chisholm, of the Supreme Court of Nova Scotia, chairman; Rev. Dr. John Forrest, of Pine Hill College, Halifax, and J. B. McLachlan, secretary-treasurer of the Amalgamated Mine Workers' Union.

The president of the union, Silby Barrett, is taking no active part in the discussions though he has recently returned from Newfoundland. McLachlan and Robert Baxter, the vice president of the union, have been conferring with General Manager Adams with the view to obtaining an amicable adjustment.

It must be understood that the iron, steel and tinplate workers are interested in the work of the commission as they have been threatening a strike. They have, of course, their own union—the Amalgamated Association of Iron, Steel and Tin Workers.

Say That Company Store Makes Them Infrugal

The mine workers of Nova Scotia are endeavoring to obtain an amendment to the coal mines regulation act that will make it illegal after Oct. 1 for any corporation, like the Dominion Coal Co., to stop the wages of their employees for the payment of store bills. The Dominion Coal Co. may have to close its chain of stores. In any event it will be hampered in merchandizing, for it will no longer enjoy its immunity from bad debts which is the bane of the independent merchant.

The miners argue that the restriction of the credit system which will follow will make the miner more frugal. With his crutch broken they expect he will stand erect as a man should. But some men need such crutches, though it is true that there are some who use them who could well lay them aside. To take the crutch from a feeble man is not an act of charity, but rather the reverse. A man newly engaged often needs the assistance of the company store.

Shorten Working Day in Canada

The miners and other underground mine workers in British Columbia have already established the 8-hour day, but this provision has hitherto not applied to mine workers on the surface. Now the government of British Columbia has introduced a bill not only providing for the 8-hour day for outside workers around the mines, but providing that the 8-hour day for all surface workers shall be reckoned from "bank to bank."

The amendment to the Metalliferous Metals Inspection Act granting these reductions in hours runs as follows:

"No person shall be employed underground in any metalliferous mine for a longer period than eight hours in any twenty-four hours; and in computing the said period of eight hours the same shall be reckoned from the time the person enters the mine until he reaches the surface. No person shall be employed above ground at or about a metalliferous mine for a longer period than eight hours in any twenty-four hours; provided that nothing in this rule contained shall apply to persons employed in the office, boarding-house or bunkhouse of any mine."

Hon. Wm. Sloan, minister of mines, argues that failure to meet the men in this respect has kept alive friction between employer and employee, and that the establishment of the principle of an eight-hour working day for the coal miner, below or above the surface, will have a salutory effect. It is his opinion that under such a working arrangement the men will be more satisfied and there will be less reason for industrial trouble. In this connection he points to the strikes in British Columbia in 1917 at Fernie, B. C., where the coal mines were closed down for several months; to Rossland, B. C., where a lockout was declared by the Canadian Consolidated Mining & Smelting Co. when the men threatened to strike; and to a strike at the Trail, B. C., smelter, where work was stopped for several months in an effort by the men to obtain an eight-hour day, as illustrations of how industry may be interfered with, and production diminished, through a spirit of discontent and dissatisfaction among the workers. The mineral output of British Columbia in 1916 was $42,290,462 and in 1917 it dropped to $37,182,570, the difference being attributable to these disturbances. It is the Minister's hope that with their grievances settled the present year will be free of such trouble and the product of the province will jump back to the 1916 mark and, possibly, climb to the 50,000,000 figure.

The coal mine operators of British Columbia are not in favor of the contemplated legsilation. They have lodged their protest with the Minister of Mines. Their argument is that shorter hours will mean less production at a time when, because of the demands of the war, greater production is essential. They say in effect: "We do not object to the principle of this legislation but we think it is inopportune." In discussing the matter with the Minister they suggested that the proposed law might be deferred to six months or a year after the end of the war. In this connection reference was made to last year's large exportations of coal from the United States to Canada. The United States thus met the Canadian shortage at serious disadvantage to herself, for coal was much needed in the United States. While this was done last year to meet an unexpected emergency, no one expects the United States will do the like again. The Dominion government, consequently, is expecting western coal miners to supply the necessary coal.

THIS country has drafted its young men for the greatest sacrifice that a man can make. Is there any logical reason why all able-bodied males should not be compelled to do at least eight hours work every working day until this war ceases, for which they will be paid far beyond what the man who makes the greatest sacrifice is paid? The enemy recognizes no restrictions of labor or time, so that the least that those of us who are at home can do is to stay on the job and put our hearts into it.—*George S. Rice to American Institute of Mining Engineers.*

DISCUSSION BY READERS

Practice in Mines in England

Letter No. 1—In reading the letter of Richard Bowen, *Coal Age*, April. 6, p. 644, I could not help but feel that what he believes is true in regard to the practice in English coal mines, he would find to be directly opposite to what is actually the case in those mines. I am certain that such is the fact in the County of Durham where I belong.

Allow me to state, for Mr. Bowen's information, that the mine officials, in the County of Durham, England, have *all* to say in regard to the safety of men, the enforcement of the mining laws and securing discipline in the mines. Their authority, in this respect, is greater than that of most of the mine officials in this country. The Miners' Union does not, as he states, "control everything pertaining to wages, safety of men, mine laws, etc.," and, in my opinion, the mines there are kept up-to-date.

If Mr. Bowen has never worked in the coal mines of the County of Durham, it would do him much good to take a trip across and visit some of those mines. He would soon see that the firebosses employed there, as well as the assistant mine foreman, have a good deal to say about the way affairs are run inside of the mine. Each of these officials is at the head, in his own district; and not, as Mr. Bowen says, "tagging on the tail."

Referring to the statement that "if a man starts in as fireboss he is apt to continue in the same position," let me say that when that is the case it is the man's own fault. Every honest worker has a good chance of promotion if he will study the science and art of mining and take the examination for mine manager.

Every man that wants to study is afforded plenty of chances to do so, as there is a night school held twice a week in every mining town. There are, besides, classes of mining that meet twice a week, which are attended by the men. I can say, with Mr. Bowen, that my motto is, "keep things moving and up to date," as I have been taught this from boyhood by the officials in the coal mines of England. ROBERT LAVERICK,

Seward, Penn. Mine Foreman.

Electrically Driven Mine Pump

Letter No. 3—In addition to the suggestions made in the letter of W. H. Noone, *Coal Age*, Mar. 23, p. 559, kindly permit me to offer a few comments in regard to the possible cause of the trouble experienced in the operation of the electrically driven mine pump to which reference has been made.

While I am not acquainted with the particular type of control of this pump, it occurs to me that the seat of the trouble may lie in the lack of proper adjustment; and I would suggest the following in the hope that it may serve to correct the trouble. My suggestion is based on the supposition that the controller may not have sufficient starting resistance to allow the motor to accelerate uniformly from zero to a speed corresponding to that when running under full load.

When using a manual controller I would suggest that the operator take a longer time to move the controller lever from the *off* to the full running position, allowing sufficient time on each notch of the controller for the motor to accelerate properly.

When using a dashpot-accelerated controller, or one accelerating the motor in accordance with the constant current method of acceleration, the dashpot should be adjusted to give a longer accelerating period. In the case of an air dashpot, the adjustment is made by means of an adjusting screw, or, in the case of an oil dashpot, a like adjustment may be made by using a little heavier grade of oil.

When using a controller acting on the constant-current method of acceleration, if the series relays or magnetic lockout switches have been adjusted to give the longest interval between the closure of each switch the accelerating period may be further increased by allowing a longer interval of time between the closure of the main switch and the first resistance switch, which will make the remainder of the resistance switches close somewhat faster than in the previous adjustment.

In closing, permit me to say that I feel that one of the suggestions mentioned here will undoubtedly cover the type of control on the pump in question. Motor control for pumps is described in Booklet "P" of the Cutler-Hammer Manufacturing Co., which will be gladly sent to any address on request.

R. J. MAUJER,

Pittsburgh, Penn. The Cutler-Hammer Mfg. Co.

Miners and the War

Letter No. 10.—It would seem, from the number of excellent letters that have been written on this subject, that the miner would be aroused to a feeling of his personal responsibility in regard to the prosecution of the war. As time goes on, it appears more and more important that some effective method be used to stir up the miner and interest him in the part he must play in the defense of the country.

If America is to develop a fighting machine that can successfully combat that of Germany, everyone must feel the earnestness and purpose of the undertaking. Every miner must be vitally interested in the production of coal, as this is the factor that underlies all munitions of war. We talk of "democracy"; but what does it mean when we fail to realize and assume our share in the great cause?

Let me suggest that mine officials must not cease to impress on their men the cold facts of the war as they are made known to us from day to day. There is no danger of exaggeration, for the truth is more

hideous and strange than fiction. We cannot afford to be skeptical in regard to the terrifying war policy of Germany when we reflect on the quick manner in which Belgium and Northern France were invaded. All that has been printed and told regarding the atrocities committed, the wholesale indiscriminate slaughter of women and children, is true and many of their foul deeds cannot be published without violating common decency.

The fact of the matter is that not alone the miners but all of us are unwilling to believe the half we are told of the war aims of Germany. The truth seems inconceivable but makes it all the more important that we should be informed and willing to tell others of the overbearing policy that Germany has pursued for years, dating back to the "mailed fist" of Bismarck. One thing is certain and that is, if Germany is successful at this time, Great Britain and America will not escape the fate of Belgium and France.

The production of coal, which is the miner's task, is not the only requirement of the Government, but it is fundamental. We need every pound of coal that can be put out of the mines to manufacture the necessary munitions of war—guns, ships, ammunitions, food and clothing for the soldiers and sailors. Every energy must be employed in the effort to produce what is necessary for our success in the war. I feel certain that if everyone fully understood the war aims of Germany there would be no slackers in this country, except the pro-German element. Let us do our part.

Thomas, W. Va. W. H. NOONE.

Women in Industry

Letter No. 3.—If not too late, I would like to add a few words endorsing some of the sentiments expressed in a letter that appeared in *Coal Age* some time since [Jan. 12, p. 70].

If my memory serves me correctly, the writer of that letter was opposed to the employment of women to take the place of men in coal mining and other industries, at the present time. In my opinion, women should not be employed, in most of our industries, until all available male help is exhausted. Their employment in the mines is particularly objectionable.

We are approaching a time when there will be a large reduction in the manufacture of liquor. It is possible that this may cease altogether. In that event, there would be thousands of men thrown out of employment and available for use in other industries. The employment of women involves many difficulties. For the most part, special training would be required, and it is a question whether they would be physically able to perform much of the work now done by men. I do not doubt but that they would prove as skillful in the performance of any work of which they are capable.

Our women are now doing a great service to their country, in the different spheres in which they are interested, chiefly the Red-Cross work of furnishing many necessities for the war, and serving as trained nurses in hospitals and at the front. I believe, also, that women are better adapted to work along agricultural lines and perform light service in mills of a certain class. The women of England and France have proved this beyond a doubt.

I recall, further, the suggestion that boys, under the age of 16, who are now debarred, by law, from working in mines would be able to do good service if the law was to be set aside during the war. These boys could be placed in charge of experienced miners, a boy with a man, and their employment would go far toward expediting the work underground.

Most of the boys not only speak their mother tongue but talk English as well, having been taught the English language in the schools. In this respect, they would be of great assistance to their older fathers and brothers, who so frequently fail to understand the instructions given them by the foreman and his assistants.

In a short time, the boys would be able to fill the places of those who have reached the draft age and been summoned to the front. I believe that this subject has an important bearing on the future welfare of coal mining. R. W. LIGHTBURN.

West Leisenring, Penn.

Storage-Battery Locomotives

Letter No. 3.—Since the publication of a number of articles in *Coal Age*, a year or more ago, drawing attention to the peculiar adaptation of the type of locomotive known as the "storage-battery" machine, little has appeared in print regarding its performance in the mine. It was, therefore, with pleasure that I read the letter of "Engineer," in the issue Mar. 16, p. 513.

In the hope of learning the results that have attended the use of this type of locomotive in the mine, kindly let me ask that some of those who have been operating these machines submit their opinions in reference to their capability to perform the work required underground. My own opinion has been that the storage-battery machine is destined to become a very dominant factor in the production of coal within the next three or four years. I have been anxiously awaiting to hear from others along this line.

There are many coal companies, among them one of the largest companies in the Pittsburgh district, that have employed a great number of these machines in their mines, for a long time. There can hardly be a doubt but that some of these companies could furnish some very interesting figures regarding the cost of maintenance of such machines and the advantages realized through their use in the gathering service, at the working face in the mine.

DUTY OF PASSING INFORMATION ALONG

It may not be out of place for me to suggest that, in these times of stress and worry, it behooves every member of the coal-mining industry to pass along all the information he may have regarding the latest types of modern mine equipment. The storage-battery locomotive belongs to this class, and its performance in the mines where it has been in use should be made known to those who, as yet, are unacquainted with its peculiar advantages.

It is my belief that the economies realized in the use of this machine must be very great, in comparison with the old mule that has been and is still so largely employed in gathering cars at the face. There must be, also, a great saving over the employment of the type of machine known as the "cable-and-reel" motor. Such

being the case, interested readers of *Coal Age* will be glad to learn these facts first-hand.

The present is no time to hoard knowledge that will advance the common interests of the coal-mining industry, inasmuch as these interests are or should be subordinate to the greater interests of the country. Let us hope that there will be a generous response along this line, not only relating to the particular type of machine that I have mentioned, but all mining equipment possessing peculiar advantages in the production of coal, which is the country's great need today. ANXIOUS.

New York City.

Observation of Sun for Latitude

Letter No. 1—Referring to the article describing the Ross meridiograph for assisting the quick determination of a true meridian, *Coal Age*, Apr. 20, p. 732, kindly permits me to offer a few comments on a misstatement made in the article, with reference to finding the latitude of a place by observation of the sun at noon, which I was glad to see was quickly caught and corrected in the following issue, Apr. 27, p. 790.

The statement to which I refer occurs at the close of the second paragraph, second column, page 732, which reads, "The altitude of the sun at noon is always the co-latitude of the place." Also, at the top of the third column, on the following page, it is stated, "The latitude is the angular distance of the sun at noon from the zenith."

Of course, this condition can only obtain twice during the year; namely, when the sun is crossing the equator,

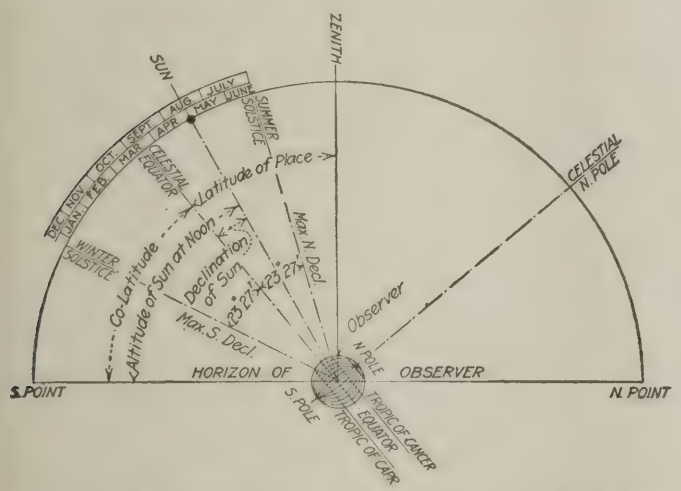


DIAGRAM ILLUSTRATING OBSERVATION OF SUN FOR LATITUDE

in March or September, and the declination is, consequently, zero. At all other times, it is necessary to subtract a north declination from, or add a south declination to, the observed altitude of the sun at noon, when the observer is in north latitude. In like manner, if the observer is in a south latitude, it is necessary to subtract a south declination or add a north declination to the observed altitude of the sun.

In other words, when the observer and the sun are both on the same side of the equator the declination must be subtracted from the observed sun's altitude, but if the observer and the sun are on the opposite sides of the equator the declination must be added to the observed altitude. The result will be the co-latitude of the place, which must be subtracted from 90 deg. to obtain the latitude.

As will appear from a study of the accompanying diagram, the latitude of a place is always the angular distance of the celestial equator from the zenith, while the co-latitude is the angle that the plane of the equator makes with the observer's horizon.

When observing the altitude of the sun at noon, for the purpose of determining the latitude of the place of observation, it is important to make the necessary correction for refraction of the sun's rays in passing through the earth's atmosphere. This correction will vary, ordinarily, from a fraction of a minute to 2 or 3 min., depending on the latitude of the observer and the declination of the sun at the time of observation. This correction must be subtracted from the sun's observed altitude.

Again, since an observation is rarely ever taken to the center of the sun, the disk of the orb being more frequently observed, allowance must be made for the semi-diameter of the sun; but, as the resulting parallax amounts to but a few seconds of arc it is usually ignored, in this observation.

HOWARD ECKFELDT,
Prof. Mining Engineering,
South Bethlehem, Penn. Lehigh University.

[We are glad to present this clear and succinct explanation of the determination of the latitude of a place, by observing the altitude of the sun at noon. The misstatement to which reference is made was a pure oversight that occurred in the hurried preparation of a difficult article for press, and observed too late for correction in that issue.—Editor.]

Sinking Shaft Through Quicksand

Letter No. 1—Having had some considerable experience in the sinking of shafts through any kind of material and in different localities, I was much interested in the inquiry of John A. Rury that appeared in *Coal Age*, Apr. 13, p. 712, and in the reply given by the editor, explaining numerous expedients to be adopted in such cases.

From the reading of the inquiry, it may be assumed that the proposition presented is attended with difficulties that will call for much experience on the part of those in charge of the sinking. Many instances have come under by observation where the attempt has been made by a company to sink a shaft through watery strata, without having the knowledge and experience that will insure success in such an undertaking.

Kindly allow me to suggest to Mr. Rury that it would be far cheaper, in the end, for him to employ an experienced shaft sinker and contract with him to sink the shaft to the required depth at a fixed price, which should be such as to afford the contractor a reasonable profit in doing the work.

My experience is that freezing is an exceedingly expensive process to apply in the sinking of shafts, because of the trouble that is liable to occur later when the frozen strata has had time to thaw out. When the excavation has passed through the strata and it is no longer necessary to maintain the freezing process, there

will frequently be some trouble experienced through water flowing into the shaft, and if proper provision has not been made to take care of this inflow disaster will certainly result.

It is worthy also of mention that, at the present price of cement and the possibility of getting no satisfactory results from its use, in an attempt to control the inflow of water into the excavation, grouting may prove a difficult and expensive undertaking. In every case, judgment and experience must decide on the measures to be adopted and which will prove most successful and require the least outlay in time and material.

For the reasons given I would advise Mr. Rury to consult some reliable engineering company or contractor who will engage to do the work after looking over the ground. In doing this he will relieve his company of the burden of possible failure, which burden is then assumed by the party contracting to do the work.

F. D. BUFFUM, Engineer,
Pittsburg, Penn. The Rust Engineering Co.

Loading and Shipping Clean Coal

Letter No. 5—Most mining men have been forcibly impressed with the growing demand, within the last few months, calling for "coal—more coal." Whatever the experts may say in regard to the supply of coal being sufficient to meet the demands, provided the car situation was cleared up and the hundreds of coal cars now lying idle on the side tracks distributed to the mines, there is one thing that is of equal if not of greater importance to the coal industry. I refer, now, to the indifferent and careless manner in which many miners load their coal.

Our mine is located on the main line of one of the great railroad systems of the country and is an important coaling station for the road. During the early winter I was continually notified, by the railroad authorities, of the many complaints they had from their firemen in regard to the poor quality of the coal that they were compelled to use.

APPEAL TO PATRIOTISM OF MINERS AND AID OF THE UNION INVOKED

As a result of these complaints coming from the railroad, I was forced to adopt some means to make our men use more care in loading their coal. I appealed to their patriotic sense of duty, telling them that it was a duty that they owed to their country and urging them to do their utmost to bring our output up to a condition fit for the market.

This argument made little impression, however, and I was then compelled to adopt the expedient of laying men off a day for the first offense, two days for the second offense, and discharging any man guilty of a third offense. Finding, after a short time, that these measures produced little effect, as the men still continued to load dirty coal and take a chance of being punished for it, I decided to make a more direct appeal to the miners and again attempt to arouse their sense of patriotism in another way.

For that purpose, I addressed the following letter to the miners' local, which met during the week, and the men were all notified to attend the meeting, as a matter of importance was to be presented:

Gentlemen—Owing to the scarcity of cars and other equipment, the coal mines of this country are working less than half-time. The railroads are unable to supply sufficient cars to haul to market the coal that is needed. It is up to all of us to help out in the present crisis that has befallen our nation. Every miner can do his share by loading only clean coal. Where he must load rock it must not be mixed with his coal, and mine officials will discharge any man who will deliberately load dirty coal.

There are localities where a man has some excuse for failing to load clean coal, as when his working place is wet, the coal of an inferior quality and the roof bad. But any man, working in a place under normal conditions, who deliberately loads rock with his coal is unfair both to himself and his fellowmen and will be dealt with accordingly. Such a practice on the part of our miners will ruin the company who employ them, and eventually force the mine out of the market.

The practice of loading rock with the coal acts to keep the miners out of employment, in other parts of the country, because of increasing the scarcity of cars. Time is wasted in the needless hauling of rock instead of coal or other useful materials; neither can you raise steam with impure coal any more than you can cook food in the home with the same.

Complaints are coming too frequently to the office in regard to the failure to raise steam sufficiently on the railroads, because of the dirty coal we are sending them. Let me urge, therefore, that every one do his best to load only clean coal. No man should sell as the fruits of his own labor that which he would himself refuse to buy as being unfit for use. Your country calls on you to do your best. Respond to your country's needs by giving the best that is in you.

Since making this appeal, our company has had no further complaints from the railroad, and I can say, with pleasure, that the coal loaded by our men is now equal to the best in the market. GRIFFITH GRIFFITH.

Blackfield, Penn.

Letter No. 6—The numerous articles that have appeared recently in *Coal Age*, regarding the shipment of dirty or high-ash coal have almost unanimously laid the blame or, as the boys say, "passed the buck" to the miner. While there is, undoubtedly, much truth in this accusation there are other factors concerned in the production of an inferior quality of coal.

The nature of the seam and its infolding strata has probably more to do with the quality of the coal mined than the greediness or the carelessness of the miner. As is well known, some coal seams contain dirt bands or are overlaid with a frail roof that makes the cleaning of the coal, in the mine, difficult. Again, some coals contain inherent ash, which is explained by geologists who say that the high-ash content of the coal may be due to the precipitation of colloids by alkaline waters and the deposition of silica in the organic mass of the coal.

THE MINER NOT ALWAYS TO BLAME

It is obviously unfair to blame the miner when he is compelled to work a seam of coal that cannot be expected to yield a fair quality of coal. It frequently happens that a company will open and operate such a seam of coal simply because it lies close to a railroad. It is

unfortunate that there were many such coal tracts available, at the time when the present boom matured.

Many inferior coals appear to the eye much as a low-ash coal of good quality, and the unwary or irresponsible operator has not hesitated to undertake the mining and marketing of such coals, taking advantage of the unprecedented demand. It is my belief that conditions such as these I have mentioned are largely responsible for the inferior quality of coal sent to market.

While there are many good coal properties available, the would-be operator has invariably chosen to invest his small capital in coal lands affording easy shipping facilities. He is deceived in the belief that the nearby coal will bring the same price in the market and will require a smaller invested capital than better grade coals that are more isolated.

Under the present existing conditions, high-ash coals will be marketed as long as men can be found that will buy and use them in their plants. Until such inferior coals are refused on the market, the better-grade coals that are less available and require a bigger investment, in mining, will not be worked by a large class of operators who have not the capital to justify the undertaking.

Besides the factors that I have mentioned, the thickness of the coal seam is an important development in determining the cost of mining. A thin seam requires the handling of a large amount of waste material. It frequently happens, however, that these thin seams contain the purest coal, while seams of greater thickness are intimately mixed with bands of fireclay, slate and bone that, in many cases, are practically impossible to separate completely from the coal. Bony coal often so closely resembles coal of good quality, that a sharp scrutiny, in broad daylight, is necessary to distinguish between the two grades, and it is practically impossible to make the separation in the dim light of the mine.

J. W. KNOWLTON,
Chief of Testing Department,
Elkins, W. Va. West Virginia Coal & Coke Co.

Air Compressor in a Gassy Mine

Letter No. 1—The proposition presented by "Inquirer," *Coal Age*, Apr. 20, p. 759, interested me, and I am led to offer the following suggestion, as the result of my own experience in the use of coal cutters:

The question uppermost in my mind is, What is the advantage that led to the installation of the coal punchers driven by compressed air, in this mine. There are, undoubtedly, conditions under which those machines can be used with some advantage. However, I have found that where a mine is equipped with electrical power, and conditions in the seam will permit of the use of chain coal cutters, these are the machines to be employed.

My suggestion is that, by all means, use the electric chain coal cutters whenever and wherever possible. I have used the Sullivan "Ironclad" continuous cutting mining machines, for some time, and have found them most efficient in room-and-pillar workings.

One point worthy of mention is the greater cutting capacity of the chain machines over that of the puncher type. The former I have found equally as flexible as the latter and easy to handle. I do not hesitate to recommend them for use wherever the conditions will permit.

In closing, permit me to say that I have not experienced the difficulty this correspondent mentions, in securing the delivery of recent orders, although it may be possible that war conditions have lately aggravated the situation and delayed deliveries. ANON.

————, W. Va.

Letter No. 2—Referring to the inquiry, *Coal Age*, Apr. 20, p. 759, from a correspondent in Kentucky, regarding the installation of an air compressor in the return airway of a gassy mine, for the purpose of furnishing power to several coal punchers, let me say that I agree with the conclusion of the editor that the compressor should be installed on the intake air.

In Pennsylvania, the mining law requires that an electric motor must be flame-proof if placed in a mine, or it must be located in a room ventilated separately with intake air, in order to avoid the possibility of an explosion from the sparking of the brushes or other connections. I mention this inasmuch as the correspondent contemplates the use of electric cutters.

POSSIBLE EXPLOSION IN COMPRESSOR CYLINDER

Permit me to say that the editor's suggestion that there is a possibility of explosion taking place in the compressor cylinder, should the compressor be located on the return air, does not appeal to me as worthy of consideration. In my opinion, the compressor cylinder never gets so hot as to ignite gas-laden air compressed by the machine.

Regarding the second question asked in reference to how the location of the compressor on the intake air would affect the ventilation of the working places, I agree fully with the editor when he says that this "would not interfere with the ventilation of the working places, because the air compressed would again be released at the working face, after operating the drills." In this connection, it should be remembered that in driving tunnels and subways, the excavation is often wholly ventilated by the exhaust air from the drills.

The correspondent's idea of locating the compressor at a point nearer the working face is a good one, as it will release a great length of pipe, which can then be used for other purposes, and at the same time avoid the losses in the pipe line by leakage and friction, in transmitting the air so great a distance.

Johnstown, Penn. FRED W. SAKON.

[The reference to the danger of a possible explosion taking place in the compressor cylinder as being hardly "worthy of consideration" does not take into account the fact that, in the use of single-cylinder compressors, explosions are not infrequent, even when the compressor is working on pure air. This is generally attributed to the flashing of the mineral oil used to lubricate the cylinder. In compressing air to five or six atmospheres, at sea level, the heat of compression in the cylinder may rise to between 400 and 500 deg. F., which is much above the flashing point of many mineral lubricants. Should the flashing of the oil occur, it can readily be imagined what would result when the compressor is working on air charged with gas and dust.—Editor.]

INQUIRIES OF GENERAL INTEREST

Gas Encountered Reopening Mine

We have been engaged recently in the reopening of an abandoned mine that gives off some firedamp. The seam is flat and is reached by a slope opening driven from the surface to the coal. Water had accumulated in such quantities that the workings were full to the roof. Since there was but one opening to the old mine, we at once started a second slope about 1 mi. from the mouth of the old slope and at a lower point.

We started to pump out the water from the old slope, but found much gas traveling up the slope. The gas gave a cap 4 in. high, on the Wolf lamp, but would not explode, although the flame in the lamp twisted about in a queer manner, as though it would explode. We even attempted to explode this gas by the use of black powder but failed.

As the water lowered in the mine I was able to penetrate about a half-mile into the workings, but could get no further owing to the blackdamp. A peculiar feature that I observed was that the flame cap decreased in height the further I went in the mine. The lamp, however, showed a cap up to the point where I was forced to turn back for lack of air.

I observed, also, that for a distance of about 350 ft. from the mouth of the slope, fresh air was flowing into the mine along the bottom, while mixed air and gases were traveling out of the mine, at the roof. The two currents, the one flowing in and the other out of the mine, were divided by an imaginary line near the center of the airway. Further down the slope, I failed to detect any movement of the air, while, as I have said, the flame cap on the lamp grew constantly shorter as I proceeded.

Water accumulated very rapidly in the second slope, it being at a much lower level. We are now pumping from that slope, which is full almost to the mouth. I have had considerable experience with "lazy gas," before, but never found gas that would give a cap on the lamp and yet would not explode. Any information that *Coal Age* can give me on this point will be much appreciated.

Adamsville, Ala. J. M. KEMP.

In several instances, we have referred in *Coal Age* to conditions that frequently occur in coal mines, favoring the production of what is termed "flashdamp." This is a mixture of methane and carbon dioxide, formed under conditions that permit these two gases to diffuse into each other in the absence of air. Pure flashdamp containing no air, as explained on page 127, *"Mine Gases and Explosions"—Beard,* consists of a mixture of 812 vol. of carbon dioxide to 1344 vol. of methane, since the gases mix in the inverse ratio of the square roots of their densities.

Practically, pure flashdamp contains about 8 vol. of carbon dioxide to 13 vol. of methane; but this ratio will vary according to the admixture of air, while the diffusion is taking place. Under conditions where sufficient air is present, the mixture may be even explosive; but flashdamp containing little or no air will not explode, owing to the presence of so large a proportion of carbon dioxide, which is extinctive of flame.

It should be remembered, here, that a body of firedamp, at its most explosive point, being 1 volume of methane to 9½ volumes of air, is rendered inexplosive by the addition of one-seventh of its volume of carbon dioxide (*"Mine Gases and Explosions,"* page 104). But, a much larger proportion of carbon dioxide is present in flashdamp, which makes the mixture inexplosive.

Again, under conditions where a body of more or less pure flashdamp is found accumulated in a pocket in the roof of a chamber and there is pure air below, a safety lamp raised into the mixture will show plainly a cap on the lamp flame, which is quickly dimmed. The flame may even be extinguished by the gaseous mixture filling the combustion chamber of the lamp and displacing the fresh air from around the flame. The extinction of the lamp, however, will depend on the purity of the flashdamp or the proportion of air it contains. It is this momentary appearance of a cap on the lamp that has given the name "flashdamp" to this mixture.

The same explanation will apply to the changing character of the flame cap remarked by this correspondent, as he proceeded further into the mine. He reports a 4-in. cap appearing on the Wolf lamp, in the mine entrance, and gradually decreasing in height as he penetrated into the mine, until he could go no further and was obliged to withdraw, owing to the blackdamp, which filled the old workings to an increasingly dangerous extent.

The observed inflow of air along the bottom of the slope, for a distance of about 350 ft. from the mouth of the mine, and the outflow of the mixed air and gases along the roof of the passage is only natural. It is a matter of common observation that, under similar circumstances, the cooler outside air will continue to circulate along the floor of an airway and form a current quite distinct from the warmer air flowing at the roof.

This is frequently observed where rooms or chambers are driven to the rise or dip of an entry and the temperature at the faces of the breasts is a few degrees above or below that of the air circulating on the road. In every case, the lighter air will travel along the roof, while the heavier air follows the floor, the two currents being separate and distinct.

In some instances, the air at the roof will give a plainly observable cap, which disappears as the lamp is lowered. At other times, a lamp will be almost or completely extinguished by the air flowing at the bottom, while the light is not affected in the same manner nearer the roof. These facts have lead to the conclusion that gas is often stratified in a mine airway; or, in other words, travels in veins.

EXAMINATION QUESTIONS

Bituminous (Penn.) First-Grade Examination, Apr. 11, 1918

(Selected Questions)

Ques.—What dangers are to be guarded against in the operation of mining machinery in gaseous mines, and what precautions would you enforce to lessen the same?

Ans.—Aside from the usual precautions taken to safeguard mining machinery of any kind, and which apply alike to gaseous and nongaseous mines, further danger arises from the operation of electrical mine equipment, because of the sparking of wires or brushes, the blowing out of fuses, or the breaking of incandescent lamps. Any of these occurrences may give rise to the ignition of accumulated gas or dust and result in a disastrous explosion.

In an electrically equipped gaseous mine, every precaution should be taken not only to avoid the occurrences just mentioned, but to prevent dangerous accumulations of gas and dust in all portions of the mine workings. The installation of electrical equipment of every kind should be in charge of a competent electrician who is thoroughly acquainted with the conditions that are liable to obtain in a gaseous mine.

Ques.—In a mine giving off 2200 cu.ft. of gas per min., the volume of air entering the intake opening is 4,200,000 cu.ft. per hour. What is the percentage of gas in the air current at the outlet? Would you consider this percentage of gas dangerous?

Ans.—The quantity of air entering the mine is 4,200,000 ÷ 60 = 70,000 cu.ft. per min. Adding to this the volume of gas generated in the mine in the same time, gives a total current of 72,200 cu.ft. per min. passing out of the mine. The percentage of gas in this current is $2200 \times 100 \div 72{,}200 = 3.05$ per cent., nearly.

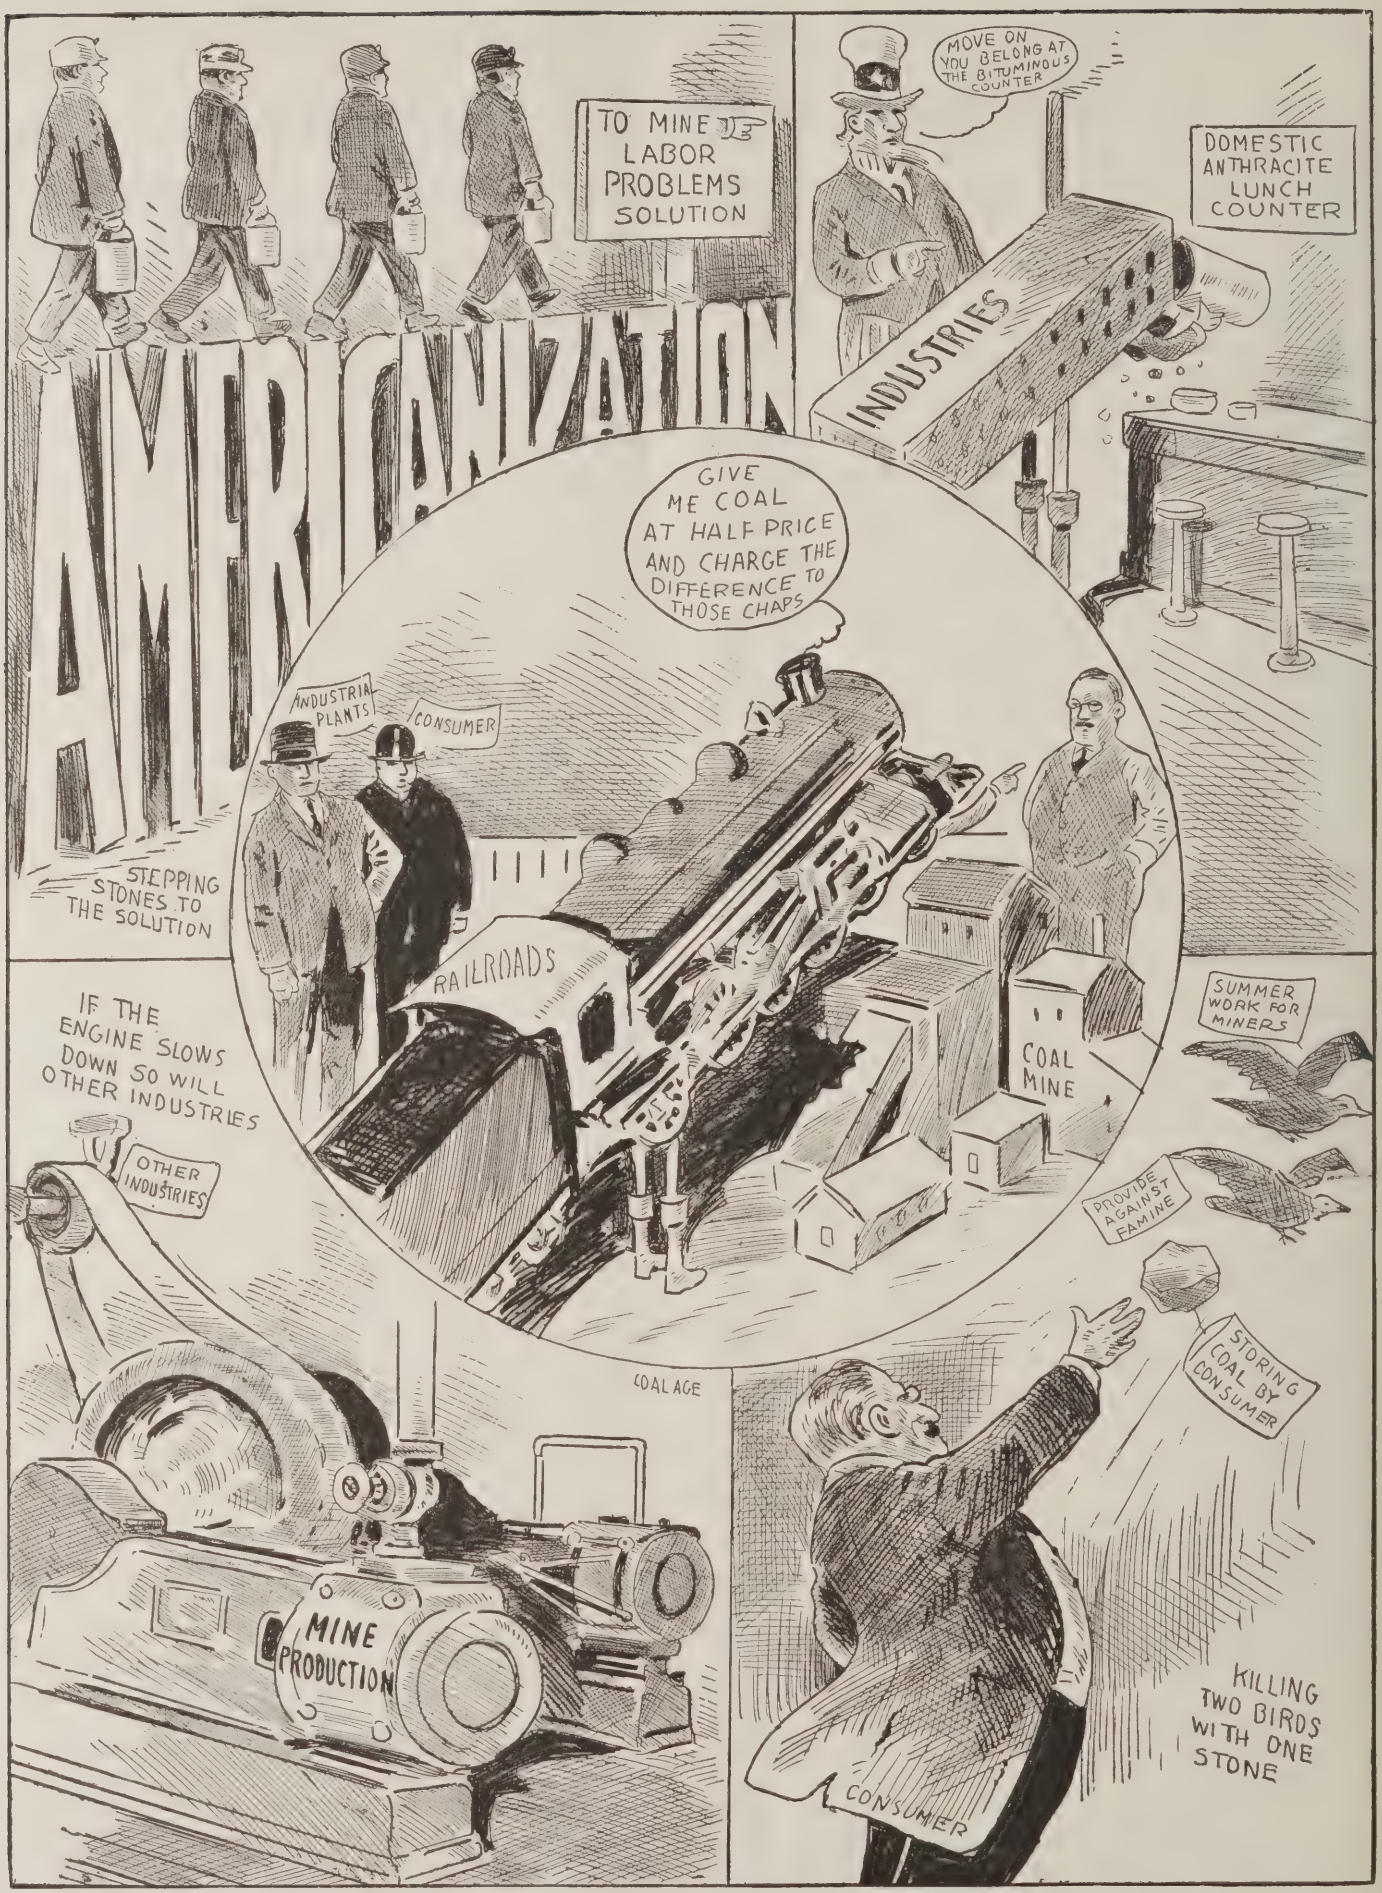
Ordinarily, this would be considered a dangerous percentage of gas to be found in the workings of a bituminous mine, and immediate steps should be taken to increase the volume of air in circulation, so as to lower the percentage of gas that it may not exceed 1 or 2 per cent., depending on the character of the coal, its inflammability and the fineness of the dust produced in the mining of the coal.

Ques.—On assuming charge, as a mine foreman, at a gaseous mine, what information would you consider it necessary to obtain in order to intelligently perform your duties?

Ans.—The mine foreman must have a thorough knowledge of the requirements of the mining law and be fully acquainted with the existing mine rules and regulations. He must understand the conditions that prevail in the mine, relating to the amount of gas generated in the different sections of the workings, character of the roof strata and the coal. He must study carefully the system of ventilation employed and the distribution of the air.

The mine foreman must examine in detail all ventilating equipment and appliances, including the fans and engines on the surface and the air stoppings, bridges, doors and brattices in the mines. He must investigate the work of the firebosses and know the duties each is expected to perform.

Having given these matters careful attention, he must instruct his assistant foremen in a manner that they will be able to carry out his plans intelligently, with a view to securing the greatest safety in the operation of the mine. They will be able, from their previous experience, to give the new foreman much information that will be valuable to him in gaining a knowledge of the practical conditions affecting the working of the mine.



Ques.—Describe what system of ventilation and general management you would adopt in a gaseous mine, in order to keep the mine in a safe condition.

Ans.—The choice between the blowing and exhaust systems of ventilation will depend on the character of the mine. In general, it can be said that the exhaust system is best adapted to the ventilation of a gaseous mine, because it permits of the haulage being performed on the intake airway, without necessitating the use of doors at the shaft bottom, which would be required if the mine was ventilated on the blowing system. On the other hand, the blowing system of ventilation is generally preferred in a nongaseous mine, for the reason that the warm return air current passing on the main haulage road and ascending the hoisting shaft prevents the formation of ice in the winter time. In order to keep the mine in the safest possible condition, the air current should be split and each district of the mine ventilated by a separate current, the return from each district passing directly into the main return airway.

In regard to the management, where blasting is performed in the mine, only permissible explosives should be used and shotfirers should be employed to examine, charge and fire all shots after the men have left the mine. Competent firebosses should examine every portion of the mine before the men are permitted to enter for work in the morning.

Ques.—State what dangers, if any, may arise from the exclusive use of electric safety lamps in a mine.

Ans.—Although the exclusive use of mine electric lamps is rapidly growing in favor, it is generally acknowledged that there are two sources of danger to be guarded against in their use: (1) The possible ignition of gas or dust by the accidental breaking of the globe of an incandescent lamp, or the sparking of electrical connections. (2) The danger of workmen being overcome by gas, the presence of which is not made known by the electric mine lamp. With proper care and precaution, however, these dangers are not generally considered as detrimental to the use of electric mine lamps, which have special advantages that render their adoption in mines as being highly desirable.

High Lights in the Fuel Situation as Seen by the "Coal Age" Cartoonist

COAL AND COKE NEWS

What Happened in April

The figures in brackets in the text refer to pages in the present volume, reference to which will give fuller information regarding the matters discussed in the item to which the bracketed figures are attached.

Apr. 1—United States Fuel Administration zoning order comes into operation [547]—Orenda Smokeless Coal Co. purchases the Orenda mine from the Merchants Coal Corporation with 1700 acres of coal land [648]—State of Indiana goes "bone dry."

Apr. 2—New prices are made for coal from Raton, Gallup, Carthage, Cerillos, Sugarite and Monero districts in New Mexico [632].

Apr. 3—Prices made by the local fuel administration in Wyoming for the Wyoming sub-bituminous coal mines are confirmed by the Federal jurisdiction [698]—New prices are made for parts of the States of Kentucky, Tennessee, Virginia, Iowa and all of Georgia [698]—Senate passes the Third Liberty Loan bill.

Apr. 4—Use of domestic sizes of anthracite for steam-raising purposes condemned by the United States Fuel Administration [698]—Price of coke raised 5 per cent. when manufactured east of the Mississippi River and sold west of the Rocky Mountains [698]—Fuel Administration orders that the term "foundry coke" shall cover only coke selected for foundry use according to the usual trade practice—New prices are made for Black Creek, Brookwood and Blue Creek cokes of Alabama and for beehive-oven coke produced in Fayette, Kanawha, Preston and Nicholas Counties in West Virginia, and for all kinds of coke produced in the State of Washington—Charles M. Means appointed manager of inspection division, United States Fuel Administration [699]—Judge Strauss, of Pennsylvania, rules, in the Joseph Zadwick case, that the corroboration of a second party is not needed to establish the right to workmen's compensation, when a workman dies as the result of a strain received in an isolated part of the mines [714].

Apr. 5—R. P. Prager is lynched as an alien spy by mine workers at Collinsville, Ill., [704, 705 and 842]—Big strike commences in the Dombrowa coal fields of eastern Russia. It was still continuing May 3 according to advices from Zurich, Switzerland.

Apr. 6—Central Pennsylvania mine workers decide to put off their threatened strike [704]—Third Liberty Loan is offered for sale.

Apr. 9—Wagon mines forbidden to add cost of hauling to Government price when coal is loaded in open-top cars except where coal is bought by a railroad for its own use—Strike commences at Lethbridge, Alta. [749]—Michigan-Ohio-Indiana Coal Association meets on this and day following at Cincinnati, Ohio [676 and 677]—President creates a National War Labor Board composed of the same members as composed the commission which advocated the formation of the board—Dr. Garfield demands that the price of coal paid by railroads shall be the price set by the Government as the fair and maximum price at the mines.

Apr. 10—Fuel administrators from states east of Mississippi meet in Washington—Order of Administration requires that smokeless coal shall be delivered only to the bunkers of ships and specifies that contracts for smithing coal made before Feb. 14 will be abrogated if the coal delivered is found not to be a true smithing coal and if the coal is not used, or to be exclusively used, for smithing; other regulations are made in the same order [747].

Apr. 11—Bottle manufacturers, not making food containers, agree to reduce their output 15 per cent.—The Government takes control of 63 coastwise vessels which added to the fleet owned by the railroads, which are also federally controlled, makes 111 coastwise vessels under Government control, having a rated capacity of 400,000 tons.

Apr. 12—Explosion in the Shoal Creek mine, Panama, Ill., possibly caused by alien enemies [749].

Apr. 13—Zone system modified so as to forbid the Pennsylvania R.R. from delivering in Washington or Baltimore, coal produced on the Pennsylvania R.R., to Monongahela R.R. and the Huntington & Broad Top Mountain R.R., and their short line connections in Pennsylvania, West Virginia and Maryland [746]—The International Board of the United Mine Workers of America protests against the frequent changes in coal prices, declaring it a large cause of the irregular work at the mines [748]—House passes the Senate bill changing the basis for the second draft from population to the number of men listed in Class 1.

Apr. 16—Frank J. Hayes, president of the United Mine Workers of America, and other officers of the union organization confer with H. A. Garfield on the slackness of the mines alleged to result from price regulation—Strike commences in Georges Creek and Upper Potomac regions, laying 6000 men idle [748 and 796]—Wage increase of 50c per day granted by the Western Fuel Co., British Columbia, to some 1500 employees [749]—Senate and House adopt conference report on "Sabotage Bill," which prescribes imprisonment penalties for interfering with war industry; but the punishment provided for strikers is eliminated.

Apr. 17—United States Fuel Administration announces that the Tennessee Coal, Iron and Railroad Co. will submit to the conditions of the Peale contract in Alabama [842]—Strike in Georges Creek region comes to an end [748 and 796].

Apr. 18—New prices for Colorado coke, for the coke of Monongalia County, West Virginia, and for such 72-hour selected foundry coke as is made by the Empire Coal Co. at Empire, Ala. [795].

Apr. 19—New prices are made for Fairmont, Thacker, New River, Logan, Kenova and Kanawha districts and Putnam County in West Virginia; Thacker and Kenova districts in Kentucky; Districts Nos. 1 and 2 and Grundy and Platte Counties in Missouri; Cherokee, Crawford, Osage, Franklin, Linn and Leavenworth Counties in Kansas [794].

Apr. 21—New wage scale signed for Alabama region [797].

Apr. 22—"Lightless Night" order suspended till Sept. 1—Delegates from District No. No. 2 (central Pennsylvania) meet at Dubois, Penn., and decide against a strike and in favor of an investigation of wages by the United States Fuel Administration [796].

Apr. 23—Hitchman Coal and Coke Co. decides to withdraw its action against the United Mine Workers of America which related to the enforcement of so-called "ironclad" contracts with working men in its employ [840]—Lehigh Coal and Navigation Co. places girls as timekeepers, weigh-scale tenders, switch tenders, etc. [841]—Explosion in which three men were burned occurs at the mine of the Deep Vein Coal Co., West Terre Haute, Ind. [808].

Apr. 24—Commercial florists and enameled-ware manufacturers agree to reduce fuel consumption 50 per cent.—Joint conference held at Bridgeport, Ohio, relative to a new scale for No. 8 A seam [840].

Apr. 25—Contract signed for No. 8-A seam [840]—Men working at No. 11 mine of the Old Ben Coal Corporation are ordered back to work under pain of arrest under charges of conspiracy [841]—New prices are made for Indiana coal, of both "bituminous" and "block" variety; for Montana coal; for Macon County (Illinois) coal; for such Kentucky "Blue Gem" as is mined in Knox and Whiteley Counties by members of the Tricounty Blue Gem Coal Operators' Association, and for Tennessee "Blue Gem" mined in Campbell County by members of the same association; certain boxcar coal is given higher rates; order not promulgated till May 2.

Apr. 26—Meeting of West Virginia coal operators at Huntington to form state operators' association [807]—New maximum prices are made by Fuel Administration for special mines in Virginia [837] and also for coke made at Coalmont, Tenn., and from the Pratt seam in Alabama, also in Marion, Harrison, Barbour and Randolph Counties, West Virginia, and in the State of New Mexico [837]—Four collieries of the Nova Scotia Steel and Coal Co. are laid idle by a "holiday" of indefinite length, a holiday being taken because the mine workers are forbidden by law to strike.

Apr. 27—New zoning arrangements made in regard to shipments in box and stock cars and to the shipment of smithing coal [835]—S. E. Button, chief of the Department of Mines of Pennsylvania, agrees to issue orders against the employment of girls in and around anthracite mines [841]—Meeting of would-be seceders from the union [796]—Extensive modifications are made in the zoning regulations.

Apr. 29—The United States Fuel Administration increases price of coke 60c. per short ton where the coke is for export to foreign countries or for transport to a possession or dependency of the United States. The 5 per cent. on coke shipped across the Rocky Mountains may be added to 60c. under this order [837]—The mine workers of the Nova Scotia Steel and Coal Co. return to work for at least three days.

Harrisburg, Penn.

Fatalities in the state increased 25 per cent. from Jan. 1 to Apr. 15, this year, over the record for a similar period in 1917, according to reports of the Bureau of Statistics of the Compensation Board. The fatalities are divided as follows: Mines, 302; industrials, 362; public service lines, 182; making a total of 846 for the first three months and 15 days of this year. During the same period last year 296 employees were killed while at work in the mines, 320 in industrial plants and 82 on public service lines. The record for 1916, was as follows: Mines, 333; industrials, 276, and public service, 87.

Luzerne County heads the list with the largest number of fatalities in the mines this year, 68; Schuylkill county is second with 38; Lackawanna County third, with 32; and Fayette County has 30. Other counties of the state in which mining is one of the industries show few fatal accidents.

One of the reasons given for the fatality increase over the previous year is the employment of green help in and about the mines. Enlistments and the draft have taken from channels of industry many of the experienced employees, leaving vacancies to be filled from the available supply of labor to be obtained. Speeding up operations to meet the demand for coal has also had a tendency to bring about conditions which are considered as requiring attention.

Exemption of expert coal miners from the military draft, practical utilization of the natural gas now going to waste in the anthracite mines, and the mine-cave evil were the chief questions discussed by Governor Brumbaugh in his address to the Pittston District Mining Institute on May 4. The audience included 1400 mine officials.

The Governor declared for the exemption of the expert miner from the draft as a measure absolutely necessary for the maintenance of the production of coal at its highest mark during the progress of the war. On the question of utilization of coal gas, a favorite one of the Governor, he said that it was most fitting he should give expression to his views and hopes on the question in Pittston, because it was more than a half century ago that practical use was first made of mine gas, the expedient having been adopted in the old Tompkins mine of burning the gas at the foot of the air shaft as an aid to ventilation.

On the mine-cave problem, a vital question in the anthracite region, especially in Pittston, where disastrous caves occurred within a week, the Governor declared that, owing to the divided property title inter-

est, the rights of life and property came into conflict. As between the two, he declared life stood first. Governor Brumbaugh favored an adjustment based on an agreement between the interests affected. The Governor pleaded for loyalty to the country in the present crisis by the labor interests of the anthracite region to the end that the production of coal shall be maintained at its highest point. The Governor went to Pittston as the guest of the Pittston District Mining Institute.

Fairmont, W. Va.

The new executive committee of the West Virginia Coal Association, which will consist of an accredited representative of every district association in the state, will meet at Huntington on June 1 to outline the plan of procedure by which the state coal association is to be perpetuated in line with the resolution adopted at a mass meeting of coal operators of the state held at Huntington, Apr. 26.

The coal men are determined to work along lines where a conflict of interests can be avoided, and it is felt that there is no question but the association can find plenty of work to do without entering upon questions which affect different districts.

Each association in the state will name not only a member of the executive committee but an alternate as well. Where regular meetings of district associations are not to be held this month special meetings are to be called for the purpose of selecting representation on the executive committee of the state organization.

W. H. Cunningham, of Huntington, who is secretary of the state organization, emphasizes that the retiring executive committee vacates on June 1, and that the election of new members is therefore of the greatest importance, in a circular letter which has been sent to all associations and to coal operators who attended the Huntington meeting on Apr. 26.

As the result of a conference which was held by President C. H. Jenkins of the Central West Virginia Operators Association with officials of the Baltimore & Ohio during the previous week, the car supply in the Fairmont and adjacent fields was probably the best which has been observed there for some time, the supply being well sustained throughout the week. President Jenkins says that operators are now beginning to feel that the Baltimore & Ohio intends to do all that it can in the future, and that with closer coöperation between mine owners and the railroad the results would be most marked. The Fairmont region received 1148 cars on Apr. 27. On Monday the supply jumped to 1458, indicating to operators that the pledges of the Baltimore & Ohio were to be fulfilled. On Tuesday 1128 cars were furnished, only six mines out of 151 reported being closed down. Men idle numbered 1382, with a production loss of 13,545 tons. On May 1 the supply had dropped to 845 cars. Restrictions on shipments is a new order in the Fairmont field, but close attention is being given it. Wrecks in numerous instances have made such restrictions necessary.

Inasmuch as there are said to be at least 200 wagon mines in the Fairmont district, the decision of the Interstate Commerce Commission denying team track operators the use of open-top cars will materially affect many mines in the northern section of the state.

Charleston, W. Va.

Relief from freight congestion in the East, to some extent at least, is reflected in a much better car supply in all the coal districts of West Virginia during the past week, though conditions are even yet far from normal. There was a most marked improvement in the car supply in the Kanawha district the latter part of last week, 1148 cars being supplied to the mines of this district, for instance, last Friday. On the other hand, the delivery of loaded coal cars to connections from the Kanawha district showed a marked decrease over deliveries of previous days, the loaded deliveries numbering 833.

Chesapeake & Ohio officials claim that they are greatly hampered in trying to supply the mines on their lines with empties by the large number of "bad order" cars dumped on them in the interchange of cars, in which condition such cars are useless, while at the same time congesting the company's sidings. Requiring all the labor it can command to repair its own equipment, the company is unable to find labor to repair the cars of other lines, nor does the company believe that it is its duty to make such repairs.

In the smokeless district along the Norfolk & Western, the mines had 100 per cent. car service during the week ending Apr. 27, the production in that territory at the same time being 60 per cent. of normal, based on present "man-power" conditions and the ability of the coal companies to produce. Car service conditions and labor conditions have shown such a marked improvement during April that the total production for the month will probably establish a record for the present year. A total of 458,927 tons of coal was produced in the Norfolk & Western territory during the week ending Apr. 20 as compared with 436,985 produced during the preceding week, a net increase of 21,942 tons. Out of 200 mines in the Tug River and Pocahontas districts to be supplied during the week ending Apr. 20, only 17 hours were lost because of a shortage of cars.

Development work in connection with new coal projects in West Virginia may be halted and stopped entirely, except in special cases, if the new order discontinuing the putting in of new sidings, as it is now understood has been issued by the Director General of Railroads, is put into effect in this state. As understood in some sections at least, the new order prevents the laying of new sidings without regard to the length of the proposed siding. It is understood that the new order is based on the theory that to put in new sidings would not only require many cars now otherwise needed for the transportation of fuel, but would draw labor from mines already in existence to new projects and thus disorganize existing organizations. As a matter of fact operators point out that in the counties in which most of the new mines are being opened native labor is used—that is, labor not heretofore used in the mines—that being the case in Barbour, Upshur, Preston, Braxton, Gilmer and Monongalia Counties. It is only within the last year or two that coal mining has been undertaken in some of the counties just named.

Much capital has been invested within the last year in the counties of Fayette, Marshall, Brooke, Raleigh, Putnam, Lincoln, Mason, Nicholas, Webster, Randolph, Mineral, Harrison, Marion, Taylor, Wayne, Wyoming, Boone, Logan, Kanawha, Clay, Ohio, Mercer, McDowell, Mingo, Lewis and the counties already mentioned. In these counties plants have been installed, tipples built and applications for sidings approved, all such preparations not only representing an investment for charter and other legal requirements but an actual expenditure, so that if the companies who have made such preparations are unable to secure sidings it will result in serious embarrassment. Of 69 applications made to the Baltimore & Ohio for sidings recently none were granted.

Morgantown, W. Va.

Word has been received from the West Virginia University at Morgantown that the United States Bureau of Mines has agreed to co-operate with the University in the Short Course in Coal Mining, by placing Mine Rescue Car No. 8 at Morgantown for the two weeks' period June 17-29. This means that the men in attendance at the short course will receive their training in first aid and mine rescue from the Federal experts who accompany the car, and will have the benefit not only of the apparatus owned by the University but also that carried on the mine rescue car.

The headquarters of car No. 8 are at Huntington, and it is subject to call whenever an accident or explosion occurs which requires the use of the breathing apparatus. Needless to say, the men who are in charge of the car are really experts in mine rescue and first-aid work, and it will be quite a privilege for the students in the short course in coal mining to receive the personal instruction which the Federal engineers will give.

During the two weeks that the car is located at Morgantown the following subjects will be covered in the short course, in addition to the first aid and the mine rescue work—Mine Gases, Explosives, Timbering, Methods of Working, and the Prevention of Accidents. The short course is open without cost to any resident of West Virginia interested in coal mining.

Birmingham, Ala.

A thorough inspection of all coal being mined and shipped by the Alabama producers will be started immediately, and coal that carries dirt, slate or other impurities is likely to be returned at once. John DeB. Hopper, who has been appointed inspector of coal in Alabama by the fuel administrator, is taking up the work with his assistants and will make frequent visits to shipping points, investigate coal being mined, loaded and shipped, and give instructions thereon when it is found there is the least carelessness in the cleaning process.

There is much activity in the coal mining section at the close of this week, but the output is not as large as it might be. Not only is there complaint that the labor is giving only partial effort, but it is also stated that much inefficiency is being found. There is more coal being mined now than ever. There is need for every ton of coal that can be mined. Shipments of coal are being rushed, and the car service, under Government regulation, including a zone system of delivery, is showing a steady improvement.

Readjustment of wages will go into effect at the mines May 15, and this is expected to be an inducement for better work and larger production. So far little buying of coal at mines is noted for next fall and winter consumption. The belief is strong that within 60 days there will have been a start on accumulating of individual stocks of coal for next winter's consumption.

Coke production shows no change, ovens operating nearly at the maximum of production. Shipments of coke from this district are not very extensive, the bulk of coke being made here being used in the local territory. Manufacturers of coke are not in a position to take on many, if any, new contracts for their product, and it may be sixty days and longer before any business can be considered. Revisions of coke prices for this state have brought about a better feeling in coke mining circles, though contracts are in hand that will last for some time.

It is officially reported that the Sloss-Sheffield Steel and Iron Co. is considering the erection of a large coke-making plant. J. W. McQueen, president of the company, has gone to New York, and it is stated that he will present suggestions to the company that may result in the erection of a large coke plant in the vicinity of Birmingham.

PENNSYLVANIA

Anthracite

Reading—Jonathan Reber, of this place, has a contract with the Lehigh Coal and Navigation Co. to dredge the dams in the Lehigh River this summer and take out the marketable coal. It is expected that many thousand tons of good coal can be reclaimed.

Scranton—Before Judge L. H. Barber, specially presiding, the mine-cave case of the Penn Store Co., Ltd., a subsidiary of the Scranton Coal Co., against the People's Coal Co., marks one of the first instances in the history of the anthracite industry where one coal company is suing another for damages caused by a mine cave.

Following out a policy inaugurated by the Delaware and Hudson Coal Co. some time ago, a safety-first institute was organized on May 3 by the employees of the Marvine colliery. It was announced that the company will award cash prizes for the best suggestions offered by members of the institute for the prevention of accidents. A cash prize of $50 will be given for the best suggestion from an individual member; $25 for the second prize and $10 for third. For the best suggestion coming from an institute $25 will be given; $15 as second prize and $10 as third prize.

Treverton—Disregarding a warrant issued by the Reading Railway Co. forbidding them to board an accommodation train from Shamokin to North Franklin colliery near here, 50 miners were arrested by special railroad officers and taken before a justice of the peace. They settled the case by paying nominal fines.

Nanticoke—Both cages at the Loomis shaft of the Delaware, Lackawanna and Western R.R., Coal Department, were wrecked on May 4 when traveling in opposite directions. In some unknown manner they collided. A force of workmen were at once put to work repairing the damage so that operations at the colliery could be resumed at once. No one was injured in the smashup.

Hazleton—Every one of the 16 mines of the Lehigh Valley Coal Co. in the Hazleton district having attained a 100 per cent. record in Liberty Bond subscriptions, the achievement was signalized on the evening of May 4 by the simultaneous sounding of the colliery whistles at 6 o'clock. Twenty nationalities are represented among the employees of the company, a considerable percentage of them from enemy alien countries.

Plymouth—The large coal washery of the Lehigh and Wilkes-Barre Coal Co., adjacent to the Parrish colliery breaker, fell to the ground with a crash shortly after 1 o'clock on the afternoon of May 1. All employees had been ordered out of the building. It was well that this was done, as a few minutes later the high and heavy building toppled a few inches to one side and fell, tearing loose steam and water pipes, smashing machinery and breaking heavy timber. The washery was erected about seven years ago by the Parrish Coal Co. and the company was taken over by the Lehigh and Wilkes-Barre Coal Co. about four years ago.

Freeland—In order to have everybody plant a garden this summer, the G. B. Markle Co. will furnish garden plots, fertilizer and plowing for the sum of $1 for each garden. The employees held an informal meeting at the colliery clubhouse and talked over methods of cultivation and planned for the summer's work. The Philadelphia & Reading Coal and Iron Co. began this work last year, and late last fall it plowed land for this spring. The latter company has an expert cookery instructor going about among the homes teaching the housewives the best way to prepare the "Hooverized" war-time dishes.

St. Clair—The Delaware & Hudson Coal Co., which has operated solely in the Wyoming region in the past, is now proving and plotting its Schuylkill holdings in the vicinity of St. Clair and Middleport. It maintains an engineering force in Pottsville which takes care of the leased lands in this part of the field.

Maryd—The Maryd Coal Co. has installed two electric storage battery locomotives and an electric generating plant. The inside haulage equipment before the new instalation consisted of gasoline motors and mules.

Pittston—One man was killed and another seriously injured, and more than 20 buildings in an entire block were ruined on May 1, when a cave occurred in the workings of the White Coal Co. Property damage will amount to tens of thousands of dollars. The cave is one of the most serious that has occurred in the anthracite region and is unusual in that the subsidence covered an enormous area at practically the same time. The cave was not unexpected, officials of the company having ordered the 40 employees out of the workings during the morning. It was predicted during the winter, after several minor caves had damaged property, that when the frost would leave the ground the entire "Hill" section would be endangered. The prediction was borne out by the cave during the afternoon. The White Coal Co. operates the Checker vein, and is practically all "robbing work." In 1917 the company mined 28,000 tons. The Lehigh Valley Coal Co. owns the lower veins, but not mined them for a number of years.

Wilkes-Barre—In orders handed down by the court recently appointments were made for the mine formen's, mine inspectors, and miners' examining boards. The mine inspectors' board has three new members this year. The board consists of E. R. Pettebone and John M. Humphrey, mining engineers; Cornelius McLaughlin, of Avoca; John Larkin, of Nanticoke, and Thomas Gallagher, of Lansford, practical miners. Gallagher succeeds John J. Hanlon, of Avoca; Larkin succeeds Daniel B. Bolton, of Nanticoke, and Gallagher succeeds the late Peter Dougherty, of Lansford. The miners' examining board is composed of the following: Patrick McGuire, of Hazleton; Gustav Ulberich, of Wilkes-Barre; Michael H. Quinan, of Pittston; Harry Cook, of Nanticoke; James F. Gildea, of Plains; John B. Thomas, of Dorranceton; John H. Evans, of Plymouth; Alexander Patterson, of Hazleton; James McGlynn, of Jeanesville.

Bituminous

Lovejoy—The Estep Brothers Coal Mining Co. is equipping its new mine here with electricity throughout. A substation has been erected and the motor-generator set is on the ground. Three Jeffrey locomotives are ready to begin operation. The power will be furnished by the Penn Public Service Company of Indiana. The power will be turned on at the plant about May 15.

Starford—The mine of the Starford Coal Co. has been closed temporarily pending the drilling of a tract of land ahead of its present holdings. A fault was hit recently, and if the new field proves a success headings will be driven through the fault.

Blairsville—The Graff Brothers have opened an old mine near Smith Station and have their siding with the Pennsylvania R.R. completed. The first coal from the new operation was shipped a few days ago. The mine is in the Pittsburgh seam of coal.

Evans City—The Brewster mine of the Big Creek Coal Mining Co. near here is undergoing great improvements. The company is equipping the mine with electrical machinery and has its power lines and substation constructed. Shortwall mining machines are on the ground, as well as other electrical machinery. The power will be furnished by the Pittsburgh, Harmony and New Castle Street Railway Co. The production will be increased greatly, and the mine will be one of the large producers on the south end of the Buffalo, Rochester & Pittsburgh Railway.

Kantner—The new branch of the Baltimore & Ohio R.R., from Stoyestown station to the new mines opened by the Quemahoning Coal Co. on the Koontz farm, Shade Township, and operated as Ralphton No. 9, was recently completed and the shipment of coal has been commenced. At present the shipment is from a large amount of coal stored awaiting the opening of the road, but new homes for miners will be erected and the mines already opened will in a short time be operated to full capacity.

WEST VIRGINIA

Sutton—The Briestweiser Lumber Co. of Pittsburgh, Penn., is planning to develop a tract of coal land owned by the company in Braxton County, near this city.

Elkins—Tests are being made by the Hayes Coal Mining Co. of Alton, of a property under option to the company in Randolph County, near Silica, on the Baltimore & Ohio, to ascertain whether or not the land is worth developing.

U. C. Edgell and associates have purchased from John T. Flynn a small acreage of coal near Wilsonburg, Harrison County, and will develop the property at once.

Charleston—The order of the Public Service Commission recently directing the Norfolk & Western R.R. to establish track connections and extensions and furnish cars to serve the mines of the Trace Coal Co. was upheld by the Supreme Court of Appeals.

Buckhannon—J. A. Tucker and J. J. Schargnecker have formed a partnership for the purpose of engaging in the coal mining business, the style of the firm to be known as the Scharfnecker-Tucker Coal Co., with mines at Ower's Mills and Hampton. The first car was loaded last week at the Ower's Mills mine. A plant will be installed at Hampton at an early date.

Moundsville—The boiler house and power house of the Central Coal Mining Co.'s mine, generally known as the Fort Pitt mine, on the Ohio side of the river opposite Moundsville, was destroyed by fire recently. The damage is estimated at about $20,000. About 300 men are employed at the mine.

Weston—The P. C. Lynch Coal Co., of Beckley, has acquired 1000 acres of coal lands on Stone Creek, near Weston, from Thomas E. Miles, of Hornor, and T. S. Stalnaker, of Weston, for a consideration of $72,000. The company recently acquired 400 acres in the same vicinity. It is arranging to erect a mining plant and build a new mining town near Weston at an outlay of $200,000.

Grant Town—The New England Fuel and Transportation Co., which has the largest mine in West Virginia at this place, broke a record one day recently when it hoisted 1206 mine cars. The mine is splendidly equipped and on this day loaded 63 railroad cars in addition to supplying coal for its coke ovens.

Mt. Clare—There are four different openings on the Holden property of 12 acres, near here, and four different wagon mines convey coal to the commercial siding.

Fairmont—The Franklin Gas Coal Co., which has opened a 40-acre tract adjoining that of the Elkhorn Coal Corporation in Harrison County, is working a 9-ft. vein, conveying the coal by incline to a tipple.

Hallwood—The West Virginia Rail and River Coal Co. has purchased the fee of the properties located on the Ohio River near here, which it has been operating under lease for two years. The property consists of approximately 3000 acres and has a mine producing 400 tons daily. In addition there are miners' houses, valuable timber and salt wells on the property. S. F. L. Dean is president of the company.

KENTUCKY

Providence—Fire which recently broke out in the R. L. Forsythe mine was finally flooded out after it had been burning for several days. It will take several days to pump out the accumulated water. The fire started from a charge that was fired late in the evening, and which smoldered through the night.

Pineville—Lewis R. Jones has sold the Straight Creek Fuel Co., to Judge M. J. Moss, Ray B. Moss and M. J. Moss, Jr. The new owners expect to develop the mine. It is understood that Judge Moss purchased the property with the idea of allowing the boys to handle it.

Paducah—City authorities have been busy for several days in examining several coal properties, it having been decided that the city will own and operate her own mines. The city expects to buy a small mine either in the Clay or Providence district.

Harlan—The Clinton Coal Co., which was recently organized in eastern Kentucky, with headquarters at Hazard, plans establishment of a town on Carr's Fork, and expects to start immediate developments.

Whitesburg—Added impetus has been given to the Big Sandy field through the organization of the Somerset Fuel Corporation, by a party of West Virginia capitalists, who have secured the coal rights to several hundred of acres of land on the Big Sandy extension of the Chesapeake & Ohio.

Hawesville—L. S. Powers, a coal mine operator working mines near here, has installed a new set of air pressure coal mining machinery, which is expected to considerably improve production at the plant.

Hazard—The Hawley Coal Co., of Milwaukee, Wis., which recently increased its capital stock from $3000 to $50,000, is making improvements at its mine near Middlesboro, Ky., which will enable it to increase production to 100 tons a day.

Roxana—The Kentucky and West Virginia Coal Co., which operates mines here, has let contracts for construction of fifty miners' houses. Mine companies and oil producers have been making arrangements for better accommodations for employees, due to the fact that employees have to be better treated than ever to enable the employer to hold them. An oil company in Lee County is installing electric lights, hot and cold water and showers in each of a number of employees' bungalows.

TENNESSEE

Briceville—The Cross Mountain Coal Co. is increasing its output from the old mines and is opening up new mines, planning a new tipple, boiler house, office, amusement hall and picture theater. It is improving old houses and building new ones. The output is to be increased about six times over that of 1917.

INDIANA

Terre Haute—Terre Haute citizens are confident their city can secure the location of a Federal coal-washing plant. One is already in operation at Danville, Ill. Sulphuric acid, used in explosives, is made of iron pyrites, which Edward Bassett, state geologist, says Indiana has in liberal deposits.

Oakland City—Armed guards have been placed at the opening of Mine No. 4 by the Ayrshire Coal Co., owner of a system of large coal mines in this vicinity. Enemy activity, believed to be due to German sympathy, prompted the action. Several attempts were made in one day to wreck the electric motors of the mine. A motorman, as he rounded a curve with a string of loaded coal cars, saw an obstruction on the rails. On the next trip another obstruction was encountered. This was repeated every trip of the two motors during the afternoon, when watchmen were placed along the entry. Twice the watchmen saw men throwing props on the track, but each time they escaped into the old works. The mine, which is a large one, has about 15 openings.

Petersburg—All coal mines along the Evansville & Indianapolis R.R. in this part of the state are idle as a result of a dispute over freight rates. Many miners are leaving for employment in other fields. This situation has existed for some time. It is estimated that the daily loss in wages is $10,000, as several hundred men are affected. So far, the fires in the engines have been kept burning and the mines clear of water, but it is feared that a permanent closing of the mines will occur if a satisfactory agreement is not reached soon. Many of the coal companies have lost heavily by the shutdown. One mine operated one day to supply coal for the oil field west of town.

ILLINOIS

Edwardsville—T. T. Brewster, president of the Mt. Olive and Staunton Coal Co., St. Louis, has applied to the circuit court for an injunction to restrain the City Coal Co. from operating Mine No. 3 and asks for an order that it be turned over to the Edwardsville Coal Co. Brewster says he has been operating the mine since 1913, when the lease of the other company expired. Representatives of the defendant company say that while their lease expired at that time, Brewster made no effort to intervene and they believed that the lease was automatically extended for five years.

Gillespie—The charter of the Gillespie Coal Co. has been filed. The capital stock will be $100,000, the stock to be distributed as follows: S. M. Westwood, $25,000; D. E. Alyward, $12,500; R. H. Isaacs, $12,500; W. F. Schmidt, $12,500; G. W. Schmidt, $12,500; B. K. Leach, $12,500; and H. A. Anderson, $12,500. The company owns 559 acres of coal land near Gillespie, the rights being located under the southeast quarter of Section 12, the north half and the southeast quarter of Section 13, Town 8, range 7. The Big Four railroad has announced that necessary arrangements have been completed for the running of a miners' train between Gillespie and the new No. 4 mine of the Superior Coal Co. It will leave the Big Four depot at 6.15 a. m. and return at 5.15.

Carlinville—The four mines of the Standard Oil Co. will produce 14,500 tons of coal daily when they are running at full capacity. The two mines northeast of town are down 200 ft. They will be known as No. 2 and No. 3. Each will employ 1100 men and each will produce 5000 tons of coal daily. The third new mine will be known as No. 4. It is now ready for the tipple. This mine will employ 550 men and will produce 3000 tons daily. The old mine at the edge of town will be known as Mine No. 1. It will employ 350 men and will produce 1500 tons of coal per day. The Carlinville Home Builders Association, an organization composed of bankers and business men of this city, will erect 300 new houses to help care for the influx of miners and their families. The Chicago & Alton R.R. has built a spur to the No. 4 mine and is rushing work on spurs to No. 2 and No. 3. The Chicago & Alton and the Illinois Traction System have arranged to run shuttle trains between the city depots and the three mines.

Personals

Fred C. Pavey, of the Baum Coal Co. of St. Louis, Mo., has gone to the Wickham Coal Co. as sales manager. The Baum Coal Co. has arranged to close its St. Louis office.

W. C. Tucker, formerly superintendent for the Wisconsin Steel Co., at Benham, Ky., has been appointed general superintendent for the Cross Mountain Coal Co., at Briceville, Tenn.

B. R. Craig, acting general superintendent and chief engineer of the Shawmut Mining Co., St. Marys, Penn., has been appointed general manager and chief engineer of the same company.

C. J. McKee, district mine inspector Associated Companies, Kittanning, Penn., has resigned to accept the position of safety engineer with the Jamison Coal and Coke Co., Barrackville, W. Va.

P. G. Elder, assistant mine superintendent, Buckeye Coal Co., Carmichaels, Penn., has resigned to look after his mining interests near Walsenburg, Colo., where he will be located after May 15.

J. W. Bowles has been appointed safety inspector with the Pittsburgh Terminal Railroad and Coal Co. He was formerly district mine inspector of the Associated Companies, Pittsburgh, Penn.

Martin Maloney, formerly with the Jefferson and Clearfield Coal and Iron Co. at McIntyre, Penn., is now in charge of the Armerford mines of the Armerford Coal Mining Co. near Blairsville, Penn.

Edward McCleary, formerly mine inspector with the Associated Companies, Pittsburgh, Penn., has been appointed chief safety inspector of the Victor American Fuel Co., with headquarters at Denver, Colo.

John Gordon Smythe, chief engineer of all divisions of the Consolidation Coal Co., has been made a captain in the Officers' Reserve Corps and expects to report for duty soon. He will likely be assigned to construction work.

D. H. Parker, formerly mine superintendent at the Soudan Mine, Youghiogheny & Pittsburgh Coal Co., Van Voorhis, Penn., has recently been appointed general superintendent for the W. H. Warner interests at Charleroi, Penn.

T. C. Miller, for eight years chief engineer for the Wisconsin Steel Co., Benham, Ky., has been appointed chief engineer for the Cross Mountain Coal Co., at Briceville, Tenn. He has also been made assistant to the general superintendent.

George Love, who has been with the Cowanshannock Coal and Coke Co. at Yatesboro, Penn., has moved his family to Rochester Mills, Penn., and has accepted a position as superintendent of the Savan mine of the Savan Colliery Co. there.

W. F. Nansteel, for six years master mechanic for the Wisconsin Steel Co., Benham, Ky., but late of the boiler inspection department of the Hartford Insurance Co., Pittsburgh District, is now master mechanic of the Cross Mountain Coal Co., Briceville, Tenn.

David Whitcomb, fuel administrator for the State of Washington, has been notified by Fuel Administrator Garfield of his appointment as executive secretary to the National Fuel Administration, with headquarters at Washington, D. C. Mr. Whitcomb has accepted and will take up his new duties about May 15. Mr. Whitcomb's appointment follows close upon a stay of more than a month in Washington, D. C.,

DAVID WHITCOMB

whither he was called by Dr. Garfield for conference. He was appointed state fuel administrator last September and organized his office locally and state-wide immediately on his return to the city in October, 1917. He is a native of Worcester, Mass., a graduate of Amherst College and the Harvard Law School. He is the head of the Arcade Building and Reality Co., president of the Seattle Building Owners and Managers Association, and was Seattle manager of the Red Cross drive last summer.

Thomas Hogarth has resigned as mine foreman of Penn Mary No. 2 mine, of the Penn Mary Coal Co. at Heilwood, Penn., to become mine foreman of the new Coal Run Nos. 4 and 5 mines at Kent, Penn. Mr. Hogarth is considered one of the best mining men in Indiana County.

James Keener, of Howesville, Preston County, W. Va., has resigned as superintendent of the Allbright Smokeless Coal Co., and is developing a mine for himself nearby. He has been succeeded by **Charles Brennan**, of Thomas, W. Va., a former employee of the Davis Coal and Coke Co.

Charles F. Ice, for 30 years identified with coal mining in northern West Virginia, and who is viewed as one of the most capable men in the Fairmont district, which includes twelve and a half counties in the Northern-Central part of the state, has been appointed chief inspector of coal for the Fairmont district, working in conjunction with the District Representative of the Fuel Administration and having his office at Fairmont.

F. A. Dalburg, mining engineer, has recently returned from Valparaiso, Chile, following two years prospecting work through Chile, Bolivia and Peru. Previous to this South American work Mr. Dalburg spent two years in the Philippine Islands, one year in China, and eighteen months at Spitzbergen, Norway, in coal-mining work. He has now affiliated as chief engineer with the Humble Oil and Gas Co., Witchita Falls, Tex., where he may be reached after May 15.

James E. Anderson, formerly chief mine inspector with the Associated Companies, Pittsburgh, Penn., has resigned to take up new work as chief safety engineer of the mining department with the Rockwood-Badgerow Co., of Chicago, Ill. His thirty odd years' experience in coal mining through Illinois and the Middle West, combined with a most genial personality, has gained "Grandpa" Anderson thousands of friends in the coal-mining fraternity, all of whom wish him unbounded success in the new work.

Obituary

Robert Morrison Olyphant died at his home, 160 West 59th St., New York, recently. He was well known to the older members of the coal trade. He was connected with the Delaware & Hudson Co. from 1873 to 1903, first as manager and then as president, and at the time of his death was honorary chairman of the executive committee of the company.

W. F. Jacoby, president of the Calumet Coal Co., 17 Battery Place, New York City, died at his home on May 1. Mr. Jacoby was at one time a station agent for the Philadelphia & Reading Co. Later he was connected with the Davis Coal and Coke Co., then he organized W. F. Jacoby & Co. which was later merged into the Fenn Collieries Co. In 1906 Mr. Jacoby withdrew from the latter company and became president of the Barton Coal Mining Co., with a mine at Barton, Md. About a year ago he, with C. W. Proctor, organized the Calumet Coal Co., the business of which will be continued.

Industrial News

Charleston, W. Va.—The White Ash Block Coal Co. has given notice of its intention to surrender its corporate charter and to go out of business.

Goodwill, W. Va.—The Foursome Block Collieries Co. has filed notice of an increase in its capitalization from $100,000 to $150,000, to provide for expansion.

Pittsburgh, Penn.—The Aspromet Co. announces the removal of its New York office to 170 Broadway. The telephone number, Cortlandt 5428, remains unchanged.

New York, N. Y.—Exports of coal from the Port of New York during the month of March were 2607 tons of anthracite, 4508 tons of bituminous and 956 tons of coke.

Knoxville, Tenn.—The Cross Mountain Coal Co. has filed notice with the Public Service Commission of an increase in its capital from $100,000 to $200,000, to provide for expansion.

Blocker, Okla.—The Tri-State Coal and Coke Co., recently incorporated with a capital of $100,000, has perfected its organization, and is planning for the immediate development of about 230 acres of coal lands. J. E. Stillwell is president.

Pennington Gap, Va.—The Cumberland Collieries Co. has been organized, and is planning for the immediate development of a large tract of coal lands recently acquired in Lee County. E. H. Easley is president; V. L. Sexton is vice president.

Alden, Penn.—The Alden Coal Co. is having preliminary plans prepared for the construction of a new one-story coal washery, about 45 x 50 ft., at its plant, to cost about $20,000. Frank B. Davenport, Coal Exchange Building, Wilkes-Barre, is engineer.

New York, N. Y.—The George Haiss Manufacturing Co., 365 Rider Ave., manufacturer of coal-handling machinery, has had plans prepared for the construction of a new one-story brick building, about 55 x 65 ft., on Rider Ave., near 141st St. The estimated cost of the structure is $15,000.

Indian Bottom, Ky.—The Rockhouse Coal Co., recently organized, is planning for the immediate development of about 200 acres of coal lands recently leased in the Rock-

house Creek fields, Letcher County, to have a daily capacity of about 1000 tons. P. M. McClanahan is president and manager.

Washington, D. C.—Construction of 50 wooden barges 3500 tons each, for use in the coastwise coal trade, has been authorized by the Shipping Board. The vessels will be built at New England and South Atlantic shipyards. They will aid materially in solving the problem of keeping New England supplied with coal.

New York, N. Y.—The Wilputte Coke Oven Corporation has been awarded a contract for the construction of 40 Wilputte ovens, with extensions to existing byproduct plant and benzol plant, by the Citizens Gas Co., of Indianapolis. Work has been started and the plant is expected to be in operation by December, 1918.

Columbus, Ohio—Improved conditions in the distribution of coal in the various cities in Ohio and Michigan have caused the Federal Fuel Administration to issue an order dissolving the distributing pools at Columbus, Cincinnati, Cleveland, Akron, Canton, Toledo and Detroit. The pools were in operation since early in January.

St. Louis, Mo.—The Interstate Commerce Commission hearing on the application of the St. Louis Chamber of Commerce for the abolition of the bridge arbitrary of 20c. a ton on coal, which was set for May 6, has been postponed to June 3, at the request of the railroads, concurred in by the East St. Louis Chamber of Commerce.

New York, N. Y.—The following officers were elected at a recent meeting of the Alberger Pump and Condenser Co., 140 Cedar St.: President, William S. Doran; vice president, William R. Wilson; secretary, Richard C. Williams; treasurer, Frederick A. Brockmeier. George Q. Palmer was elected chairman of the board of directors.

Des Moines, Iowa—The Flat Brush Coal Co. is planning the opening of a mine at Melcher, W. Va., at a cost of $100,000. When completed the mine is expected to have a capacity of about 400,000 tons a year. Engines, boilers, screens, cars and rails have not yet been purchased. E. C. Smith is superintendent in charge of construction.

St. Louis, Mo.—Sebastian A. Weissenborn, coal operator, has moved from offices on Olive St., between Third and Fourth Sts., which he had occupied for 37 years, to new ones in the Boatmen's Bank Building. He moved on his seventy-third birthday. He has been in business in St. Louis 40 years and is now associated with his son, J. E. Weissenborn.

Springfield, Ill.—Although the present contract for supplying coal to the various Illinois state institutions does not expire until July 1, the state is preparing plans and specifications for the new contract. It is said that bids will be asked early this year on account of the uneasiness which has prevailed in the state over a possible shortage of fuel for state institutions.

New York, N. Y.—C. Andrade, Jr., of Matlack Coal and Iron Corporation; J. M. Leonard, of the Brothers Valley Coal Co., and Gardner Pattison, of Pattison & Bowns, have been elected directors of The Wholesale Coal Trade Association of New York City to fill the vacancy existing as the result of the authorization given the Board of Directors to increase its membership to eleven.

Charleston, W. Va.—The Federal Coal Co., recently incorporated with a capital of $3,000,000, is planning to organize subsidiary companies for the development of 33,000 acres of coal lands in Boone County and 22,300 acres in Nicholas County. The company has already ordered a large amount of equipment and it is said that about $500,000 will be expended for improvements.

Columbus, Ohio—Contracts have been awarded by the Columbus Board of Education for approximately 10,000 tons of coal for the various school buildings of the city. The Reliance Coal Co. secured the larger contract to supply 28 buildings with Hocking mine-run at $5.05 delivered. Scholl & Graham will supply 12 schoolhouses at $5, and the Hamilton-Parker Co. 12 school buildings at $4.90.

Oakland, Md.—The Taylor-Offutt Coal Co. has been organized and is planning for the immediate establishment of a plant for the development of 800 acres of coal lands about three miles from Oakland. H. N. Taylor, of Philadelphia, Penn., is president; William R. Offutt, of Oakland, is vice president; Julius C. Renninger, Oakland, is secretary; and William W. Justice, Philadelphia, Penn., is treasurer.

Evansville, Ind.—Coal prices in Evansville and Vandenburg county will not be affected through an order of the state fuel administrator received by George S. Clifford, county fuel administrator for Vandenburg county. Lump coal will be delivered in the city at $3.85 to $4.40 a ton, the price to the consumer depending on the source from which the coal comes. The prices are the same as those of last winter.

Indianapolis, Ind.—The question of whether coal, transported to points on the Ohio River in Indiana, may be shipped from these points to other cities in the State by rail, under the zone system, was presented to the state fuel administration by Harry Dowd, fuel administrator for Jennings County. The question was referred to C. G. Hall, district representative of the national fuel administration, with offices at Terre Haute.

Cincinnati, Ohio—Permission has been granted to Cincinnati coal dealers to increase their selling price 25c. per ton. This action was taken by Chairman Albert Bettinger, of the Hamilton County Fuel Committee, after hearing the request, presented by James A. Reilly, general manager of the Queen City Coal Co. He showed that there is a big increase in the cost of delivery and claimed that an advance was necessary to cover the increased costs.

Hartford, Conn.—The Terry Steam Turbine Co. has appointed E. E. Maher as manager for the Chicago District, with offices at 1328-29 McCormick Building, 322 South Michigan Ave. John D. Stout has been appointed manager of the New York office, in charge of that district with the exception of navy and marine installations. Mr. Stout has been assisting Mr. Herbert, formerly in complete charge of that district, who will now devote his entire time to navy and marine requirements.

Pittsburgh, Penn.—E. J. Frauenheim Jr., president and secretary of the Logansport Coal Co., has organized the E. J. Frauenheim Coal Co., with a capital of $200,000 to develop operations in Somerset County. Two miles of railroad are to be built. The mine will be electrically equipped for an output of 1000 tons a day of smokeless, byproduct and smithing coal. It is situated on the Western Maryland R.R. E. J. Frauenheim is president, C. F. Roy, vice president and Nettie M. Frauenheim, secretary.

St. Louis, Mo.—The Ajax Coal Co. has been incorporated here for $25,000 by Ralph D. Woodley, C. J. Dolan and L. Jaech. They have arranged to open up a yard at Theresa Ave. and Gratiot St. and engage in the retail coal business. This is generally supposed to be a subsidiary company of the Taylor Coal Co. of Chicago, which also is supposed to control the Energy Coal and Supply Co., with retail yards in southeast Missouri, and the Distributers Coal Co. and the J. W. Reiner Coal and Lumber Co., also of Chicago.

Terre Haute, Ind.—Indiana mines reached a maximum of more than 75 per cent. of their capacity for the week ended Apr. 20. Horace H. Herr, director of publicity and conservation of the state fuel administration, has announced in the Terre Haute district 13 mines of the 96 in operation in the district were closed one day of that week because of a lack of cars. The Southern Indiana bureau reported only five of its 41 mines closed on Saturday of that week. Mining conditions throughout the State showed a slight improvement over the preceding week, Mr. Herr said.

Kansas City, Mo.—United States Fuel Administrators Webster of Iowa, Kennedy of Nebraska, Crossley of Missouri, Cary of Kansas and Couch of Arkansas, and E. J. Wallace, of the Missouri Retail Coal Merchants Association, with Mr. Hope, of the Fuel Administration at Washington, held a conference here on May 6 to determine the tonnage of anthracite that moved into this territory in 1916 and 1917, and what tonnage is coming from the same shippers at this time, with the intention of taking steps to see that there is an equal distribution of tonnage for the Central West.

Jefferson City, Mo.—Fuel Administrator Crossley has made an emphatic ruling on the illegitimate shipment of coal to associations or individuals who are not licensed dealers, which is generally called "snowbirding." He has ruled that the act to regulate a man's business also carries with it the assumption that he must protect that business. He has licensed every dealer in the state. Corporations that retail coal to their employees, etc., may have action taken against them for the violation of the incorporation laws, if their charter does not specify that they are to engage in the retailing of commodities such as coal.

Alton, Ill.—At a conference of Chairman George M. Potter of the Alton Fuel Committee with the dealers of Alton, Wood River and East Alton, at the Board of Trade rooms here, the dealers filed a formal protest against the rule permitting mines having coal-washing equipment to charge an additional 20c. a ton. It was declared that the mining companies, taking advantage of ambiguity of the rule, were charging 20c. additional whether the coal was washed or not, and it was shown that only part of the coal is washed at any mine, although the increase is charged on the entire output. The protest was taken under advisement.

Columbus, Ohio—While ice in the upper lake passages has been hindering the opening of the lake trade, still there has been a considerable tonnage from Ohio and West Virginia mines loaded at the lower lake ports. Reports show that the ice is moving away well, and it is expected that the lake trade will be in full swing by May 15. The Hocking Valley docks at Toledo loaded 131,900 tons up to May 4. Of that amount 25,832 tons were loaded prior to Apr. 20; 20,250 tons during the week ending Apr. 27 and 85,810 tons during the week ending May 4. The Toledo & Ohio Central R.R. loaded 39,000 tons up to Apr. 26 and 38,000 tons the week ending May 3, making a total of 77,000 tons for the present season.

New York, N. Y.—Action toward securing a supply of coal for the poor of New York city was taken at a meeting of the Executive Committee of the Committee on Domestic Supplies of the Mayor's Committee on National Defense on Monday of this week. City Chamberlain Johnson assured the meeting of the financial support of bankers who will loan money at a low rate in order to purchase the coal. Michael Burns, of Burns Brothers was appointed a committee of one to call a meeting of coal distributors of the various boroughs, and to have a committee of the distributors meet in conference with the Executive Committee of Domestic Supplies, when definite steps will be taken toward securing the coal.

Cincinnati, Ohio—The Hamilton County Fuel Administration has granted retail dealers an additional 25c. in price, effective May 15, on account of increased delivery cost, evidence that in some instances delivery costs have increased 100 per cent. being presented to the Administration. The Fuel Administration has directed the City of Cincinnati to make arrangements at once for the winter's coal supply for schools and city institutions, including the fire department, in order to aid in the movement to get as much work as possible out of the way before winter. The Cincinnati Traction Co. reports that it is accumulating reserves as rapidly as possible, present receipts running 1000 tons a month over current requirements.

Grafton, W. Va.—At the regular monthly meeting of the Grafton Coal Operators Association, held at the Willard Hotel here on May 2, George S. Brackett, of Flemington, W. Va., general superintendent of the Pitts-Vein Coal Co., was elected secretary-treasurer of the association, to succeed H. R. Bissell, resigned. David Williamson, of Wendel, Taylor County, W. Va., general manager of the Maryland Coal Co. and Simpson Creek Coal Co., was elected vice president to succeed Mr. Brackett. Mr. Brackett and Thomas Murphy, of Austin, W. Va., president of the association, were selected as delegates to attend the meetings of the state association being formed at Huntington, W. Va., and the next meeting of the National Coal Association at Philadelphia, Penn.

Columbus, Ohio—The recent order of the Director General of Railroads, prohibiting the construction of spurs and switches to new mines, excepting when the individual projects are approved by his department, has effectually stopped all mine development work in the Hocking Valley mining district. This is shown by the total absence of leases announced by the Buckeye Coal and Railway Co., of Columbus, which has been making on the average of about three leases weekly for new openings. The Buckeye Coal and Railway Co. controls a large acreage in the Hocking Valley and has been making innumerable leases to small operating companies for the opening of mines. The present company retains the sale of coal, and many tons were added to its selling amount as the result of the leases.

MARKET DEPARTMENT

Weekly Review

Early Buying a Stimulus to Production—Soft Coal Output Still Behind—Labor Short in Anthracite Region—New England Outlook Poor—Lake Trade Gaining Momentum

OPTIMISM rightly comes with sunny skies and high temperatures. The Fuel Administration early recognized this fact, and the "buy-your-coal-early" campaign was the result. With warm weather, argued Dr. Garfield, the public will soon forget the experiences of the past winter and delay until fall the buying of coal. This delay, the Fuel Administrator foresaw, would mean that many mines would have to close down for lack of orders, and as a stimulus to production the public is being urged to order its coal now—during the spring and summer months.

The matter of a sufficient supply of bituminous coal in this country has never been simply a question of production. It is at all times a question of adequate transportation facilities. The car-supply problem, furthermore, is one that seriously affects only the soft-coal mines of the country—the mines from which must come the fuel to keep our vital war industries going. It can readily be seen, therefore, that the final solution of the coal problem, insofar as it affects the shortage of bituminous coal, rests in large measure with the Railroad Administration.

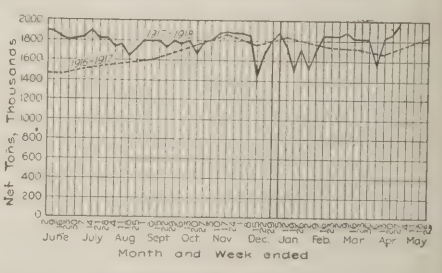
Nothing proves this statement more conclusively than the showing made by the bituminous mines during the last two weeks, when record tonnages were produced. For the week ending Apr. 27, owing to an improvement in the car supply, these mines shipped a total of 11,668,000 short tons, an increase of 5.7 per cent. over the preceding week. For the four months ending April, 1918, the production of soft coal is estimated at 181,992,000 short tons, which is an increase of more than 5,000,000 tons, or about 3 per cent. over the same period in 1917.

In order to meet the estimated demand of 620,000,000 tons this year, however, the production for the first four months of 1918 should have been over 206,000,000 short tons. In other words, the soft-coal supply is behind more than 25,000,000 tons. Whether production will be maintained at a rate that will overcome this shortage depends on the railroads.

To the degree in which transportation difficulties are solved will the soft-coal problem be solved. Not only must the mines receive plenty of cars, but these cars must be distributed evenly over the entire week. A 100 per cent. car supply on Monday and nothing for the rest of the week will not correct the situation.

While the eastern bituminous fields are working short time for the reasons mentioned in the foregoing, the operators in the states west of the Mississippi report that they are forced to shut down because the public is not buying coal. The mines in these states can easily take care of the consumers in the respective territories allotted them under the zone system, but they must be kept working to maximum capacity during the entire year in order to provide a proper supply. The railroads, too, should be buying their coal now, so as not to conflict with industrial and domestic demand in the fall.

The anthracite region, instead of being confronted with a car-shortage problem, is hampered by a scarcity of labor in its efforts to maintain maximum production. The shipments of anthracite during the week ended Apr. 27 totaled 39,522 cars, an increase of 392 cars over the preceding week. This production is insufficient to take care of the demands, and the public, anticipating another scarcity next winter, is insisting on prompt deliveries. In the meantime more and more men are being drawn from the mines by the draft, while quite a number desert for other industries. The outlook for anthracite is not over-pleasing.



New England seems to be in a bad way for both anthracite and bituminous. With the needs for 1918-1919 fixed at 10 million tons by rail and 20 million tons by water (an increase of 5½ million tons by way of water transportation) the quantity sent there so far this year is below normal. Unless shipments are speeded up, the New England States will suffer a shortage next winter that will be even worse than it was last winter.

Shipment over the lake routes is proceeding in considerable volume, though the movement from the mines to the loading docks has diminished. Cargoes are not available for all the carriers offered, and as the ore movement is not yet large, ships are being detained at the ports to await the arrival of coal from the mines. Little anthracite coal has been loaded to date.

COAL PRODUCTION

The week ended Apr. 27 recorded not only the highest rate of production of bituminous coal during the past twelve months but the third successive week of rising production. Production of bituminous coal (including lignite and coal made into coke) is estimated at 11,668,000 net tons, an increase of 5.7 per cent. over the preceding week. The average production per working day is estimated at 1,946,000 net tons compared with 1,840,000 net tons last week and 1,680,000 net tons during April, 1917. Production for the month of April, 1918, is estimated at 46,478,000 net tons, an increase of 4,400,000 net tons, or 10 per cent., over April of last year. Production for the four months ended April, 1918, is estimated at 181,992,000 net tons, an increase of over 5,000,000 net tons or 3 per cent. compared with the same four months of 1917. The production of beehive coke during the week ended Apr. 27 is estimated at 652,000 net tons, compared with 614,000 the week previous. The average daily production is estimated at 109,000 net tons, an increase of 7 per cent. over last week.

The operators reporting produced 8,551,767 net tons or 77.5 per cent. of total production. These 4617 mines were operated to 72.2 per cent. of their full-time capacity during the week of Apr. 20. Losses attributed to car shortage declined from 18.1 per cent. the week of Apr. 13 to 16.2 per cent. and no market losses from 2.8 per cent. to 1.8 per cent. Labor shortage-losses were reported at 4.8 per cent of full-time capacity, as against 3.6 per cent. the week previous. Western Pennsylvania operators, representing 13.7 per cent. of the production of operators reporting, produced 81.8 per cent. of their full-time capacity, compared with 72.2 per cent. the week of April 13. Operators in the Fairmont field of West Virginia report production at 50 per cent. of their full-time capacity compared with 40 per cent. the week previous. Increase in production is attributed to improved car supply. Hazard and Northeastern Kentucky operators report increased production due to improved car supply. Improved car supply is also reported by the Cumberland-Piedmont operators and the Western Kentucky operators, but such improvement is partly offset by strikes in the former fields and labor shortage in the latter. Operators in western and Pacific coast states report increased production due to better market conditions. Kansas and Missouri operators alone report material decrease in production due to car shortage.

Beehive Coke—Improved car supply and better labor conditions caused beehive coke production in the Connellsville and adjacent districts to reach the highest point attained this year. Sixty-one of the principal operators reported production of 324,800 net tons during week ended Apr. 27, or 75.2 per cent. of their full-time capacity. The same operators shipped 166,450 net tons of coal.

Byproduct Coke—An increased supply of byproduct coal during week ended Apr. 27 resulted in the largest production since the weekly statistics on byproduct coke were begun. The plants of the country operated at 89.1 per cent. of maximum capacity as compared with 88 per cent. the week previous. Out of a loss of potential capacity of 10.9 per cent., only 5.1 per cent. was lost for lack of coal. No labor difficulties reducing output were reported. Losses due to repairs to plant decreased slightly. Material improvement

was reported by operators in New Jersey and Ohio, production by the operators of the former state rising from 84.7 per cent. the week of Apr. 20 to 88.8 per cent., and by the operators of the latter state from 93.8 per cent. to 96.6 per cent. Lack of byproduct coal caused the operators in Indiana to report the lowest ratio of production to maximum capacity at 79.2 per cent.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS

	Week Ended Apr. 6	Apr. 13	Apr. 20	Apr. 27
Bituminous shipments, 123 roads	160,178	188,311	193,667*	204,599†
Anthracite shipments, 9 roads	32,223	37,760	39,130*	39,522†

* Revised from last report. † Subject to revision.

Anthracite shipments slightly increased during the week of Apr. 27. Nine roads reporting 39,522 carloads compared with 39,130 during the preceding week.

BUSINESS OPINIONS

Bradstreet's—With the Government operating in practically every essential line, civilian trade, while still large, has been subjected to further repression. Vim in war work, speeding up of the Liberty Loan campaign, extraordinarily large Government orders, further improvement in the outlook for food crops, and more cheerful sentiments regarding operations on the warring fronts, which latter factor is reflected in financial markets, are overshadowing features.

Dry Goods Economist—It is understood that all wool in the possession of dealers or growers, the new clip of 1918, and wools that are in transit from foreign countries will be put at the disposal of the Government and the major part of it will be taken over for army needs. The residue—the extent of which cannot be estimated—will later become available for the manufacture of fabrics for the civilian population's use. In cottons, the impression is growing that price regulation is nearer than ever before, and, according to statements by leaders in Congress, cotton exchanges may be closed by the Government to put a stop to speculation.

Marshall Field & Co.—Current wholesale distribution of dry goods is well ahead of the corresponding period of a year ago. Road sales for both immediate and future shipment show good increases over the same week in 1917. Merchants have been into market in about the same numbers. Collections are excellent.

Atlantic Seaboard

BOSTON

Anxiety continues over inability of consumers to make contracts. Important industries on priority list still uncovered. Railroad fuel question waits decision. State administrators now placing requisitions with district representatives. "Storrow order" all-rail cancelled, but will continue in new form. Water receipts disappointing. Thirty-four new ships coming from the Lakes. Work of paring down fuel allowances to "non-essentials" continues at Washington. "Smithing coal" prices flourish mildly. Anthracite receipts all-rail curtailed through embargoes. Large volume of steam sizes coming forward. Barges move slowly.

Bituminous—Notwithstanding that already six weeks of the coal year have passed, there is as yet no well formulated plan of handling the requirements of plants both large and small whose output is of great importance to the Government. Washington indicated a program, but tested by results it falls short of being practical and there is a wavering between state fuel administrators and Washington as to what requirements are to be made special cases and what are to be left to individual action and to chance. While New England plants are able to keep running on supplies eked out here and there, the anxiety increases over receipts in future. Production shows gains over a month ago, but so far New England has had a small share of the increase.

The situation here is the more urgent because of the Army's great need of cloth for uniforms, and every pressure is now being exerted upon textile mills to speed up their output. Supplies needed by the Red Cross are also dependent upon coal for New England cotton factories. One of these plants alone making army shirtings as well as surgical dressings, is using 4000 tons weekly, and because of labor and other conditions the great bulk of this fuel should come forward in weekly proportions. It should also come by water were the facilities adequate, but in the great shortage of shipping there is really no hope of keeping such a plant in operation exclusively by water borne coal.

Operators who furnished coal all-rail last year are many of them embarrassed by their interrupted negotiations with railroads. The latter are apparently obliged to wait until the Railroad Administration decides upon a policy. Meanwhile there are still "assigned cars" for certain railroad fuel, although the program of the Fuel Administration is all against them. Railroads in this territory that a fortnight ago were almost frantic in their efforts to relieve themselves of engine coal congestion now find the volume of coal in transit so much smaller that they are not adding to their storage as they were hoping to do.

The Garfield-McAdoo orders of Jan. 3, usually called the "Storrow" order, has now been cancelled, effective May 8, but a small volume of coal will continue to be at the disposal of the New England Fuel Administration for emergency purposes. Some of this coal to the extent of 20 cars daily is moving to each of three loading piers, namely, Port Reading, N. J., South Amboy, and Curtis Bay, Md. There is reason to believe that the "Storrow" order will soon reappear in new form for delivery all-rail. It is probable the different district representatives will be expected to furnish a given number of cars weekly, the same as has been done since Apr. 1, when "assigned cars" were abolished on the east end of the Pittsburgh division of the Pennsylvania Railroad.

At Hampton Roads it is again a case of too few bottoms for the coal available. Dumping has again slackened on this account and consumers at this end are correspondingly disappointed. The terminals here are by no means worked to capacity, although there are periods when demurrage accrues either on account of steamers "bunching" or because many of the steamers would not in normal times be considered at all suitable for this trade. The price regulations also have a bearing on the irregularity of loading and rehandling. The 35c. differential in favor of New River tends to create a preference for the piers where Pocahontas can be furnished, and at this end the heavy bonus granted "retail dealers" offers a strong temptation to factors who would ordinarily forward their coal from railroad piers.

In this connection the United States Shipping Board has authorized the statement that from now on there will be a steady flow of completed new vessels from the Great Lakes shipyards. Thirty-four of these are now en route for Atlantic ports, and of the whole number soon to be available 16 to 20 are to be put into the coastwise coal carrying service from Hampton Roads to New England. They approximate a total of 50,000 tons, but at least three times as many more are needed.

Under the wide open regulation as to coal for "smithing purposes" a fairly good-sized tonnage is moving into New England at prices around $7 f.o.b. mines. It is one of the scandals that the same kind of coal merchant who dabbles in "smithing coal" is also permitted to charge any rate he pleases on barge transportation that he may happen to have under "contract."

Anthracite—Embargoes continue an upsetting factor in receipts all-rail for a large area. A further cause is the recent repairs to Poughkeepsie Bridge in order to make it suitable for the new type of locomotive, several of which have already been delivered. A considerable tonnage of barley and culm is coming through for those steam-users who want to be forehanded.

Water shipments are still much hampered by the lack of tugs, although there are now domestic sizes on hand almost everywhere. At the same time the stocks on the wharves of Boston retail dealers is less than 25 per cent. what it was a year ago.

NEW YORK

No abatement in demand for anthracite domestic sizes. Report that Fuel Administrator Wiggin is to resign, and coalmen want practical coal man appointed. New England wants coal. Local retail dealers swamped with orders. Bituminous situation easier, but free coals are scarce. Bunker coals in greater demand.

Anthracite—There has been no abatement in the demand for coal. Although production figures show an increase over the previous week, receipts are insufficient to take care of the call for supplies. Reports of labor conditions at the mines indicate that they are becoming serious, and that in addition to the men going to war many are going into other industries.

A rumor that Albert H. Wiggin is to resign as state fuel administrator resulted in a telegram being sent to Dr. Garfield by the Wholesale Coal Trade Association of this city stating that the directors of that body request the appointment of a practical coal man as his successor should Mr. Wiggin resign. The telegram stated that in view of a possibility of a coal famine this year, the situation in New York under the circumstances demands calling into service a man who has a thorough knowledge not only of the requirements of this community and the territory depending upon it for its coal supply, but one who shall know thoroughly the producing district from which the supply must necessarily be drawn.

Shipments of anthracite during the week ended Apr. 27 were 39,522 cars as compared with 39,130 cars the week previous, an increase of 392 cars; while dumpings at the New York tidewater docks for the week ended May 4 amounted to 7303 cars as compared with 7286 cars for the previous week, an increase of 17 cars.

New England continues to call for coal, and the local shippers are being urged to send shipments forward. It is claimed that receipts so far this year are far below normal requirements, and unless shipments are speeded up at once the shortage next winter will be as bad as, if not worse than, it was last winter.

In New York City dealers are swamped with orders, the consumers having taken the advice of the Fuel Administration. There is hardly a day that some yard is not without coal. Egg and stove are in greatest demand. Most retail dealers have chestnut and pea, but more of the first-named coals are used by household consumers, hence the heavy demand.

The steam sizes are easier. Buckwheat No. 1 is easy, but not in oversupply. Rice and barley are more plentiful with quotations in some quarters slightly lower than a week ago. Wherever possible barley is being stored by consumers.

Contracts have been awarded for supplying the school buildings in Manhattan and the Bronx with coal for one year, but as no bids were received for furnishing fuel to the buildings in the other boroughs of the Greater City an agreement has been reached which provides that the schools will be kept in coal.

Current quotations, per gross ton, f.o.b., Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.15	$6.90
Egg	6.05	6.80
Stove	6.30	7.05
Chestnut	6.40	7.15
Pea	4.90	5.65
Buck	4.45@5.15	4.80@5.50
Rice	3.90@4.10	4.80@4.50
Barley	3.40@3.65	3.00@4.00
Boiler	3.65@3.90	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—Market conditions are more encouraging. With an improvement in car supply reports from the mines indicate heavier production and a better feeling among the mine workers. The increased production for the week ended Apr. 27 is reflected in the dumpings at the New York tidewater ports for the week ended May 4, when 6565 cars were dumped as compared with 6070 cars the previous week. However, the increased dumpings did not add materially to the available quantity of free coal, which is at a minimum here.

Receipts here are barely able to take care of the needs of regular customers which, in many instances, continue to be nearly up to full winter requirements notwithstanding the higher temperatures.

Operators are optimistic, however, of the future and believe that with a more equitable distribution of cars there would be a surplus of coal. They also point out that while many of the miners are now disgruntled because of the small number of cars furnished by the railroads and are threatening to seek employment elsewhere, they would willingly remain at the mines if they could be assured of steadier employment.

A slight improvement in cars is reported by operators along the Baltimore & Ohio where last month some of the mines received about 40 per cent. of their requirements. Some operators along this road have contracts for railroad fuel which do not expire until July 1

Some change for the better may be expected because of the cancellation of the Fuel Administration's order of last winter diverting certain shipments to New England. In the cancellation order, which took effect May 8, it is stated that the order is not now necessary because of the zoning system.

The shortage of fuel in New England is serious according to reports received here, and not much hope is held out unless more coal is sent to the Southern ports for transshipment, even though the United States Shipping Board shall provide more bottoms.

The demand for bunker fuel is heavy owing to the limited number of pools from which these coals must be taken.

BITUMINOUS PRICES

	F. o. b. New York Price	Mine Price	
	Gross	Net	Gross
Central Pennsylvania	$5.06	$3.05	$3.41
Maryland:			
Mine-run	4.84	2.85	3.19
Prepared	5.06	3.05	3.41
Screenings	4.50	2.55	2.85

PHILADELPHIA

Anthracite trade unduly stirred by newspaper reports. Shipments unimproved. Local committee labors to secure heavier receipts. Retailers cautioned against soliciting new trade. Misunderstanding as to distribution. Shipments of buckwheat coal forbidden until exemptions are granted. Bituminous trade unchanged. Situation continues serious. Future unpromising. Assigned cars continued.

Anthracite—All retail men are swamped with orders, and some of them have oversold their quota as based on shipments to them during the period of the present allotment—April, 1916, to March, 1917, inclusive. Published accounts anticipating another scarcity next winter have made the public more anxious than ever to stock their cellars, and the dealers have been tormented with insistent demands for prompt deliveries. The shipments show little improvement, and as coal is usually delivered by the dealers as rapidly as received, there is very little coal in the yards. It would appear that the dealers who depend on the smaller operators for the bulk of their supply are receiving a larger proportion of their requirements than those who are supplied by the companies.

The entire trade is hopefully awaiting the result of the local fuel administration's efforts to secure heavier shipments for them. Chairman Lewis has been busy compiling figures showing shipments, deliveries, stocks on hand, as well as orders unfilled. The dealers have been assured of his earnest efforts in their behalf to secure more coal for this territory within the next 60 days.

The fuel committee somewhat surprised the retailers by giving them written notice to use due caution not to solicit orders for new trade beyond their reasonable expectation of ability to fill such orders. The consumer was also warned that in placing his order with other than the regular dealer he risks not being supplied with coal, for the reason that the fuel administration's efforts to secure a proper allotment of coal for the city are based on each dealer's tonnage of former years. The dealers, however, have been directed to supply newcomers in their immediate neighborhood, irrespective of the fact whether they have been former customers.

This week the producing companies were somewhat startled by a drastic order handed down by the National Fuel Administration directing that they discontinue shipping at once all buckwheat to manufacturing plants until these plants secured permits from Washington. There were a few exemptions to this order, which were based on the exemption clause of the Garfield closing order under date of Jan. 17 last. The trade is entirely in the dark as to the reason for this order, and as a matter of fact up to the end of the week some of the shippers claim not to have received the instructions. There is no doubt of the issuance of the order, as your correspondent has seen the circular letter sent out. The suddenness of the ruling had a tendency to disrupt some shippers, especially those without storage room. As the order allowed the selling of buckwheat to retail dealers for domestic trade, several shippers availed themselves of this opportunity. In the meantime consumers succeeded in securing exemptions from the national administration and shipments are assuming a normal trend again. The operators are in the dark as to the cause for the move, and at first felt that possibly the Government intended to take the coal for some special use, but as they have not done so it begins to look as if the purpose of the order was to have their hand directly on the distribution of steam coal.

Another order that stirred certain anthracite shippers was sent out by the national anthracite distribution committee. This had particular reference to the producers and distributors of anthracite coal who have changed their selling agencies during the coal year 1916-17, and directed that these concerns must place their output in the same communities which received coal from these mines in the coal year beginning Apr. 1, 1916. The letter stated that unless this was done the output of such operations would be considered as "liquid" coal and the distribution directed by the above committee. It will be recalled that there were several changes of this nature during the above-named period, whether either by sale or expiration of lease, the selling agencies had been changed, the most notable being wherein the Pennsylvania R.R. disposed of its anthracite interests held through the Susquehanna Coal Co.

The prices per gross ton f.o.b. cars for line shipments and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$4.90	$6.05	Buckwheat	$3.15	$3.75
Egg	4.50	5.70	Rice	2.65	3.65
Stove	4.75	6.05	Boiler	2.45	3.55
Nut	4.85	6.10	Barley	2.15	2.40
Pea	3.45	4.35			

Bituminous—Conditions do not improve and have really shown very little variation for the past two months. Every operator continues to clamor for more cars and then some more. Short working time is yet the rule at numerous mines, yet all the while promise is made that rail conditions will improve so as to relieve the situation. Locally the important plants, such as public utilities and concerns on war material, continue to be fairly supplied, while other less essential industries are curtailed. Shippers continue to complain that the practice of assigning cars is not yet entirely eliminated.

BALTIMORE

Coal supply here largely at the mercy of diversions. City served in rather haphazard fashion with industrial fuels. Hard coal receipts comparatively light.

Bituminous—"About 300 cars of coal are being diverted to Baltimore district." That was the message of hope that came to the trade and business here after a week of scarcity caused by railroad congestion that prevented coal directly consigned from coming through. This coal is being distributed here at present, supplemented by directly consigned coal that had edged its way past the jam at the Cumberland gateway. For several days there was a glowing example of the fact that the Baltimore & Ohio and Western Maryland Ry. were unable to care for their coal delivery obligations in this territory without attempting to supplement the extra amount cut off from this section by the embargoing of the Pennsylvania deliveries. The 15,000 or so tons diverted here from their original northern destinations not only aided in preventing shortage among consumers, but assisted in clearing a part of the railroad congestion to the westward of this point.

Anthracite—Hard coal dealers here report that the summer weather has brought a lessened urgent call for hard coal. Coal men are rather glad of a let-up in demand for immediate deliveries, because the receipts of anthracite are comparatively light. Constant urging by Fuel Administration officials, supplemented by announcements here by the Maryland fuel administrator that people should put in their supplies up to two-thirds of requirements at once, had caused more of a rush for immediate delivery than the coal men could supply. Now the lull will allow a catching up. Few of the coal men are figuring that they are to secure enough hard coal over summer to enter the fall term with even the two-thirds supply in the bins of their household customers.

Lake Markets

PITTSBURGH

Car supplies slightly improved. Lake shipments light. Little coal for stocking purposes.

There has been a slight further improvement in car supplies, and the Pittsburgh district is now working fairly well, although not up to capacity by any means. Conditions are better than 30 days ago, when the Geological Survey report showed 27.8 per cent. of the capacity idle on account of car shortage. As to the Pittsburgh and Connellsville districts generally, however, conditions were not as good even as shown by that report, which covered western Pennsylvania as a whole. The Panhandle division has been particularly short of coal cars right along, while the Connellsville district shippers have been very short. The railroads have endeavored to place coke cars first in that region, and coal cars next, and even the coke cars have been quite below requirements. Numerous exceptions, however, are made in the case of byproduct coke. The difference between coal and coke car supplies is shown by the report, for the week ended Apr. 27, by certain coke producers in the Connellsville, Greensburg and Latrobe districts. Their coke car shortages represented 8.6 per cent. of their capacity, while their coal car shortages represented 18.8 per cent. of capacity. Their mine labor shortage was reported very high in the case of coal, presumably because they figured their mining labor full as to coal destined for their beehive ovens and allotted only the remaining labor to their raw coal business.

Lake shipments have increased a trifle, but are still very light, and the movement is not expected to be on in full for several weeks yet, or until the vessel movement is in full swing.

Coal consumers are fairly well supplied for current needs, but are obtaining little coal to accumulate stocks, as the authorities are so anxious that they should do at this time. There is little free coal in the market. Prices remain quotable at the Government limits: Slack, $2.20; mine-run, $2.45; screened, $2.70, per net ton at mine, Pittsburgh district, with 15c. brokerage allowed to be charged extra under certain conditions.

BUFFALO

Plenty of bituminous in consumers' hands, especially in Canada, but clamor for anthracite is as general as ever. Shippers do not see any real excuse for so much fright over the anthracite situation.

Bituminous—The jobbers as a rule do not find it easy to fill their orders and they are groping along as best they can between the operators, who have no real need of them, and the consumers, who give them business sparingly. All reports from Canada agree that the territory covered from Buffalo by rail is full of bituminous coal, so that the sellers have paid large demurrage charges. Some of them are still with coal on track that there is no demand for. A great part of this coal is of poor quality. It would not sell here, and all that could be done with it was to send it on till it reached the end of the line. There it stuck and there much of it will remain unsold awhile yet.

The chief reason for the Canadian situation is that a margin of 30c. profit is allowed there, while only 15c. can be realized here. Some of this poor coal has been taken by the railroads, but even they cannot well absorb all of it. So the paying of demurrage must go on awhile yet. It is said that as soon as the water coal destined for the St. Lawrence valley trade by shippers from Ohio ports gets well started the situation there will be much the same that it is now in the district further west in Canada.

Bituminous prices are still pretty low, so that the consumer has the Fuel Administration to thank for that at least, being $4.45 for thin-vein Allegheny Valley, $4.25 for Pittsburgh lump, $4 for mine-run and $3.75 for slack, all per net ton, f.o.b. Buffalo.

Anthracite—The actual scarcity of this coal is not very great, for the shippers say that they have distributed as much this season as they did last season to date. Some claim that they have done more than that, so far as the city is concerned, but that is not easily determined. At any rate the consumers are not at all satisfied and are making all possible effort to get more. The rule not to furnish any coal except on written order accompanied by a statement of the needs and the amount on hand is strictly adhered to, but the retailers find that if they get any amount to handle they must be at the trestles very early in the morning, for the supply usually gives out before noon. Some days the trestles get none, and never do they get enough to keep the deliveries busy.

Whether this proceeding is going to be such that the actual needs are met before winter is hard to say, for it will require a house-to-house inspection to find how much the consumers have on hand. They will

not make that known if they can help it. All will buy much more than they need if they can get it. Shippers are advising everybody to use as much wood as they can for fuel, and it is expected that a large amount of bituminous coal will be burned in homes next winter, especially where the anthracite supply is most uncertain.

The lake season opens slowly, with only a part of the shippers supplied with coal for that trade. The amount loaded so far is 69,000 tons for Chicago and 20,400 tons for Milwaukee in April, and 18,000 tons for Chicago, 10,000 tons for Duluth-Superior and 13,500 tons for Milwaukee so far in May. Rates are 48c. per net ton to Duluth, 55c. to Milwaukee and 65c. to Chicago.

DETROIT

Receipts of bituminous are materially reduced. Anthracite is scarce. Lake shipments are of good volume.

Bituminous — Shipments of bituminous coal coming into Michigan are lighter than a month ago. Traffic records show the movement of 27,434 cars into the state between Apr. 1 and Apr. 28, of which 24,315 were bituminous and 3119 anthracite. Detroit's average daily receipts during this period were 395 cars of bituminous and 69 cars of anthracite. Estimates on local consumption requirements call for a daily supply of all kinds of coal, amounting to about 700 cars. Further reduction of the volume of bituminous coal shipments is developing with the opening of navigation season on the lakes. This curtailment is the result both of demands on the mines for lake coal and of a shortening of transportation equipment, resulting from the diversion of cars and locomotives from all rail routes to those over which the coal is hauled to lake loading docks.

The local situation is made more complicated as the result of a clash between W. K. Prudden, Michigan fuel administrator, as opposed to the Wayne County fuel commissioners and Detroit coal dealers. After allowing Detroit dealers a margin of $2.50 a ton for deliveries of domestic coal made during the summer months, Mr. Prudden has become something of a storm center. Detroit dealers assert it is impossible for them to handle domestic coal at the margin allowed and make a profit. They say that rather than continue business at a loss, they will close their yards. The Wayne County fuel commissioners, Edgar B. Whitcomb, chairman, James Couzens and Charles A. Dean, support the Detroit dealers' contention, though they were unable to agree among themselves what would be a just margin. Mr. Couzens suggested $2.60 a ton, Mr. Dean desired $2.75, and Mr. Whitcomb thought $3 necessary.

Owing to the differences, coal distribution to Detroit consumers of domestic stock have been much restricted, and time which should have been utilized in stocking up household consumers has seen little progress in that direction from the Detroit Board of Commerce, which also is endeavoring to obtain from the Federal Fuel Administration a modification of the zone system that will give Detroit a larger supply of West Virginia coal, as a substitute for Pocahontas and New River coals, neither of which is now supplied the Detroit market.

Anthracite — Incoming shipments of anthracite have been so scanty that the receipts of retail dealers have been scarcely more than sufficient to supply current needs of their customers. The state fuel administrator says an allotment of anthracite will soon be made to Detroit. Meantime the opportunity to put in stocks required by household consumers for next winter is being lost.

Lake Trade—Shipments over the lake routes is proceeding in considerable volume, though the movement from the mines to the leading docks has diminished. Cargoes are not available for all the carriers offered and as the ore movement is not yet of much volume, ships are being detained at the ports to await the arrival of coal from the mines. Little anthracite coal has been loaded to date.

COLUMBUS

The coal trade has shown more strength during the past week. Lake trade is increasing, and has had the effect of absorbing all tonnage. Steam business is rather more active than previously.

The coal trade in central Ohio territory has been rather strong in every department during the past week. This is especially true of domestic and lake tonnage, which has been snapped up rapidly. Steam business continues to show considerable strength, as mine-run is not as plentiful as formerly. Taking it all in all, the trade is in good shape and future prospects are for continued activity.

Domestic trade is still attracting the bulk of the attention of producers, jobbers and fuel administrators. The warnings recently issued to householders to lay in their fuel supply have met with prompt response, with the result that dealers in every section are active. With Pocahontas and West Virginia splints arriving on the local market in larger quantities, many private users who have been holding back for the fancy grades are now placing orders. Retailers are busy making deliveries, and all available trucks and teams are employed. Retail stocks are not so large as formerly, as many have been using from their surplus. Retail prices continue firm at the levels which have prevailed for some time. Anthracite is quite scarce on the local market.

The steam business is rather active, as some of the larger users are stocking up to a large degree. Uncertainty as to price fluctuations is now about over, and consequently some of the larger consumers who have been holding back are placing orders. Most of the steam orders are for immediate shipment. Railroads are taking coal for current needs only, as many have large surplus stocks on hand. The smaller consumer of steam varieties is not stocking, being content to buy in the open market. On the whole the steam trade is more active than formerly.

Lake trade is becoming more important as the season advances. This is especially true as it affects coal produced in Ohio and West Virginia. A considerable tonnage is moving to the lower lake ports and vessels are being loaded. Ice in the upper lake channels is still interfering with the free movement, but this is expected to pass away in the near future. Loadings at the docks of the lower lake ports are growing larger.

Production is better since the car supply has been improved. This is especially true of the Hocking Valley, where the output is close to 80 per cent. The fact that May 1 was kept as a holiday reduced the output to a certain extent. In eastern Ohio operators are still worried by a rather short car supply.

CINCINNATI

Improved car supply has helped the situation, but supply remains below demand. Storage orders are on an unprecedented basis.

Reports from the various nearby coal-mining districts indicate that in most cases a better car supply is being received, the average probably running as high as 75 per cent. of requirements. As this is much better than has been the case for some months, the volume of coal loaded and forwarded is also larger than for some time. So far, however, actual receipts have not been such as to run much ahead of the orders actually in the hands of dealers, although it is understood that such orders are to be filled from time to time during the spring and summer, as supplies of coal become available. This is especially true of domestic consumers, thousands of whom have placed with their dealers orders covering their entire winter's supply, to be cared for as the dealers may find convenient. Large industrial consumers are also placing orders in advance of current requirements, in order that they may accumulate substantial reserves for next winter, in line with the advice of the trade and of the Fuel Administration. These orders explain the heavy demand for coal, and will go far toward taking care of all that can be shipped to this market during the warm weather.

LOUISVILLE

Good weather conditions lead to smaller domestic demand for immediate use. Domestic stocking demand good. Steam buyers signing up contracts freely.

Mild weather since the latter part of April has resulted in a much lighter demand from the retailers, except in that large domestic consumers are placing heavy stocking orders. Indications are that winter will find more coal stored by domestic consumers than even the Fuel Administration had anticipated, according to some of the local coal men. The steam demand is also good, but is principally on contract orders.

The situation at the eastern and western Kentucky mines shows little if any improvement, the car supply still being short, while labor is scarce and steadily growing scarcer. However, indications are that none of the mines will have to close down this summer during the dull period, as has been the case with some of the smaller mines in past years. It is believed that it will be easier to hold labor, as operations will be controlled almost entirely by the car supply.

So far local retailers have not made much headway toward piling up any yard stocks, as the domestic demand is strong enough to keep the yards fairly well cleaned up. Some little western Kentucky coal has been looking for an open market, but as a whole the supply is well taken care of.

BIRMINGHAM

Increasing priority demands bringing about an embarrassing condition in the trade. Nonessential industries are feeling the pinch of a short and uncertain supply. Domestic receipts continue unsatisfactory in volume. Mine capacity not being obtained, due to slack working schedules principally.

Coal producers in this field are now complying with Government instructions to supply industries and other classes of steam users certified as being essential to the welfare of the nation with 100 per cent. of their requirements, or with such a proportion thereof as possible, before turning their attention to the nonessential consumers. As a result, the fuel question with the latter class is becoming more and more serious. The Southern Ry. made a substantial increase in its demands upon the mines on its system the past week, and it is understood that its tonnage requirements from such operations for the current week will be based on 47 per cent. of the production. This and other interferences with the normal movement of coal to regular customers is causing much confusion in the trade and embarrassment to consumers not in the preferential class. Free coal is indeed scarce, and the majority of the available tonnage is of an inferior grade.

Complaint is made that domestic receipts are very unsatisfactory and uncertain. Hardly any local yards have made any progress in stocking—some are kept clean by deliveries on current orders. Retail prices will be boosted 45c. per ton May 16, it is understood, though the local fuel board has not yet announced the increase. This amount will be added to the mine prices when the new wage scale and agreement is put into effect by the commercial operators. Furnace companies will receive little or no benefit from the increased mine price, as they have a limited tonnage for the market.

Much relief could be afforded the situation by an increased production. However, mine labor continues to manifest indifference. Comment is general that, although there is some labor shortage, many operations have full working forces and such mines are falling far short of capacity output. The Miners' Union ratified the recent wage agreement at their convention last week, but such action is not expected to boost production, in the light of past experiences.

Coke

CONNELLSVILLE

Slight increase in shipments. Labor shortage more in evidence. Prospective influence of four new byproduct plants.

There has been a slight gain in Connellsville coke shipments, but the movement is still not altogether adequate. With long range comparisons, the blast furnaces are distinctly better supplied than 30 days ago, and of course vastly better than in January or February; but there is still considerable lack of coke. In the first place, many of the furnaces, particularly merchant stacks, are running at gaited rates, being unable to operate full, and in the second place there are a number of idle furnaces which it is desired to blow in. Very rarely are any furnaces banked nowadays, but this does not show that production is up to the available capacity, by any means.

Labor shortage is somewhat more in evidence, partly by reason of the change of season, whereby some men are attracted to other employments, and partly by reason that with somewhat better car supplies there are more jobs. Undoubtedly the irregular operation of the past few months has induced some men to seek steadier employment. Their wages at the coke works are very high, at scale rates, but practically all the work is piece work.

A decided change in the situation as to coke supply is in near prospect, by reason of several byproduct coke operations nearing completion. The 180-oven plant at Cleveland of the American Steel and Wire Co. is expected to make its first coke this week. The Lorain plant of the National

Tube Co., 208 ovens, and the Clairton plant of the Carnegie Steel Co., 640 ovens, are expected to begin making coke late next month. All three plants should be running at capacity within a couple of months after making their first coke, making easily 75,000 tons of coke a week, and the shortage of Connellsville coke has hardly amounted to more than that in the past two months The coke will, of course, go only to Steel Corporation blast furnaces, and much of the coal must come from the Connellsville region, but the Clairton coal will move by river exclusively, thus relieving the railroads to that extent at any rate. The Solvay plant in the Ironton district, 40 ovens, is expected to be operating some time next month. It has made a number of ten-year coke contracts with merchant blast furnaces in the Ironton district. That district has been suffering particularly from coke shortage for a year or more.
